Sect. I. Sarcocra'mbe (from σαρξ σαρκος, *sarx sarcos*, flesh; and κραμβη; because the leaves of the plants contained in this section are fleshy.) D. C. syst. 2. p. 651. prod. 1. p. 225. Lower joint of silicle depressed, thick; stigma sessile. Larger filaments furnished each at the top with a tooth. Roots perennial, with many stems rising from the neck. Leaves large, usually fleshy. The young shoots of all are eatable when blanched.

1 C. marítima (Lin. spec. 937.) Longer filaments forked; pods blunt; leaves roundish, sinuate, waved, toothed, and are, as well as the stem, very smooth. ♃. H. Native in the sand on the sea-shore, from Sweden to France, and along the Mediterranean sea on the European side; also in Tauria, along the Euxine sea. Plentiful in Britain, in the sand by the sea-side. Oed. fl. dan. t. 316. Smith, engl. bot. t. 924.

Sea-kale (Eng.) *Chou marin* (Fr.) *Meerkohl* (Germ.) *Crambio* (Ital.). The country people in the west of England have been, from time immemorial, in the practice of watching when the shoots and leaf-stalks begin to push up the sand and gravel in March and April, when they cut them off underground, as is done in gathering *Asparagus*, and boil them as greens. About the middle of the last century the plant was first introduced into gardens, grown on deep sandy soil, and blanched either by sand, ashes, litter, or by covering with flower-pots, earthen pots made on purpose, or any opaque cover. It is now almost as universal in good gardens as *Asparagus*, and, like it, is forced, either by taking up the roots and planting them on a hot-bed, or in a border of a forcing-house, or by covering or surrounding them with litter, in the open garden. Before covering a bed with warm litter, each plant, or stool of plants, is covered with an earthenware blanching pot, or a wicker case, to keep off the dung from the young shoots, and to ensure their being blanched. No plant is so easily forced, and, unlike *Asparagus*, it yields produce the first spring after raising from seed. The taste is very like that of *Cauliflower*. The whole plant is smooth, of a beautiful glaucous hue, covered with a very fine meal. However, it varies much; for sometimes it is to be seen almost with green-leaves. The radical leaves are large, more or less sinuated or indented, containing in the axil a bud or rudiment of next year's stem. The flowers are in ample panicles; they are small, of a pure white, and smell strongly of honey.

The precise period of its introduction to the garden is unknown. Parkinson and Bryant state, that the radical leaves are cut by the inhabitants where the plant grows wild, and boiled as cabbage; and W. Jones, of Chelsea, assured the late W. Curtis, that he saw bundles of it, in a cultivated state, exposed for sale in Chichester market, in 1753. J. Maher observes, (Hort. trans. vol. 1.) that "the *Crámbe marítima* was known, and sent from this kingdom to the continent, more than two hundred years ago, by L'Obel; but Miller, in 1731, was the first who wrote upon it professionally. About the year 1767, it was cultivated by Lettsom, at Grove-hill, and by him brought into general notice in the neighbourhood of London. In the Gardener's Dictionary, published 1774, by James Gordon, at Fountain Bridge, near Edinburgh, directions are given for the cultivation of this vegetable, and for blanching it by covering the beds, four inches deep, with sand or gravel. Professor Martyn has printed some valuable instructions for its cultivation, from the MSS. of the Rev. M. Laurent; and the late W. Curtis, by a pamphlet on the culture, has done more to recommend it, and diffuse the knowledge of it, than any of his predecessors. *Sea-kale* is now a common vegetable in Covent Garden market, and, Mr. Neill observes, has begun to appear on the green-stalls of Edinburgh; but in France it is almost unknown. Bastien (Manuel du Jardinier, 1807,) describes the *Chou marin d'Angleterre*; but he appears to have tried to use the broad green leaves, instead of the blanched shoots. Disgusted with his preparation, he denies the merit of *Sea-kale*, and resigns the plant, with a sneer, to colder climates."

The young spring shoots, and the stalks of the unfolded leaves, blanched by rising through the ground in a wild state, or by earthing up in gardens, are the parts used; and when boiled and dressed like *Asparagus*, are not inferior to that vegetable. They form also an excellent ingredient in soups. Sometimes the ribs of the large leaves are peeled and dressed as *Asparagus*, after the plant has ceased to send up young shoots. By forcing, *Sea-kale* may be had in perfection from November till May, a period including all the dead months in the year. It is remarked by Nicol, that vegetables seldom improve by forcing, but that *Sea-kale* forms an exception; the forced shoots produced at midwinter being more crisp and delicate in flavour than those procured in the natural way, in April and May. Sir George Mackenzie observes, (Caled. hort. mem. 1. p. 313.) that *Sea-kale* cannot easily be overdone in cooking; and that, after being well boiled, it should be thoroughly drained, and then suffered to remain a few minutes before the fire, that a further portion of moisture may be exhaled."

Sea-kale may be cultivated by rearing the plants from seed, on a seed-bed, and when a year old transplanting them into beds, at the distance of eighteen inches each way. But in setting young plants, place them in patches of three plants each, taking care, in removing them from the seed-bed, not to injure the tap-roots.

Sea-kale plants of a proper age may be had of any nurseryman, but in well-regulated gardens, a part should be annually

sown, so as to have a supply always at hand. However, where circumstances will admit, it would be advisable to sow the seed in the beds where they are to remain to come to perfection. This is attended with much less trouble, and if the beds have been properly prepared, the plants will become stronger than those which have been transplanted. *Sea-kale* is also propagated by some eminent gardeners in the vicinity of London, by cutting the roots of the old plants into pieces about an inch long, and planting them in drills like potatoes. By this means the buds will spring and find their way to the surface with greater certainty than if planted by the dibble; by which latter process many of them run a chance of being placed with their end uppermost, and consequently be unproductive of shoots.

In light sandy garden-soil the *Sea-kale* comes to perfection with little care; but in strong clayey soils it is often apt to rot in winter. In preparing ground for *Sea-kale*, if the ground be naturally strong, it should be trenched to a depth of 3 feet, if the ground will admit of that depth, and well manured. Divide the ground into 4 feet beds, with alleys 18 inches wide; throw out the mould of the alleys to the depth of 10 or 12 inches, which mould being laid on the beds will raise them from 15 to 18 inches above the bottom of the alleys, which will render the beds dry. If the ground be particularly stiff, lay on a quantity of fine sharp sand and leaf mould, which, if properly mixed in the process of trenching, will render the beds sufficiently light for the cultivation of this excellent vegetable, for the success depends upon the lightness of the mould and dryness of the bottom. About the middle of April, if the beds be prepared as above, proceed to draw two drills in each bed, about 2 inches deep, in which the seeds must be sown. Sow moderately thick, so as to secure a crop, which afterwards should be thinned out to 12 inches apart. or sow in patches 18 inches apart. The turnip-fly and the wire-worm are great enemies to this as well as to all cruciferous plants. The best remedy for the latter is to have them picked out of the ground by the hand; the former may be prevented from doing much injury by a circle of quick-lime strewed round the plants. If the months of June and July prove dry, water the whole beds plentifully; and in the following November as soon as the leaves are decayed, clear them away and cover the beds an inch thick with light rich earth and sand, that has lain in a heap and been turned over at least three times the preceding summer. Upon this dressing of sandy loam, throw about 6 inches of light stable litter, which finishes every thing to be done the first year. In the spring of the second year, when the plants begin to grow, rake off the stable litter, digging a little of the most rotten into the alleys, and add another inch in depth of fresh loam and sand. Abstain from cutting this year, though some of the plants will probably rise very strong, treating the beds the succeeding winter exactly as before. The third season, a little before the plants begin to stir, rake off the winter covering, laying on now an inch in depth of pure sand or gravel. Then cover each parcel or plant with one of the blanching-pots, or large flower-pots with the hole corked up, pressing it very firmly into the ground, so as to exclude all light and air, for the colour and flavour is greatly injured by being exposed to either." But the most convenient method for blanching *Sea-kale* which is not forced, is to cover the beds in autumn with leaves raked up from the woods or pleasure-ground, covering each bed in thickness according to the strength and age of the plants, giving the greater covering to the oldest and strongest roots. The covering may be from 5 to 15 inches deep, when first laid on, and over that place a slight covering of light littery dung to prevent the leaves from blowing about; this covering is to remain on until the crop be all cut, when it may be taken away, and the beds dug over, or when, from particular circumstances, this has not been attended to in autumn. At the time the buds begin to appear, fork the beds regularly over, and cover the plants from 12 to 15 inches with saw-dust or rotten tan, when it can be conveniently procured; if neither can be had, break the mould on the surface of the beds as fine as possible and mould up the plants with it.

As the heads become ready for use they will raise the covering, by which means they will be easily perceived without removing any more of the covering than the part where those heads are that are intended to be cut. Those beds which have had the thickest covering in autumn come first into use, and the other in rotation, so that the last cutting is from what was sown the spring before. Although cutting from one year old plants is generally disapproved of, Barton (Caled. hort. mem.) defends the practice from his experience of its not proving injurious; and because thereby the *Sea-kale* season is prolonged, as the one year old plants come into use much later in spring than the old established roots.

When the young shoots are about 3 or 4 inches high, remove the leaves, or whatever has been used in blanching, carefully, and cut them off; but so as not to injure the remaining buds, which are springing from the same root. A succession of gatherings may be continued for 5 or 6 weeks, after which period the plants should be uncovered and their leaves suffered to grow, that they may acquire and retain a sufficient quantity of nutriment to the roots for next year's buds. The flowers, when the seeds are not wanted, ought to be nipped off with the finger and thumb as long as they appear, as they tend considerably to weaken the plants.

Forcing Sea-kale. "No vegetable is more easily or more cheaply forced than *Sea-kale*, whether the operation be performed in beds or drills in the open air, or in hot-bed frames or flued pits." Abercrombie, Nicol, and Maher recommend forcing in beds "in the open air." "Seven weeks," the former observes "before the time at which you wish to cut shoots for the table, begin to prepare the plants for forcing, and to ferment a sufficient quantity of stable dung. Having trimmed the leaves from the plants, carefully point the surface of the ground, and over the top of the roots spread fresh light earth, mixed with light sand or coal-ashes 2 or 3 inches in depth, this is the best remedy against worms. Salt also destroys worms and will not injure the *Sea-kale*. When the dung is well prepared, which will be in about three weeks, proceed to forcing. If you mix tree-leaves with the dung, begin to ferment them a week or a fortnight sooner. Cover each of the plants either with a regular blanching-pot, or with a garden-pot of the largest size, taking care to stop up the hole. Then lay a portion of prepared dung alone, or mixed with tree-leaves about and over each pot, pressing it down firm, extending it 8 or 10 inches all round, and raising the bank six or eight inches above the pot. It will be necessary to examine the plants frequently, and to measure the heat within the covers now and then, lest by some inadvertency the quantity of litter should not have been well-apportioned or rightly prepared; if the heat be under 50° there is not enough to excite the plants; and if above 60° it is too fiery, and may injure them, for it is better to begin time enough and force slowly rather than too quickly." The litter round the pots should be renewed at least once in eight weeks, but oftener if the weather is rigorous. When the stools will produce no more shoots, remove the litter and the covers, and dress the ground, that the plants may be suffered to grow and return strength to the root for the next year's shoots. Nicol says, he knows of a row of *Sea-kale* having been forced in the above way every season for seven years, in which the plants were at the end of that period as healthy and vigorous as others in the same quarter that were forced only every second year.

Barton (Caled. hort. mem.) forces *Sea-kale* on dung beds,

under frames exactly in the same manner usually adopted for *Asparagus*. For a common melon-frame will contain as many heads as are capable of being produced in two drills, of twenty yards each, by covering with dung. He finds three frames of two lights each, quite sufficient for a large family; the first prepared about the beginning of November, and the second about the last week in December; and by the time the second frame is exhausted, *Sea-kale* will be ready for use in the open ground.

Gibbs (Caled. hort. mem. 1. p. 388.) also forces in frames, blanching by keeping the beds covered with mats. As the plants are no longer of use after being forced in this and the preceding method, a succession is kept up by annual sowings, and the plants are allowed to attain three years growth before taken up for forcing. Economy and certainty are advantages attending these last methods.

Balwin (Hort. trans. 4. p. 63.) forces *Sea-kale* where it stands in the following manner. "On each side of a three foot bed, in which the *Sea-kale* has been planted, trenches are formed two feet deep, and eighteen inches wide at bottom; the side of the trench next the bed is perpendicular, the other side is sloped so as to make the top of the trench at the surface level, two feet and a half wide; this trench is filled with linings of hot dung, on the inner edges of which garden-lights are placed, and the glass kept covered with mats until the kale is fit to cut, and a covering of broad canvass or mats might be substituted for the glass lights."

Melross (Caled. mem. 4. p. 164.) forces *Sea-kale* in a vinery. He "plants along the back of the flue where no vine-roots are, places covers on the plants, and in two weeks, when the heat for forcing vines is kept up, he has as fine *Sea-kale* as could be desired. When a dish is cut, he lifts the roots and supplies their places by others from the open ground."

Gathering. "Remove a part of the earth, leaves or pots, or whatever is employed in blanching, cut off the heads or shoots, and slip off the stalks of the leaves," (Loud. ency. gard. p. 732.)

Produce. From four or six heads, according to the size, held together like *Asparagus*, make a dish; and Maher says, a blanching pot which contains three plants will afford a dish twice in a season. Hence from sixty to a hundred pots will suffice for forcing *Sea-kale* for a large family (Loud. l. c.)

To save seed. Let a stool, which has not been cut, run in spring; and seed will be produced in the autumn.

Common *Sea*-kale. Fl. May, June. Britain. Pl. 3 feet.

2 C. pinnatífida (R. Br. in hort. kew. ed. 2. vol. 4. p. 72.) longer filaments forked; pods awnless; leaves profoundly pinnatifid; lobes oblong, acute, toothed, and are as well as the stem, smooth. ♃. H. Native of Hungary in fields about Buda, Tauria, and in deserts adjacent to the north of Caucasus. C. Suécica, Mill. dict. ed. 7. no. 2. C. orientàlis, Jacq. icon. rar. 1. t. 128. C. laciniàta, Desf. hort. par. An intermediate species between *C. marítima* and *C. orientàlis*.

Pinnatifid-leaved Sea-kale. Fl. April, Ju. Clt. 1759. Pl. 2 ft.

3 C. grandiflòra (D. C. syst. 2. p. 652.) longer filaments forked; pods awnless; leaves pinnate-parted; lobes oblong, acutely and deeply toothed, intermixed with smaller ones along the raches, and are as well as the stem, smooth. ♃. H. Native of the island of Tama at the mouth of the Kuban, and on the shores of the Euxine Sea. This species is intermediate between *C. pinnatífida* and *C. áspera*. It is only perhaps a variety of *C. marítima*, but the flowers are 2 or 3 times larger.

Great-flowered Sea-kale. Fl. May, June. Pl. 3 feet.

4 C. orientàlis (Lin. spec. 937.) longer filaments forked; pods awnless, smooth; leaves pinnatifid, toothed, scabrous; stem smooth. ♃. H. Native of the Levant.

Oriental Sea-kale. Fl. June, July. Clt. 1752. Pl. 2 foot.

5 C. Tatárica (Jacq. misc. 2. p. 274. icon. rar. 1. t. 129. exclusive of synonym of Clusius,) longer filaments forked; pods awnless; radical leaves decompound; leaflets cut, toothed, younger leaves rough, adult ones smooth as well as the stem. ♃. H. Root fusiform, 2 or 3 feet long.

Var. α, Hungárica (D. C. syst. 2. p. 653.) lobes of cauline leaves oblong-linear, almost entire and somewhat pectinated. ♃. H. Native of gravelly places and fertile fields in Hungary about Agria and elsewhere; in Moravia about Aussitz; in Transylvania in calcareous meadows and on sandy mountains. C. Tatárica, Jacq. misc. 2. p. 274. Willd. spec. 3. p. 419. This plant is called in Hungary *Tatar-kenyer* or *Tartarian-bread*, and its root, stripped of the bark and sliced, is eaten with oil, vinegar, and salt. The boiled root is sweet, and eaten by children. The young shoots are boiled and eaten like those of common *Sea-kale*, and have an excellent taste, but are stringy, which they would not be if well cultivated, which the plant appears to deserve. Hares are extremely fond of the root and stems.

Var. β, Taúrica (D. C. syst. 2. p. 653.) lobes of leaves sinuately-lobed. ♃. H. C. orientàlis, Reich. syst. 3. p. 290. Falk. itin. p. 219. no. 791. t. 14. C. Tatárica, Bieb. fl. taur. 2. p. 90. Native of Tauria in fields, and adjacent to the northern regions of Caucasus at the Tanais, and from Borysthene to the Rhymnus. Roots fusiform, 2 or 4 feet long.

Tartarian Sea-kale. Fl. June, July, in gardens; April, May, in its native countries. Clt. 1789. Pl. 2 to 3 feet.

6 C. á'spera (Bieb. fl. taur. 2. p. 90.) longer filaments forked; pods awnless, wrinkled; leaves pinnate-parted, with oblong-linear, toothed lobes, and are scabrous as well as the stem. ♃. H. Native of fields in Tauria at the lower Wolga, and near Sarepta. The whole plant is usually rough from stiff erect hairs. Deless. icon. sel. 2. t. 91.

Rough Sea-kale. Fl. May, June. Clt. 1820. Pl. 1 foot.

7 C. ju'ncea (Bieb. suppl. ined. D. C. syst. 2. p. 654.) longer filaments forked; pods awnless, smooth; leaves lyrate, with toothed lobes, terminal lobe large; leaf stalked and stem hispid from reflexed hairs. ♃. H. Native of Iberia about Tiflis. Pods small, globose, smooth, and seated upon slender pedicels.

Rushy Sea-kale. Fl. May, June. Clt. 1820. Pl. 2 feet.

8 C. cordifòlia (Stev. in mem. soc. nat. mosc. 3. p. 267.) longer stamens forked; pods almost awnless; leaves stalked, toothed, lower ones cordate, upper ones ovate, and are as well as the stems almost glabrous. ♃. H. Native of North Caucasus in deserts, and in exposed places about the towns of Mosdock and Georgisock. C. cordàta, Willd. enum. suppl. 43. Panicles of flowers leafless, smooth, much branched. Flowers like those of *C. orientàlis*. The root of this plant tastes like *Horse-radish*. Lower leaves very large and hispid.

Cordate-leaved Sea-kale. Fl. June. Clt. 1800. Pl. 6 feet.

Sect. II. Leptocra'mbe (from λεπτος, *leptos*, slender, and κραμβη, *krambe*, Sea-kale; because of the plants contained in this section being slender.) D. C. syst. 2. p. 655. prod. 1. p. 226. Lower joint of silicle cylindrical, elongated. Stigma sessile. Filaments either toothed or toothless. Roots annual or biennial. Stem solitary.

9 C. Hispa'nica (Lin. spec. 937.) longer filaments furnished with a tooth; pods awnless; leaves lyrate, scabrous, with the terminal lobe cordate and orbicular. ⊙. H. Native of Spain in Valentia on the sea-shore, also in the north of Portugal. Sab. hort. rom. 4. t. 2. Lam. ill. t. 553. Gært. fruct. 2. p. 292. t. 142. f. 4. Schkuhr. handb. 2. no. 1924. t. 189. Myàgrum sphærocárpum, Jacq. obs. 2. p. 20. t. 41. Rapístrum Hispánicum, Medik. in Ust. new. ann. 2. p. 37. Rapístrum scàbrum, Mœnch. meth. 211. Pods exactly globose. Herb hispid.

Spanish Sea-kale. Fl. June, July Clt. 1683. Pl. 1½ foot.

10 C. glabra'ta (D. C. prod. 1. p. 226.) longer filaments furnished with a tooth; pods awnless; leaves cordate-roundish, and are as well as the stem smooth. ⊙? H. Native of Spain near St. Philip. C. cordifòlia, Dufour. in ann. gen. sc. phys. 7. p. 308. but not of Steven. Perhaps sufficiently distinct from *C. Hispánica.*

Smooth Sea-kale. Fl. June, July. Clt. 1827. Pl. 1½ foot.

11 C. renifo'rmis (Desf. atl. 2. p. 78. t. 151.) longer filaments furnished with a tooth; pods awnless; leaves lyrate, scabrous, terminal lobe kidney-shaped. ♂. H. Native of the north of Africa in fissures of rocks, near Tlemsen. Pods fleshy. Very like *C. Hispánica.* Herb hispid.

Reniform-lobed Sea-kale. Fl. Ju. Jul. Clt. 1820. Pl. 2 to 3 ft.

12 C. filifo'rmis (Jacq. coll. suppl. 120. icon. rar. 3. t. 504.) longer filaments almost toothless; pods awnless; leaves pinnately-lyrate, hairy, terminal lobe ovate. ♂. H. Native of Patagonia at Champion River. Rapístrum filifórme, Mœnch. suppl. 69. Ovary slender, 2-jointed, lower joint terete, longest.

Filiform Sea-kale. Fl. July, Aug. Clt. 1796. Pl. 1 to 2 feet.

Sect. III. Dendrocra'mbe (from δενδρον, *dendron*, a tree, and κραμβη, *crambe*, Sea-kale; because of the plants being shrubby.) D. C. syst. 2. p. 656. prod. 1. p. 226. Lower joint of silicle short, filiform. Stigma seated upon a short style. Stems shrubby.

13 C. fruticòsa (Lin. fil. suppl. 299.) longer filaments toothed on one side; pods mucronate with the style; leaves lyrately-pinnatifid, toothed, hoary; stem shrubby. ♄. G. Native of Madeira on the highest rocks near Pico de Ranxo. D. C. syst. 2. p. 656. A small stiff hoary shrub.

Shrubby Sea-kale. Fl. May, Nov. Clt. 1777. Sh. 2 feet.

14 C. strigòsa (Lher. stirp. 1. p. 151. t. 72.) filaments toothless; pods mucronate; leaves ovate, toothed, unequal and somewhat auricled at the base, and are hispid, as well as shrubby stem. ♄. G. Native of Canary Islands; in Teneriffe in humid places. Myàgrum arboréscens, Jacq. coll. 1. p. 39. icon. rar. t. 120. C. fruticòsa, Murr. syst. veg. 498. exclusive of synonym of Lin. fil. C scàbra, Lam. dict. 2. p. 163.

Var. β, *glabràta* (D. C. syst. 2. p. 657.) leaves almost smooth, with a few scaly dots.

Strigose Sea-kale. Fl. May, June. Clt. 1779. Sh. 1½ foot.

Cult. The hardy perennial species may be either increased by dividing at the roots or by seeds, but the latter mode is preferable; they will grow in any kind of soil, but those species used for culinary purposes should be grown in a rich light soil. The annual and biennial kinds only require to be sown in the open ground. The shrubby green-house kinds may either be increased by seeds or by cuttings, which should be planted under a hand-glass. A mixture of sand, loam, and peat, suits these last well.

XCIX. RAPI'STRUM (*rapa*, the rape; resemblance.) Boerh. ludg. 406. D. C. syst. 2. p. 430. prod. 1. p. 227.

Lin. syst. *Tetradynàmia*, *Siliquòsa*. Silicle 2-jointed; lower joint ovate, rough, with a solitary seed in each cell, the seed in the upper joint erect, that in the lower one pendulous. Cotyledons oblong, folded together. Annual or perennial, branched, pubescent or villous herbs. Leaves not fleshy, lower ones stalked, pinnatifid or somewhat lyrate; upper ones oblong toothed. Racemes elongated, somewhat panicled; pedicels filiform, strictly erect. Flowers yellow.

1 R. pere'nne (Berg. phyt. icon. Desv. journ. bot. 3. p. 160.) pods smooth, upper joint ovate, longer than the style; leaves pinnatifid; lobes deeply-toothed, acute. ♃. H. Native of fields in the east of France, Switzerland, Piedmont, Germany, Austria, and Transylvania. Myàgrum perénne, Lin. spec. 893. Jacq. aust. t. 414. Rapístrum diffùsum, Crantz. cruc. p. 105. Myàgrum biarticulàtum, Crantz. aust. p. 6. Myàgrum perénne var. α, Lam. fl. fr. 2. p. 482. Schránckia divaricàta, Mœnch. suppl. 86. Cakìle perénnis, Lher. diss. cak. ined. p. 6. Bùnias perénnis, Smith, prod. fl. græc. 2. p. 2. Stem diffusely branched, somewhat hispid at the base. Flowers small.

Perennial Rapistrum. Fl. July. Clt. 1789. Pl. 1 to 1½ foot.

2 R. rugo'sum (Berg. phyt. 3. p. 171. icone. All. ped. no. 940. t. 78.) pods pubescent; upper joint globose, rough, shorter than the style; leaves blunt, toothed, radical ones somewhat lyrate. ⊙. H. Native throughout middle and south Europe in cultivated fields and sandy places. Myàgrum rugòsum, Lin. spec. 893. Myàgrum perénne, Scop. carn. ed. 2. no. 795. Schránckia rugòsa, Medik. in Ust. new. ann. 2. p. 39. Cakìle rugòsa, Lher. diss. cak. ined. p. 7. Flowers a little smaller than those of *R. perénne*, of a deep yellow.

Var. β, *stylòsum* (D. C. syst. 2. p. 432.) leaves almost all radical, cauline ones very few and very small; pods villose, with a long style, and with the lower joint often abortive. Cakìle rugòsa, var. *stylòsa.* D. C. fl. fr. suppl. p. 598. Native of Occitania and the south of Provence.

Var. γ, *venòsum* (D. C. syst. l. c.) younger pods villose, adult ones smooth, upper joint much wrinkled and furrowed, lower one very rarely abortive. Myàgrum venòsum, Pers. ench. 2. p. 183. Native about Tolosa and Genoa.

Wrinkled-podded Rapistrum. Fl. April, July. Pl. 1 foot.

† *Species not sufficiently known.*

3 R. orienta'le (D. C. syst. 2. p. 433.) pods furrowed, smooth; leaves oblong, toothed, sinuate. ⊙. H. Native of the Levant. In Melos in corn-fields, also in Crete. Myàgrum orientàle, Lin. spec. 893. Schránckia sulcàta, Mœnch. suppl. 87. Cakìle orientàlis, Lher. diss. cak. ined. p. 7. Bùnias raphanifòlia, Smith, fl. græc. t. 612. Leaves scabrous.

Oriental Rapistrum. Fl. July. Clt. 1795. Pl. 1 foot.

4 R. clava'tum (D. C. syst. 2. p. 433.) pods smooth, upper joint globose, rough, bearing the style, lower one smooth, somewhat cylindrical, longer than the pedicel. ⊙. H. Native of Syria and near Tripoli. Cakìle clavàta, Spreng. syst. 2. p. 852. The whole plant smooth. Lower leaves hastate.

Clubbed-podded Rapistrum. Fl. June, July. Pl. 1 foot.

5 R. costa'tum (D. C. syst. 2. p. 434.) pods smooth, upper joint ovate, ribbed, ending in a conical acumen, lower one smooth, obconical, somewhat shorter than the pedicel. ♃? ⊙? H. Native of the Levant at Tyra. Myàgrum rugòsum β, Bieb. fl. taur. 86.? Myàgrum perénne, Stev. in litt. Perhaps *R. orientàle.* Style conical, thick, short

Ribbed-podded Rapistrum. Fl. June, July. Pl. 1 foot.

Cult. These plants are not worth cultivating except in botanical gardens. The perennial species may be either increased by dividing the plants at the root or by seeds. The seeds of the annual kinds only require to be sown in the open ground.

C. DIDE'SMUS (from δις, *dis*, twice, and δεσμος, *desmos*, a chain, because of the pod being of two joints, like two links of a chain). Desv. journ. bot. 3. p. 160. t. 25. f. 11. D. C. syst. 2. p. 657. prod. 1. p. 227.

Lin. syst. *Tetradynàmia*, *Siliquòsa*. Silicle 2-jointed, both joints 1 or 2-seeded, lower one truncate at the end, upper one bearing the style. Seeds pendulous in the cells. Smooth, annual, erect, branched herbs, some of them resembling *Cakìle* and others *Ráphanus.* Lower leaves stalked, pinnatifid, or lyrate. Racemes elongated; pedicels bractless, filiform, or thickening after flowering. Flower white or yellow?

1 D. Ægy'ptius (Desv. l. c.) lower leaves elliptical or pinnatifidly-lyrate; upper ones oblong, somewhat toothed. ⊙. H. Native of Egypt and the island of Cyprus. Deless. icon. sel. 2. t. 92. Myàgrum Ægýptium, Lin. spec. 895. Cakìle Ægýp-

tia, Spreng. syst. 2. p. 852. Habit of *Cakìle marítima*. Flowers yellow or perhaps white.

Var. β, oblongifòlius (D. C. syst. 2. p. 658.) lower leaves oblong, grossly serrated, not pinnatifidly-lyrate. Native in the fields of Astypalæa in the Morea.

Egyptian Didesmus. Fl. June, July. Clt. 1827. Pl. 1 ft.

2 D. tenuifo'lius (D. C. syst. 2. p. 659.) leaves pinnate-parted; lobes linear, distant; upper leaves linear; stem smooth. ⊙. H. Native of the Grecian Archipelago, especially in the islands of Nio and Cyprus. Cakìle striàta, Lher. cak. diss. ined. p. 6. Bùnias Tournefórtii, Sibth. Bùnias tenuifòlia, Smith, prodr. fl. græc. 2. p. 3. Flowers white. Habit of *Cakìle marítima*. Tour. voy. 1. p. 254. icon. Cells of pod 1-seeded.

Slender-leaved Didesmus. Pl. 1 foot.

3 D. bipinna'tus (D. C. syst. 2. p. 659.) leaves pinnate-parted; lobes linear, toothed, or cut; stem rough from reflexed hairs. ⊙. H. Native of Mauritania in the mountains of Cafsa. Sinàpis bipinnàta, Desf. atl. 2. p. 97. Cakìle bipinnàta, Spreng. syst. 2. p. 852. Petals whitish, obovate, retuse, somewhat emarginate. Pods smooth, with 1-seeded cells.

Bipinnate-leaved Didesmus. Fl. Ju. July. Clt. 1818. Pl. ½ ft.

† *A species not sufficiently known.*

4 D. pinna'tus (D. C. syst. 2. p. 659.). Myàgrum pinnàtum, Russ. in Schrad. journ. 1. p. 426. Native about Aleppo. Pods striated, 2-jointed. Leaves pinnate, smooth; segments linear, cut. Perhaps the same as *D. tenuifòlia*. Flowers white.

Pinnate-leaved Didesmus. Fl. June, July. Pl. ¾ foot.

Cult. These plants are not worth cultivating, except in botanical gardens. The seeds only require to be sown in the open ground.

CI. ENARTHROCA'RPUS (from *εννεα, ennea*, nine, *αρθρον, arthron*, a joint, and *καρπος, karpos*, a fruit, in allusion to the pod having 9 or 10 seeds in the lower joint). Lab. syr. dec. 5. p. 4. t. 2. D. C. syst. 2. p. 660. prod. 1. p. 228.

Lin. syst. *Tetradynàmia, Siliquòsa*. Silique 2-jointed, lower joint obconical, short, 1 to 3-seeded, upper joint long, 9 or 10-seeded, loculate in the inside (f. 47, *k*.) Erect, branched, roughish herbs, having the appearance of *Ráphanus*. Lower leaves stalked, lyrate, upper ones sessile, grossly toothed. Racemes elongated; pedicels filiform, erect, becoming thicker after flowering; all or only the lower ones bracteate. Flowers yellow, veined, or purplish.

1 E. arcua'tus (Lab. syr. dec. 5. p. 4. t. 2.) pods terete, torulose, scabrous; lower pedicels bracteate. ⊙. H. Native of Crete and Mount Lebanon. Sepals oblong-linear, with hispid margins. Flowers purplish. Lower point of pod 1-2-seeded.

Arched-podded Enarthrocarpus. Fl. Ju. Jul. Clt. 1820. Pl. 1 ft.

2 E. lyra'tus (D. C. syst. 2. p. 661.) pods compressed, knotted, striated longitudinally; pedicels almost all bracteate. ⊙. H. Native of sandy deserts and among barley-fields about Alexandria, also in the Nilotic islands. Ráphanus lyràtus, Forsk. fl. ægyp. arab. p. 119. Ráphanus recurvàtus, Pers. ench. 2. p. 209. Delile, fl. ægypt. p. 105. t. 36. f. 1. Very like *E. arcuàtus*, but differs in the flowers being yellow, with purple veins, not purplish.

Lyrate-leaved Enarthrocarpus. Fl. Ju. Jul. Clt. 1828. Pl. 1 ft.

3 E. pteroca'rpus (D. C. syst. 2. p. 661.) pods compressed, edged with a wing, ending in a long point; pedicels almost all bracteate. ⊙. H. Native of Egypt. Deless. icon. sel. 2. t. 93. Ráphanus pterocárpus, Pers. ench. 2. p. 209. Flowers yellow with purple veins? Lower joint of pod 1-seeded.

Winged-podded Enarthrocarpus. Fl. June, July. Clt. 1823. Pl. ¾ foot.

Cult. These plants are not worth cultivating, except in botanic gardens. They only require to be sown in the open ground, and treated as other hardy annuals.

CII. RA'PHANUS (*ραφανις* in Greek is derived from *ρα, ra*, quickly, and *φαινομαι, phainomai*, to appear, because of the rapid germination of the seeds). Lin. gen. no. 1098. D. C. syst. 2. p. 662. prod. 1. p. 228.

Lin. syst. *Tetradynàmia, Siliquòsa*. Silique transversely many-celled, or breaking off into several joints (f. 47. *m*.). Seeds globose, pendulous, in one row. Cotyledons thickish, folded together. Erect, branched, smooth, or somewhat hispid herbs, with round divaricating stems. Roots perpendicular, simple, more or less fleshy, with an acrid taste, when young furnished with a 2-valved *Coleorhiza* at the tip. Lower leaves stalked, lyrate. Racemes opposite the leaves and terminal, elongated; pedicels filiform, bractless. Flowers yellow, white, or purplish, sometimes veined. The English name *Radish* is derived from *radix*, a root.

Sect. I. Ra'phanus (see genus). D. C. syst. 2. p. 663. prod. 1. p. 228. Silique spongy, 2-celled.

1 R. sati'vus (Lin. spec. 935.) pods terete, torose, pointed, scarcely longer than the pedicel. ⊙. H. Native of China, Japan and Western Asia by way-sides, Lam. ill. 566. Flowers at first red-violet, when old whitish. There are numerous varieties of this plant cultivated in gardens.

Cultivated Radish. Fl. May, June. Clt. 1548. Pl. 3 feet.

In Italy the Radish is called *Ramolaccio* or *Ravanello*, in France they are called *Rabiole, Raviole, Rave*, or *Radis*.

* A. radi'cula (D. C. syst. 2. p. 663.) root more or less fleshy, white, rose, or red-coloured. R. radícula, Pers. ench. 2. p. 208. The varieties of this plant are commonly called *Summer*, or *Turnip-radishes*.

Var. a. rotúnda (D. C. syst. 1. c.) root somewhat globose. R. rotúndus, Mill. dict. no. 2. This plant varies much in the color of its root. We shall now add the different varieties of the *Turnip-radish* from Hort. trans. vol. 3. p. 441 to 446.

1 *The early white Turnip-radish* of the Dutch, *Radis blanc hâtif* of the French. The flesh is clear and white. This radish from its superior merit ought to be introduced into every garden.

2 *The small early white Turnip-radish* or *Radis blanc petit hâtif* of the French. The root of this is rather pear-shaped, with a slight tinge of purple on its top. It is rather earlier than the preceding kind. This is probably the Ráphanus rotúndus of Mill. dict. no. 2.

3 *The pink, rose-coloured, scarlet*, and *crimson Turnip-radishes* are all one sort. *Radis rouge* or *Radis rose rond* of the French. This variety was introduced into England from France about 1802. The root, externally, is a fine deep scarlet; and internally white. It comes in with the common white *Turnip-radish*. The flesh is mild and good.

4 *The rose-coloured Turnip-radish* or *Radis rose rond hâtif* of the French. The root is both externally and internally rose-coloured, usually pear-shaped, but sometimes it lengthens out to the appearance of a long-rooted radish. It is sometimes to be found under the name of *early scarlet Turnip-radish*.

5 *The purple Turnip-radish* or *Radis violet rond* of the French. The external colour is a fine purple. The flesh is sometimes white and sometimes stained with purple. The Dutch call it *early red Turnip-radish*. This is a very good *Radish*, but not common in our gardens. This is an autumn *Radish*.

6 *The Yellow Turnip-radish* or *Radis jaune* of the French. The root is more ovate than round, somewhat inclining to pear-shaped, of a pale brown colour and rather rough. The flesh is white and firm. It is a good *Radish*, but is rather later than the other early sorts.

Var. β, oblónga (D. C. syst. 1. c.) root long, fleshy. R. satìvus, Mill. dict. no. 1.—Weinm. phyt. t. 860. f. a. Roots varying in colour. For the under-mentioned varieties, see Hort. trans. vol.

3. p. 438 to 441. The varieties are called *Long-rooted* or *Spring Radishes.*

1 *Long white Radish, white transparent,* or *white Italian* or *Naples Radish.* This is the oldest variety mentioned in our gardens, and is called by Gerard the *Radicula sativa minor.* It is a week later of coming to perfection than those sorts commonly grown; it is very mild, and has a delicate pleasant flavour. The root is white; the flesh is transparent when young, but becomes more opaque as the root enlarges. This is the *La Rave blanche* of the Bon Jardinier.

2 *White Russian Radish.* The root is long and white. Its flesh is not transparent, and it is much hotter to the taste than the preceding variety. It remains good even when large, and is not fit for use until a week later than the other long radishes.

3 *Twisted long white Radish* or *Rave tortillée du Mans* of the French. The root grows long and does not taper much. A considerable part of it grows above ground, from whence it does not rise straight, but is bent or twisted, the exposed part of the root is tinged with green. The flesh is white and firm without heat, and insipid. The footstalks of the leaves are tinged with purple. The root is slow in coming to perfection, and may be considered a pleasant variety for use in the latter part of the year. It is not destroyed by frost.

4 *Scarlet Radish, Salmon Radish* or *Rave rose* of the French. *Scarlet transparent Radish* of the Dutch. The root is of a brilliant pink colour, and when young is full an inch above the ground. The flesh is transparent and colourless. This is the kind cultivated not only most frequently, but almost exclusively, within the last 30 years, especially for the supply of the London market. The *Short-top Scarlet* and *Early Frame Scarlet Radish* are sub-varieties of this plant. Perhaps the *Rave corail,* the *Rave petite hâtive* and the *Rave couleur de rose* or *La Rave saummonée* of the Bon Jardinier are also sub-varieties.

5 *Purple Radish,* or *Rave longue rouge* of the French, though formerly much used, has been of late driven out of our gardens by the universal preference given to the *Scarlet Radish.* It is the *Long red transparent Radish* of the Dutch, and it was formerly called the *Short-top Radish.* The seed-leaves being large has caused it to be used exclusively for small salading. The root grows high out of the ground, and is externally of a deep purple colour; the flesh is white. It is a very early sort, equally as good in flavour as the *scarlet Radish* and perhaps preferable for forcing.

6 *Red-necked Radish* or *Rave blanche à collier rouge* of the French. The upper part of the root is dark purple, and the lower part white. It is a good flavoured radish, but is more remarkable for its singularity than peculiar excellence.

Var. γ, *oleífera* (D. C. syst. 2. 664.) root slender, elongated, scarcely fleshy. R. Chinénsis, Mill. dict. no. 5. This variety is cultivated in China for an oil, which is obtained from the seeds by expression.

** B. nìger (D.C. syst. 2. p. 665.) root with compact hardish flesh, which possesses a very sharp taste. The varieties of this plant are commonly called *Winter-radishes.*

Var. α, *vulgàris* (D. C. syst. 1. c.) root oblong, with black or violet skin, and white flesh. Ráphanus nìger, Lob. icon. 202. f. 1. Merat. fl. par. 265.—Mor. oxon. 2. p. 265. no. 2. sect. 3. t. 13. f. 2.—Weinm phyt. t. 860. f. c. The following varieties are enumerated in the Hort. trans. vol. 4. p. 13.

1 *Black Spanish Radish,* or *Le Radis gros noir d'hiver,* or *Le Radis Raifort,* of the French. Root very large, externally black, and regularly pear-shaped. The flesh is hot, firm, and white.

2 *Large purple winter Radish,* or *Le Radis gros violet d'hiver* of the French, is a beautiful variety in shape and character. It much resembles the preceding variety; but the outside, when cleaned, is of a beautiful purple colour, though it looks black when first drawn out of the earth.

Var. β, *rotúndus* (D. C. syst. 2. p. 665.) root roundish, with black skin and white flesh.—Mor. oxon. 2. p. 265. no. 1. sect. 3. t. 13. f. 1.—Weinm. phyt. t. 860. f. b. It is perhaps only a variety of the common *Black Spanish Radish,* and therefore may be properly called the *Round Black Spanish Radish.*

Var. γ, *gríseus* (D. C. syst. 1. c.) root with a grey skin. For the following varieties of this plant, see Hort. trans. vol. 4. p. 12 and 13.

1 *Round brown Radish,* or *Radis gris rond* of the French. The root may be called round, though it is rather irregular in its shape. When allowed to grow large it becomes hollow; and it therefore should be used when young. The flesh is mild, rather soft, of a greenish white colour; the skin is mottled with greenish brown. This is an autumn *Radish.*

2 *Oblong brown Radish;* or *Radis gris oblong* of the French. Root pear-shaped. It does not grow particularly large, and is hardier than any of the other winter *Radishes,* and therefore fit for late use. The flesh is hot, firm, hard, and white. The skin is rough and brown, marked with white circles.

Var. δ, *álbus* (D. C. syst. 1. c.) root of a depressed roundish form; white, both externally and internally. R. orbiculàris, Mill. dict. no. 3. This is called the *White Spanish Radish, Le Radis gros blanc d'Augsbourg* of the French. The root is rather oval, and grows to a large size. The flesh is rather hot, firm, solid, and white. The skin is white tinged with green, and streaked with purple on the part which is exposed above ground.

Cult. Radishes are all of easy cultivation. They are sown at various times of the year, according to the time they are designed for use. Those intended to come in early in the spring are generally sown in October, on a warm border: the long-rooted kinds are preferred for this purpose. The *Turnip-radishes* are generally sown in spring or summer, to come in after the long-rooted kinds. These all force well on hot-beds, or dung-beds covered with mats. The winter *Radishes* should be sown in July; and those intended for winter use should be taken up in dry weather, in November, be divested of their leaves and fibres, and preserved in sand until they are wanted.

Formerly the leaves of the *Radish* were boiled and eaten, but now the roots are chiefly employed. These are eaten raw in spring, summer, autumn and winter. The young seedling leaves are often used with *Cress* and *Mustard,* as small sallad; and *Radish* seed-pods, when of plump growth, but still young and green, are used to increase the variety of vegetable pickles, and are considered a tolerable substitute for capers.

"The spindle-rooted kinds are cultivated in the largest proportion for the first crops. The small turnip-rooted sorts may be sown in spring as secondary crops, and in summer and autumn for more considerable supplies. The winter sorts have a coarser flavour than the other kinds, but being of a hardy nature, are frequently sown; they are sliced in salads, or occasionally eaten alone, with salt, vinegar, and other condiments."

"The soil should be light and mellow, well broken by digging. For sowing between the middle of October and the middle of February, let the site be a dry sheltered border, open to the full sun. From the middle of February to the end of March, any dry, open compartment will be suitable. As spring and summer advance, allot cooler and shaded situations. A scattering of the smaller growing sorts may be sown among some broad-cast crops of larger growth, such as *Spinach, Lettuce,* and *Onions.* It may be also drilled between wide rows of beans, or on ground intended to be sown with a late spring-crop."

The crops raised between the middle of October and middle of February, are usually confined to the spindle-rooted kinds. Of the early short-top-scarlet, a first small sowing may be made

at the end of October, another in November, and another in the last fortnight of December, if open temperate weather; respectively to stand over the winter; but make the principal early sowings in January, or the beginning of February. From this time sow every fortnight or ten days, in full succession crops, till the end of May, as well the white and red small turnip-rooted, as the autumn sorts. The winter sorts are sometimes raised at the beginning of summer; but the fittest season to sow them is from the end of June to the end of August; that is in July for use in autumn, and in August to provide a supply throughout the winter.

Sow each sort separately, and for a bed four feet six inches by twelve feet, two ounces of seed will be required of the spring sorts, and an ounce and a half for the summer, winter, and autumn varieties. All the kinds may be either sown broad-cast or in drills, but the latter is preferable, as allowing the roots to be drawn regularly with less waste. If sown broad-cast, it is a good method to make beds four or five feet wide, with alleys between a foot wide, the earth of which may be used to raise the beds or not, as the season may make it desirable to keep the beds dry or moist. Avoid sowing excessively thick, as it tends to make the tops run, and the roots stringy. Rake in the seed well, full half an inch deep, leaving none on the surface to attract the birds. If you trace drills, let them be for the spindle-rooted kinds, half an inch deep, and about two inches and a half asunder; for the small turnip-rooted kinds, three quarters of an inch deep, and four or five inches asunder, and for the black turnip or Spanish six or eight inches asunder, because the root grows to the size of a middle-sized turnip. As the plants advance in growth, thin them, so as to leave the spindle-rooted kinds two inches square distance, and the other sorts three, four, or five, leaving the most space to the respective sorts in free, growing weather; water pretty frequently, this swells the roots and makes them mild and crisp.

The crops sown between the end of October and the end of February, besides being favoured in situation, will want occasional shelter according to the weather. On the first approach of frost, whether the seed is just sown, or the plants have appeared, cover the ground, either with clean straw, dry long haulm, or dried fern, two or three inches thick, or with mats supported with short stout pegs. The covering will keep off the birds, and by its warm effect on the mould, forward the germination of the seed. The time for removing or restoring it must be regulated by the weather; as the plants should be exposed to the full air whenever it can be safely done. If the season be cold without frost, take off the covering every morning, and put it on towards evening, and if the weather be sharp and frosty, let it remain on night and day, till the plants have advanced into the first rough leaves, and afterwards occasionally till the atmosphere is settled and temperate. Replace it constantly at night till there is no danger of much frost happening. then wholly discontinue the covering. *Radish* seed-pods should be taken for pickling when of plump growth, in July and August, when still young and green.

Abercrombie says " to obtain the earliest spring *Radishes*, sow on a hot-bed of dung or leaves some Early Dwarf Short Tops, in December, January, or the beginning of February. Having made a hot-bed two feet, or two and a half feet high of dung, place on a frame; earth the bed at top six inches deep; sow on the surface, covering the seed with fine mould about half an inch thick, and put on the glasses. When the plants have come up, admit air every day, in mild, or tolerably good weather, by tilting the upper end of the lights, or sometimes the front, one, two, or three inches, that the *Radishes* may not draw up weak and long-shanked. If they have risen very thick, thin them, when young, moderately at first, to one or two inches apart. Be careful to cover the frame at night with garden-mats or straw litter. Give gentle waterings about noon in sunny days. If the heat of the bed declines much, apply a moderate lining of warm dung or stable litter to the sides, which by gently renewing the heat will forward the *Radishes* for drawing in February and March. Remember, as the plants advance in growth, to give more copious admissions of air daily; either by tilting the lights several inches in front, or, in fine mild days, by drawing the glasses mostly off; but be careful to draw them on again in proper time. Small Turnip-rooted *Radishes*, or the white and red kinds, may be forced in the same manner. For raising early *Radishes* on ground not accommodated with frames, a hot-bed made in February may be arched over with hoop-bends, or pliant rods, which should be covered with mats constantly at night, and during the day in very cold weather. In moderate days turn up the mats at the warmest side; and on fine mild days take them off altogether."

" For seed transplant a sufficiency of the finest plants in April or May, when the main crops are in full perfection. Draw them for transplanting in moist weather, selecting the straightest, best-coloured roots, with the shortest tops, preserving the leaves to each; plant them by dibble, in rows, two feet and a half distant, inserting each root wholly into the ground, down to the leaves. Keep the kinds in separate situations to prevent the commixture of the pollen, and to preserve the kinds distinct. With proper watering they will soon strike fresh root, and shoot up in branchy stalks; producing plenty of seed; which will be ripe in September or October. In transplanting for seed the turnip-rooted kinds, select those with the neatest-shaped roundest roots, of moderate growth, and with smallest tops; they, as the other, will ripen seed in autumn. To obtain seed of the winter sorts, sow in spring to stand for seed; or leave, or transplant in that season some of the winter standing full roots. As the different kinds ripen seed in autumn cut the stems, or gather the principal stems or branches of pods; and place them in an open, airy situation, towards the sun, that the pod, which is of a tough texture, may dry and become brittle, so as readily to break and give out the seed freely, whether it be threshed or rubbed out."

2 R. cauda'tus (Lin. mant. 95. Lin. fil. dec. 1. t. 10.) pods depressed, acuminated, decumbent, longer than the whole plant. ⊙. H. Native of Java. Root fusiform. Differing from the rest of this section in the pods being 1-celled, and from the section *Raphanîstrum*, in the pods not being torulose, and from both by the calyx being bisaccate at the base, as well as the seeds being oblong, not round. The stems are purplish, with a glaucous hue, at first they are erect, but at last they become prostrate. Flowers the size of those of common *Wallflower*; purplish and veined. This plant is called in Java *Mougri*, where the pods are gathered and eaten as a condiment.

Tailed-podded Radish. Fl. May, Aug. Clt. 1815. Pl. 1 foot.

Sect. II. Raphani'strum (altered from *Ráphanus.*) D. C. syst. 2. p. 666. prod. 1. p. 229.—Gært. fruct. 2. p. 300. t. 143. Silique terete, acuminated, having the form of a necklace (f. 47. *m.*) when mature, 1-celled; joints 1-seeded.

3 R. rostra'tus (D. C. syst. 2. p. 666.) pods 1-celled, 4 or 5-seeded, with striated joints, shorter than the subulate-conical style. ⊙? H. Native of the north of Persia near Lenkeran. R. Raphanístrum var. Fisch. in litt. Flowers purplish.

Beaked-podded Radish. Fl. Ju. Jul. Clt. 1828. Pl. 1½ foot.

4 R. raphani'strum (Lin. spec. 953.) pods 1-celled, 3 to 8-seeded, jointed, longer than the style; leaves simply lyrate. ⊙. H. Native throughout the whole of Europe in corn-fields; a troublesome weed, plentiful in Britain. Oed. fl. dan. t. 678. Curt. fl. lond. t. 267. Schkuhr. handb. no. 1911. t. 188. Smith, engl. bot. t. 856. R. sylvéstris, Lam. fl. fr. 2. p. 495. Rapístrum

arvénse, All. ped. no. 942. Raphanístrum Lampsàna, Gært. fr. 2. p. 300. t. 143. f. 6. Raphanístrum innócuum, Medik. in Ust. new. ann. 2. p. 39. Durándea uniloculàris, Delarb. fl. auv. ed. 2. vol. 1. p. 365. Ráphanus inféstus, Sal. prod. 273. Raphanístrum ségetum, Baumg. fl. trans. 2. p. 280. Ráphanus articulàtus, Stok. bot. mat. med. 3. p. 482. White Charlock, Pet. hort. brit. t. 46. f. 10.

Var. α, *albiflòra;* flowers white, more or less streaked, with dark veins.—Weinm. phyt. t. 862. f. a.

Var. β, *purpuráscens;* flowers purplish.—Weinm. phyt. t. 862. f. b.—Tab. icon. p. 407.

Var. γ, *flaviflòra;* flowers yellow. Tab. icon. p. 408.—J. Bauh. hist. 2. p. 844. icone. This variety at first sight is easily confounded with *Wild Charlock*, *Sinàpis arvénsis*, by its yellow flowers. The stems are rather glaucous.

Linnæus, in a dissertation in the Amœnitates Academicæ informs us, that in wet seasons this weed abounds among barley in Sweden, and that being ground with the corn, the common people, who eat barley bread, are afflicted with convulsive complaints, or an epidemic spasmódic disease. M. Villars, however, remarks, that this weed is so common in some of the cold moist vallies of Dauphiny, that it must make great ravages there, if it were as dangerous as Linnæus has represented it, and yet this spasmodic disorder is unknown in that country, nor has it ever been heard of in England, where it abounds. Kroker has proved the plant to he harmless, and recommends it as a nutritious food for domestic quadrupeds, and as very agreeable to bees.

Wild-Radish or Jointed-podded Charlock. Fl. June, July. Britain. Pl. 1½ to 2 feet.

5 R. Odessa'nus (Spreng. syst. 2. p. 855.) pods 1-celled, 8-angled, furrowed, equal in length with the compressed style; leaves somewhat lyrate, alternately runcinate. ⊙. H. Native about Odessa. Raphanístrum Odessànum, Andrz. and Bess.

Odessa Radish. Fl. Ju. July. Pl. 2 feet.

6 R. La'ndra (Moretti, fl. insubr. ined. D. C. syst. 2. p. 668.) pods 1-celled, jointed (f. 47. *m.*), somewhat striated, 2-6-seeded, longer than the subulate style; leaves interruptedly lyrate. ♂. H. Native of Italy, Insubria, very common among wheat and rye. Flowers yellow. Deless. icon. sel. 2. p. 94. The radical leaves of this plant are prepared with oil, and eaten as a salad by the poor inhabitants of Insubria; and is by them called *Landra*. Roots fusiform, yellowish.

Landra Radish. Fl. Ju. July. Clt. 1820. Pl. 2 to 3 feet.

7 R. maritimus (Smith, eng. bot. t. 1643.) pods 1-celled, jointed, striated, 2-6-seeded; style conical, shorter than the ultimate joint of the pod; leaves interruptedly-lyrate. ♂. H. Native of many parts of Europe by the sea side, Britain, in the Isle of Bute, on the sea beach, 3 miles from the Mull of Galloway; in various parts of the coast of Ayrshire, and on rocks near Beachy Head, Sussex. Flowers yellow, scarcely veined. Root large, succulent, sometimes, according to Dr. Walker, lasting three years, and preferable to *Horse-Radish* for the table. Cattle were observed by Dr. Walker to be very fond of the herbage. Ráphanus raphanístrum, *var.* γ, Smith. fl. brit. 2. p. 723. Great White Charlock, Pet. herb. brit. t. 46. f. 11.

Sea-side-Radish. Fl. May, June. Britain. Pl. 3 to 4 feet.

† *Species not sufficiently known.*

8 R. lanceola'tus (Willd. spec. 3. p. 562.) pods 2-celled, ventricose, smooth, with a somewhat 4-sided beak; leaves oblong-lanceolate, somewhat toothed at the top. ⊙.? H. Native of the Antilles. Sinàpis integrifòlia, West. St. Cruc. p. 222. from Willd. Flowers middle-sized, yellow. Pods half an inch long.

Lance-leaved Radish. Fl.? Pl. 1½ foot.

9 R. biarticula'tus (Willd. enum. suppl. p. 46.) pods suberose, thick, 2-jointed; joints 1-celled, 1-seeded; lower leaves lyrate, upper ones oblong, toothed. ⊙. H. Native of China. Perhaps a species of *Rapístrum* or *Didésmus*.

Two-jointed-podded Radish. Fl. Ju. July. Pl. 1 foot.

Cult. None of these plants are worth cultivating for ornament, therefore those species not used for culinary purposes are only worth preserving in botanic gardens. The seed only requires to be sown in the open ground, and the plants afterwards treated as other hardy annuals.

Sub-order IV. SPIROLO'BEÆ (from σπειρα, *speira*, a circle, and λοβος, *lobos*, a lobe; because of the spirally twisted cotyledons, f. 45, *k. l.*) D. C. syst. 2. p. 670. prod. 1. p. 229. Cotyledons incumbent, linear, spirally or rather circinnately convolute (f. 45. *k. l.*). Seeds somewhat globose.

Tribe XVII.

BUNIA'DEÆ (plants agreeing with *Bunias* in some important characters,) or SPIROLO'BEÆ (See Sub-Order IV.) NUCAMENTA'CEÆ (*nucamentum*, a cat-kin; shape of pods.) D. C. syst. 2. p. 670. prod. 1. p. 229. Silicle nucamentaceous, indehiscent, 2-4-celled (f. 46. *s.*). Cotyledons truly circinnately twisted (f. 45. *k. l.*).

CIII. BU'NIAS (from βουνος, *bounos*, a hill; because the plants usually grow in elevated situations.) R. Br. in hort. kew. ed. 2. vol. 4. p. 75. D. C. syst. 2. p. 670. prod. 1. p. 229.

Lin. syst. *Tetradynàmia*, *Siliculòsa*. Character the same as the Tribe. Erect, branched herbs. Root perpendicular, simple. Stems round, furnished with sessile glands on the upper part, the rest somewhat villous with lymphatic hairs. Leaves pinnatifidly-runcinate, or entire. Racemes elongated; pedicels filiform, somewhat spreading, bractless. Flowers yellow.

Sect. I. ERUCA'GO (from *eruca*, rocket; analogy.) D. C. syst. 2. p. 670. prod. 1. p. 229. Tourn. inst. 232. t. 103. Calyx erect. Petals obcordate, bluntly emarginate. Silicle 4-sided (f. 47. *s.*), with the angles furnished with crested wings, and somewhat toothed, terminated with the filiform style; inside 4-celled.

1 B. eruca'go (Lin. spec. 935.) pods 4-sided, angles crested; radical leaves runcinate. ⊙. H. Native of cultivated fields throughout the south of Europe; especially Spain, south of France, Dauphiny, Italy, Austria, and Greece. Jacq. aust. t. 340. Boiss. fl. eur. t. 460. Myàgrum erucàgo, Lam. dict. 1. p. 571. no. 12. Myàgrum clavàtum, Lam. fl. fr. 2. p. 482. Erucàgo dentàta, Mœnch. Erucàgo Monspelìaca, Jaume. Erucàgo campéstris, Desv. Erucàgo runcinàta, Horn. Flowers drooping at night.

Rocket-Bunias. Fl. Apr. Jul. Clt. 1640. Pl. 1 to 1½ foot.

2 B. a'spera (Retz. obs. 2. p. 21.) pods 4-sided; angles crested; leaves all lanceolate. ⊙. H. Native of Portugal, on the banks of the Douro, near Oporto. Myàgrum ásperum, Poir. suppl. 2. p. 47. Erucàgo áspera, Horn. hafn. 2. p. 593.

Var. β, *cristàta* (D. C. syst. 2. p. 672.) lower leaves sinuately-toothed. Bùnias áspera, Brot. fl. lus. 1. p. 562. B. cristàta, Desv.

Rough Bunias. Fl. June. Clt. 1820. Pl. 1½ foot.

Sect. II. LAE'LIA (Lael, the name of some botanist.) D. C. syst. 2. p. 672. prod. 1. p. 230. Silicles ovate, 2-celled.

3 B. orienta'lis (Lin. spec. 936.) pods ovate, 2-celled, not crested, but somewhat warted. ♃. H. Native of grassy and cultivated places, in Transylvania; very common throughout European Russia, and in Siberia. It is now very common about

Paris, having migrated from gardens. Schkuhr. handb. 2. no. 1918. t. 189. Rapístrum glandulòsum, Berg. phyt. 3. p. 163. icon. Myàgrum taraxacifòlium, Lam. dict. 1. p. 570. no. 10. Bùnias verrucòsa, Mœnch. meth. 278. Bùnias perénnis, Mœnch. suppl. 91. Lae'lia orientàlis, Desv. journ. bot. 3. p. 160.

Var. β, Wintérli (D. C. syst. 2. p. 672.) leaves pubescent-hoary. Crámbe, spec. nov. Winterl, hort. Pesth. Bùnias Wintérli, Schult. obs. p. 121. no. 925.

Oriental Bunias. Fl. May, Jul. Clt. 1731. Pl. 1 to 2 feet.

Cult. These plants are not worth cultivating except in botanic gardens. They are all propagated by seeds, which only require to be sown in the open ground.

Tribe XVIII.

ERUCARIE'Æ (plant agreeing with *Erucària* in many important characters,) or SPIROLO'BEÆ (See Sub-Order IV.) LOMENTA'CEÆ (*lomentum*, a loment; shape of pods.) D. C. syst. 2. p. 673. prod. 1. p. 230. Silique lomentaceous, 2-jointed, lower joint 2-celled, upper one ensiform (f. 47. *l.*) Cotyledons replicate and somewhat spiral (f. 45. *l.*)

CIV. ERUCA'RIA (from *eruca*, rocket; analogy.) Gært. fr. 2. p. 298. t. 143. f. 9. D. C. syst. 2. p. 673. prod. 1. p. 231.

Lin. syst. *Tetradynàmia, Siliquòsa.* Character the same as tribe. Smooth, erect, branched, annual herbs. Stems round, whitish, older ones hard at the base. Cauline leaves pinnate-parted or rarely deeply-toothed, usually rather fleshy. Racemes opposite the leaves and terminal, elongating as they grow old; pedicels short, strictly erect, bractless. Flowers from white to purplish. Habit of *Cakìle.*

§. 1. *Upper joint of silique ending in the filiform style.*

1 E. Ale'ppica (Gært. fruct. l. c.) pods styliferous; leaves pinnate-parted; lobes linear, those of the lower leaves pinnatifid, those of the upper ones entire. ⊙. H. Native of the islands in the Grecian Archipelago; in Asia-Minor; about Alexandria, and in Syria near Aleppo. Vent. hort. cels. t. 64. Bùnias myagroìdes, Lin. mant. 96. Cordylocárpus lævigàtus, Willd. spec. 3. p. 563. Smith, fl. græc. t. 649. Cakìle myagroìdes, Poir. suppl. 2. p. 88? Didésmus myagroìdes, Desv. journ. bot. 3. p. 160? Stems glaucous at top. Flowers pale violet. Seed in the lower joint oblong, that in the upper orbicular.

Aleppo Erucaria. Fl. Jul. Aug. Clt. 1680. Pl. 1 foot.

2 E. latifo'lia (D. C. syst. 2. p. 675.) pods styliferous, leaves pinnate-parted; lobes oblong, deeply toothed. ⊙. H. Native of Egypt, and in Syria, near Aleppo. Deless. icon. sel. 2. t. 95. Sinàpis Hispánica, Herb. Banks. Flowers pale violet, not so large as those of *E. Aléppica.*

Broad-leaved Erucaria. Fl. June, July. Pl. 1 foot.

3 E. Olive'rii (Spreng. syst. 2. p. 915.) silique styliferous, scabrous; leaves pinnatifid, pubescent; segments linear, bluntly toothed. ⊙. H. Native of Syria between Mossul and Bagdad. Ráphanus cakiloìdes, D. C. syst. 2. p. 669. Flowers pale violet.

Oliver's Erucaria. Fl. June, July. Pl. ½ foot.

4 E.? tenuifo'lia (D. C. syst. 2. p. 675.) lower joint of pod 2-seeded, upper joint 1-seeded; leaves bipinnate-parted, lobes linear. ⊙. H. Native of Spain. Sinàpis Hispánica, Lin. spec. 935. exclusive of the synonym of Tournefort. Flowers purplish.

Slender-leaved Erucaria. Pl. 1 foot.

5 E. hypogæ'a (Viv. append. fl. cors. in. Schlecht. Linneæ. 1. p. 501.) pods styliferous; leaves pinnate; leaflets sessile, triangularly falcate; scape naked, 1-flowered. ⊙. H. Native of Corsica. Sisýmbrium monánthon, Viv. fl. libyc. The name is derived from *υπο, under,* and *γη, the earth;* because the plant grows close to the earth.

Hypogæus Erucaria. Fl. May, July. Pl. 2 inches.

§. 2. *Upper joint of silique pointed with the sessile stigma.*

6 E. crassifolia (Delile, ill. fl. ægyp. p. 20. pl. bot. t. 34. f. 1. descr. p. 100.) stigma sessile; beak longer than pod; leaves pinnate-parted, thick; lobes linear. ⊙. H. Native of Egypt, frequent about the Saqqarah Pyramids. Brássica crassifòlia, Forsk. fl. ægyp. arab. descr. p. 118. Herb fleshy. Flowers from white to violet, scarcely so large as those of *E. Aléppica.* This plant has a hot taste like *Cress.*

Thick-leaved Erucaria. Fl. June, Dec. Clt. 1823. Pl. ¾ foot.

7 E. Hyrca'nica (D. C. syst. 2. p. 676.) stigma sessile; beak length of pod; leaves few, grossly toothed. ⊙. ? H. Native of the North of Persia. Sisymbrium myàgro affìne, Stev. in litt. Flowers when dry cream-coloured.

Hyrcanian Erucaria. Fl. Ju. July. Pl. 1 to 1½ foot.

Cult. None of these plants are worth cultivating except in botanic gardens. The seeds only require to be sown in the open ground, and the plants treated like other hardy annuals.

Sub-order V. DIPLECOLO'BEÆ (from *διπλαξ, diplax,* double, and *λοβος, lobos,* a lobe; because the cotyledons have a double plait, or two legs, f. 45. *m.* f. 47. *p.*) D. C. syst. 2. p. 776. prod. 1. p. 230.

Cotyledons incumbent, linear, with two legs or a double plait, that is to say plaited twice crosswise (f. 45. *m.* f. 47. *p.*). Seeds depressed.

Tribe XIX.

HELIOPHI'LEÆ (plants agreeing with *Heliόphila* in many characters,) or DIPLECOLO'BEÆ (See Sub-order V.) SILIQUO'SÆ (*siliqua,* a long pod; pods long.) D. C. syst. 2. p. 676. prod. 231. Silique elongated (f. 47. *o.*), rarely oblong or oval, with a linear or oval dissepiment; valves flat, or in those with elongated siliques rather convex (f. 47. *o.*).

CV. CHAMI'RA (from *χαμαι, chamai,* on the ground; plant weak and laying on the ground.) Thunb. nov. gen. pl. 2. p. 48. D. C. syst. 2. p. 677. prod. 1. p. 231.

Lin. syst. *Tetradynàmia, Siliquòsa.* Calyx with 2 spurs at the base. A smooth, weak herb. Leaves stalked, cordate, grossly toothed. Racemes lax; pedicels filiform, bractless. Flowers white. Silique ovate-oblong.

1 C. cornu'ta (Thunb. l. c.) ⊙. H. Native of the Cape of Good Hope, in the fissures of the rocks called Vitteklip. Heliόphila circeoìdes, Lin. fil. suppl. 298. Leaves alternate, almost kidney-shaped.

Horned-calyxed Chamira. Fl. Ju. July. Clt. 1828. Pl. ½ foot.

Cult. The seeds of *Chamìra* should be sown in a pot filled with a mixture of peat and sand, in the month of March, then placed in a hot-bed, and when the plants are grown to a sufficient size, which will be about the end of April, they may be planted out into the open border, in a dry, warm situation, where they will flower, and ripen their seed.

CVI. HELIO'PHILA (from *ηλιος, helios,* the sun, and *φιλεω, phileo,* to love; because the plants grow in places exposed to the sun.) N. Burm. in Lin. gen. no. 816. Lam. ill. t. 563. D. C. syst. 2. p. 677. prod. 1. p. 231.

Lin. syst. *Tetradynàmia, Siliquòsa.* Calyx equal at the base. Annual herbs or sub-shrubs. Roots slender. Stem round, branched. Leaves very variable. Racemes elongated; pedicels filiform, bractless. Flowers yellow, white, but usually blue.

SECT. I. CARPONE'MA (from καρπος, *karpos*, a fruit, and νημα, *nema*, a thread; because of the slender pods.) D. C. syst. 2. p. 679. prod. 1. p. 231. Silique sessile, terete, scarcely contracted between the seeds, acuminated at both ends, indehiscent or hardly dehiscent. A weak annual herb.

1 H. FILIFÓRMIS (Lin. fil. suppl. 296.) herbaceous, smooth; pods terete, tapering towards both ends; leaves linear, awl-shaped. ⊙. H. Native of the Cape of Good Hope. Lam. ill. t. 563. f. 3.? Flowers small, purplish, or bluish.

Filiform-podded Heliophila. Fl. Jul. Aug. Clt. 1786. Pl. 1½ foot.

SECT. II. LEPTO'RMUS (from λεπτος, *leptos*, slender, and ορμος, *ormos*, a necklace; in allusion to the pods being slender, as well as being contracted between the seeds, giving them the appearance of a necklace.) D. C. syst. 2. p. 680. prod. 1. p. 231. Silique sessile, somewhat compressed, very slender, somewhat necklace-formed, contracted between the seeds; joints ovate-oblong. Smaller stamens usually furnished with a tooth. Annual herbs, intermediate between Sect. *Ormíscus* and *Carponèma*.

2 H. DISSE'CTA (Thunb. prod. 108.) herbaceous, smooth; pods very slender, somewhat necklace-formed, terminated by the thick knotted stigma; leaves filiform, entire, trifid or parted at the apex. ⊙. H. Native of the Cape of Good Hope. Flowers blue. This is a very pretty species.

Var. β, *H. pinnàta*; var. (Vahl. herb.) Flowers, when dry, white.

Dissected-leaved Heliophila. Fl. Ju. Jul. Clt. 1792. Pl. ¾ ft.

3 H. TENE'LLA (Banks. herb. D. C. syst. 2. p. 680.) herbaceous, smooth; pods? Leaves filiform, entire; stem simple. ⊙. H. Native of ——? Very like *H. dissécta*, but the pods are unknown. Flowers blue?

Tender Heliophila. Fl. Ju. July. Pl. ¾ foot.

4 H. TENUISÍLIQUA (D. C. syst. 2. p. 680.) herbaceous, smooth; pods very slender, compressed, somewhat moniliform, terminated by the acuminated stigma; leaves linear, entire. ⊙. H. Native of the Cape of Good Hope. Deless. icon. sel. 2. t. 96. A'rabis Capénsis, Burm. herb. Flowers when dry whitish, but when fresh probably reddish.

Thin-podded Heliophila. Pl. 1 foot.

5 H. LONGIFO'LIA (D. C. syst. 2. p. 681.) herbaceous, smooth; pods very slender, compressed, somewhat moniliform; stigma punctiform; leaves linear, entire, or 3-parted. ⊙. H. Native of the Cape of Good Hope. Flowers blue. Habit of *H. pilòsa*, but differs from it in the plant being smooth.

Long-leaved Heliophila. Fl.? Pl. ¾ foot.

6 H. SONCHIFO'LIA (D. C. syst. 2. p. 681.) herbaceous, smooth; pods slender, somewhat compressed, torulose; radical leaves pinnatifid, with 2 or 3 pairs of linear lobes. ⊙. H. Native of the Cape of Good Hope. Flowers blue. Sepals oblong, hardly membranous on the margin. Habit of *Sónchus picroìdes*.

Sowthistle-leaved Heliophila. Fl. Ju. July. Pl. ¾ foot.

SECT. III. ORMÍSCUS (from ορμισκος, *ormiskos*, a small necklace; because of the pods having links like a necklace.) D. C. syst. 2. p. 682. prod. 1. p. 231. Silique sessile, much compressed, moniliform, with the margins narrowed or contracted between the seeds; joints orbicular, 1-seeded; seeds orbicular, much compressed. Stamens toothless in all except *H. sessilifòlia*, no. 14. Herbs annual.

7 H. AMPLEXICAU'LIS (Lin. fil. suppl. 296.) herbaceous, smooth; pods moniliform; lower leaves opposite, upper ones alternate, cordate, stem-clasping, oblong, entire. ⊙. H. Native of the Cape of Good Hope. Jacq. fragm. 49. t. 64. f. 2. Trentepòhlia integrifòlia, Mertens. H. integrifòlia, Mus. hort. monsp. Flowers small, from white to purplish.

Stem-clasping-leaved Heliophila. Fl. June, Sept. Clt. 1774. Pl. ¾ foot.

8 H. RIVA'LIS (Burch. cat. pl. afr. aust. extratrop. no. 5496.) herbaceous, smooth; pods moniliform, erectish; leaves pinnatifid, with 3 or 4 pairs of linear-acute lobes; petals obovate. ⊙. H. Native of the Cape of Good Hope, in humid places at Melkhout-Kraal, near Nysna. Lam. ill. t. 563. f. 2. Flowers white, sometimes changing to lilac.

River-side Heliophila. Fl. Jun. Sep. Clt. 1819. Pl. 1 foot.

9 H. VARIA'BILIS (Burch. cat. georgr. pl. afr. aust. extratrop. no. 1249.) herbaceous, smooth; pods moniliform, erectish; leaves pinnate-parted, with 3 or 4 pairs of linear-acute lobes; petals oblong-linear. ⊙. H. Native of the Cape of Good Hope in the desert called Roggeweld-Karro, near Juck-river. Flowers at first white, but changing to pale rose. Habit of *H. Chamæmelifòlia*. Terminal lobe of leaf much elongated.

Variable-flowered Heliophila. Fl. Ju. Sept. Pl. ¾ foot.

10 H. PE'NDULA (Willd, spec. 3. p. 529.) herbaceous smooth; pods moniliform, pendulous; leaves pinnate-parted, with 3 or 5 pairs of linear-entire lobes. ⊙. H. Native of the Cape of Good Hope. H. pinnàta, Vent. malm. t. 113. not Lin. H. coronopifòlia, var. β, Lam. dict. 3. p. 90. ill. t. 562. f. 2. Petals dirty-white, with short yellowish claws.

Pendulous-podded Heliophila. Fl. Ju. Sep. Clt. 1792. Pl. 1 to 1½ foot.

11 H. TRI'FIDA (Thunb. prod. 108.) herbaceous, smooth; pods moniliform, rather pendulous; leaves trifid or pinnately-quinquefid; lobes entire, filiform. ⊙. H. Native of the Cape of Good Hope. H. pinnàta, Lin. fil. suppl. 297. Stems dividing at the neck into many branches, which form a tuft. Flowers small, purplish, almost like those of *A'rabis vérna*.

Trifid-leaved Heliophila. Fl. June, Sep. Clt. 1819. Pl. 3 or 4 inches.

12 H. PUSÍLLA (Lin. fil. suppl. 297.) herbaceous, smooth; pods moniliform, spreading; leaves linear-setaceous, entire. ⊙. H. Native of the Cape of Good Hope. A'rabis Capénsis, Burm. fl. cap. 18.—Pluk. mant. 135. t. 432. f. 2. Racemes corymbose, 6-8-flowered. Flowers small, white.

Small Heliophila. Fl. Ju. Sep. Clt. 1824. Pl. 2 inches.

13 H. LEPIDIOÍDES (Link. enum. 2. p. 174.) herbaceous, smooth, decumbent; pod erectly-spreading, oblong-ovate, somewhat repand on the margin, few-seeded; leaves pinnatifid, with linear-lobes. ⊙. H. Native of the Cape of Good Hope. Trentepòhlia lepidioides, Roth. nov. spec. 326.? Flowers white, very small.

Cress-like Heliophila. Fl. Ju. Sep. Clt. 1820. Pl. ½ to ¾ foot.

14 H. SESSILIFLO'RA (Burch. cat. geogr. pl. afr. aust. extratrop. no 1318 and 1391.) herbaceous, smooth; pods moniliform; leaves pinnate-parted, with linear-subulate lobes; stamens furnished on each side with a tooth. ⊙. H. Native of the Cape of Good Hope, in the territory called Roggeweld, near the Jackal-fountain. Habit nearly of *H. péndula*. Petals obovate, white. It is doubtful whether this plant belongs to this Section or to that of *Leptórmus*.

Sessile-flowered Heliophila. Fl. Ju. Sep. Pl ¾ foot

SECT. IV. SELENOCARPÆ'A (from σελην, *selene*, the moon, and καρπος, *karpos*, a fruit; in allusion to the shape of the pods as well as the former name of the plants.) D. C. syst. 2. p. 684. prod. 1. p. 232. Silicles sessile, compressed, oval or orbicular, few-seeded. Seeds compressed, orbicular. Smooth annual herbs, branching from the base.

15 H. DIFFU'SA (D. C. syst. 2. p. 685.) herbaceous, smooth; pods oval-oblong, 4-8-seeded; leaves pinnate-parted, with filiform entire lobes. ⊙. H. Native of the Cape of Good Hope. Lunària diffùsa, Thunb. prod. 107. Farsètia diffùsa, Desv.

journ. bot. 3. p. 173. Ricòtia multífida, Herb. Banks. Trentepòhlia lepidioìdes, Roth. nov. spec. 326.? Flowers small, whitish? Seeds 2-4 in each cell.

Diffuse-branched Heliophila. Fl. June, Sept. Clt. 1818. Pl. ¾ foot.

16 H. PELTA'RIA (D. C. syst. 2. p. 685.) herbaceous, smooth; pods oval-orbicular, 2-4-seeded; leaves pinnate-parted; lobes linear, entire. ⊙. H. Native of the Cape of Good Hope. Peltària Capénsis, Lin. fil. suppl. 296. Lunària pinnàta, Thunb. prod. 107. Aurínia Capénsis, Desv. journ. bot. 3. p. 162. Farsètia pinnàta, Desv. journ. bot. 3. p. 173. Flowers small, whitish. Cells of silicle usually 1-seeded.

Shield-podded Heliophila. Fl. June, Sept. Clt. 1820. Pl. ¼ to ½ foot.

SECT. V. ORTHÓSELIS (from *ορθος*, *orthos*, upright, and *σελις*, *selis*, the side of a leaf; because the margins of the pods are straight, or nearly so.) D. C. syst. 2. p. 685. prod. 1. p. 232. Siliques sessile, compressed, linear, with straight margins, or scarcely contracted between the seeds, (f. 47, *o*.) apiculate by the style. Lateral stamens usually toothless.

§. 1. *Annual Herbs.*

17 H. PILO'SA (Lam. dict. 3. p. 90.) stem hispid with spreading hairs; pods linear; leaves rather hairy, sometimes linear, entire, sometimes trifid at the top, and cuneated at the base. ⊙. H. Native of the Cape of Good Hope. Petals pale blue, twice the length of the calyx. An elegant plant.

Var. α, integrifòlia (D. C. syst. 2. p. 685.) leaves linear, entire. H. integrifòlia, Lin. spec. 926, exclusive of the synonym of Pluk. Jacq. icon. rar. 3. t. 506. Cheiránthus Africànus, Lin. amœn. acad. 6. p. 90. Helióphila, Burm. nov. act. ups. 1. p. 1773. p. 94. t. 7.—Lam. ill. 563. f. 1.

Var. β, incìsa (D. C. syst. 2. p. 686.) leaves cuneated at the base, and divided into 3 linear-lobes at the apex. H. arabioìdes, Sims, bot. mag. t. 496.

Hairy Heliophila. Fl. May, Jul. Clt. 1768. Pl. ½ to 1 foot.

18 H. DIGITA'TA (Lin. fil. suppl. 296.) stem hispid from spreading hairs; pods linear; leaves oval, entire, or here and there grossly toothed. ⊙. H. Native of the Cape of Good Hope. Jacq. fil. icon. in herb. Jacq. H. coronopifòlia, Thunb. prod. 107.? Perhaps only a variety of *H. pilòsa*. Flowers pale-blue. Leaves sometimes cut into 5-6 lobes.

Digitate-leaved Heliophila. Fl. Ju. Sept. Clt. 1819. Pl. ½ to ¾ foot.

19 H. INCÌSA (Herb. Banks. and D. C. syst. 2. p. 687.) smooth; pods linear; leaves oblong, cuneated at the base, lobed at the top; lobes narrow, acute. ⊙. H. Native of the Cape of Good Hope. Flowers middle-sized, yellow.

Cut-leaved Heliophila. Fl. June, Sept. Pl. ¾ foot.

20 H. DIVARICA'TA (Herb. Banks. and D. C. syst. 2. p. 687.) smooth; pods? leaves linear, quite entire; branches spreading. ⊙.? H. Native of the Cape of Good Hope. Flowers when dry yellowish. Habit of *Lepídium graminifòlium*.

Divaricate-branched Heliophila. Fl. Ju. Sept. Pl. ¾ foot.

21 H. CORONOPIFO'LIA (Lin. spec. 927, exclusive of the synonym of Pluk.) smooth; pods linear; leaves pinnate-parted; lobes linear, quite entire. ⊙. H. Native of the Cape of Good Hope.—Herm. lugd. 366. and 367. icon. Flowers blue-violet, spreading. Perhaps belonging to this section.

Buck-horn-leaved Heliophila. Fl. June, Sept. Clt. 1778. Pl. 1 to 2 feet.

22 H. STRÍCTA (Sims, bot. mag. 2526.) leaves hairy, lower ones lanceolate, pinnatifid, upper ones linear, quite entire; pods straight, mucronate, pubescent. ⊙. H. Native of the Cape of Good Hope. Flowers blue.

Straight-podded Heliophila. Fl. June, July. Clt. 1820. Pl. ½ to 1 foot.

23 H. TRIFU'RCA (Burch. cat. geogr. pl. afr. aust. extratrop. no. 1487.) smooth; pods linear, deflexed; leaves very narrow, 3-forked; lobes linear, very entire. ⊙. H. Native of the Cape of Good Hope, near Sack river. H. tripártita, Thunb. prod. 108? Petals large, obovate, appearing when dry pale-purplish, 4 lines long, and 3 lines broad.

Three-forked-leaved Heliophila. Fl. June, Sept. Pl. 1 to 2 feet.

24 H. PECTINA'TA (Burch cat. geogr. pl. afr. austr. extratrop. no. 1362, and 1397.) smooth; pods linear, pendulous; leaves pinnate-parted, with 4 or 5 pair of approximate lobes. ⊙. H. Native of the Cape of Good Hope, in Roggeweld territory, near the rivulet called Riet river. Farsètia elongàta, Desv. journ. bot. 3. p. 173? Flowers small, whitish. Stem much branched. Seeds small, not margined.

Pectinated-leaved Heliophila. Fl. June, Sept. Clt. 1819. Pl. 1 foot.

25 H. FŒNICULA'CEA (R. Br. in hort. kew, ed. 2. vol. 4. p. 100.) hairy; pods linear, spreading; leaves pinnately or bipinnately parted; lobes filiform. ⊙. H. Native of the Cape of Good Hope. Flowers small, purple.

Fennel-like Heliophila. Fl. June, Sept. Clt. 1774. Pl. 1½ foot.

26 H. CHAMÆMELIFÒLIA (Burch. cat. geogr. pl. afr. austr. extratrop. no. 1226.) pilose at the base, smooth at the top; pods linear, erectish; leaves pinnate-parted; lobes linear, very entire, acute. ⊙. H. Native of the Cape of Good Hope, at Ongeluke's river, in Roggeweld's-Karro. Flowers white. Plant very like *H. crithmifòlia*, but differs in not being pubescent.

Camomile-leaved Heliophila. Fl. June, Sept. Plt. ½ foot.

27 H. CRITHMIFÒLIA (Willd. enum. 2. p. 682.) velvety-pubescent; pods linear, drooping; leaves pinnate-parted; somewhat fleshy; lobes rather filiform, and furrowed on the upper surface. ⊙. H. Native of the Cape of Good Hope. Deless. icon. sel. 2. t. 97. Sisýmbrium crithmifòlium, Roth. nov. pl. spec. 225. Flowers small, violet.

Var. β, H. parviflòra (Burch cat. geogr. afr. aust. extratrop. no. 1236.) Not differing from the species, unless that the flowers are white, not violet.

Samphire-leaved Heliophila. Fl. June, July. Clt. 1816. Pl. ½ foot.

§ 2 *Stems frutescent or shrubby.*

28 H. ABROTANIFÒLIA (herb. Banks and D. C. syst. 2. p. 690.) smooth; pods linear, spreading; leaves 3 to 5-lobed; lobes awl-shaped, short. ♄. G. Native of the Cape of Good Hope. Flowers middle-sized, white? Calyxes membranous. Seeds flat, margined, orbicular.

Southernwood-leaved Heliophila. Shrub ½ foot.

29 H. GLAU'CA (Burch. cat. geogr. afr. austr. extratrop. no. 4782.) smooth, glaucous; pods linear, erect; leaves oblong, rather fleshy, lower ones blunt, upper ones acute. ♄. G. Native of the Cape of Good Hope. Flowers white, about the size of those of *Vélla pseùdo-cytisus*.

Var. α, cándida (D. C. syst. 2. p. 690.) flowers white. Burch. l. c. no. 4782. Native near Loeri river.

Var. β, purpuráscens (D. C. syst. l. c.) flowers tinged with purple. Burch. l. c. no. 4969. Native in the territory of Langekloof.

Glaucous Heliophila. Shrub 1½ to 2 feet.

30 H. FASCICULA'RIS (herb. Banks, and D. C. syst. 2. p. 691.) smooth; pods linear, somewhat erect, scarcely longer than the pedicels; leaves filiform. ♄. G. Native of the Cape of Good

Hope. Flowers? Bearing small leafy branches in the axils of the leaves. Silique linear, a line in breadth.

Bundled Heliophila. Shrub 1 foot.

31 H. SUAVÍSSIMA (Burch. cat. geogr. pl. afr. aust. extratrop, no. 2742.) smooth; pods almost linear, narrowed at the base, spreading; leaves linear-subulate, acutish. ♄. G. Native of the Cape of Good Hope, near Plettenbergs-Baaken. H. júncea, Vahl. herb. Flowers very sweet-scented, violet.

Very-sweet-scented-flowered Heliophila. Shrub 1 foot.

32 H. SUBULÀTA (Burch. cat. geogr. afr. aust. extratrop. no. 6214.) pubescent; pods linear, spreading, not narrowed at the base; leaves linear-subulate, very acute. ♄. G. Native of the Cape of Good Hope, at Hartenbosch, near Mossel Bay. This plant, at first sight, has the appearance of a variety of *H. suavíssima*. Flowers violet? Petals oblong.

Subulate-leaved Heliophila. Shrub 1 foot.

33 H. PLATYSÍLIQUA (R. Br. in hort. kew, ed. 2. vol. 4. p. 99.) smooth; pods linear, erect, or pendulous; leaves fleshy, terete. ♄. G. Native of the Cape of Good Hope. Cheiránthus carnòsus, Thunb. prodr. 108. Hésperis cheiránthus carnòsus, Poir. suppl. 3. p. 197. Flowers purple. Sepals with membranous margins. Stems whitish.

Broad-podded Heliophila. Fl. July, August. Clt. 1774. Shrub 1 foot.

34 H. LINEARIFOLIA (Burch. cat. geogr. afr. austr. extratrop. no. 347, and 793.) smoothish; pods erect, linear, pointed with the style; leaves linear, acute, quite entire. ♄. G. Native of the Cape of Good Hope, in the vicinity of Cape Town. Flowers blue. Stems erect, or decumbent.

Var. β, hirsùta (Burch. l. c. no. 5518.) plant rather hairy. Native at Nysna, in the region of Anteniqua-land.

Linear-leaved Heliophila. Fl. July, August. Clt. 1819. Shrub 1 foot.

35 H. STYLOSA (Burch. cat. geogr. afr. aust. extratrop. no. 3291.) smooth; pods linear, pendulous; style filiform longer than the pedicel; leaves linear, quite entire. ♄. G. Native of the Cape of Good Hope, at Komme-dakka. Petals oblong-linear, apparently from yellow to reddish in a dry state.

Long-styled Heliophila. Fl. July, August. Shrub ½ to ¾ ft.

36 H. VIRGÀTA (Burch. cat. pl. afr. austr. extratrop.) smooth; pods somewhat deflexed, linear, pointed with the filiform style, which is longer than the pedicel; leaves ovate, entire, or toothed. ♄. G. Native of the Cape of Good Hope.

Var. α, integrifòlia (D. C. syst. 2. p. 693.) leaves entire; flowers yellowish-white. Burch. l. c. no. 4605.

Var. β, dentàta (D. C. l. c.) leaves grossly and sharply toothed; flowers white, sweet-scented. Burch. l. c. no. 3933.

Twiggy Heliophila. Shrub 2 feet.

37 H. SCOPÀRIA (Burch. cat. geogr. pl. afr. austr. extratrop. no. 7887, and 8557.) smooth; pods erect, linear, ending in the short style; (f. 47, *o.*) leaves linear-subulate; racemes few-flowered. ♄. G. Native of the Cape of Good Hope, in the vicinity of Cape Town, and on the Baviaans-Kloof mountains. Cheiránthus stríctus, Poir. suppl. 2. p. 781. Flowers white, tipped with red. Habit of plant very unlike any of the other species of *Heliophila*.—Deless icon. sel. 2. t. 98.

Broom Heliophila. Fl. July, Aug. Clt. 1802. Sh. 1 to 2 ft.

SECT. VI. PACHYSTYLUM (from παχυς, *pachys*, thick, and στυλος, *stylos*, a style; because the pods are terminated by a thick conical style.) D. C. syst. 2. p. 694. prod. 1. p. 234. Siliques sessile, somewhat compressed, linear, velvety, crowned by the thick conical short style. A pubescent sub-shrub, with entire leaves.

38 H. INCÀNA (Ait. hort. kew. ed. 1. p. 397. ed. 2. vol. 4. p. 99.) pods linear, compressed, velvety, terminated by the thick, conical, smooth style; leaves oblong. ♄. G. Native of the Cape of Good Hope. H. frutéscens, Lam. dict. 3. p. 91. Petals blueish-purple, longer than the calyx.

Hoary Heliophila. Fl. May, Aug. Clt. 1774. Shrub 2 ft.

SECT. VII. LANCEOLÀRIA (from *lancea*, a lance; lanceolate shape of pods.) D. C. syst. 2. p. 695. prod. 1. p. 235. Siliques sessile, lanceolate, ending in a short style; seeds large. Cotyledons 2-legged, somewhat twisted. A little smooth shrub.

39 H. MACROSPÉRMA (Burch. cat. geogr. pl. afr. austr. extratrop. no. 3425.) pods lanceolate, ending in the short style; leaves linear, acute. ♄. G. Native of the Cape of Good Hope, on rocks at Zwart-Waterpoost. Flowers unknown.

Large-seeded Heliophila. Shrub 1 foot.

SECT. VIII. CARPOPÒDIUM (from καρπος, *karpos*, a fruit, and πους ποδος, *pous podos*, a foot; in allusion to the pods being seated on pedicels.) D. C. syst. 2. p. 695. prod. 1. p. 235. Siliques compressed, elongated, linear, standing on long pedicels, pointed by the short style. A smooth erect shrub.

40 H. CLEOMOÌDES (D. C. syst. 2. p. 695.) pods compressed, pedicellate; leaves linear-lanceolate. ♄. G. Native of the Cape of Good Hope. Deless. icon. sel. 2. t. 99. Cleòme Capénsis, Lin. spec. 940. Cheiránthus stríctus, Lin. fil. suppl. 296. Petals oblong, yellow, a little longer than the calyx.

Cleome-like Heliophila. Fl. July. Clt. 1802. Sh. 1 foot.

† *Species not sufficiently known.*

41 H. MOLLUGÍNEA (D. C. syst. 2. p. 696.) ⊙. H. Native of the Cape of Good Hope.—Pluk alm. 213. t. 200. f. 3. Weinm. phyton. t. 641. f. c. from the figure the leaves are opposite, 3-parted, with linear acute lobes. Flowers blue.

Mollugo-like Heliophila. Fl. June, July. Pl. 1 foot.

42 H. LINIFLÒRA (D. C. syst. 2. p. 696.) ⊙. H. Native of the Cape of Good Hope.—Herm. lugd. b. 366. Pods upright. Leaves narrow, toothed. Flowers blue.—Tourn. inst. 223.

Flax-flowered Heliophila. Fl. June, July. Pl. ½ foot.

43 H. HETEROPHÝLLA (Thunb. prodr. 107.) ⊙.? H. Native of the Cape of Good Hope. Stem branched; leaves filiform, lower ones 3-parted, upper ones entire. Scarcely differing from *H. linearifòlia*.

Various-leaved Heliophila. Pl. 1 foot.

44 H. LYRÀTA (Thunb. prodr. p. 108.) Native of the Cape of Good Hope. Leaves lyrate. Pods terete.

Lyrate-leaved Heliophila. Fl.? Pl.?

45 H. LINEÀRIS (D. C. syst. 2. p. 697.) ⊙. H. Native of the Cape of Good Hope. Hésperis cheiránthus lineàris, Poir. suppl. 3. p. 197. Cheiránthus lineàris, Thunb. prodr. 108. Stems erect, herbaceous. Leaves linear, smooth.

Linear-leaved Heliophila. Pl. 1 foot.

46 H. CALLOSA (D. C. syst. 2. p. 696.) ♄. G. Native of the Cape of Good Hope. Cheiránthus callòsus, Lin. fil. suppl. 296. Stem shrubby, angular. Leaves lanceolate entire, callose.

Callous-leaved Heliophila. Shrub 1? foot.

47 H. GRAMÍNEA (D. C. syst. 2. p. 697.) ⊙. H. Native of the Cape of Good Hope. Cheiránthus gramíneus, Thunb. prodr. 108. Hésperis cheiránthus gramíneus, Poir. suppl. 3. p. 167. Stem herbaceous, simple, erect. Radical leaves ensiform.

Grassy-leaved Heliophila. Pl. 1 foot.

48 H.? ELONGÀTA (D. C. syst. 2. p. 697.) ⊙. H.? Native of the Cape of Good Hope. Cheiránthus elongàtus, Thunb. prodr. 108. Hésperis cheiránthus elongàtus, Poir. suppl. 3. p. 197. Stem herbaceous, erect. Leaves linear, entire, smooth.

Elongated Heliophila. Pl. ¾ foot.

Cult. This genus is composed of pretty little plants, which deserve to be cultivated in every garden. The seeds of the annual

kinds should be sown in pots early in the spring, and placed either in a green-house or gentle hot-bed; and in May the plants should be planted out into the open border, in a warm dry situation. A light sandy soil will suit them best. The green-house species are all little shrubby plants, and grow freely in a mixture of sand, loam, and peat. They may be either increased by seeds, or young cuttings will root readily if planted in a pot of sand, and then placed under a hand-glass.

Tribe XX.

SUBULARIE'Æ (plants agreeing with *Subulària* in some characters), or DIPLECOLO'BEÆ (see Sub-Ord. V.) LATISE'PTÆ (from *latus*, broad, and *septum*, a partition; dissepiment broad.) D. C. syst. 2. p. 697. prod. 1. p. 235. Silicle oval, (f. 47. *n.*) with an elliptical dissepiment, convex valves, many-seeded cells, and a sessile stigma. (f. 47. *n.*) Cotyledons plaited twice cross-wise. (f. 45. *m.* f. 47. *p.*)

CVII. SUBULA'RIA (from *subula*, an awl; form of leaves.) Lin. gen. no. 799. D. C. syst. 2. p. 697. prod. 1. p. 235.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle oval, with convex valves, and 4-seeded cells, (f. 47. *n.*) and a sessile punctiform stigma. Calyx closed. A little aquatic, stemless herb, with fascicular, simple, white, fibrous roots. Radical leaves linear, awl-shaped. Scapes naked, few-flowered. Pedicels filiform, bractless. Flowers small, white.

1 S. aqua'tica (Lin. spec. 896.) ⊙. H. Native of the colder parts of Europe, in ditches, lakes, rivulets, and rivers, with a sandy or gravelly bottom; viz. Lapland, Sweden, Norway, at Petersburg along the Neva, Germany, &c., plentiful in the north of England, Scotland, and Ireland. Oed. fl. dan. t. 35. Smith engl. bot. 732. Schkuhr handb. 2. no. 1762. t. 180. Dràba subulària, Lam. ill. t. 556. f. 3. Dr. Hooker has confirmed Sir James Smith's account of the flowers always being several feet under water, where he observed them to be constantly expanded, so that the impregnation actually takes place in that element. The leaves are about 8 or 10 lines long, awl-shaped.

Aquatic, or Common Awl-wort. Fl. June, July. Britain. Pl. 1 to 2 inches.

Cult. This curious little plant only requires to be planted or sown in a pond or rivulet, with a sandy or gravelly bottom; or it may be preserved in a pot filled with gravel or sand, and then plunged in water.

CVIII. PLATYPE'TALUM (from πλατυς, *platys*, broad, and πεταλον, *petalon*, a petal; petals broad.) R. Br. in app. Parry's voy. p. 8.

Lin. syst. *Tetradynàmia, Siliculòsa.* Silicle oval, with convex valves, crowned by a short style. Seeds numerous in the cells, disposed in two rows. Calyx spreading. Petals dilated. Plants with the habit of *Bràya*, which it agrees with in the structure of the flowers, and in the cotyledons being incumbent. To *Subulària* it is more nearly allied, in the cotyledons being narrow and 2-legged.

1 P. purpura'scens (R. Br. l. c.) stigma 2-lobed, spreading; style manifest; scape naked, or furnished with 1-leaf, pubescent; pods smoothish. ♃. H. Native of Melville Island. Root fusiform, with numerous short undivided stems, rising from its neck. Stems short, naked at the base, but leafy at the top. Leaves oblong, bluntish, usually quite entire, thick, rather pilose at the top. Calyx purplish; petals white, with a faint tinge of purple. Flowers 4 to 6, in a bractless corymb.

Purplish-flowered Platypetalum. Pl. $\frac{1}{4}$ foot.

2 P. du'bium (R. Br. l. c.) stigma undivided, almost sessile; pods and scapes pubescent. ♃. H. Native at Melville Island.

Doubtful Platypetalum. Pl. $\frac{1}{4}$ foot.

Cult. These little alpine plants will require to be grown in pots filled with a mixture of peat and sand, and treated as other alpine plants. They may be either increased by cuttings, made of the barren shoots, or by seeds.

Tribe XXI.

BRACHYCARPE'Æ, or DIPLECOLO'BEÆ (see Sub-Ord. V.) ANGUSTISE'PTÆ (*angustus*, narrow, and *septum*, a partition; dissepiment narrow.) D. C. syst. 2. p. 698. prod. 1. p. 235. Silicle didymous (f. 51. *a.*), or twin, with a very narrow dissepiment, and very ventricose valves, one-seeded cells, and a short style. (f. 51. *b.*) Cotyledons biplicate?

CIX. BRACHYCARPÆ'A (from βραχυς, *brachys*, short, and καρπος, *karpos*, a fruit; alluding to the short pods.) D. C. syst. 2. p. 698. prod. 1. p. 235.

Character the same as tribe. A little smooth twiggy shrub, with a pod like that of *Senebièra* or *Biscutélla*, and with the habit of the shrubby species of *Heliόphila* (f. 51.).

1 B. va'rians (D. C. syst. 2. p. 699.) suffruticose, smooth; pods somewhat twin; leaves oblong-linear. ♄. G. Native of the Cape of Good Hope. Corónopus anómalus, Spreng. syst. 2. p. 853. Deless. icon. sel. 2. t. 200. Flowers large.

FIG. 51.

Var. α, *flàva* (D. C. l. c.) flowers yellow. Heliόphila flàva, Lin. fil. suppl. 297. Myàgrum grandiflòrum, herb. Banks.

Var. β, *purpuráscens* (D. C. l. c.) flowers purplish. Polýgala bracteolàta, Burm. herb.

Varying Brachycarpæa. Shrub 1 to $1\frac{1}{2}$ foot.

Cult. This curious little shrub will thrive well in a mixture of sand, loam and peat; and young cuttings will root freely under a hand-glass, if planted in a pot of sand.

Sub-order VI. SCHIZOPETALIE'Æ. Cotyledons 4, twisted separately, whorled. Calyx closed. Petals pinnatifid. Filaments nearly equal. Glands 4, linear, erect, nearly opposite the petals. Style very short, crowned by 2 approximate stigmas, which are decurrent at the base. Silique torose, sessile, 2-celled, narrow-linear. Seeds in one row. Radicle white, arched, a little longer than the seed.

CX. SCHIZOPE'TALON (from σχιζω, *schizo*, to divide, πεταλον, *petalon*, a petal; in allusion to the cut or divided petals.) R. Br. in bot. reg. t. 752. Character the same as the order.

1 S. Walke'ri (R. Br. in bot. mag. 2378.) ⊙. F. Native of Chili. An annual herb, with alternate sinuately-pinnatifid leaves. Flowers white, in long racemes; pedicels each furnished with a linear bractea. The whole plant is beset with branched down.

Walker's Schizopetalon. Fl. May, Aug. Clt. 1821. Pl. 1 to 2 feet.

Cult. This singular cruciferous plant should be raised in pots in a green-house in spring, when some of them may be planted out in the borders, others may be saved in the pots, and placed in an airy part of the green-house, where they will produce seeds, although sparingly. A mixture of loam, peat, and sand suits it best.

† *Additional cruciferous plants.*

1 Mathi'ola pa'tens (Presl. fl. sic. ex Spreng. syst. app. p. 242.) plant tomentose or hoary from stellate down; stem herbaceous, diffusely branched; leaves lanceolate, entire, tomentose; siliques terete, spreading, tomentose, and muricated with glands. ♂. H. Native of Sicily. This plant comes nearest to *Mathìola ánnua*, p. 151. no. 2. of this work.

Spreading-branched Stock. Fl. May, June. Pl. 1 foot.

2 Mathi'ola simplicica'ulis (Sweet, hort. brit. p. 17.) ♂. H. Native of? This is the *Brompton Stock*. It differs from *Mathíola incàna* or *Queen Stock* (to which it was formerly attached as a simple variety,) in the plant being a biennial not shrubby; it is simple, not branched. The flowers of this variety are either scarlet or white, single or double. It is a very ornamental plant, and is very generally cultivated for that purpose.

Brompton Stock or *Simple-stemmed* Stock. Fl. May, Aug. Clt.? Pl. 1 foot.

3 nastu'rtium? Sine'nse (D. C. syst. 2. p. 699) Native of China. Lepídium petræ'um, Lour. fl. cochin. ed. Willd. 2. p. 479. exclusive of the synonyms. Lepídium Chinénse, Stok. bot. mat. med. 3. p. 429. Stem annual, eight inches high, round, erect. Leaves broad, lanceolate, quite entire, small, pinnated. Stamens tetradynamous. Spikes of flowers simple, erect, long, terminal. Flowers yellow. Pods ovate, emarginate, compressed, 2-celled, many-seeded. Plant bitter and acrid to the taste.

Chinese Nasturtium. Pl. ½ foot.

4 nastu'rtium? rotundifòlium (Rafin. fl. lud. p. 86. no. 274.) Native of Louisiana. Cochleària, no. 4. Rob. voy. Louis. 3. p. 467. Habit of *A'rabis rhomboìdea*. Plant large. Leaves thick, juicy, and eatable, but insipid. Stem erect, branched. Leaves roundish, sinuately-lobed. Petals elongated, longer than the calyx.

Round-leaved Nasturtium. Pl. 2 feet.

5 A'rabis longisi'liqua (Presl. ex Spreng. syst. app. 242.) stem very simple, and is as well as the leaves hoary from forked down; radical leaves oblong-lanceolate, quite entire; pedicels appressed, much shorter than the calyx. ♃. H. Native of Sicily. Flowers white? This plant comes very near to *A'rabis collìna*, p. 165. no. 56. of this work.

Var. β, *A. purpuráscens* (Presl. l. c.) Flowers purplish.

Long-podded Wall-Cress. Pl. ½ foot.

6 pteroneu'rum Dalma'ticum (Vis. in bot. zeit. 1829.) plant smooth; stem diffuse, much branched; leaves pinnate, fleshy, glaucescent; leaflets obovate, stalked, 3-lobed, lower ones palmate; silique erect, smooth, crowned by the elongated terete style; seeds margined at the top. ⊙. H. Native of Dalmatia. Cardámine marítima, Portenschlag, p. 170, no. 48, of this work. This is considered by Visiani to be a true species of *Pteroneùrum*, in the calyx being spreading, in the silique being lanceolate, as well as in the funicle being dilated.

Dalmatian Pteroneurum. Fl. June. Pl. ½ foot.

7 farse'tia Dalma'tica (Vis. l. c.) is F. triquètra, D. C. see p. 175, no. 8. of this work. The branches are not triquetrous, but round. Visiani gives the following amended character. Plant covered with stellate down; stems suffruticose at the base; branches round, ascending; leaves obovate, tapering into the petiole and repand; style long, deciduous; stigma 2-lobed. ♃. H. Native of Dalmatia.

Dalmatian Farsetia. Fl. May, June. Pl. 1 foot.

8 Vesica'ria microca'rpa (Vis. fl. bot. zeit. no. 12. March 1829. p. 17.) plant herbaceous, covered with stellate down; stems erect, branched; leaves obovate, spatulate, entire, radical ones stalked; calyx equal, not gibbous; fructiferous corymbs crowded; pods globose, inflated, smooth, few-seeded; style permanent; seeds margined. ♃. H. Native of Dalmatia on mount Biokova. Flowers yellow.

Small-fruited Vesicaria. Fl. June, July. Pl. ½ foot.

9 lepi'dium pube'scens (Gusson. fl. sic. prod. ex Schlecht. Linnæa 4. p. 38, under *Thlàspi.*) ⊙. H. Native of Sicily. Very like *L. hírta*, p. 218. no. 12. of this work; but the plant is pubescent, not hairy, and the pods are oblong and emarginate, and with the style protruding beyond the notch.

Pubescent Mithridate Pepperwort. Pl. ½ foot.

10 Ibe'ris intege'rrima (Mor. elench. p. 4.) plant suffrutescent at the base, pubescent at the top; leaves oblong-spatulate, fleshy, quite entire, rather concave, uppermost ones ciliated; pods emarginate, racemosely-corymbose. ♄. H. Native of Sardinia. An intermediate plant between *I. Tenoreàna* and *I. Prúitii*, p. 194, no. 2 and 3, of this work.

Very-entire-leaved Candy Tuft. Fl. May. Pl. ½ foot.

11 biscute'lla inca'na (Tenore, prod. fl. nap. 1826.) stem woody at the base; pods smooth, somewhat undulated, scabrous in the disk from elevated tubercles; leaves hispid, hoary, oblong, unequally sinuate-toothed; teeth blunt. ♃. H. Native of Calabria. This plant differs from *B. saxátilis*, in the stems being more tufted and more woody at the base, as well as in the pods being undulated, and twice the size.

Hoary Buckler Mustard. Fl. May, July. Pl. 1 foot.

12 he'speris glutinòsa (Vis. in bot. zeit. Dec. 1829.) plant covered with viscid hairs; stems branched; radical leaves lyrately-pinnatifid, thickish; cauline ones broad-lanceolate, toothed at the base, acuminated and entire at the top, on very short petioles; pedicels racemose, shorter than the calyx, leaning almost to one side; claws of the petals twice the length of the calyx; pods clothed with viscid hairs, at length spreading and deflexed, somewhat torulose; seeds oblong-truncate. ♃. H. Native of Dalmatia. Colum. ecph. 2. p. 261.—Mor. oxon. p. 252. sect. 3. t. 10. f. 5. Flowers lilac. This species comes very near *H. laciniàta*, All. p. 202, no. 4, of this work.

Clammy Dame's violet. Fl. March, April. Pl. 2 to 3 feet.

CXI. STREPTA'NTHUS (from στρεπτος, *streptos*, twisted, and ανθος, *anthos*, a flower; twisted claws of petals.) Nutt. in journ. acad. nat. sc. philad. 5. p. 132. ann. 1825.

Lin. syst. *Tetradynàmia, Siliquòsa.* Calyx erect, coloured. Petals dilated, with channelled twisted claws. Glands none. Filaments awl-shaped, thickened at the base. Silique very long, angular, compressed. Seeds flat, marginate, disposed in one row. Cotyledons accumbent. An annual herb, with quite entire leaves, and purple flowers. Pods very long, tetragonal, 2-edged. This genus agrees in habit with *A'rabis*, but in the pods with *Turrìtis*.

1 S. macula'tus (Nutt. l. c. with a figure.) ⊙. H. Native of the Arkansa territory.

Spotted Streptanthus. Fl. May. Pl. 1 foot.

Cult. The seeds of this plant only require to be sown in the open border, and the plants afterwards treated as other hardy annuals.

CXII. SELE'NIA (from σεληνη, *selene*, the moon; shape of pods.) Nutt. in journ. acad. nat. sc. philad. 5. p. 132. ann. 1825.

Lin. syst. *Tetradynàmia, Siliculòsa.* Calyx coloured, equal at the base, spreading. Silicle large, many-seeded, elliptical, compressed, marginate, almost sessile; valves parallel, smaller than the dissepiment. Glands 10, by pairs between the sepals, and solitary emarginate between the shorter stamens and the pistil. An annual plant, with triquetrous stems; pinnatifid leaves and axillary golden flowers. Habit of *Brássica*, but with the fruit of *Lunària.* Radical leaves almost bipinnatifid.

1 S. au'rea (Nutt. l. c. with a figure.) ⊙. H. Native of Arkansa upon the banks of the river Pottoe.

Golden-flowered Selenia. Fl. March, April. Pl. 1 foot.

Cult. The seeds of this plant will only require to be sown

in the open border, and the plants afterwards treated as other hardy annuals.

ORDER XV. CAPPARI'DEÆ (plants agreeing with *Capparis* in many important characters.) Juss. gen. 242. ann. mus. 18. p. 474. D. C. prod. 1. p. 237.

Parts of flower usually imbricate in the bud. Sepals 4 (f. 52. *a*. f. 53. *a*.), seldom more, sometimes almost free, equal or unequal, sometimes connected at the base into a tube (f. 54. *a*.) with a variable limb. Petals 4 (f. 52. *b*. f. 53. *f*.), seldom more, cruciate, usually unguiculated (f. 52. *b*.) and unequal. Stamens almost perigynous, inserted at the bottom of the calyx (f. 52. *c*. f. 53. *d*.), rarely tetradynamous, usually disposed in a quaternary order, definite (f. 54. *d*.) or indefinite (f. 53. *e*. f. 52. *c*.). Torus hemispherical or elongated (f. 52. *d*. f. 54. *c*.), usually bearing glands. Stipe of ovary slender (f. 52. *d*. f. 54. *e*.), rising from the torus; the ovary is therefore stipitate (f. 52. *f*. f. 54. *e*.). Ovary composed of 2 or more closely-joined carpels. Style none (f. 53. *c*. f. 54. *e*.) or filiform. Fruit variable, siliquose (f. 54. *e*.). or baccate (f. 52. *f*.), 1-celled, but rarely 1-seeded, usually with 2 or more many-seeded placentas, in the dehiscent fruit these are intervalvular. Seeds usually kidney-shaped without albumen. Embryo incurved. Cotyledons leafy, flat, somewhat incumbent. Herbs, shrubs, or trees, either with or without stipulas, but when they are present they are in the form of spines. The leaves are alternate, simple, or palmately compound. The disposition of the flowers is variable. This order differs from *Crucíferæ* in the receptacle being hemispherical or elongated, as well as in the fruit being destitute of a dissepiment, and the seeds being without an umbilical cord, and in the very different disposition of the stamens. It differs from *Flacourtiàneæ* in the seeds never being inwrapped in a pulpy pellicle.

The plants contained in this order partake of the properties of *Crucíferæ*. The different kinds of *Capers* are reputed to be stimulating, antiscorbutic and aperient. The bark of the root of the common *Caper* passes for a diuretic medicine. Several species of the *Cleòmeæ* have an acrid taste, which has been compared to that of mustard. The root of *Polanísia gravèolens* is employed as a vermifuge in the United States, and the leaves of *P. dodecándra* produce an inflammation on the skin, whence they are used in Cochin-china as a sinapism. Most of the plants contained in this order have beautiful flowers.

The seeds of those plants belonging to tribe *Cleòmeæ* are easily introduced, in a living state, from any part of the world: but the seeds of those belonging to tribe *Cappàreæ* soon become rancid, therefore they are truly difficult to introduce in a vegetative state, and on that account very few of this tribe are to be seen in the gardens.

Synopsis of the Genera.

TRIBE I.

CLEO'MEÆ. *Fruit truly capsular, with membranous dehiscent valves. Herbs or sub-shrubs with compound leaves, usually clothed with glandular down.*

1 CLEOME'LLA. Calyx of 4-spreading sepals. Petals 4. Receptacle ovate-globose. Stamens 6, free. Silicle stipitate within the calyx, shorter than broad.

2 PERI'TOMA. Calyx cut round about at the base, 4-toothed at the apex. Petals 4. Receptacle small. Stamens 6, monadelphous at the base. Silique stipitate.

3 GYNANDRO'PSIS. Calyx of 4-spreading sepals. Petals 4. Receptacle elongated. Stamens 6, monadelphous around the torus, and free at the top. Silique stipitate.

4 CLEO'ME. Calyx of 4-spreading, nearly equal sepals. Petals 4. Receptacle somewhat hemispherical. Stamens 6, rarely 4, free. Silique stipitate or sessile.

5 POLANI'SIA. Calyx of 4-spreading sepals. Petals 4. Stamens 8-32, free. Receptacle small. Silique sessile or on a short stipe, terminated by a distinct style.

6 PHYSOSTE'MON. Calyx of 4 sepals. Petals 4. Stamens 6-8, unequal, free, inflated under the anthers. Receptacle marginate. Silique sessile.

7 CORYNA'NDRA. Calyx of 4 sepals. Petals 4. Stamens numerous; filaments clavated, and coloured at the top; anthers curved. Silique sessile, 2-valved.

TRIBE II.

CAPPA'REÆ. *Fruit rather fleshy, indehiscent* (f. 52. *f*.). *Shrubs and trees, rarely herbs, with simple or ternate leaves.*

8 CRATÆ'VA. Sepals 4. Petals 4, larger than the calyx. Stamens 8-28. Torus elongated or hemispherical. Berry stipitate, ovate-globose, pulpy inside.

9 RITCHIE'A. Calyx of 4 sepals, valvate in the bud. Petals 4, much longer than the calyx. Stamens 10-20, incurved. Torus elevated, glanduliferous. Berry stipitate, globose, crowned by a sessile stigma.

10 NIEBU'HRIA. Sepals 4, valvate in the bud. Petals wanting, or shorter than the calyx. Torus cylindrical, very short. Stamens indefinite. Berry stipitate, ovate or cylindrical.

11 BÓSCIA. Sepals 4. Petals none. Stamens 12-20, inserted in the short torus. Berry stipitate, globose, 1-seeded.

12 CA'DABA. Sepals 4. Petals 4 or wanting. Nectary strap-formed, emanating from the base of the sub-cylindrical torus. Stamens 4-5, monadelphous at the base. Berry stipitate, cylindrical.

13 SCHEPPE'RIA. Sepals 4, spreading. Petals 4. Torus elongated. Stamens 8, monadelphous around the torus, but free at the top. Nectary concave at the base of the torus. Silique fleshy, stipitate.

14 SODA'BA. Sepals 4, the superior one is large and concave. Petals 4. Stamens 8? Torus small. Ovary ovate, 4-furrowed, on a long stipe.

15 CA'PPARIS. Calyx 4-parted (f. 52. *a*.). Petals 4 (f. 52. *b*.). Torus small (f. 52. *e*.). Stamens numerous (f. 52. *c*.). Silique somewhat baccate, stipitate (f. 52. *f*.). Stipe long and slender (f. 52. *d*.).

16 STEPHA'NIA. Calyx campanulate, 2-lobed (f. 54. *a*.). Petals 4 (f. 54. *b*.). Torus small (f. 54. *c*.). Stamens 6 (f. 54. *d*.). Ovary oblong, stipitate (f. 54. *e*.).

17 MORISÒNIA. Calyx obovate, bifid. Petals 4. Torus small. Stamens 20, somewhat monadelphous at the base. Berry globose, stipitate.

18 TOVA'RIA. Calyx usually of 8 sepals, with an equal num-

ber of petals. Stamens the same number as the sepals, and alternating with them, inserted on the inside of a large disk or torus. Berry spherical, seated on the elevated disk, pulpy inside.

19 Thyla'chium. Calyx follicular, at length cut round about. Petals none. Stamens numerous, inserted in the short torus. Berry oblong, stipitate.

20 Hermu'poa. Calyx double, outer one tubular, inner one of 4 small sepals. Petals 4, linear. Stamens 6, very long. Berry oblong-cylindrical.

21 Mæ'rua. Calyx tubular, 4-parted, valvate in the bud, with a crown of petal-like scales in the throat. Petals none. Torus elongated. Stamens numerous, somewhat monadelphous at the top of the torus. Silique fleshy, stipitate.

22 A'rsis. Calyx of 5 coloured sepals. Petals 5. Stamens numerous; anthers 4-celled. Berry stipitate, 1-seeded.

Tribe I.

CLEO'MEÆ (plants agreeing in important characters with *Cleòme*.) D. C. prod. 1. p. 237.—Genus Cleome, Lin. Fruit truly capsular, with somewhat membranous opening valves.—Herbs or sub-shrubs. Leaves usually compound, seldom simple, covered with glandular hairs. Flowers usually disposed in terminal racemes.

I. CLEOME'LLA (a diminutive of *Cleòme*, which see.) D. C. prod. 1. p. 237.

Lin. syst. *Hexándria, Monogýnia.* Calyx of 4-spreading sepals. Petals 4. Torus ovate-globose. Stamens 6, free. Silicle stipitate within the calyx, shorter than broad.

1 C. Mexica'na (Moc. et Sesse. icon. fl. mex. ined. D. C. prod. 1. p. 337.) ♃. S. Native of Mexico. Leaves trifoliate, smooth. Flowers yellow.

Mexican Cleomella. Fl. July. Pl. 1 foot.

Cult. A rich light soil will suit this plant well, and cuttings will root freely under a hand-glass, but if it seed freely this will be unnecessary.

II. PERI'TOMA (from περιτομη, *peritome*, a cutting round about; base of calyx.) D. C. prod. 1. p. 237. Atalánta, Nutt. gen. amer. 2. p. 73. not of Corr.

Lin. syst. *Hexándria, Monogýnia.* Calyx cut round at the base, 4-toothed at the top. Petals 4. Torus small. Stamens 6, joined at the base. Silique oblong, stipitate within the calyx.

1 P. serrula'tum (D. C. prod. 1. p. 237.) ⊙. H. Cleòme serrulàta, Pursh, fl. amer. sept. 2. p. 441. Native of North America on the banks of the Missouri. Leaves ternate, smooth, leaflets lanceolate, finely serrulated. Racemes elongated. Bracteas linear. Flowers pale purple.

Serrulated-leaved Peritoma. Fl. Jul. Aug. Clt. 1823. Pl. 3 ft.

Cult. The seeds of this plant should be sown in a pot, which should be placed in a gentle hot-bed, and when the plants are of sufficient size, they should be planted out into the open border in a sheltered situation.

III. GYNANDRO'PSIS (from γυνη, *gyne*, a female, and ανηρ, ανδρος, *aner*, *andros*, a male, οψις, *opsis*, resemblance; because of the stamens appearing as if inserted on the top of the ovary). D. C. syst. 2. p. 237. Cleòmes, spec. Lin.

Lin. syst. *Monadélphia, Hexándria.* Calyx of 4 spreading sepals. Petals 4. Torus elongated. Stamens 6, joined together around the ovary, but free at the apex. Silique stipitate, within the calyx at the top of the torus.

The African species of this genus are readily distinguished, according to Mr. Brown, the great peculiarity of which consists in the petals not covering the stamina at any period. This mode of æstivation of the petals, he says, has never before been noticed, though it equally exists in *Cratæ'va* and *Resedàceæ*; to this mode he proposes to apply the term *aperta.*

§ 1. *Angiogònia. Petals imbricate in the bud and covering the stamina.*

1 G. sessilifo'lia (D. C. prod. 1. p. 237.) smooth; leaves all trifoliate, lower ones hardly stalked; leaflets oblong, entire. ⊙. H. Native of the West Indies in sandy barren places. Cleòme triphýlla, Lin. spec. 938. exclusive of the synonyms. Flowers whitish or flesh-coloured.

Sessile-leaved Gynandropsis. Fl. June, August. Clt. 1820. Pl. 1 to 2 feet.

2 G. triphy'lla (D. C. prod. 1. p. 237.) smoothish; leaves all trifoliate, floral ones sessile, the rest stalked; stalks of the lower leaves longer than the leaves themselves. ⊙. H. Native of the West Indies in dry sandy places. Cleòme triphylla, Lin. spec. 938. from Herm. lugd. 565. icon. Flowers white or flesh-coloured.

Three-leaved Gynandropsis. Fl. Ju. Aug. Clt. 1820. Pl. 1 to 2 feet.

3 G. palmi'tes (D. C. prod. 1. p. 238.) smoothish; leaves 5-7-foliate; leaflets entire; stalks of the leaflets somewhat connected at the base by a membrane. ⊙. S. Native of Cayenne. C. palmìtes, Spreng. syst. 2. p. 122. Flowers perhaps white.

Palmate-leaved Gynandropsis. Pl. 1 foot.

4 G. brachyca'rpa (D. C. syst. 1. p. 238.) leaves ternate or quinate; leaflets entire; pods smooth, oval-oblong, shorter than the stipe. ⊙? H. Native of Peru. Cleòme brachycárpa, Vahl. Flowers white or pink.

Short-podded Gynandropsis. Pl. 1 foot.

5 G. hispi'dula (D. C. prod. 1. p. 238.) hispid; leaves quinate; leaflets entire; pods rather hispid, shorter than their stipe. ⊙? H. Native of Peru. Cleòme hirsùta, Ruiz et. Pav. Flowers white or rather pinkish.

Hispid Gynandropsis. Pl. 1 foot.

6 G. candela'brum (Sweet, hort. brit. p. 468.) pubescent; leaves quinate; leaflets broad-ovate, acuminated; floral leaves ternate, sessile; siliques scabrous, longer than the stipe. ⊙. H. Native of South America. Petals of a whitish-pink colour. Stamens purple; anthers yellow. Cleòme, Sims, bot. mag. 2656.

Chandelier Gynandropsis. Fl. July. Clt. 1824. Pl. 1 to 2 ft.

7 G. specio'sa (D. C. prod. 1. p. 238.) plant somewhat velvety at the top; leaves 5-7-foliate; leaflets somewhat serrulated, oblong, acuminated. ♃? S. Native of New Granada near Carthagena. Cleòme speciòsa, H. B. et Kunth, nov. spec. amer. 5. p. 84. t. 436. Flowers violet.

Showy Gynandropsis. Fl. Ju. Aug. Clt. 1818. Pl. 2 feet.

8 G. pulche'lla (Lindl. in hort. trans. lond. 6. p. 65.) rather pilose; lower leaves quinate, upper ones ternate; leaflets entire; silique oval, smooth; seeds kidney-shaped, tuberculated. ⊙. H. Native of Maranham. Leaves smooth, with hairy petioles. Flowers small. Petals white, with purplish claws.

Neat Gynandropsis. Fl. June, Jul. Clt. 1825. Pl. ½ foot.

9 G. affi'nis (Blum. bijdr. fl. ind. ned. ex Schlecht. Linnæa. 1. p. 644.) plant covered with glandular hairs; lower and floral leaves trifoliate, middle ones with 5 leaflets; leaflets obovate, quite entire, but ciliated, with glandular hairs. ⊙. H. Native of Java. Flowers white.

Allied Gynandropsis. Fl. July. Pl. 1 to 2 feet.

§ 2. *Gymnogònia. Petals open in the bud, never covering the stamina at any period.*

10 G. pentaphy'lla (D. C. prod. 1. p. 238.) smoothish;

leaves on the middle of the stem with 5 leaflets, the lowest and floral ones with 3 leaflets; leaflets entire or somewhat serrulated. ⊙. H. Native of tropical Africa in sandy places near the sea. Cleòme pentaphýlla, Lin. spec. 938. Sims, bot. mag. t. 1681. Perhaps this species grows spontaneous in South America and Egypt as well as India. Flowers white or flesh-coloured, with pink stamens and brown anthers.

Five-leaved Gynandropsis. Fl. Ju. Aug. Clt. 1640. Pl. 1 ft.

11 G. DENTICULA'TA (D. C. prod. 1. p. 238.) smoothish; lowest leaves with 7 leaflets, middle ones with 5 leaflets; upper ones ternate; leaflets serrulated. ⊙. H. Native of Angola on the west coast of Africa. Flowers white, tinged with pink. The stamens are pink.

Denticulated-leaved Gynandropsis. Fl. Ju. Aug. Pl. 1 to 2 ft.

12 G. HETERO'TRICHA (D. C. prod. 1. p. 238.) covered with variable hairs, some of which are elongated, others sessile and glandular; leaves ternate or quinate; leaflets almost entire. ⊙. H. Native of the Cape of Good Hope. Cleòme heterótricha, Burch. trav. 1. p. 537. cat. no. 2011. Flowers white.

Variable-haired Gynandropsis. Pl. 1 foot.

Cult. The seeds of these plants should be sown on a hot-bed, in the month of March; and when the plants have attained a sufficient size, which will be in May, they should be planted out into the open ground, in a warm sheltered situation, where they will flower and seed, if the summer proves warm. But in order to secure seeds, a plant or two of each kind should be planted separately, in pots, in a mixture of sand and loam, and placed in the green-house.

IV. CLEO'ME (from κλειω, *kleio*, to shut, in allusion to the parts of the flower; a name adopted by Linnæus from Theodosius). D. C. prod. 1. p. 238. Cleòme, spec. Lin.

LIN. SYST. *Tetra-Hexándria, Monogýnia.* Calyx of 4, spreading, almost equal sepals. Petals 4. Torus somewhat hemispherical. Stamens 6, rarely 4. Silique dehiscent, stipitate, or sessile within the calyx.

SECT. I. PEDICELLA'RIA (from *pedicéllus*, a pedicle; fruit on long stalks.) D. C. prod. 1. p. 238. Torus fleshy, somewhat globose. Stipe of ovary elongated.

1 C. GIGANTE'A (Lin. mant. 430.) shrubby, velvety-pubescent, somewhat clammy; leaves 7-foliate, with 30 or 40 veins on each side of each leaflet. ♄. S. Native of South America. Cleòme viridiflòra, Schreb. nov. act. nat. cur. 4. p. 136. t. 3. Flowers whitish-green, with pinkish filaments and yellow anthers. This is a beautiful plant, but has a strong disagreeable smell and a caustic taste.

Giant Cleome. Fl. June, July. Clt. 1774. Sh. 6 to 12 feet.

2 C. ARBO'REA (H. B. et Kunth, nov. spec. 5. p. 86.) shrubby, velvety-pubescent, somewhat clammy; leaflets 7, with 20 veins on each side of each leaflet. ♄. S. Native of Caraccas. Perhaps sufficiently distinct from Cleòme gigantèa. Flowers white or greenish.

Tree Cleome. Fl. June, July. Clt. 1817. Sh. 6 to 8 feet.

3 C. GLANDULO'SA (Ruiz et Pav.) somewhat arborescent, hispid with thick hairs which bear glands at their apex; leaves with 7-9 leaflets, upper and floral ones simple, ovate-cordate; ovary covered with glandular hairs. ♄. S. Native of Peru. Fruit unknown. Silique the length of the stipe.

Glandular Cleome. Fl. June, July. Shrub 2 feet.

4 C. CARDINA'LIS (D. C. prod. 1. p. 238.) herbaceous, smooth; leaves 5-foliate, floral ones sessile and leaflets oval-lanceolate. ⊙. S. Native of Mexico, where it is called *Borla di Cardinal* (icon. fl. mexic. ined.). Flowers reddish?

Cardinal Cleome. Fl. Jul. Aug. Clt. 1823. Pl. 2 feet.

5 C. HEPTAPHY'LLA (Lin. spec. 987.) herbaceous, prickly, covered with clammy hairs; leaves with 7 leaflets, floral ones simple, cordate-roundish; silique longer than the stipe, covered with clammy pubescence. ⊙. S. Native of both Indies. Perhaps several species are confused under this name, and it is very probable that the South American plant differs from the East India plant. Flowers white or flesh-coloured, with purplish stamens and brownish anthers.

Seven-leaved Cleome. Fl. Jul. Aug. Clt. 1817. Pl. 1 to 3 ft.

6 C. ANO'MALA (H. B. et Kunth, nov. spec. 5. p. 85.) herbaceous, unarmed, velvety-pubescent; leaves with 7 leaflets, floral ones simple, round, and somewhat cordate; siliques elliptical, muricated. ⊙? S. Native of South America. Valves of fruit very convex. Flowers white.

Anomalous Cleome. Pl. 1 foot.

7 C. CHILE'NSIS (D. C. prod. 1. p. 238.) herbaceous, unarmed, smooth; leaves with 7 leaflets, floral ones with 3-5 leaflets; sepals permanent; siliques pendulous, smoothish, scarcely longer than the stipe. ⊙. H. Native of Chili. Flowers white, or pinkish.

Var. α, glàbra (D. C. prod. l. c.) leaves with 7 leaflets, smooth.

Var. β, pubéscens (D. C. prod. 1. p. 239.) leaves with 3-5 leaflets, pubescent.

Chili Cleome. Pl. 1 foot.

8 C. LO'NGIPES (D. C. prod. 1. p. 239.) herbaceous, prickly, smooth; leaves ternate; silique cylindrical, slender, one half shorter than the stipe, which is about a foot long. Native of Guayaquil. Flowers white.

Long-footed-fruited Cleome. Pl. 2 feet.

9 C. SPINO'SA (Lin. spec. 939.) herbaceous, prickly, pubescent; leaves with 5-7 leaflets, smooth; floral ones simple, stalked, ovate-cordate; silique smooth, longer than the stipe. ♂. S. Native of South America. Marcgr. bras. p. 34. icon. Flowers with white petals, purple filaments, and yellow anthers.

Spinose Cleome. Fl. Ju. Jul. Clt. 1731. Pl. 2 to 4 feet.

10 C. PU'NGENS (Willd. hort. berl. t. 18.) herbaceous, prickly, covered with clammy pubescence; leaves with 5-7 leaflets, smooth, floral ones simple, sessile, cordate; silique smooth, shorter than the stipe. ♂. S. Native of South America and the West India islands. Cleòme púngens, H. B. et Kunth, nov. spec. 5. p. 85. C. spinòsa, Sims. bot. mag. t. 1640. Flowers flesh-coloured, or white.

Pungent Cleome. Fl. Juné, July. Clt. 1812. Pl. 1 to 2 ft.

11 C. PUBE'SCENS (Sims, bot. mag. t. 1857.) herbaceous, unarmed, pubescent; leaves with 5-7 leaflets, floral ones simple, cordate; silique length of stipe. ⊙. H. Native of? Flowers white, with purple stamens and stipe.

Pubescent Cleome. Fl. Jul. Clt. 1815. Pl. 1½ foot.

12 C. PSORALEÆFO'LIA (D. C. prod. 1. p. 238.) herbaceous, prickly, pubescent; leaves trifoliate; petioles beset with glandular hairs; floral leaves ovate, stalked; silique at last smooth, longer than the stipe. ⊙? S. Native of Brasil. C. Brasiliàris, Weinm. ex Spreng. syst. 2. p. 121. Flowers white?

Psoralea-leaved Cleome. Pl. 1 to 2 feet.

13 C. LATIFO'LIA (Vahl. ined. D. C. prod. 1. p. 239.) herbaceous, unarmed, smooth; lower leaves simple, middle ones ternate, stalked; leaflets oval, acuminated; floral leaves simple, sessile, ovate, one half shorter than the pedicel; stipe length of pedicel. ⊙? S. Native of Guiana. Flowers white or red.

Broad-leaved Cleome. Pl. 1 to 2 feet.

14 C. RO'SEA (Vahl. ined. D. C. prod. 1. p. 239.) herbaceous, unarmed, smooth; leaflets quinate, lower and floral ones ternate, uppermost ones ovate, sessile; silique smooth, length of stipe. ⊙. S. Native of Rio Janeiro. Flowers beautiful rose-coloured. Stem erect, branched. Lindl. bot. reg. 960.

Rose-coloured-flowered Cleome. Fl. Ju. Jul. Clt. 1824. Pl. 1½ ft.

15 C. SPECIOSI'SSIMA (Deppe in litt. Lindl. bot. reg. 1312.) herbaceous, unarmed; leaflets 5-7, lanceolate, acuminated,

pilose; bracteas ovate; petals length of pedicels; pedicel of fruit long. ⊙. H. Native of Mexico about Xalapa. Like *C. rósea*, but differs in the leaves being pilose, not smooth, and they are never trifoliate; the flowers are larger and the pedicels shorter. Flowers beautiful rose-coloured.

Very shewy Cleome. Fl. Jul. Aug. Clt. 1829. Pl. 1½ foot.

16 C. purpu'rea (D. C. prod. 1. p. 238.) herbaceous, unarmed, smooth; leaves trifoliate, floral and upper ones simple, ciliated; ovary smooth, twice the length of the stipe. ⊙. S. Native of Peru. Flowers purplish. Perhaps this plant belongs to the following section.

Purple-flowered Cleome. Pl. 1½ foot.

17 C. nummula'ria (D. C. prod. 1. p. 239.) herbaceous, unarmed, pubescent; upper leaves simple, stalked, orbicular; ovary covered with glandular pubescence; silique at length smooth, longer than the stipe. Native of Brasil. Flowers white or reddish. The lower part of the plant is unknown.

Moneywort-leaved Cleome. Pl. 1 to 2 feet.

Sect. II. Siliqua'ria (from *siliqua*, a long pod; pods long). D. C. prod. 1. p. 239. Torus small. Stipe of ovary short or wanting. All the species that should be included in this section are said by Mr. Brown to be indigenous to north Africa and middle Asia.

§ 1. *Leaves simple.*

18 C. monophy'lla (Lin. spec. 940.) herbaceous, pubescent; leaves simple, stalked, lanceolate, blunt at the base; silique puberulous, almost sessile. ⊙. H. Native of Malabar and Ceylon. Flowers yellow, anthers greenish-blue.

Var. α, *Malabárica* (D. C. l. c.). Rheed. hort. mal. 9. t. 34.

Var. β, *Zeylánica* (D. C. l. c.). Burm. zeyl. t. 100. f. 2.

One-leaved Cleome. Fl. Ju. Jul. Clt. 1759. Pl. ½ to 1 ft.

19 C. corda'ta (Burch. cat. n. 2374.) sub-herbaceous, pubescent; leaves simple, on short stalks, lanceolate, cordate at the base; silique puberulous, almost sessile. ⊙? H. Native of the Cape of Good Hope. Flowers yellow; anthers pale. Perhaps sufficiently distinct from *Cleòme monophýlla*.

Cordate-leaved Cleome. Fl. June, July. Pl. 1 foot.

20 C. glau'ca (D. C. prod. 1. p. 239.) herbaceous, smooth, glaucous; leaves stalked, ovate, floral ones elliptical; siliques pendulous, smooth, on short stipes; seeds hairy. ♃. G. Native of Arabia. Flowers yellow.

Glaucous Cleome. Fl. June, July. Pl. 1 foot.

21 C. glauce'scens (D. C. prod. 1. p. 239.) herbaceous, smooth, glaucous; leaves stalked, ovate, floral ones elliptical; siliques pendulous, striated, on short stipes; seeds smooth. ♃. H. Native of Syria between Bagdad and Mossul. Flowers yellowish.

Glaucescent Cleome. Pl. ½ to 1 foot.

22 C. quinquene'rvia (D. C. prod. 1. p. 239.) herbaceous, rather pubescent, glaucous; leaves stalked, cordate, 5-nerved, floral ones very small; silique sessile, oval-oblong, glandular, rough; seeds smooth. ⊙? H. Native of Persia. Flowers yellow.

Five-nerved-leaved Cleome. Pl. 1 foot.

23 C. scapo'sa (D. C. prod. 1. p. 239.) herbaceous; leaves almost radical, stalked, roundish-ovate, strigosely-pilose; scape naked, rough; bracteas small; siliques erect, sessile, smooth. ♃? H. Native of Egypt. Stamens 4? Habit of a species of *Cardámine*. Flowers yellow.

Scaped Cleome. Pl. ½ foot.

24 C. droserifo'lia (Del. fl. eg. t. 36. f. 2.) shrubby, strigosely-pilose; leaves stalked, obovately-orbicular, 3-nerved, beset with glandular hairs; siliques sessile, oblong, hispid with hairs which are glandular at top. ♄. G. Native of Egypt. Rorídula, Forsk. æg. 35. Rórida, Ræm. et Schulz. syst. 3. p. 13. Flowers tetrandrous, yellow, with a violet base.

Sun-dew-leaved Cleome. Pl. ½ foot.

25 C. raphanoi'des (D. C. syst. 2. p. 662.) herbaceous, somewhat hispid at the top; leaves lanceolate-linear, acuminated, runcinate at the base; silique almost sessile, terete, smooth, pointed with the style. ⊙? S. Native of Guinea. Ráphanus pilòsus, Willd. spec. 3. p. 562. Cleòme longifòlia, Vahl. herb. Wormskióldia heterophýlla, Thonn. in herb. Vahl. Hairs long, rusty. Flowers yellow.

Radish-like Cleome. Fl. June, July. Pl. 2 foot.

26 C. Guiane'nsis (Aubl. guian. 2. t. 273.) herbaceous, smooth, erect; leaves linear, floral ones longer than the pedicels; siliques almost sessile, smooth. ⊙. S. Native of Guiana. Flowers yellow; petals oblong-lanceolate.

Guiana Cleome. Pl. 1 foot.

27 C. procu'mbens (Jacq. amer. t. 120.) herbaceous, smooth, procumbent; leaves lanceolate-linear, floral ones a little shorter than the pedicel; siliques sessile, terete, somewhat torulose. ♃. S. Native of the West India islands. Jacq. amer. t. 120. Sloane, jam. t. 123. Flowers dark yellow; anthers blackish.

Procumbent Cleome. Fl. June, July. Clt. 1798. Pl. ½ ft.

§ 2. *Leaves with 3-5-7 leaflets.*

28 C. tene'lla (Lin. fil. suppl. 300.) herbaceous, smooth; leaves trifoliate; leaflets linear, twice the length of the petiole; flowers hexandrous; siliques slender, sessile. ⊙. S. Native of the East Indies. Leaflets 4 or 5 lines long. Flowers yellow.

Slender-podded Cleome. Pl. ½ foot.

29 C. tetra'ndra (Banks herb.) herbaceous, smooth; leaves trifoliate; leaflets linear, 3-times longer than the petiole; flowers tetrandrous; siliques sessile, slender. ⊙. H. Native of New Holland. Leaflets 2 or 3 lines long. Flowers yellow?

Tetrandrous Cleome. Pl. 1 foot.

30 C. multicau'lis (Moc. et Sesse, fl. mex. ined.) herbaceous, smooth; leaves all sessile, trifoliate; leaflets oblong-linear, bluntish; flowers hexandrous; siliques on very short stipes. ⊙. H. Native of Mexico. Flowers yellow.

Many-stemmed Cleome. Pl. 1 foot.

31 C. viola'cea (Lin. spec. 940.) herbaceous, clothed with glandular pubescence; leaves trifoliate; leaflets and upper leaves linear; siliques sessile, puberulous, deflexed, linear, acuminated with the short style. ⊙. H. Native of Portugal in sandy places. Schkuhr. handb. t. 189. f. b. exclusive of the synonym of Gært. Flowers violaceous or purple, and spotted with yellow.

Violaceous-flowered Cleome. Fl. Ju. Jul. Clt. 1776. Pl. 1 ft.

32 C. defle'xa (D. C. prod. 1. p. 240.) herbaceous, covered with glandular pubescence; leaves trifoliate; leaflets and upper leaves oblong-linear; siliques sessile, deflexed, smooth, acuminated. ⊙. S. Native of Peru or Portugal. Very like *C. violàcea* and probably only a variety of it. Flowers purplish.

Deflexed-podded Cleome. Pl. 1 foot.

33 C. Dillenia'na (D. C. prod. 1. p. 240.) herbaceous, covered with glandular pubescence; leaves trifoliate; leaflets oblong-linear, length of petiole; siliques oblong-linear, almost sessile, deflexed, pubescent, pointed with the style. ⊙. H. Native of the Levant. Dill. elth. t. 266. C. ornithopodioìdes of authors, exclusive of the synonym of Buxbaum. Flowers small, pale-yellow, with saffron-coloured anthers.

Dillenius's Cleome. Fl. Ju. Jul. Clt. 1732. Pl. 1 to 2 ft.

34 C. Ara'bica (Lin. spec. 939.) herbaceous, covered with glandular pubescence; leaves trifoliate; leaflets oblong; siliques oblong, deflexed, almost sessile, puberulous; seeds hairy. ⊙. H. Native of sandy places from Arabia to Mauritania. Lin. fil. dec. t. 8. Siliquària glandulòsa, Forsk. descr. 78. Flowers white with yellow veins, and tinged with purple at the top. Filaments yellow.

Arabian Cleome. Fl. Ju. Jul. Clt. 1794. Pl. 1 to 2 feet.

35 C. Ibe'rica (D. C. prod. 1. p. 240.) herbaceous, covered with glandular pubescence; leaves trifoliate, on short petioles; siliques on short stipes, puberulous, somewhat pendulous, torulose, scarcely longer than the pedicels of the flowers. ⊙. H. Native of Iberia about Tiflis. Cleòme ornithopodioìdes Ibérica, Bieb. fl. taur. 2. p. 130. Flowers yellowish.

Iberian Cleome. Fl. Ju. Jul. Clt. 1820. Pl. ½ to 1 foot.

36 C. virga'ta (Stev. in litt.) herbaceous, covered with glandular pubescence; leaves trifoliate, on short petioles; leaflets oblong-linear; siliques on short stipes, puberulous, somewhat pendulous, torulose, three times longer than the pedicels. ⊙. H. Native of the north of Persia. Buxb. cent. 1. t. 9. f. 2. Flowers yellowish, with saffron anthers.

Twiggy Cleome. Fl. June, July. Clt. 1820. Pl. 1 foot.

37 C. brachyca'rpa (Vahl. ined.) suffruticose; younger plants glandular, adult ones smooth; leaves trifoliate, on short petioles; leaflets oval-oblong, thick; siliques sessile, ovate, terete, bearing the style. ♃. F. Native of Arabia. Cleòme ornithopodioìdes, Forsk. fl. arab. no. 402. Flowers yellowish.

Short-podded Cleome. Pl. 1 foot.

38 C. foliolo'sa (D. C. prod. 1. p. 240.) herbaceous, smooth, glaucous; leaves almost sessile, trifoliate; leaflets and upper leaves almost orbicular; siliques almost sessile, oblong-linear, beset with glandular hairs. ⊙. H. Native of Persia. Flowers whitish, or rather yellowish.

Leafy Cleome. Pl. 1 foot.

39 C. cane'scens (Stev. ined.) herbaceous, glaucescent, somewhat strigosely-pubescent; leaves 3-4-foliate; leaflets and upper leaves oblong-linear; siliques stipitate, puberulous, erectish, torulose, equal in length with the pedicels of flowers. ⊙. H. Native of southern Tauria. Flowers yellowish.

Canescent Cleome. Pl. 1 foot.

40 C. parviflòra (R. Br. in Salt's abyss. 65.) herbaceous, covered with glandular pubescence; leaves 4-foliate; leaflets and upper leaves elliptical-ovate; siliques sessile, oblong, covered with glandular pubescence, bearing the style, somewhat shorter than the pedicels. ⊙. H. Native of Abyssinia. Flowers yellowish. Petioles as well as nerves prickly.

Small-flowered Cleome. Fl. June, July. Pl. 1 foot.

41 C. a'spera (Kœn. ined. et D. C. prod. 1. p. 241.) herbaceous, clothed with rough hairs; leaves trifoliate; leaflets oblong; siliques sessile, terete, smooth, acuminated with the style. ⊙. H. Native of Coromandel. Habit of *Polanísia felìna*, but the flowers are hexandrous. Flowers yellowish.

Rough Cleome. Pl. 1 foot.

42 C. fla'va (Banks, herb. et D. C. prod. 1. p. 241.) herbaceous, covered with glandular pubescence, somewhat glaucous; lower leaves quinate; upper ones ternate; leaflets oblong; siliques sessile, striated, clothed with glandular pubescence. ⊙. H. Native of New Holland. Flowers yellow.

Yellow-flowered Cleome. Pl. 1 foot.

43 C. rutidospe'rma (D. C. prod. 1. p. 241.) herbaceous, smooth; leaves all trifoliate; leaflets oval-oblong; siliques smooth, stipitate, elongated, pointed. ⊙. H. Native of Tobago? Habit of *Gynandrópsis triphýlla*, but the torus is not elongated. Flowers whitish.

Rough-seeded Cleome. Pl. 1 foot.

44 C. poly'gama (D. C. prod. 1. p. 241.) herbaceous, smooth; leaves stalked, lower ones simple, the rest trifoliate; leaflets ovate-lanceolate, acuminated, somewhat serrulated; siliques almost sessile, terete, smooth. ⊙. S. Native of the West India Islands. Flowers white, with purple stamens; anthers yellow.

Var. α, *C. polýgama*, Lin. spec. 939.—Sloane, jam. t. 124. f. 1.

Var. β, *C. serràta*, Lin. spec. 939. Jacq. amer. ed. pict. t. 262. f. 73. a leaf. Flowers white.

Polygamous Cleome. Fl. June, July. Clt. 1824. Pl. 1 to 2 ft.

45 C. aculea'ta (Lin. syst. 3. p. 232.) herbaceous, smooth; stipulas spinescent; leaves trifoliate, floral ones ovate; siliques somewhat stipitate, terete, torulose, smooth. ⊙. S. Native of South America, in sandy places. Flowers white.

Prickly-stipuled Cleome. Fl. July. Clt. 1817. Pl. 1 to 2 ft.

46 C. Houstòni (R. Br. in hort. kew. ed. 2. vol. 4. p. 131.) herbaceous, clothed with glandular down; stipulas and petioles spinescent; leaves ternate or quinate; floral ones oval-oblong; siliques on short stipes, clothed with glandular down. ⊙. H. Native of Jamaica. Mart. dec. t. 45. Flowers white.

Houston's Cleome. Fl. Jul. Aug. Clt. 1730. Pl. 1 to 1½ foot.

47 C. Humbo'ldtii (D. C. prod. 1. p. 141.) herbaceous, smooth; petioles long, prickly; leaves ternate or quinate, floral ones ovate, on short stalks, shorter than the pedicels; siliques stipitate, smooth, pointed with the style. Native of South America. Cleòme parviflòra, Humb. Bonpl. and Kth. nov. gen. 5. p. 83. not of R. Br. Flowers white.

Humboldt's Cleome. Fl. Ju. July. Pl. 1 to 1½ foot.

48 C. diffu'sa (Banks, herb. et. D. C. prod. 1. p. 241.) herbaceous, smoothish, diffuse; stipulas spinescent; leaves trifoliate, floral ones ovate, shorter than the pedicels; siliques oblong-linear, 6-times longer than the stipe. ⊙. S. Native about Rio Janeiro, in Brazil. Flowers white.

Diffuse Cleome. Fl. Ju. Jul. Clt. 1823. Pl. 1 foot long.

49 C. affi'nis (D. C. prod. 1. p. 241.) herbaceous, smoothish, diffuse, unarmed; leaves trifoliate, floral ones ovate, shorter than the pedicels; siliques oblong-linear, 10-times longer than the stipe. ⊙. S. Native of Brazil, at Rio Janeiro. Very like *C. diffùsa*. Flowers whitish.

Allied Cleome. Fl. Ju. Jul. Pl. 1 foot.

50 C. rube'lla (Burch. cat. no. 2025. trav. 1. p. 543.) herbaceous, covered with glandular pubescence; leaves with 5-linear, smooth, glaucous leaflets; siliques sessile, smooth, pubescent. ⊙. H. Native of the Cape of Good Hope. Flowers reddish.

Reddish-flowered Cleome. Pl. 1 foot.

51 C. angustifo'lia (Forsk. ægyp. p. 120.) herbaceous, smooth, dotted at the top; lower leaves with 7 leaflets, upper ones trifoliate; leaflets linear filiform; siliques stipitate, pendulous. ⊙. H. Native of Arabia Felix. Cleòme filifòlia, Vahl. symb. 1. p. 48. Flowers with yellow petals, and violet and yellow anthers and filaments.

Narrow-leaved Cleome. Pl. 1 foot.

† *Species not sufficiently known.*

52 C. parado'xa (R. Br. in Salt's abyss. p. 65.) suffruticose at the base, smooth; herbaceous at the top and scabrous with glandular hairs; leaves ternate, or quinate; leaflets glaucous, oblong-linear, much shorter than the muricated petiole. ♄. S. Native of Abyssinia. Flowers whitish?

Paradoxical Cleome. Fl. June, July. Pl. 1 foot.

53 C. cuneifo'lia (Muhl. from Nut. gen. amer. 2. p. 73.) herbaceous, smooth; leaves simple, cuneated, retuse; siliques stipitate. ⊙. H. Native of Georgia, in North America. Flowers white; filaments 6, long, capillary.

Wedge-leaved Cleome. Fl. June, July. Pl. 1 foot.

54 C? arbòrea (Schrad in Goett. anz. 1821, p. 707.) unarmed, polyandrous; stamens seated near the base of the stipe of the ovary; leaves ovate, acuminated. ♄. S. Native of Paraiba, in Brasil. A tree, with small yellow flowers. Perhaps a species of *Polanísia*.

Tree Cleome. Tree 30 feet.

Cult. The shrubby species of *Cleòme* thrive best in a rich light soil, and ripened cuttings root freely under a hand-glass, in a moderate heat; but as most of the species seed freely, this will be

unnecessary. The seeds of the annual species require to be sown on a hot-bed frame, early in spring; and when the plants are of sufficient size they should be planted out into the open border, but this should never be done before the middle of May. The biennial species require to be kept in the stove; cuttings of these will strike root freely under a hand-glass, in a moderate heat.

V. POLANI'SIA (*πολυ, poly,* many, *ανισος, anisos,* unequal; stamens numerous and unequal.) Raf. journ. phys. aout. 1819. p. 98. D. C. prod. 1. p. 242.

Lin. syst. *Octo-Polyándria, Monogýnia.* Calyx 4-sepalled, spreading. Petals 4. Stamens 8-32. Torus small. Silique sessile within the calyx, or scarcely stipitate, terminated by a distinct style. Annual herbs with the habit of *Cleòme.*

Sect. I. Brachy'styla (from *βραχυς, brachys,* short, and *στυλος, stylos,* a style; because of the style being shorter than the ovary.) D. C. prod. 1. p. 242. Style shorter than the ovary. This section, according to Mr. Brown, includes in addition to the species from which the genus was formed, at least two sets of plants having very little affinity with each other, or with the original species, whose only congener is *P. uniglandulòsa.*

1 P. dia'nthera (D. C. syst. 1. p. 242.) smooth, somewhat prickly; leaflets 7, linear-filiform; stamens 8, 6 sterile, and 2 bearing anthers; silique stipitate, pendulous. ⊙. H. Native of the Cape of Good Hope. Cleòme diándra, Burch. trav. 1. p. 548. cat. no. 2103. Flowers red.

Two-anthered Polanisia. Fl. July, Aug. Pl. 1½ foot.

2 P. chelidònia (D. C. prod. 1. p. 242.) pilosely-hispid; leaflets 7-9, obovately-cuneated; stamens 24-32; silique sessile —? Native of the East Indies. Cleòme chelidònia, Lin. fil. suppl. 300. Flowers rose-coloured, somewhat like those of *Römèria hýbrida,* whence the specific name.

Celendine-like Polanisia. Fl. Jul. Nov. Clt. 1792. Pl. 1½ ft.

3 P. angula'ta (D. C. prod. 1. p. 242.) smooth; stem somewhat triquetrous; leaflets 5-7, oblong-linear; silique sessile, striated. ⊙. H. Native of Java. Flowers violet.

Angular-stemmed Polanisia. Fl. Ju. July. Pl. 1½ foot.

4 P. oxyphy'lla (D. C. prod. 1. p. 242.) glandular and pilose; leaflets 3-7, elliptical-oblong; stamens 8-12; siliques on short stipes, striated, puberulous, pendulous. ⊙? H. Native of the Cape of Good Hope. Cleòme oxyphýlla, Burch. cat. no. 1887. Flowers yellow.

Sharp-leaved Polanisia. Fl. July, Sep. Pl. 1½ foot.

5 P. grave'olens (Rafin. journ. phys. aout. 1819. p. 98.) plant beset with glandular hairs; leaves trifoliate; leaflets elliptical-oblong; stamens 8-12; siliques oblong, narrowed at the base, glandularly-muricated, pubescent. ⊙. H. Native of North America. Cleòme dodecándra, var. Canadénsis, Lin. spec. 939. Bart. fl. amer. t. 22.—Corn. can. 131. icon. Flowers small, pinkish. This plant is employed as a vermifuge.

Strong-scented Polanisia. Fl. July, Sep. Clt. —? Pl. 2 feet.

6 P. viscòsa (D. C. prod. 1. p. 242.) plant covered with glandular hairs; leaflets 3-5, obovately-cuneate or oblong; stamens 8-20; siliques oblong, sessile, striated, covered with glandular hairs. ⊙. H. Native of the East Indies. Flowers small, yellow.

Var. α, Cleòme viscòsa, Lin. spec. 938.—Rheed. mal. 9. t. 23.

Var. β, Cleòme icosándra, Lin. spec. 938.—Burm. zeyl. t. 99. This plant has an acrid taste something like mustard, and is eaten by the natives among other herbs as a salad.

Clammy Polanisia. Fl. July, Sep. Clt. 1730. Pl. 2 feet.

7 P. dodeca'ndra (D. C. prod. 1. p. 242.) puberulously-scabrous; leaves trifoliate; leaflets smooth, elliptical-lanceolate, somewhat serrulated; stamens 8-12; siliques sessile, narrowed at the base, smooth. ⊙. H. Native of the East Indies. Cleòme dodecándra, Lin. spec. 939. exclusive of the synonym of Sloane. —Burm. zeyl. t. 100. f. 1. Flowers with white petals and a purplish calyx.

Dodecandrous Polanisia. Fl. July, Sep. Clt. 1795. Pl. 1 ft.

8 P. feli'na (D. C. prod. 1. p. 242.) strigose; leaves almost radical, trifoliate; leaflets wedge-shaped; stamens 28-32; siliques almost sessile, smooth. ⊙? H. Native of the East Indies. Cleòme felìna, Lin. fil. suppl. 300. Flowers small, red. The leaves are rough and pointed at the end, which has been likened to the roughness of a cat's tongue, whence the specific name.

Cat-tongue-leaved Polanisia. Fl. June, Sept. Pl. 1½ foot.

Sect. II. Styla'ria (from *στυλος, stylos,* a style; because of the style being longer than the ovary.) D. C. prod. 1. p. 242. Style much longer than the ovary.

9 P. uniglandulòsa (D. C. prod. 1. p. 242.) plant covered with glandular pubescence; leaves trifoliate; leaflets and bracteas oblong-lanceolate; stamens 8-16; siliques sessile, somewhat puberulous. ⊙. H. Native of Mexico at Acapulco. Cleòme uniglandulòsa, Cav. icon. 4. t. 306. Flowers white, with rose-coloured filaments, and yellow anthers.

One-glanded Polanisia. Fl. July, Sept. Clt. 1823. Pl. 1½ ft.

Cult. The species of *Polanísia* being all annual plants from tropical countries, the seeds require to be sown in a hot-bed frame, and when the plants are of sufficient size they should be planted out into the open border in a sheltered situation, but this should not be done before the middle of May. A plant of each should be kept in pots and placed in the green-house during summer, in order to secure seeds for next year's sowing, in case the summer should prove unfavourable for ripening in the open border. This may be said of all the annual plants belonging to *Capparídeæ.*

VI. PHYSOSTE'MON (from *φυσα, physa,* a bladder, and *στημων, stemon,* a stamen; because of the stamens being inflated at the top.) Mart. fl. bras. 1. p. 72.

Lin. syst. *Hexo-Octándria, Monogýnia.* Calyx of 4 sepals. Corolla of 4 petals, which are unguiculated. Stamens 6 or 8, unequal, 2 or 4 smaller, inflated under the anthers. Ovary almost sessile. Siliques 1-celled, 2-valved. Receptacle marginate, permanent. Seeds numerous, echinated. Small annual plants, with slender fibrous roots; branched, erect or prostrate stems; simple exstipulate scattered leaves, and terminal racemes of yellow flowers.

1 P. lanceola'tus (Mart. fl bras. 1. p. 73. t. 45.) erect; leaves linear-lanceolate; capsules elongated, linear, rather terete; style very short, permanent. ⊙. S. Native of Brazil in the province of Pernambuco, in low sandy places.

Lanceolate-leaved Physostemon. Fl. April. Pl. 1½ foot.

2 P. tenuifòlium (Mart. fl. bras. 1. p. 73. t. 46.) smooth, erect; leaves linear-awl-shaped; capsules ovate, equal in length to the style. ⊙. S. Native of Brazil in the province of Pernambuco in grassy places. Stem branched from the base.

Slender-leaved Physostemon. Fl. April. Pl. 1½ foot.

3 P. rotundifòlium (Mart. fl. bras. 1. p. 74. t. 47.) leaves ovate-elliptical, acute; capsules ovate, compressed, exceeding the length of the permanent style. ⊙. S. Native of Brazil on the confines of the provinces of Pernambuco and Bahia, on the banks of the river Francisco. Stem decumbent, hairy.

Round-leaved Physostemon. Fl. April. Pl. decumbent.

Cult. The seed of these plants should be sown on a hot-bed early in spring, and when the plants are of sufficient size, which will be about the beginning of May, they should be planted out into a warm sheltered situation in the open border, where they will ripen their seed if the summer proves warm.

VII. CORYNA'NDRA (from *κορυνη, coryne,* a club, and

ανηρ ανδρος, *aner andros*, a male; because of the filaments being club-shaped at the top.) Schrad. ex Spreng. syst. append. p. 201 and 204.

Lin. syst. *Polyándria*, *Monogýnia*. Calyx of 4 sepals. Petals 4. Stamens numerous; filaments clubbed at the top under the anthers, and coloured; anthers curved. Silique sessile. 2-valved, many-seeded. An annual erect herb, with the lower leaves quinate and the upper ones ternate; leaflets lanceolate, linear. Flowers in corymbs, with white petals and red filaments.

1 C. pulche'lla (Schrad. l. c.) ⊙. H. Native of Nipaul and China. This is an elegant plant.

Pretty Corynandra. Fl. July. Pl. 1 to 2 feet.

Cult. The seeds of this pretty annual plant should be sown in a pot, in the month of March, and when the plants are of sufficient size, which will be in May, they should be planted out into the border in a warm situation, where they will flower and ripen seed.

Tribe II.

CAPPA'REÆ (plants agreeing in some characters with *Cápparis*.) D. C. prod. 1. p. 242, Fruit somewhat fleshy, indehiscent (f. 52. *f.*). Shrubs or trees, with simple or ternate leaves.

VIII. CRATÆ'VA (to the memory of Cratævus, a Greek botanist, who lived in the time of Hippocrates.) Lin. gen. 599. D. C. prod. 1. p. 242.

Lin. syst. *Polyándria*, *Monogýnia*. Calyx 4-sepalled. Petals 4, larger than the calyx. Stamens 8-28. Torus elongated or hemispherical. Berry stipitate, with a very thin skin, ovate-globose, pulpy in the inside. Unarmed shrubs or trees, with trifoliate leaves and terminal cymes or racemes of largish flowers. This genus differs particularly in the open æstivation of the petals. The flowers are sometimes polygamous.

1 C. gyna'ndra (Lin. spec. 636.) stamens 20-24, inserted on the cylindrical receptacle, longer than the petals; berry ovate; leaflets ovate, acute; petals lanceolate. ♄. S. Native of bushy places near the sea in Jamaica.—Pluk. phyt. t. 147. f. 6. Flowers in panicled racemes, with whitish petals and purplish stamens, and anthers. This plant has a nauseous smell and a burning taste.

Gynandrous Garlic Pear, Fl.? Clt. 1789. Tree 12 to 16 feet.

2 C. religiòsa (Forst. prod. 203.) stamens 20-28, inserted in an annular torus, length of petals; berry oval; leaflets lanceolate-elliptical, acute. ♄. S. Native of Malabar and the Society Islands.—Rheed. mal. 3. t. 42. Flowers greenish-white, with red stamens. In the Society Islands this tree is planted in burial grounds, and is supposed to be sacred to their idols. In Otaheite the tree is called *Pura-au* and *Puratarura*.

Sacred Garlic-Pear. Tree 20 feet.

3 C. læ'ta (D. C. prod. 1. p. 243.) stamens 20-24, inserted in an annular torus, longer than the petals; berry oval; leaflets ovate, acuminated, unequal at the base. ♄. S. Native of Senegal. Flowers whitish, with reddish stamens, sometimes polygamous. Perhaps the same as *C. Adansònii*.

Fruitful Garlic-Pear. Tree 20 feet.

4 C. Ta'pia (Lin. spec. 637.) stamens 8-16, inserted in a cylindrical torus, nearly one-half shorter than the pedicel of the fruit and petals; berry globose; leaflets ovate-acuminated, unequal at the base; petals narrow. ♄. S. Native of the West India Islands and South America.—Plum. gen. t. 21.—Pis. bras. t. 69. The plant from the West India Islands is octandrous, and the one from South America is dodecandrous; and therefore probably distinct species. Flowers on long peduncles, forming loose terminal panicled racemes, whitish. The fruit is as large as an orange, and when ripe has a strong scent of garlic, which is communicated to the animals that feed on it. *Tapia* is the American name of the tree.

Tapia or Common Garlic-Pear. Clt. 1752. Tree 30 to 40 ft.

5 C. Adansònii (D. C. prod. 1. p. 243.) stamens 12-16, inserted in a short torus; berry globose; leaflets oblong, acuminated, almost equal at the base, but the lateral leaflets have unequal sides. ♄. S. Native of Senegal. Cratæ'va Tàpia, Adans. in herb. Juss. This plant is very like *C. Tàpia*. Flowers whitish-green, with reddish stamens.

Adanson's Garlic-Pear. Tree 30 feet.

6 C. Roxbu'rghii (R. Br. in append. to Denh. and Clapp. trav.) stamens numerous; leaflets ovate, unequal; petals ovate-roundish. ♄. S. Native of the East Indies. Fruit and flowers like those of *C. Tàpia*. C. Tàpia, Vahl. symb. 3. p. 61. Cápparis trifoliàta, Roxb. mss.—This species comes very near to *C. Adansònii*, but the lateral leaflets are more unequal; this consists of the greater decurrence of the lamina on the outer side of the lateral leaflets.

Roxburgh's Garlic-Pear. Tree 30 feet.

7 C. tapioi'des (D. C. prod. 1. p. 243.) stamens 8-16, inserted in a short torus, twice as long as the oblong stipitate petals, and almost equalling the pedicel of the fruit; leaflets ovate, terminal one bluntish, lateral ones acuminated. ♄. S. Native of South America. Cápparis trifoliàta, Spreng. in herb. Balb. Flowers white, with red stamens.

Tapia-like Garlic-Pear. Clt. 1820. Tree 20 feet.

8 C. acumina'ta (D. C. prodr. 1. p. 243.) stamens 12 to 16, inserted in a short torus, a little longer than the oblong petals; leaflets ovate, much pointed, lateral ones unequal at the base. ♄. S. Native of French Guiana. Flowers white, in spreading terminal racemes. This is probably the same as *C. Tàpia*.

Acuminated-leaved Garlic-Pear. Tree 30 feet.

9 C. obova'ta (Vahl. symb. 1. p. 61.) stamens 12, inserted in an annular torus, longer than the petals; berry cylindrical; leaflets obovate. ♄. S. Native of Madagascar. O'thrys, Pet. Th. gen. mad. no. 44. Flowers white. Fruit eatable.

Obovate-leaved Garlic-Pear. Tree 20 feet?

10 C. magna (D. C. prodr. 1. p. 243.) stamens 12 to 24, very long, inserted in a hemispherical torus; berry ovate; leaflets oval-lanceolate; petals ovate. ♄. G. Native of Cochin-China. Cápparis mágna, Lour. cochin. p. 331. Flowers large, white. Fruit roundish, ash-coloured, eatable.

Large Garlic-Pear. Tree 30 feet.

11 C. falca'ta (D. C. prod. 1. p. 243.) stamens 12 to 16, inserted in a short torus; berry oblong; lateral leaflets falcate at the base. ♄. G. Native of China, near Canton. Cápparis falcàta, Lour. cochin. p. 331. Flowers large, white. Berry oblong, red.

Falcate-leaved Garlic-Pear. Tree 30 to 40 feet.

12 C. radiatiflòra (D. C. prodr. 1. p. 243.) stamens indefinite, inserted in an annular torus; berry roundish-oval, pendulous; leaflets ovate or obovate, acuminated, shining. ♄. S. Native in woods of Guayaquil. Cápparis radiatiflòra, Ruiz. et Pav. fl. per. 5. t. 433. Flower white, large.

Radiate-flowered Garlic-Pear. Tree 30 feet.

13 C. unilocula'ris (Hamilt. in Lin. trans. vol. 15.) stamens 16, inserted on a short torus; petals ovate, with the claws longer than the calyx; berry oblong. ♄. S. Native of the East Indies. Flowers either of separate sexes, or hermaphrodite. The tree is called *Borun* in Bengalese.

Unilocular Garlic-Pear. Tree 30 feet.

Cult. The species of *Cratæ'va* require a soil composed of loam, peat and rotten dung. Cuttings of all will root freely, if planted in a pot of sand, and placed under a hand-glass, in heat.

IX. RICHIE'A, (to the memory of Mr. Richie; the African traveller, died 1821, at Tripoli.) R. Br. in app. to Denh. et Clapp. trav.

Lin. Syst. *Polyándria, Monogýnia.* Calyx of 4 sepals, valvate in the bud. Petals 4, very long and narrow, undulated at the apex. Stamens 12 to 16, inserted in an elevated cylindrical torus. Ovary on a long stalk. Berry oblong, many-seeded. A rambling smooth shrub, with ternate leaves, which are rather coriaceous, and terminal corymbose racemes of large sweet-scented flowers, with white petals and filaments, and blue anthers. Filaments curved at the top.

1 R. fra'grans (R. Br. l. c.) ♄. ◡. S. Native of Sierra Leone. Cratæ'va fràgrans, Sims, bot. mag. t. 526. Cratæ'va capparoìdes, Andr. bot. rep. t. 176.

Fragrant Richiea. Fl. Ju. Aug. Clt. 1795. Shrub cl.

Cult. This plant is well adapted for covering rafters in stoves. A mixture of loam, peat and sand suits it best. Cuttings will root readily if planted in a pot of sand, and placed under a hand-glass, in heat.

X. NIEBU'HRIA (in honour of Carsten Niebuhr, an Arabian traveller, author of Reisebeschreibung nach Arabien, 2 vols. 4to. Copenhagen, 1774 and 1778, &c.) D. C. prodr. 1. p. 243.

Lin. Syst. *Polyándria, Monogýnia.* Calyx 4-sepalled; sepals valvate in the bud. Petals none, or shorter than the calyx. Torus cylindrical, very short. Stamens indefinite. Berry ? ovate or cylindrical, stipitate. Unarmed shrubs, with white flowers, which are disposed in terminal racemes.

Sect. I. Cratævæfo'rmes (shrubs with the habit of *Cratæ'va*) D. C. prod. 1. p. 243. Petals none. Leaves trifoliate.

1 N. Ca'fra (D. C. prodr. 1. p. 243.) racemes terminal; leaflets oblong, almost 4-times longer than the petiole. ♄. G. Native of the Cape of Good Hope, on the border of Cafraria. Cratæ'va Càfra, Burch. cat. no. 3678, and 3648.

African Niebuhria. Clt. 1818. Shrub 5 feet.

2 N. avicula'ris (D. C. prod. 1. p. 243.) racemes terminal; leaflets obovate, one half shorter than the petioles. ♄. G. Native of the Cape of Good Hope. Cratæ'va aviculàris, Burch. cat. no. 4445. Perhaps sufficiently distinct from *N. Càfra.*

Knotted Niebuhria. Shrub 4 feet.

3 N. linea'ris (D. C. prod. 1. p. 244.) racemes terminal; leaflets linear, recurvedly-mucronate, roughly-punctate on both surfaces, shorter than the petioles. ♄, S. Native of the East Indies. Cápparis apétala, Roth. nov. spec p. 238. Cratæ'va apétala, Spreng. syst. 2. p. 448. Berry globose.

Linear-leaved Niebuhria. Shrub 6 feet.

4 N. oleoi'des (D. C. prod. 1. p. 244.) peduncles 1-flowered, axillary; leaflets oblong, nearly 4-times longer than the petioles. ♄. G. Native of the Cape of Good Hope. O'lea, Burm. in herb. Deless.

Olive-like Niebuhria. Shrub 6 feet.

5 N. Madagascarie'nsis (D. C. prod. 1. p. 244.) peduncles 1-flowered, axillary; leaflets oblong, equalling the petiole in length. ♄. S. Native of Madagascar.

Madagascar Niebuhria. Clt. 1822. Shrub 4 feet.

Sect. II. Capparoi'deæ (from *Capparis*, and *idea*, form; plants with the habit of *Cápparis.*) D. C. prod. 1. p. 244. Petals small. Leaves simple.

6 N. oblongifo'lia (D. C. prod. 1. p. 244.) leaves oval-oblong, blunt, mucronulate. ♄. G. Native of Arabia and the East Indies. Cápparis oblongifòlia, Forsk. descr. p. 99. Cápparis heteroclìta, Roxb. ined. Cratæ'va oblongifòlia, Spreng. syst. 2. p. 448.

Oblong-leaved Niebuhria. Clt. 1822. Shrub 4 feet.

7 N. arena'ria (D. C. prod. 1. p. 244.) leaves oval-oblong, emarginate, mucronulate, glaucous. ♄. S. Native of Gambay, in sandy places. Perhaps sufficiently distinct from *N. oblongifòlia.*

Sand Niebuhria. Shrub 4 to 6 feet.

Cult. Cultivated and propagated in the same way as *Cratæ'va.*

XI. BO'SCIA (in honour of Louis Bosc, long time professor of agriculture in the Jardin des Plantes, Paris, and author of several works.) Lam. ill. t. 395. D. C. prod. 1. p. 244. but not of Thunb.

Lin. syst. *Polyándria, Monogýnia.* Calyx 4-sepalled. Petals none. Stamens 12 to 20, inserted in a short torus. Berry stipitate, globose, 1-seeded. An unarmed shrub, with small white corymbose flowers.

1 B. Senegale'nsis (Lam. l. c) ♄. S. Native of Senegal. Podòria Senegalénsis, Pers. ench. 2. p. 5.

Senegal Boscia. Clt. 1824. Shrub 3 feet.

Cult. Cultivated and propagated in the same manner as *Cratæ'va.*

XII. CA'DABA (*Kadhab*, or *Qathab*, is the Arabic name of *C. rotundifòlia.*) Forsk. ægyp. 67. D. C. prod. 1. p. 244.

Lin. syst. *Tetra-Pentándria, Monogýnia.* Calyx 4-sepalled. Petals 4 or none. Nectary strap-formed, rising from the base of a cylindrical torus, these are usually fulvous above, and yellow beneath. Stamens 4 to 5, monadelphous at the base. Berry stipitate, cylindrical. Shrubs, with simple leaves and terminal racemes of white or yellow flowers.

§ 1. *Flowers petalless, pentandrous.*

1 C. rotundifòlia (Forsk. descr. 68.) unarmed; leaves orbicular, and are, as well as the branches, smooth. ♄. G. Native of Arabia and Abyssinia. Strœ'mia rotundifòlia, Vahl. symb. 1. p. 20. Nectary fulvous above and yellow beneath.

Round-leaved Cadaba. Tree 20 feet.

2 C. glandulòsa (Forsk. descr. 68.) unarmed; leaves roundish, scabrous; branches covered with glandular hairs at the top. ♄. G. Native of Arabia. Strœ'mia glandulòsa, Vahl. symb. 1. p. 20. The number of stamens in this and the preceding species is unknown. Fruit hispid.

Glandular-branched Cadaba. Tree 10 feet.

§ 2. *Flowers of 4 petals.*

3 C. longifòlia (D. C. prod. 1. p. 244.) unarmed; stamens 4; leaves oblong-linear, smooth. ♄. S. Native of Abyssinia. Strœ'mia longifòlia, R. Br. in Salt's voy. abyss. 64.

Long-leaved Cadaba. Shrub 10 feet?

4 C. Indica (Lam. dict. 1. p. 544.) unarmed; stamens 4; leaves oblong, smooth, mucronate. ♄. S. Native of the East Indies. Cleòme fruticòsa, Lin. spe. 937.—Burm. ind. t. 46. f. 3. Flowers white.

Indian Cadaba. Shrub 8 feet.

5 C. du'bia (D. C. prod. 1. p. 244.) unarmed; stamens 4-5; leaves somewhat elliptical, mealy with glaucous powder, 1-nerved. ♄. S. Native of Senegal and Abyssinia. Strœ'mia farinòsa, R. Br. in Salt's voy. abyss. 64. Perhaps distinct enough from the following species?

Doubtful Cadaba. Tree 20 feet.

6 C. farinòsa (Forsk. descr. 68.) unarmed; stamens 5; leaves oval-oblong, 1-nerved, mealy from glaucous powder. ♄. G. Native of Arabia and Senegal. Strœ'mia farinòsa, Vahl. symb. 1. p. 20. Flowers yellow. Nectary white. Perhaps several species are confused under this name.

Mealy Cadaba. Shrub.

7 C. trine'rvia (D. C. prod. 1. p. 244.) unarmed; stamens

6; leaves 3-nerved, ovate-orbicular. ♄. G. Native of Persia, near Ispahan.

Three-nerved-leaved Cadaba. Shrub 10 feet.

8 C. CAPPAROI'DES (D. C. prod. 1. p. 244.) stipulas spinose; stamens 6; leaves oblong-lanceolate, feather-nerved. ♄. G. Native of New Holland and the island of Timor. Petals 3, long-clawed.

Capparis-like Cadaba. Shrub 10 feet.

Cult. The species of *Cádaba* will thrive well in a mixture of loam and peat; and cuttings will root freely if planted in a pot of sand, and then placed under a hand-glass.

XIII. SCHEPPE'RIA (meaning unknown). Neck. elem. no. 1392, D. C. prod. 1. p. 244.

Lin. syst. *Monadélphia, Octándria.* Calyx 4-sepalled, spreading. Petals 4. Torus elongated. Stamens 8, monadelphous around the torus, but free at the top. Nectary concave at the base of the torus. Silique fleshy, stipitate within the calyx. Flowers white or dirty yellow.

1 S. JU'NCEA (D. C. prod. 1. p. 245.) ♄. G. Native of the Cape of Good Hope. Cleòme júncea, Lin. suppl. 300. Macromèrum júnceum, Burch. trav. 1. p. 388, and 492. A leafless shrub, or with small deciduous leaves.

Rushy Schepperia. Shrub 3 feet.

Cult. See *Cádaba* for the culture and propagation.

XIV. SODA'BA (from *Sodab*, the Arabic name of the plant.) Forsk. descr. 81. D. C. prod. 1. p. 245.

Lin. syst. *Octándria, Monogýnia.* Calyx 4-sepalled, upper sepal large, concave. Petals 4, unequal. Stamens 4, 8, or 16. Torus small. Ovary on a long stipe, ovate, 4-furrowed. A diffuse shrub, with spinose stipulas, and many axillary pedicels. Flowers red; stamens brownish-green. Fruit red, bigger than a hazelnut, eatable when dressed before it is ripe. (Forsk.) This is probably the *Suag* of Dr. Oudney's Journal, which he observed at Aghedem, and is said to be a tetrandrous plant, "having a small drupe, which is in great request about Bournou and Soudan, for removing sterility in females; it is sweetish, and hot to the taste, approaching to *Water-cress;* and that in passing the plant a heavy narcotic smell is always perceived." Mr. Brown does not consider this genus generically distinct from *Cápparis.*

1 S. DECI'DUA (Forsk. l. c. Del. ægyp. 74. t. 26.) ♄. G. Native of Arabia and Upper Egypt. Hombak. Adans. fam. 2. p. 408. Cápparis Sodába, R. Br. Petals red. Anthers yellow.

Deciduous Sodaba. Shrub 6 feet.

Cult. See *Cadába* for culture and propagation.

XV. CA'PPARIS (*kabir* is the Arabic name of *C. spinòsa*, which the Greeks have changed to καππαρις, the Latins to *Cápparis*, the French to *Caprier*, and the English to *Caper*). Lin. gen. no. 643. D. C. prod. 1. p. 245.

Lin. syst. *Polyándria, Monogýnia.* Calyx 4-parted (f. 52. *a.*). Petals 4 (f. 52. *b.*). Torus small. Stalk of fruit slender (f. 52. *d.*). Stamens indefinite (f. 52. *c.*). Siliques somewhat baccate (f. 52. *f.*), stipitate. Shrubs with entire simple leaves, and mostly white flowers. This genus ought perhaps to be divided into several genera.

Sect. I. Euca'pparis (from ευς, *eus*, genuine, and καππαρις, *capparis;* this section contains the genuine species of *Cápparis.*) D. C. prod. 1. p. 245. Cápparis, Plum. gen. 39. Bud of flower globose (f. 52. *a.*), with ovate, imbricated, concave, blunt, unequal sepals. Stalk of fruit long (f. 52. *d.*). Species all from the old world or New Holland, not from America.

§ 1. *Pedicellàres, (from pedicellus, a pedicle; because the pedicels are solitary.) D. C. prod. 1. p. 245. Pedicels axillary, solitary* (f. 52. *e. a.*), *or rarely with 2 or 3 rising from the same centre. Flowers polyandrous* (f. 52. *c.*).

1 C. Maria'na (Jacq. h. Schœnbr. t. 109.) unarmed; leaves roundish, somewhat cordate, smoothish, 10-times longer than the petiole; pedicels 1-flowered, solitary, length of the leaves. ♄. S. Native of Marianne Islands, Timor and the Mauritius, Cápparis cordifòlia, Lam. dict. 1. p. 609. Flowers large, white. Resembling *C. spinòsa* in habit.

Marriane Islands' Caper-tree. Clt. 1820. Shrub 4 feet.

2 C. Sandwichia'na (D. C. prod. 1. p. 245.) unarmed; leaves elliptical, smoothish, scarcely 3-times longer than the petiole; pedicels solitary, 1-flowered, length of the leaves. ♄. G. Native of the Sandwich Islands. Flowers white.

Sandwich Caper-tree. Fl. May, Aug. Shrub 4 to 6 feet.

3 C. Chine'nsis; unarmed; leaves ovate-lanceolate, acuminated, quite smooth; pedicels 1-flowered, solitary, a little longer than the petioles. ♄. G. Native of China. C. acuminàta, Lindl. bot. reg. 1320. but not of Vahl. Petals white, tinged with red at the base. Stamens white; anthers blue.

China Caper-tree. Fl. Sept. Clt. 1820. Sh. 4 to 6 feet.

4 C. rupe'stris (Sibth. and Smith, fl. græc. t. 487.) unarmed; leaves roundish, fleshy, deciduous; pedicels 1-flowered, solitary, longer than the leaves. ♄. F. Native of Crete and Mycon on rocks by the sea-side. C. spinòsa, Curt. bot. mag. 291. Flowers large, with white petals and red stamens.

Rock Caper-tree. Fl. May, Aug. Shrub 6 feet.

FIG. 52.

5 C. spino'sa (Lin. spec. 720.) stipulas spinose, hooked; leaves ovate, roundish, deciduous; pedicels solitary, 1-flowered. ♄. F. Native of southern and eastern Europe on walls and rocks. In the Grecian islands on rocks by the sea-side. Blackw. herb. t. 417. Smith, spic. 18. t. 12. fl. græc. 486. There is a variety with abortive stipulas and ovate leaves, which are more or less hoary. Flowers white, tinged with red on the outside; filaments red. The flower-bud (f. 52. *a.*) of this plant is the well-known pickle the *Caper.*

The chief supply of caper buds is from Sicily, but the plant is cultivated in the neighbourhood of Toulon in orchards, in the intervals between fig and olive trees, and in the neighbourhood of Paris, where it is trained on low walls, and the shoots, during winter, laid down and covered with earth, to protect them from the frost. The plant is cultivated on a large scale between Marseilles and Toulon, and in many parts of Italy. The plant is raised from suckers or cuttings, which are planted about 10 feet distance from each other. They require shelter from severe winds, and favourable exposure to the sun, and scarcely ever suffer from drought or heat. In spring they need only one dressing; in autumn they are cut down to within six inches of the ground, and covered with the surrounding earth, which is raised about them on all sides. In the succeeding spring they are laid bare to the crown of the stump, and they soon throw out fresh shoots. In the early part of the summer they begin to flower, and a succession of them continues till they are destroyed by the cold of the advancing winter. In this country it is generally treated as a frame plant, though it has stood the winter in the open air in some situations. A plant stood near a century against the wall of the garden of Camden House, Kensington; it produced many flowers annually, though

the young shoots were frequently killed to the stump during winter. As a pickle, the flower-buds of the *Caper* are in great esteem throughout Europe. In Italy the fruit is prepared in the same way as the flower-buds, both are bitterish, acrid, and aromatic to the taste. In the isles of the Mediterranean, and near Toulon, the flower-buds of the *Caper* are gathered while very young, for as they enlarge they decrease in value; this forms a daily occupation for six months, while the plants are in a flowering state. As the buds are gathered they are thrown into a cask among as much salt and vinegar as is sufficient to cover them, and as the quantity of *capers* is increased more vinegar is added. When the caper season closes, the buds are then sorted according to their size and colour. The smallest and greenest being the best, are separated and put into small casks of fresh vinegar for commerce. They will in this state keep fit for use for many years. It is said to be a common practice to put filings of copper in the first pickle to give the buds a green colour. The best *capers* are called nonpareills and the second best capucines. (N. Cours complet. d'Agr. art. *Caprier*.) The *Caper* is called in France *caprier*, in Italy *capriolo* or *Cappero*, and in German *Kapernstrauch*. *Capers* have the character of being anti-scorbutic, and of removing hepatic and other visceral obstructions; but the part of the plant which has been chiefly recommended for medicinal purposes, is the bark of the root.

Spiny or Common Caper-tree. Fl. May, Aug. Clt. 1596. Shrub 3 feet, lying on the ground if not supported.

6 C. Fontane'sii (D. C. prod. 1. p. 245.) stipulas spinose, hooked; leaves ovate, cordate at the base, acutish at the top. ♄. F. Native of Mauritania near Oran in fissures of rocks. C. ováta, Desf. atl. 1. p. 404. but not of Bieb. Flowers dull white. Fruit club-shaped. Habit of the last.

Desfontaine's Caper-tree. Fl. May, Aug. Clt. 1800? Sh. 3 ft.

7 C. herba'cea (Willd. enum. 560.) stipulas spinose, straight; leaves elliptical, mucronulate, smooth; pedicels solitary, 1-flowered, longer than the leaves; stem herbaceous, trailing on the earth. ♃. F. Native of Tauria, Caspia, and Caucasus in fields. C. ovàta, Bieb. suppl. 2. p. 1. exclusive of the synonym. Flowers white.

Herbaceous Caper-tree. Clt. 1818. Pl. trailing, 2 feet long.

8 C. Ægy'pta (Lam. dict. 1. p. 605.) stipulas spinose, somewhat hooked; leaves glaucous, roundish-cuneated, smooth, mucronate at the apex; pedicels solitary, 1-flowered, length of the leaves. ♄. G. Native of Upper Egypt in the deserts. Del. fl. eg. p. 93. t. 31. f. 3. Flowers whitish or rose-coloured.

Egyptian Caper-tree. Clt. 1822. Shrub 2 to 4 feet.

9 C. rotundifo'lia (Rottl. in Willd. berl. mag. p. 185.) stipulas spinose, straight; leaves sessile, roundish-ovate, somewhat cordate; peduncles solitary, 1-flowered; capsules globose. ♄. S. Native of the East Indies. Flowers white.

Round-leaved Caper-tree. Shrub 4 feet.

10 C. Nepaule'nsis (D. C. prod. 1. p. 246.) stipulas spinose somewhat hooked; leaves ovate, on very short petioles, and are as well as branches rather hoary; peduncles axillary, 1-flowered, longer than the leaves; ovary oblong. ♄. G. Native of Nepaul. Flowers white.

Nepaul Caper-tree. Shrub 8 feet.

11 C. nummula'ria (D. C. prod. 1. p. 246.) stipulas spinose, straight; leaves ovate-orbicular, mucronate and emarginate, smooth, twice the length of the petioles. ♄. G. Native of New Holland on the Barren Islands. Flowers white.

Money-wort-leaved Caper-tree. Shrub 3 feet.

12 C. cane'scens (Banks, ined. D. C. prod. 1. p. 246.) stipulas spinose, straight; leaves ovate, somewhat acute, velvety-puberulous, 6-times longer than the petioles; pedicels solitary, 1-flowered, length of the leaves. ♄. G. Native of New South Wales. Flowers white.

Hoary Caper-tree. Shrub 3 or 4 feet.

13 C. heteraca'ntha (D. C. prod. 1. p. 246.) stipulas spinose, some are straight, others hooked; leaves orbicular, velvety, on very short petioles. ♄. F. Native between Bagdad and Aleppo. Leaves almost 3-nerved. Flowers white.

Variable-spined Caper-tree. Fl. May, Aug. Shrub 4 feet.

14 C. leucophy'lla (D. C. prod. 1. p. 246.) stipulas spinose, hooked; leaves orbicular, hoary-velvety, on very short petioles; pedicels solitary, 1-flowered, longer than the leaves. ♄. F. Native between Bagdad and Aleppo. Flowers white. Fruit smooth, with 6 longitudinal veins.

White-leaved Caper-tree. Fl. May. Aug. Shrub 3 or 4 feet.

15 C. tomento'sa (Lam. dict. 1. p. 606.) stipulas spinose, hooked; leaves ovate-oblong, blunt, velvety-tomentose; pedicels solitary, 1-flowered, shorter than the leaves. ♄. S. Native of Senegal. Flowers white.

Tomentose Caper-tree. Shrub 8 feet.

16 C. dealba'ta (D. C. prod. 1. p. 246.) stipulas spinose, short, hooked; leaves ovate-lanceolate, acuminated, younger ones rather velvety, at length becoming very smooth on the upper surface; pedicels solitary, 1-flowered, length of the petioles. ♄. S. Native of Timor. Flowers white.

Whitened Caper-tree. Shrub 4 feet.

17 C. brevispi'na (D. C. prod. 1. p. 246.) stipulas spinose, short, straight; leaves ovate-lanceolate, mucronate, smooth; pedicels solitary, 1-flowered, 3-times longer than the petioles. ♄. S. Native of the East Indies. Flowers white.

Short-spined Caper-tree. Shrub 4 to 6 feet.

18 C. erythroca'rpa (Isert. berl. natur. 9. p. 339. t. 9.) stipulas spinose, reflexed; leaves oblong, acuminated, younger ones as well as branches somewhat velvety from stellate hairs, but at length becoming smooth; pedicels solitary, 1-flowered, longer than the very short petioles. ♄. S. Native of Guinea. Flowers white. Fruit red.

Red-fruited Caper-tree. Shrub 4 to 6 feet.

19 C. Rhee'dii (D. C. prod. 1. p. 246.) stipulas spinose, straight; leaves oval-oblong, mucronate, smooth, on very short petioles, netted on the under surface; pedicels solitary, 1-flowered, about the length of the leaves. ♄. S. Native of Malabar in sandy places. Badúkka, Rheed. mal. 6. t. 57. Differing from *C. Badúcca* of Lin. in which there are many species confused. Flowers large, white, with a faint mixture of red.

Rheede's Caper-tree. Fl.? Shrub 4 to 6 feet.

20 C. Afze'lii (D. C. prod. 1. p. 246.) stipulas spinose, hooked; leaves ovate-lanceolate, younger ones somewhat puberulous, adult ones smooth, on very short petioles; pedicels solitary, 1-flowered. ♄. S. Native of the western coast of Africa. Flowers white. Very like *C. Rheèdii*.

Afzelius's Caper-tree. Shrub 6 feet.

21 pyrifo'lia (Lam. dict. 1. p. 606.) stipulas spinose, short, hooked; leaves oval-lanceolate, acute, younger ones rather tomentose, adult ones smooth; pedicels solitary, 1-flowered, much shorter than the leaves. ♄. S. Native of the East Indies. Flowers white.

Pear-leaved Caper-tree. Shrub 6 feet.

22 C. stylo'sa (D. C. prod. 1. p. 246.) stipulas spinose, spreading; leaves oval-lanceolate, acute, younger ones somewhat woolly, adult ones smooth; pedicels solitary, 1-flowered, 3-times longer than the petioles; sepals acuminated, ovary narrowed out into a thick style. ♄. S. Native of Coromandel in sandy places. Flowers white.

Var. β, velutìna (D. C. l. c.) plant somewhat hoary with short down. Native of Mysore.

Long-styled Caper-tree. Shrub 6 feet.

23 C. ho'rrida (Lin fil. suppl. 264.) stipulas spinose, spread-

ing; leaves ovate, mucronate; pedicels 1-flowered, rising above the axils of the leaves, 2 or 4 together. ♄. S. Native of Coromandel and Ceylon. Flowers white.

Horrid Caper-tree. Shrub 10 feet.

24 C. PUBIFLÒRA (D. C. prod. 1. p. 246.) stipulas spinose, spreading, small, straight; leaves oval-oblong, acuminated, smooth, pedicels 1 to 3 together, axillary, twice the length of the petioles. ♄. S. Native of Timor? and Java. Petals downy, white.

Downy-flowered Caper-tree. Shrub 6 feet.

25 C. APHY'LLA (Roth. nov. spe. p. 238.) stipulas spinose; leaves none? umbels of flowers almost sessile, rising from the axils of the stipulas; stem flexuous, dichotomous, leafless, and is, as well as the divaricate branches, very smooth. ♄. S. Native of the East Indies. Flowers white?

Leafless Caper-tree. Clt. 1822. Shrub 4 to 6 feet.

26 LINEA'TA (Pers. synop. 2. p. 60.) leaves ovate, acuminated, on short foot-stalks, at last becoming glabrous on the upper surface; under surface, as well as branches, covered with velvety tomentum; peduncles axillary, 1-flowered. ♄. S. Native of Brazil, at Rio Janeiro. Flowers white.

Lined-leaved Caper-tree. Shrub 6 feet.

27 C. DIVARICA'TA (Lam. dict. 1. p. 606.) stipulas spinose, hooked, divaricate; leaves glabrous, linear, acute, on very short foot-stalks. ♄. S. Native of Coromandel. This plant certainly belongs to Sect. *Eucápparis*, but the flowers and fruit are unknown.

Divaricated stipuled Caper-tree. Shrub 10 feet.

§ 2. *Seriàles* (from *sero*, to lay in order; because of the flowers being disposed in something like whorles.) *Pedicels 1-flowered, rising above the axils of the leaves, several together, and disposed in a vertical series.*

28 C. ZEYLA'NICA (Lin. spec. 720.) stipulas spinose, straight; leaves oval, pointed at both ends, smooth; pedicels 2 or 3 together, 3-times longer than the petiole. ♄. S. Native of Ceylon and Java. Flowers small, white, 12-anthered. Perhaps the same as *C. Zeylánica* of Lour, which is described as having a small, black, round, 3-seeded berry.

Ceylon Caper-tree. Clt. 1819. Shrub 6 feet.

29 C. BILLARDIE'RII (D. C. prod. 1. p. 247.) stipulas spinose, straight; leaves oval-oblong, veiny-netted, and are, as well as branches, smooth; pedicels 3-together; ovary almost sessile. ♄. S. Native of the Molucca Islands, at the straits of Bouton. Flowers white.

La Billardiere's Caper-tree. Shrub 4 to 6 feet.

30 C. ACUMINA'TA (Willd. spec. 2. p. 1131.) stipulas spinose, hooked at the top; leaves ovate, mucronately-acuminated; rusty-tomentose on the under surface; pedicels 2-3 together. ♄. S. Native of the East Indies. Petals white, ciliated with down. Perhaps this plant is referable to t. 29. of Braam. icon. chin. 1821.

Taper-pointed-leaved Caper-tree. Clt. 1822. Shrub 6 feet.

31 C. FŒ'TIDA (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa. 1. p. 644.) stipulas spinose, straight; leaves oval, acuminated, a little cordate at the base, clothed beneath, as well as the branches with stellate down; pedicels solitary, or 2-5 together, twice the length of the petiole; petals villous. ♄. S. Native of Java. Flowers white. Like *C. acuminàta*.

Fetid Caper-tree. Shrub 6 feet.

32 C. MICRA'NTHA (Blum. l. c.) stipulas spinose, small, straight; leaves oval, scariose, coriaceous, smooth, somewhat cordate at the base; pedicels 2-6 together, shorter than the petioles. ♄. S. Native of Java. Flowers probably white.

Small-flowered Caper-tree. Shrub 6 feet.

33 C. CALLO'SA (Blum. l. c.) stipulas spinose, straight; leaves oblong, scariose at the apex, coriaceous, smooth, rounded at the base; pedicels solitary, 1-2-3 together, about equal in length with the petioles. ♄. S. Native of Java. Flowers probably white. Allied to the preceding.

Callous Caper-tree. Shrub 6 feet.

34 C. FLEXUO'SA (Blum. l. c.) stipulas spinulose, very short; leaves elliptical-oblong, acute at both ends, coriaceous, smooth, but scariose at the apex; pedicels on the younger branches, 2-4-together, equal in length with the petioles. ♄. S. Native of Java. Flowers probably white. Allied to the two preceding.

Flexuous-branched Caper-tree. Shrub 6 feet.

35 C. VOLKAME'RIÆ (D. C. prod. 1. p. 247.) stipulas spinose, hooked at the top; leaves ovate, pointed with a callous mucrone, rusty-velvety on the under surface along the nerves; pedicels 2-3 together. ♄. G. Native of the Cape of Good Hope. Volkamèria Capénsis, Burm. prod. cap. 17. Petals white, ciliated with hairs.

Volkameria-like Caper-tree. Shrub 6 feet.

36 C. LASIA'NTHA (R. Br. ined. and D. C. prod. 1. p. 247.) stipulas spinose; leaves ovate-oblong, on very short petioles, at length smooth, younger ones as well as branchlets and calyx velvety; pedicels 2-3 together. ♄. S. Native of New Holland on the eastern coast within the tropic. Flowers white.

Woolly-flowered Caper-tree. Shrub 4 to 6 feet.

37 C. TERNIFLÒRA (D. C. prod. 1. p. 247.) stipulas spinose, hooked; leaves ovate-mucronate, at length smooth, younger ones pubescent; pedicels 3 together; sepals velvety. ♄. S. Native of Coromandel. Flowers white.

Tern-flowered Caper-tree. Shrub 6 feet.

38 C. QUADRIFLÒRA (D. C. prod. 1. p. 247.) stipulas spinose, straightish; leaves ovate, acuminated, with a callous point, upper surface smooth, under surface velvety, as well as branches and calyx; pedicels 4 together. ♄. S. Native of the East Indies. C. pyrifòlia β, Lam. dict. 1. p. 606.—Pluk. phyt. t. 107. f. 3. Flowers white.

Four-flowered Caper-tree. Shrub 6 feet.

39 C. QUINIFLÒRA (D. C. prod. 1. p. 247.) stipulas none; leaves ovate, somewhat acuminated, younger ones pubescent, at length smooth; pedicels 4-6, together. ♄. G. Native of New Holland on the northern coast. Flowers white.

Five-flowered Caper-tree. Shrub 4 to 6 feet.

40 C. MICRACA'NTHA (D. C. prod. 1. p. 247.) stipulas spinose, small, straight; leaves oval, blunt, pointed with a callous mucrone; pedicels 4-6 together. ♄. S. Native of Java. Flowers white.

Small-spined Caper-tree. Shrub 6 feet.

§ 3. *Corymbòsæ* (from *corymbus*, a corymb; because of the flowers being disposed in corymbs.) *Pedicels disposed in corymbs or racemes. Flowers polyandrous.*

41 C. CITRIFÒLIA (Lam. dict. 1. p. 606.) stipulas spinose, hooked; leaves oblong, mucronate, smooth; pedicels umbellate, terminal. ♄. G. Native of the Cape of Good Hope. There is a variety of this plant with puberulous branches. Flowers small, white.

Citron-leaved Caper-tree. Shrub 6 feet.

42 C. SEPIA'RIA (Lin. spec. 720.) stipulas spinose, hooked; leaves ovate, somewhat emarginate, and pubescent on the under surface as well as the branches; pedicels umbellate, terminal. ♄. S. Native of the East Indies in hedges.—Pluk. phyt. t. 338. f. 3. Flowers small, white.

Var. β, glabràta (D. C. l. c.) adult leaves smooth. Native of Timor.

Hedge Caper-tree. Fl. Clt. 1823. Shrub 4 to 8 feet.

43 C. callophy'lla (Blum. bijdr. fl. ned. ind. ex Schlecht. Linnæa. 1. p. 645.) stipulas spinose, hooked; leaves oval, coriaceous, smooth, with a callous mucrone at the point; racemes elongated; pedicels umbellate. ♄. S. Native of Java. C. tylophýlla, Spreng. syst. append. p. 204. Flowers probably white.

Beautiful-leaved Caper-tree. Shrub 4 to 6 feet.

44 C. umbella'ta (R. Br. ined. and D. C. prod. 1. p. 247.) unarmed; leaves oval, blunt; somewhat emarginate, smooth; branchlets and petioles pubescent; pedicels umbellate, terminal. ♄. G. Native of New Holland on the eastern coast within the tropic. Flowers white.

Umbellate-flowered Caper-tree. Shrub 6 feet.

45 C. incane'scens (D. C. prod. 1. p. 247.) stipulas spinose, hooked; leaves elliptical, mucronate, and are hoary as well as the branches from appressed down; pedicels umbellately-corymbose, terminal. ♄. S. Native of Mysore. Flowers white.

Incanescent Caper-tree. Shrub 6 to 8 feet.

46 C. corymbo'sa (Lam. dict. 1. p. 605.) stipulas spinose, hooked; leaves oval, or obovate, smooth, but usually pubescent beneath; pedicels corymbose, terminal, and axillary. ♄. S. Native of Senegal and Gambia. Flowers white. Perhaps the plant with the smooth is specifically distinct from that with the pubescent leaves.

Corymbose-flowered Caper-tree. Fl. Mar. Ap. May. Sh. 8 ft.

47 C. cane'scens; stipulas spinose; leaves tomentose, lanceolate-obovate, emarginate; pedicels corymbose, terminal. ♄. S. Native of the eastern coast of Africa. Flowers white.

Candescent Caper-tree. Shrub 8 feet.

48 C. Roxbu'rghii (D.C. prod. 1. p. 247.) stipulas of the branches spinose, reflexed, on the branchlets none; leaves elliptical, smooth; branchlets grey-velvety; pedicels racemosely-corymbose. ♄. S. Native of the East Indies. Flowers white. (C. A'guba, herb. Banks.)

Roxburgh's Caper-tree. Shrub 6 to 8 feet.

49 C. obova'ta (Buch. ined. D. C. prod. 1. p. 248.) leaves obovate, cinereously-velvety on the under surface as well as the branches; pedicels racemosely-corymbose. ♄. S. Native of Mysore. Flowers probably white.

Obovate-leaved Caper-tree. Shrub 4 to 6 feet.

50 C. ma'xima (Roth. nov. spec. 237.) unarmed; leaves roundish-ovate, narrowed a little at both ends, upper surface smooth, shining, under surface pubescent, and is as well as the branches greyish; racemes terminal, somewhat paniculate. ♄. S. Native of the East Indies. Flowers white.

Greatest Caper-tree. Tree 20 feet.

51 C. gra'ndis (Lin. fil. suppl. 263.) unarmed; leaves ovate, and are as well as younger branches somewhat velvety, adult ones smooth; racemes terminal. ♄. S. Native of Ceylon. Flowers pale yellow. Fruit small, globose.

Grand Caper-tree. Tree 30 feet.

52 C. racemi'fera (D. C. prod. 1. p. 248.) stipulas of the branches rather spinose, unequal, none on the branchlets; leaves obovate, upper surface smooth, under surface pubescent, as well as the younger branches; racemes terminal. ♄. S. Native of the East Indies. Flowers white.

Raceme-bearing Caper-tree. Shrub 6 feet.

53 C. pube'rula (D. C. prod. 1. p. 248.) stipulas on the branches spinose, hooked, those on the branchlets punctiform; leaves ovate-lanceolate, upper surface smooth, under surface somewhat velvety as well as the branchlets; racemes terminal. ♄. S. Native on the western coast of tropical Africa. Flowers white.

Puberulous Caper-tree. Shrub 6 to 8 feet.

54 C. Bra'ssii (D. C. prod. 1. p. 248.) stipulas spinose, hooked; leaves ovate-lanceolate, smooth; branchlets and petioles pubescent; racemes corymbose, axillary. ♄. S. Native on the western coast of Africa, at Cape Coast, and Acra. Flowers white.

Brass's Caper-tree. Clt. 1793. Shrub 4 to 6 feet.

55 C. fasciula'ris (D. C. prod. 1. p. 248.) stipulas on the branches spinose, somewhat hooked, none on the branchlets; leaves elliptical, adult ones smooth; racemes fasciculately-corymbose, axillary. ♄. S. Native on the western coast of Africa, at Cape Coast, and Acra. Flowers white.

Fascicled-corymbed Caper-tree. Shrub 6 feet.

56 C. lanceola'ris (D. C. prod. 1. p. 248.) stipulas spinose, hooked; leaves lanceolate, acute; racemes axillary, somewhat corymbose; pedicels furnished on each side at their base with a spinose stipula. ♄. S. Native of Java. C. Salaccénsis, Blum. Flowers white.

Lanceolar-leaved Caper-tree. Shrub 6 feet.

§ 4. *Octándræ* (so named because of the flowers being octandrous). *Pedicels axillary, usually many-flowered; flowers octandrous.* Perhaps a proper section. Species all from the Cape of Good Hope.

57 C. cluytiæfòlia (Burch. cat. no. 3881, and D. C. prod. 1. p. 248.) unarmed; leaves oblong-cuneated, blunt, smooth, with a mucrone; pedicels axillary, solitary, 1-flowered, one-half shorter than the leaves. ♄. G. Native of the Cape of Good Hope. Flowers white.

Cluytia-leaved Caper-tree. Shrub 6 feet.

58 C. oleoìdes (Burch. cat. no. 4200.) unarmed; leaves oblong, smooth, narrowed at the base, blunt at the apex, with a mucrone; racemes axillary, a little shorter than the leaves; stalk of fruit shorter than the pedicel. ♄. G. Native of the Cape of Good Hope. Berry globose, about the size of a pea. Flowers white.

Olive-like Caper-tree. Shrub 4 to 6 feet.

59 C. coria'cea (Burch. cat. no. 2898.) unarmed; leaves oblong, blunt, smooth; racemes axillary, a little shorter than the leaves. ♄. G. Native of the Cape of Good Hope. Scarcely differing from *C. oleoìdes*. Flowers white.

Leathery-leaved Caper-tree. Shrub 4 to 6 feet.

60 C. albitru'nca (Burch. cat. no. 1762. trav. 1. p. 343.) unarmed; leaves oblong, very blunt, narrowed at the base, smooth; racemes axillary, shorter than the leaves; stalk of fruit length of the pedicel. ♄. G. Native of the Cape of Good Hope. Flowers white.

White-trunked Caper-tree. Tree 16 feet.

61 C. puncta'ta (Burch. cat. no. 1891. trav. 1. p. 492.) unarmed; leaves oblong, somewhat narrowed at the base, and somewhat mucronate at the top, smooth, netted with veins; racemes axillary, much shorter than the leaves. ♄. G. Native of the Cape of Good Hope. Flowers white.

Dotted Caper-tree. Shrub 6 feet.

62 C. racemulo'sa (D. C. prod. 1. p. 248.) stipulas spinose, small; leaves oval-oblong, smooth; racemes axillary, 3-times longer than the leaves. ♄. G. Native of South Africa. Flowers apetalous? 8-12 stamened.

Racemulose-flowered Caper-tree. Shrub?

Sect. II. Capparida'strum (from *Capparis*, and *astrum*, an affixed signification). D. C. prod. 1. p. 248. Flower-bud somewhat obovate, with small, roundish, equal sepals, imbricated before expansion. Stalk of fruit middle-sized. Branches unarmed. Leaves smooth. Species all from America.

63 C. frondo'sa (Jacq. amer. 162. t. 104. pict. 79. t. 153.) leaves leathery, lanceolate, acuminated, somewhat cordate at the base, 3-times or more, longer than the petiole; pedicels corymbose at the top of the peduncle. ♄. S. Native of Carthagena, in woods; also in St. Domingo and New Granada. Flowers greenish or purple. Fruit purple, with whitish flesh.

Leafy Caper-tree. Clt. 1800. Shrub 7 feet.

64 C. cunea'ta (D. C. prod. 1. p. 249.) leaves leathery, obovately-cuneated, mucronate, 3-times longer than the petiole; flowers racemose; stalk of fruit longer than the pedicel of the flower. ♄. S. Native of the West-India Islands. C. petiolàris, Banks. herb. Flowers white.

Wedge-leaved Caper-tree. Shrub 6-8 feet.

65 C. macrophy'lla (H. B. and Kunth, nov. spec. 5. p. 91.) leaves leathery, oval, acutish at both ends, twice the length of the petioles; flowers racemose, on long pedicels. ♄. S. Native on the banks of the river Magdalena. Flowers white inside.

Long-leaved Caper-tree. Shrub 8 feet, climbing.

66 C. petiola'ris (H. B. and Kunth, nov. spec. 5. p. 91.) leaves membranous, oval-oblong, blunt, twice the length of the petioles; flowers racemose; stalk of fruit double the length of the pedicel. ♄. S. Native near Guayaquil. Flowers white.

Petiolar Caper-tree. Shrub 6 feet.

67 C. trifo'ra (Mill. dict. no. 10.) leaves elliptic-oblong, acuminated at both ends, 3-times longer than the petioles; peduncles 3-flowered, much shorter than the leaves. ♄. S. Native of South America, about Tolu. Flowers small white, succeeded by oval fruit.

Three-flowered Caper-tree. Shrub 4 to 6 feet.

68 C. Brasilia'na (D. C. prod. 1. p. 249.) leaves oblong, narrowed at the base, somewhat cordate, almost sessile; peduncles racemose; stalk of fruit scarcely shorter than the pedicel. ♄. S. Native of Brazil, near Rio Janeiro. Flowers white.

Brasilian Caper-tree. Shrub 4 to 6 feet.

Sect. III. Cynopha'lla (from κυων, *kyon*, a dog, and φαλλος, *phallos*, a phallus; in allusion to the shape of the fruit.) D. C. prod. 1. p. 249. Flower-bud globose, with roundish sepals, imbricated before expansion, and each furnished at the base with a gland or hollow. Siliques long, terete, fleshy. Stalk of fruit elongated. Species all from America. Unarmed shrubs, usually with glands in the axils of the leaves.

69 C. se'ssilis (Banks. herb. and D. C. prod. 1. p. 249.) leaves almost sessile, oval, cordate at the base; axillary gland wanting or concave; pedicels axillary, solitary, 1-flowered. ♄. S. Native of Carthagena. Flowers white.

Sessile-leaved Caper-tree. Shrub 8 feet.

70 C. cynophallo'phora (Lin. spec. 721. Jacq. amer. t. 98. pict. t. 145.) leaves smooth, leathery, oblong, on short petioles; axillary gland ovate-oblong; peduncles few-flowered, shorter than the leaves. ♄. S. Native of the West-India Islands and South America. C. flexuòsa, Lin. spec. 722. A very polymorphous species; perhaps a heterogeneous mass of species collected. Flowers large white, or greenish-white, fragrant. Fruit reddish when ripe, opening at the suture. Seeds enveloped in scarlet-pulp.

Dog-phallus-bearing Caper-tree. Clt. 1752. Shrub 8 to 12 feet, with weak branches.

71 C. Eustachia'na (Jacq. amer. ed. pict. t. 146.) leaves smooth, somewhat coriaceous, ovate, acuminated, on short footstalks; axillary gland ovate-oblong; peduncles few-flowered, shorter than the leaves. ♄. S. Native of the Island of St. Eustach. Flowers purple.

St. Eustach Caper-tree. Clt. 1822. Shrub 6 feet.

72 C. sali'gna (Vahl. symb. 3. p. 66.) leaves smooth, leathery, on short petioles, linear, somewhat dilated at the base, and cordate; axillary gland ovate-oblong. ♄. G. Native of Santa Cruz. Flowers white.

Willowy Caper-tree. Clt. 1807. Shrub 8 feet.

73 C. hasta'ta (Lin. spec. 722. Jacq. amer. t. 174. f. 56. pict. t. 147.) leaves smooth, leathery, on short petioles, hastate at the base, or somewhat cordate, the rest long linear; axillary gland wanting; racemes terminal. ♄. S. Native of the woods of Carthagena. Flowers purple, somewhat odorous, and nearly 2 inches in diameter.

Halbert-leaved Caper-tree. Shrub 6 to 8 feet.

74 C. linea'ris (Jacq. amer. t. 102. pict. t. 151.) leaves smooth, leathery, on very short petioles, linear, with glands in the axils; racemes somewhat panicled. ♄. S. Native of Carthagena and Cumana, in woods. Flowers white, half-an-inch in diameter, scentless. Fruit orange-coloured.

Linear-leaved Caper-tree. Clt. 1793. Tree 15 to 20 feet.

75 C. lanceola'ta (Ruiz et Pav. fl. per. 5. t. 429. f. a. ined. et D. C. prod. 1. p. 249.) leaves smooth, ovate-lanceolate, acuminated; peduncles panicled; bracteas glanduliferous at the base. ♄. S. Native of Guayaquil, on the banks of the Daule. Flowers white; petals oblong-obovate, twice as long as the calyx. Siliques 2 hands long.

Lanceolate-leaved Caper-tree. Shrub 6 feet.

76 C. Guayaquile'nsis (H. B. et Kunth, nov. spec. 5. p. 89.) leaves smooth, oblong, blunt, somewhat retuse, on short petioles; axillary gland truncate; racemes terminal. ♄. S. Native of Guayaquil. Siliques 2 or 4 inches long, torulose. Flowers white.

Guayaquil Caper-tree. Shrub 6 feet.

77 C. læ'ta (H. B. et Kunth, nov. spec. 5. p. 88.) leaves smooth, oblong, blunt at both ends, somewhat emarginate, on very short petioles; axillary gland truncate; racemes branched at the base. ♄. S. Native about Turbaco. Flowers white.

Fruitful Caper-tree. Shrub 8 feet.

78 C. subbi'loba (H. B. et Kunth, nov. spec. 5. p. 90.) leaves smooth, elliptical, emarginately 2-lobed at the top, on short petioles; axillary gland blunt; racemes panicled, short. ♄. S. Native about Cumana. Flowers white.

Sub-bilobed-leaved Caper-tree. Tree 20 feet.

79 C. pauciflòra (H. B. et Kunth, nov. spec. 5. p. 89.) leaves smooth, leathery, elliptical, blunt at both ends, somewhat emarginate; axillary gland truncate; peduncles 3-flowered. ♄. S. Native of shady places near Cumana. Flowers unknown. Siliques 2 or 3 inches long.

Few-flowered Caper-tree. Shrub.

80 C. verrucòsa (Jacq. amer. t. 99.) leaves smooth, oblong, blunt at the base, acutish at the top; axillary gland wanting; racemes terminal, few-flowered; siliques warted. ♄. S. Native of Carthagena and Island of St. Thomas, in low woods. Flowers white. Siliques $1\frac{1}{2}$ inch long. Pulp of fruit white.

Warted-podded Caper-tree. Clt. 1820. Shrub 8 feet.

81 C. mòllis (H. B. et Kunth, nov. spec. 5. p. 88.) leaves oblong, on short petioles, somewhat ovate at the base, and narrowed towards the top; upper surface smooth, under surface velvety, as well as the branches; axillary gland blunt; racemes terminal, 8-flowered. ♄. S. Native of Peru, on the banks of the Macera. Flowers white. Fruit unknown.

Soft Caper-tree. Shrub 8 feet.

82 C. heterophy'lla (Ruiz, et Pav. ined. D. C. prod. 1. p. 250.) leaves smooth, oblong-obovate, mucronate, or emarginate; axillary gland pyxidiform; racemes terminal, somewhat corymbose; fruit club-shaped. ♄. S. Native of Guayaquil, in woods. Flowers small, white. Fruit an inch long.

Variable-leaved Caper-tree. Shrub 8 feet.

83 C. ampli'ssima (Lam. dict. 1. p. 607.) leaves smooth, oval, on short petioles; axillary gland ovate; pedicels few, or solitary at the top of the branches; fruit ovate. ♄. S. Native of Hispaniola and Mexico. Plum. ed Burm. t. 73. f. 2. exclusive of the synonyms. Flowers large, whitish-yellow. Fruit large.

Very ample Caper-tree. Tree 30 feet.,

84 C. saxa'tilis (H. B. et Kunth, ined. et D. C. prod. 1. p. 250.) leaves smooth, oval-oblong, retuse, on short petioles; pedicels loosely-racemose; fruit ovate. ♄. S. Native of Angustura, in the fissures of rocks. Flowers white.

Rock Caper-tree. Shrub 10 feet.

85 C. RACEMO'SA (Mill. dict. no. 5.) leaves opposite, on long footstalks, ovate; peduncles 2-3-flowered. ♄. S. Native of New Spain, near Carthagena. Flowers white. Siliques 2 or 3 inches long, the thickness of a man's little finger.

Racemose Caper-tree. Tree 20 feet.

86 C. DIDYMOBÓTRYS (Ruiz, et Pav. fl. per. 5. t. 429. f. *b.* ined. D. C. prod. 1. p. 253.) leaves oval, emarginate, somewhat keeled, upper surface shining; axillary glands none; peduncles axillary, racemose, in pairs, distich; siliques very long. ♄. S. Native of Guayaquil, in woods. Flowers white.

Double-bunched Caper-tree. Shrub 8 feet.

87 C. MACROCA'RPA (Ruiz, et Pav. fl. per. ined. 5. t. 530. et D. C. prod. 1. p. 250.) leaves smooth, oval, mucronate; glands of the calyx large; sepals and petals acute; berry roundish. ♄. S. Native of Guayaquil, in woods, and near Loxa. Perhaps a proper section. Flowers white.

Large-fruited Caper-tree. Shrub 10 feet.

SECT. IV. CALA'NTHEA (from καλος, *kalos*, beautiful, and ανθος, *anthos*, a flower; because of the species contained in this section bearing beautiful flowers). D. C. prod. 1. p. 150. Sepals somewhat linear, acute, reflexed, distant at the base. Fruit roundish. Species all from America.

88 C. PULCHE'RRIMA (Jacq. amer. t. 106.) leaves smooth, oblong, blunt, on very short footstalks; axillary glands none; racemes terminal, simple; fruit somewhat pointed with the style. ♄. S. Native of Carthagena on declivities of mountains. C. arboréscens, Mill. dict. no. 21. Petals pale yellow, woolly, oblong; filaments at first white, then beautiful purple. Berry yellow.

Very-fair Caper-tree. Clt. 1700. Shrub 12 to 14 feet.

89 C. NEMORO'SA (Jacq. amer. ed. pict. t. 156.) leaves ovate, acuminate, upper surface smooth, under surface clothed with deciduous wool; fruit ovate-oblong. ♄. S. Native of Carthagena in woods. Flowers unknown.

Grove Caper-tree. Tree 20 feet.

SECT. V. BREYNIA'STRUM (plant like *Cápparis Bréynia*). D. C. prod. 1. p. 250. Breyniæ spec. Plum. gen. t. 16. not of Forst. Sepals much smaller than the petals, triangular, acute. Berry oblong. Stalk of fruit shortish. Unarmed species from America. Peduncles axillary, many-flowered.

* *Flowers polyandrous.*

90 C. AMYGDALI'NA (Lam. dict. 1. t. 608. exclusive of the synonym of Jacq. and Lin.) leaves elliptical-oblong, narrowed towards both ends, with a callous point; upper surface smooth, under surface covered with silvery scaly dots as well as the branches; peduncles axillary, compressed, corymbiferous. ♄. S. Native of the West India islands and the continent of South America. Brey. icon. rar. p. 13. icone. Plum. gen. 40. t. 16. Pods a foot long. Flowers white.

Var. β, *umbellàta* (H. B. et Kunth, nov. spec. 5. p. 97.) differing from the species by the leaves being a little narrower.

Almond-like Caper-tree. Clt. 1818. Shrub 6 feet.

91 C. BARCELLONE'NSIS (H. B. et Kunth, nov. spec. 5. p. 97.) leaves elliptical-oblong, acuminate, upper surface of younger leaves pubescent, under surface scaly, as well as the branches; peduncles axillary and terminal, racemiferous. ♄. S. Native of New Barcelona in bushy places. Flowers whitish.

Barcelona Caper-tree. Shrub 8 feet.

92 C. COMÒSA (Jacq. amer. t. 160.) leaves lanceolate, stalked; upper surface smooth, under surface grey-woolly; peduncles many-flowered; stamens shorter than the corolla. ♄. S. Native of St. Domingo in inundated places by the sea-side. Flowers white, sweet-scented.

Tufted Caper-tree. Shrub 6 feet.

FIG. 53.

93 C. ODORATI'SSIMA (Jacq. hort. Schœnbr. t. 110.) leaves oblong, acuminate, on long footstalks, upper surface smooth, under surface covered with little hard scales; peduncles racemiferous at the top; stamens 28-32, length of corolla. ♄. S. Native of Caraccas. Flowers violet, sweet-scented; about the size of a myrtle, with yellow anthers (f. 53.).

Most-sweet-scented Caper-tree. Clt. 1814. Shrub 6 feet.

94 C. PACHA'CA (H. B. et Kunth, nov. spec. 5. p. 93.) leaves ovate-elliptical, somewhat emarginate, leathery, smooth, on very short footstalks; racemes terminal, few-flowered; fruit somewhat globose, pendulous. ♄. S. Native of Cumana in woods. Flowers green. *Pachaca* is the native name of the tree.

Pachaca Caper-tree. Tree 25 feet.

95 C. SCA'BRIDA (H. B. et Kunth, nov. spec. 5. p. 95.) leaves oblong, blunt at the base, acutish at the top, upper surface roughish, under surface somewhat velvety, on long footstalks; branches and racemes tomentose; stamens 24, villous at the base. ♄. S. Native of South America. Fruit ovate-oblong, $1\frac{1}{2}$ inch long. Sepals oval-oblong, conniving into an ovate bud. Flowers white. Perhaps a separate section.

Roughish-leaved Caper-tree. Shrub 6 feet.

96 C. TENUISI'LIQUA (Jacq. amer. t. 105.) leaves lanceolate or ovate, smooth, stalked; racemes terminal, many-flowered; stamens 16-24, and are as well as the siliques very long. ♄. S. Native of Carthagena, very frequent. Flowers greenish-white. Leaves deciduous.

Slender-siliqued Caper-tree. Clt. 1822. Shrub 15 feet.

97 C. OBOVATIFO'LIA (H. B. et Kunth, nov. spec. 5. p. 92.) leaves elliptical-obovate, somewhat cordate, smooth, on very long footstalks; racemes somewhat axillary, many-flowered; siliques somewhat elongated, pendulous. ♄. S. Native near Cumana. Flowers white?

Obovate-leaved Caper-tree. Shrub 6 feet.

98 C. BREVISI'LIQUA (Moc. et Sesse, fl. mex. ined. icon. D. C. prod. 1. p. 251.) leaves elliptical, blunt, emarginate, smooth, on short footstalks; pedicels terminal, 2-3-flowered, umbellate; siliques torulose, twice the length of their stalks. ♄. S. Native of New Spain. Petals oblong-spatulate, whitish-green.

Short-siliqued Caper-tree. Shrub 6 feet.

99 C.? OVALIFÒLIA (Ruiz, & Pav. fl. per. t. 432. f. a. ined. D. C. prod. 1. p. 253.) leaves oval, mucronate or emarginate, under surface hoary-tomentose; racemes many-flowered, axillary and terminal; calyx 4-notched; glands of calyx scale-formed, ciliated; stalk of fruit short. ♄. S. Native of Peru at Ica and of Guayaquil. Petals unguiculate, yellowish, with a purple margin. Stamens declinate, 12-18; exterior ones at the base somewhat monadelphous. Fruit oval.

Oval-leaved Caper-tree. Shrub 10 feet.

** *Flowers octandrous.*

100 C. ANGUSTIFÒLIA (H. B. et Kunth, nov. spec. 5. p. 96. t. 438. leaves linear, somewhat cordate at the base, on very short footstalks; upper surface smooth, under surface somewhat pubescent; peduncles corymbose, and are velvety, as well as the branch-

lets. ♄. S. Native between Mexico and Acapulco. Branchlets sulcately-angular. Bud of flower ovate, woolly. Flowers white.

Narrow-leaved Caper-tree. Shrub 6 feet.

101 C. FERRUGI'NEA (Lin. amœn. 5. p. 398.) leaves lanceolate, acuminate, stalked, upper surface smooth, under surface covered with rusty hard scaly-like hairs; branchlets downy; petioles rusty; peduncles axillary, corymbosely-racemose at the top. ♄. S. Native of Jamaica in bushy places by the sea-side, as well as in St. Domingo.—Browne, jam. t. 28. f. 1. C. octándra, Jacq. amer. t. 100. Flowers white, scentless, fragrant or fetid, according to various authors. The plant is strongly impregnated with an acrid volatile salt, like the mustard tribe; and hence in Jamaica it has obtained the name of the *Mustard Shrub*. (Br. jam.)

Rusty Caper-tree. Clt.? Shrub 4 to 6 feet.

102 C. INCA'NA (H. B. et Kunth, nov. spec. 5. p. 94.) leaves ovate-oblong, very much pointed, and are as well as the branchlets covered with appressed velvety wool; racemes few-flowered, somewhat shorter than the leaves. ♄. S. Native of South America between Mescala and Estola. Petals white, downy on the outside. Filaments of stamens very short. Fruit ovate, hoary, tomentose.

Hoary Caper-tree. Tree 30 feet.

103 C. CORDA'TA (Ruiz, et Pav. fl. per. 5. t. 432. f. b. ined. D. C. prod. 1. p. 251.) leaves cordate, roundish, woolly on both surfaces with stellate down; peduncles racemose, few-flowered; berry somewhat globose, few-seeded. ♄. S. Native of Guayaquil. Flowers white.

Cordate-leaved Caper-tree. Shrub 8 feet.

Sect. VI. QUADRE'LLA (from *quadratus*, square; form of flower-bud) D. C. prod. 1. p. 251. Flower-bud somewhat quadrate, with the sepals valvate in the bud, with their margins somewhat revolute, and hence the sutures are rather prominent. Siliques dehiscent. Stalk of fruit elongated. Unarmed species from America, velvety or covered with scales. Peduncles axillary, many-flowered.

104 C. CROTONOI'DES (H. B. et Kunth, nov. spec. 5. p. 95. t. 437.) leaves cordate-roundish, stalked, upper surface villous, under surface downy, as well as the branches; racemes angular, terminal, few-flowered; stamens 8; fruit globose. ♄. S. Native in hot places by the river Magdalena. Flowers yellow.

Croton-like Caper-tree. Shrub 8 feet.

105 C. FURFURA'CEA (Ruiz, et Pav. in herb. Lamb. D. C. prod. 1. p. 252.) leaves elliptical-oblong, blunt, stalked, upper surface glabrous, under surface, as well as branches and footstalks velvety; racemes terminal, angular, many-flowered; stamens 12, hispid at the base. ♄. S. Native of Mexico. Flowers white.

Scurfy Caper-tree. Shrub 6 feet.

106 C. SIDÆFÒLIA (Ruiz, et Pav. in herb. Lamb. D. C. prod. 1. p. 252.) leaves ovate, cordate at the base, stalked, upper surface in the adult leaves glabrous, under surface velvety with starry down, as well as the branches; racemes terminal, shorter than the leaves, somewhat corymbose. ♄. S. Native of Peru. Stamens and fruit unknown.

Sida-leaved Caper-tree. Shrub 6 feet.

107 C. BRE'YNIA (Lin. spec. 721. Jacq. amer. t. 103. pict. t. 152.) leaves elliptical, leathery, stalked, upper surface glabrous, under surface scaly, as well as the branchlets; peduncles angular, racemosely-corymbose; stamens 16; siliques very long. ♄. S. Native of the West India islands and the South American continent towards the sea in dry coppices. Bréynia Indica and C. cynophallóphora, Lin. spec. ed. 1. p. 503.—Breyn. icon. 13. Leaves covered beneath with a mixture of small silvery and rust-coloured dots or scales. Petals white, tinged with purple; anthers yellow. Flowers about the size ef a myrtle.

Var. β, uniflòra (D. C. prod. 1. p. 252.) C. siliquòsa, Lin. spec. 721. exclusive of the synonyms. This variety has a shorter fruit stalk and very acute leaves, the upper surface is glittering, and the lower surface is covered with ferrugineous and silvery scales or dots.

Breynius's Caper-tree. Fl.? Clt. 1752. Shrub 12 feet.

108 C. JAMAICE'NSIS (Jacq. amer. t. 101.) leaves oblong, emarginate, leathery, upper surface glabrous, under surface and branches covered with grey tomentum; peduncles few-flowered; stamens 20. ♄. S. Native of Jamaica. Fruit like those of *C. Bréynia*, and probably only a variety of it. Flowers yellowish-white, fragrant.

Jamaica Caper-tree. Clt. 1793. Shrub 6 feet.

109 C. TORULÒSA (Swz. fl. ind. occ. 2. p. 932.) leaves ovate-lanceolate, leathery, stalked, upper surface glabrous, under surface scaly, as well as the branches; peduncles few-flowered, racemosely-corymbose; stamens 28; siliques very long. ♄. S. Native of the mountains of Jamaica and Barbadoes in bushy places. Flowers white.—Brown, jam. p. 246-2.

Torulose-siliqued Caper-tree. Clt. 1822. Shrub 6 feet.

110 C. INTERME'DIA (H. B. et Kunth, nov. spec. 5. p. 98.) leaves ovate-lanceolate, leathery, stalked, upper surface glabrous, under surface, as well as branchlets, scaly; peduncles few-flowered, racemosely-corymbose at the top; siliques terete, stalk of fruit short and thick. ♄. S. Native of Cumana, where it is called *Olive*. Flowers white.

Intermediate Caper-tree. Shrub 10 feet.

111 C. COMMUTA'TA (Spreng. new. entd. 3. p. 57.) leaves oblong-lanceolate, glabrous; peduncles racemose, elongated, naked; stamens shorter than the corolla. ♄. S. Native of Guadaloupe and Martinico. Habit of *C. Bréynia*. Flowers white?

Changed Caper-tree. Shrub 8 feet.

† *Capparides; uncertain to which of the sections they belong.*

* *Species natives of the old world.*

112 C. MITHRIDA'TICA (Forsk. descr. 99.) leaves linear-lanceolate, blunt, glabrous, pendulous, stalked. ♄. G. Native of Arabia about Surdub. Perhaps a species of *Cápparis*.

Mithridate Caper-tree. Shrub 6 feet.

N.B. *Cápparis Dàhim* of the same author is omitted, because it is evident from his description that it is a species of *Zygophýllum* or *Cæsalpínia*.

** *Unarmed species from America.*

113 C. NI'TIDA (Ruiz, et Pav. ined. in litt. D. C. prod. 1. p. 252.) leaves oblong, acuminated, shining, glabrous, stalked; peduncles axillary, 1-flowered; fruit oval. ♄. S. Native of the Andes of Peru in groves. Flowers yellow.

Shining-leaved Caper-tree. Tree 30 feet.

114 C. FRUTICÒSA (Mill. dict. no. 7.) leaves lanceolate, acute, leathery, on short footstalks; flowers axillary, on short pedicels. ♄. S. Native of South America near Tolu. Petals white; anthers purple; filaments white.

Shrubby Caper-tree. Shrub 14 feet.

115 C. AVICENNIÆFÒLIA (H. B. et Kunth, nov. spec. 5. p. 94.) leaves elliptical, blunt at both ends, on very short footstalks, upper surface glabrous, under surface as well as younger leaves canescent; racemes shorter than the leaves; calyx campanulate, 4-lobed; stamens scarcely exceeding the petals in length; fruit globose. ♄. S. Native of South America in the sand on the shores of the Pacific ocean and about Guayaquil. Flowers white.

Avicennia-leaved Caper-tree. Shrub 12 feet.

116 C. LONGIFÒLIA (Swz. prod. 81.) leaves linear, acuminate,

on short footstalks, upper surface glabrous, under surface as well as branchlets covered with mealy scales. ♄. S. Native of Jamaica and Barbadoes.—Pluk. phyt. t. 327. f. 6. Flowers white. Perhaps belonging to section *Quadrélla*.

Long-leaved Caper-tree. Shrub 8 feet.

117 C. Dominge'nsis (Spreng. in herb. Balb. D. C. prod. 1. p. 253.) leaves oblong, on short footstalks, upper surface glabrous, under surface as well as branchlets tomentosely-velvety; peduncles corymbose, few-flowered; fruit ovate, velvety; stalk of fruit velvety. ♄. S. Native of St. Domingo. Flowers unknown. Perhaps a species of *Breyniástrum* or *Quadrélla?*

St. Domingo Caper-tree. Shrub 10 feet.

118 C. lauri'na (H. B. et Kunth, nov. spec. 5. p. 93.) leaves oblong, blunt at both ends, stalked, leathery, glabrous; racemes terminal; fruit globose, pendulous. ♄. S. Native of Peru near Guancabamba. Flowers violet-coloured.

Laurel-like Caper-tree. Tree 30 feet.

119 C. angula'ta (Ruiz, et Pav. fl. 5. per. t. 431. D. C. prod. 1. p. 253.) leaves ovate-oblong, mucronate, stalked, upper surface shining, under surface as well as branches velvety from 10-rayed hairs; peduncles terminal, corymbosely racemose; fruit ovate, angular. ♄. S. Native of Guayaquil. Filaments somewhat monadelphous at the base. Flowers white.

Angular-fruited Caper-tree. Tree 10 feet.

120 C. viridiflòra (H. B. et Kunth. nov. spec. 5. p. 92.) leaves oval-oblong, cordate, mucronulate, on long footstalks, upper surface glabrous, under surface as well as branchlets pubescent; racemes terminal, angular; sepals obovate, very short. ♄. S. Native near Cumana in shady places. Flowers greenish. Silique linear.

Green-flowered Caper-tree. Tree 20 feet?

121 C. confe'rta (Mill. dict. no. 8. exclusive of the synonyms) leaves elliptical, both ends acuminated, glabrous, on long footstalks; racemes terminal, velvety; pedicels compressed, shorter than the fruit-stalk. ♄. S. Native of Carthagena. Flowers white. Fruit oval.

Crowded-flowered Caper-tree. Shrub 8 feet.

122 C. pelta'ta; leaves coriaceous, at first round and peltate at the base, but at length becoming broad, cordate, and acuminated, beset with mealy scales while young, as well as the young branches. ♄. S. Native of Caraccas by the sea-side.

Peltate-leaved Caper-tree. Clt. 1824. Tree 15 feet?

* * * *Species doubtful whether they belong to Cápparis.*

123 C.? Cantone'nsis (Lour. fl. coch. ed. Willd. 1. p. 404.) stipulas spinose; leaves ovate, acuminate, glabrous, wrinkled; peduncles racemose; flowers 5-petalled. ♄. G. Native of China near Canton. Flowers white. Fruit ovate.

Canton Caper-tree. Shrub 8 feet.

124 C. bre'vis (Spreng. from Fisch. cat. hort. gorenki, 1808. p. 85.) ovary sessile. ♄. S. Native of?

Short-fruited Caper-tree. Shrub?

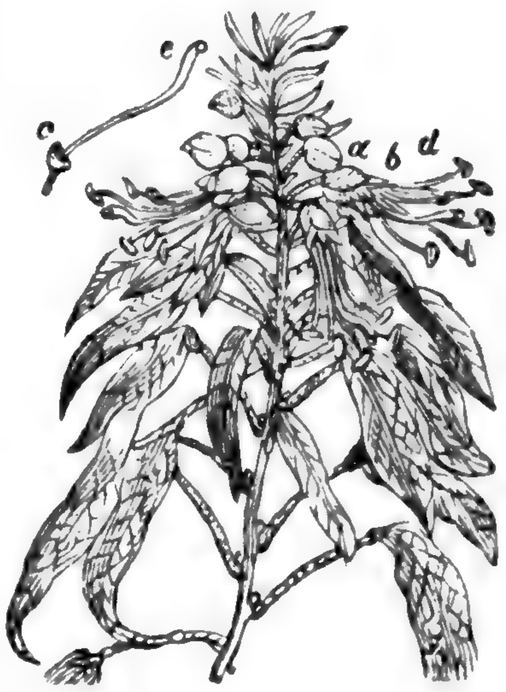
Cult. All the species of *Cápparis* thrive well in a mixture of loam and peat. Cuttings should be taken from young wood, and these will root freely if planted in a pot of sand and placed under a hand-glass; those of the stove species should be placed in a good heat. The *Cápparis herbàcea* is only to be increased by seeds, but cuttings of this may also be tried.

XVI. STEPHA'NIA (in honour of Fred. Stephan, once a professor at Moscow, died 1817, author of Enumeratio stirpium agri Mosquensis, &c.) Willd. spec. 2. p. 239. but not of Lour.

Lin. syst. *Hexándria, Monogýnia.* Calyx campanulate, 2-lobed, (f. 54. *a.*). Petals 4 (f. 54. *b.*). Torus small (f. 54. *c.*). Stamens 6 (f. 54. *d.*). Ovary stipitate (f. 54. *e.*) oblong. All unarmed shrubs, with simple leaves on long footstalks, and terminal racemes of flowers.

1 S. cleomoi'des (Willd. l. c.) leaves oblong-lanceolate, much acuminated, scarcely longer than the footstalks. ♄. S. Native of Caraccas in South America. Cápparis paradóxa, Jacq. schœnb. t. 111. Flowers with a reddish-brown calyx, and yellow petals and stamens.

FIG. 54.



Cleome-like Stephania. Fl. April, July. Clt. 1823. Shrub 6 feet.

2 S. elli'ptica (D. C. prod. 1. p. 253.) leaves elliptical, scarcely acuminated, double the length of the footstalks. ♄. S. Native of the island of Trinidad. Fruit of both species unknown. Flowers yellowish?

Elliptical-leaved Stephania. Shrub 6 feet.

Cult. These plants thrive well in a mixture of loam, peat, and sand. Cuttings should be taken from young wood, planted in a pot of sand, and plunged in heat under a hand-glass. They are worth cultivating for the beauty of their flowers.

XVII. MORISO'NIA (to the memory of Robert Morison, a Scotchman, once director of the Royal Garden at Blois, afterwards Professor of Botany at Oxford, author of Plantarum Historia Universalis Oxoniensis, 1680, 2 vol. fol. He died 1683.) Plum. gen. t. 23. D. C. prod. 1. p. 254.

Lin. syst. *Polyándria, Monogýnia.* Calyx obovate, bifid. Petals 4. Torus small. Stamens 20, somewhat monadelphous at the base? Berry stipitate, globose. A tree with glabrous stalked alternate simple leaves, and dirty-white flowers.

1 M. America'na (Lin. spec. 719. Jacq. amer. t. 97.) ♄. S. Native of the West India islands, as well as the South American continent. Cápparis Morisònia, Swartz, obs. 272. This tree is called in Martinique *Bois Mabouia.*

American Morisonia. Clt. 1824. Tree 15 feet.

Cult. This tree requires the same treatment as the species of *Stephània*, which see above.

XVIII. TOVA'RIA (in honour of Simon Tovario, a Spanish physician.) Ruiz, et Pav. fl. per. 3. p. 73. t. 309. in herb. Lamb. and D. Don, in Edinb. new phil. journ. oct. 1828.

Lin. syst. *Octándria, Monogýnia.* Calyx of 8 sepals, rarely 6-7 or 9, spreading, deciduous. Petals the same number, inserted in an elevated fleshy tubercled disk. Stamens the same number, also inserted in the disk; filaments awl-shaped, pilose at the base; anthers bursting inwards. Ovary 1-celled, spherical, seated on the disk. Style short, thick, crowned by an 8-lobed stigma. Berry succulent, 8-nerved, many-seeded. A smooth green annual erect branched herb, with ternate leaves and many-flowered terminal pendulous racemes. Flowers white, small. The berry when mature is about the size of a cherry. The plant has the habit of *Cleòme*, but with the fruit of the form and structure of *Morisònia* and *Cratæ'va*. The structure of the stigma shews its affinity to *Papaveràcea*, and the structure of its seeds accords precisely with *Resèda*.

1 T. pe'ndula (Ruiz. et Pav. l. c. and syst. 1. p. 85. gen. p. 49. t. 8. Pav. in act. acad. madr. 1. p. 192.) ⊙. S. Native of Peru in groves between Chinchao and Pati.

Pendulous-racemed Tovaria. Fl. Aug. Sep. Pl. 6 feet.

Cult. The seeds of this plant should be sown in a pot in spring, and placed in a hot-bed frame, and when the plants are about three inches high, they should be planted separately in small pots, and then placed again in the hot-bed; they should afterwards be shifted into larger pots from time to time as they

grow. About the end of June they should be removed into the green-house, where they will flower and seed. A few plants may be planted out into a sheltered situation in the open border, in order to ascertain whether the plant will grow in the open air.

XIX. THYLA'CHIUM (from *θυλακιον*, *thulakion*, a sack or follicle; in allusion to the form of the calyx.) Lour. coch. 1. p. 342. D. C. prod. 1. p. 254.

Lin. syst. *Polyándria*, *Monogýnia*. Calyx follicular, at length cut round at the base. Petals none. Stamens indefinite, seated on a short receptacle. Berry oblong, 1-seeded, stipitate. Unarmed shrubs, with variable leaves. Peduncles few or many-flowered, terminal.

1 T. lu'cidum (D. C. prod. 1. p. 254.) leaves entire, elliptical, acutish, glabrous; branchlets and footstalks velvety; berry ovate-globose. ♄. G. Native of Booby Island, lying between New Holland and New Guinea. Cápparis lùcida, Banks, herb. Flowers with copper-coloured stamens and anthers.

Shining-leaved Thylachium. Shrub 10 feet.

2 T. Africa'num (Lour. l. c.) leaves entire, ovate, mucronulate, and are, as well as the branches, glabrous; berry oblong. ♄. S. Native of the eastern coast of Africa. T. ovalifòlium, Juss. ann. 12. p. 71. Flowers with copper-coloured stamens and anthers.

African Thylachium. Shrub 10 feet.

3 T. heterophy'llum (Juss. ann. 12. p. 71.) leaves glabrous, some of which are simple, others trifoliate. ♄. S. Native of Madagascar. Cápparis panduriformis, Pet. Th. obs. afr. aust. p. 26. Flowers with brownish stamens.

Variable-leaved Thylachium. Shrub 8 feet.

4 T. pandurifo'rme (Juss. ann. 12. p. 71.) leaves glabrous, some of which are simple, fiddle-shaped, others are trifoliate. ♄. S. Native of the Mauritius. Cápparis panduriformis, Lam. dict. 1. p. 609. Flowers with brownish stamens.

Fiddle-shaped-leaved Thylachium. Shrub 10 feet.

5 T.? oppositiflo'rum (D. C. prod. 1. p. 254.) leaves glabrous, ovate-lanceolate, somewhat cordate at the base, entire; pedicels 1-flowered, opposite the leaves. ♄. S. Native of the West Indies.

Opposite-flowered Thylachium. Shrub 8 feet.

Cult. No species of this genus has as yet been introduced into European gardens, but should they be, we would advise that they should be treated in the same manner as the genus *Stephània*, which see, p. 285.

XX. HERMU'POA (native name of the plant.) Lœfl. itin. 307. D. C. prod. 1. p. 254.

Lin. syst. *Hexándria*, *Monogýnia*. Calyx double, exterior one tubular, interior one 4-sepalled, small. Petals 4, linear. Stamens 6, very long. Berry oblong, cylindrical. Allied to *C. Bréynia*, from Lœfl. Perhaps the interior calyx should be termed a nectary.

1 H. Lœflingia'na (D. C. prod. 1. p. 254.) ♄. S. Native of South America. Flower scarlet. †

Lœfling's Hermupoa-tree. Tree 20 feet?

Cult. This plant has not yet been introduced, therefore the mode of cultivating and propagating it is not known; but we would recommend its being treated in the same manner as *Stephània*. See p. 285.

XXI. MÆ'RUA (*Meru* is the Arabic name of *M. uniflòra*.) Forsk. ægyp. 104. D. C. prod. 1. p. 254.

Lin. syst. *Polyándria*, *Monogýnia*. Calyx tubular, 4-parted, valvate in the bud; throat crowned with petaloid scales. Petals none. Torus elongated. Stamens indefinite, seated on the top of the receptacle, somewhat monadelphous at the base. Silique fleshy, stipitate. Unarmed, downy shrubs, with simple coriaceous leaves, furnished with setaceous stipulas.

1 M. uniflo'ra (Vahl. symb. 1. p. 36.) pedicels axillary, solitary, 1-flowered; petaloid crown filamentosely jagged; leaves veinless. ♄. S. Native of Arabia Felix at Yemen. M. crassifòlia, Forsk. l. c. Flowers with white filaments and yellow anthers.

One-flowered Mærua. Shrub 4 feet.

2 M. Angole'nsis (D. C. prod. 1. p. 254.) pedicels axillary, solitary, 1-flowered; petaloid crown 4-lobed, with deeply-jagged lobes; leaves in the middle 1-nerved. ♄. S. Native of Angola. Perhaps sufficiently distinct from *M. uniflòra*.

Angola Mærua. Shrub 6 feet?

3 M. racemòsa (Vahl. symb. 1. p. 36.) racemes terminal, drooping; petaloid crown entire. ♄. G. Native of Arabia.

Racemose-flowered Mærua. Shrub 6 feet?

4 M. rígida (R. Br. in append. to Clapp. and Denh. trav.) corymbs terminal, few-flowered; leaves obovate, thick, rigid, downy, veinless; petaloid crown, many-parted. ♄. G. Native of the north of Africa, at Aghedem.

Rigid-leaved Mærua. Shrub 4 feet.

5 M. Senegale'nsis (R. Br. ined.) corymbs terminal, scarcely pubescent; leaves ovate or obovate, distinctly veined; petaloid crown many-parted. ♄. S. Native of Senegal.

Senegal Mærua. Shrub.

Cult. These shrubs will no doubt thrive well in a mixture of loam and peat, and cuttings taken from young wood will strike root if planted in a pot of sand, placed under a hand-glass, in a moderate heat.

XXII. A'RSIS (from *αρσις*, *arsis*, elevation; because of the fruit being seated on a long pedicel within the calyx.) Lour. fl. coch. p. 335.

Lin. syst. *Polyándria*, *Monogýnia*. Calyx of 5-coloured deciduous sepals. Petals 5. Stamens numerous, seated on an elongated receptacle; anthers 4-celled. Berry stipitate, 1-seeded. A small branched shrub, with ovate-lanceolate, wrinkled, quite entire leaves, and terminal racemes of small white flowers.

1 A. rugo'sa (Lour. l. c.) ♄. G. Native of Cochinchina.

Wrinkled-leaved Arsis. Shrub 5 feet.

Cult. A mixture of loam and sand will suit this shrub well, and cuttings will strike root if planted in a pot of sand, placed under a hand-glass.

Order XVI. RESEDA'CEÆ (plant agreeing with *Resèda* in some important characters). D. C.

Calyx of 4-5-6 permanent segments, which are slightly open in the bud, or rotate 5-toothed, as in *Ochradènus*. Petals open in æstivation, equal in number with the segments or teeth of the calyx, and alternating with them, usually fringed or cleft, furnished with broad claws, and inserted at the base of the elevated, dilated disk. Stamens definite, 2 or 3 for each petal, inserted in the disk; they are rather connate at the base. Anthers 2-celled, at first erect, at length incumbent, and sometimes as if they were bursting outwardly; cells parallel, 2-valved, free at the base, the rest connate, opening by a longitudinal suture; the outer valve is largest. Ovary trigonal, or tetragonal, pedicelled, with the pedicel closely fenced by the connate base of the filaments. Style none. Stigma 3-4-lobed, with the lobes equal in number to the angles of the capsule, and alternating with them, spreading, 2-valved; valves connivent, truncate, and papillosely-hispid at

the top. Capsules (berry in *Ochradènus*) trigonal or tetragonal, membranous, inflated, open at the top, with the seminiferous nerves equal in number with the stigmas; these are perpendicular and parietal. Seeds simple, cochleated, sessile, pendulous, white or yellow, disposed in an alternate double series, but they are sometimes scattered from abortion; umbilicus small, oblique, with the upper side approximating the recess of the radicle; outer coat of seed crustaceous, ornamented with minute dots, disposed in elevated lines; inner coat membranous, diaphanous. Albumen none. Embryo curved, conforming to the cavity of the seed, terete, yellowish, rather narrowed towards the base, with semi-cylindrical cotyledons, and with a superior cylindrical thick radicle, which is very blunt at the base, and equal in length with the cotyledons, and opposite the umbilicus. This order agrees with *Ranunculàceæ*, especially with *Delphínium*, in the complicated stigma, and structure of the ovary, as well as in the seminiferous placentas. It is also allied to *Capparídeæ* and *Tropæòleæ*, in the petals being unguiculate, as well as in the seed being destitute of albumen. The *Capparídeæ*, *Resedàceæ*, *Crucíferæ*, *Papaveràceæ*, and *Tropæòleæ*, appear to constitute a grand natural class; and near to them, but at different points, must be arranged the *Ranunculàceæ*, *Polygàleæ*, and *Balsamíneæ*, an arrangement which the many analogies and affinities existing between these families appear to justify.

Most of the species of *Resèda* are rather ornamental; and *R. odoràta* is cultivated extensively for the fragrance of its blossoms. All the species are herbaceous, or slightly suffruticose. The leaves are simple, trifid, or pinnate; and the flowers, which are either yellow or white, are small, disposed in dense or loose terminal racemes. The seeds are kidney-shaped, and retain their vegetating power a considerable time, therefore they are easily introduced, in a living state, from one part of the world to another.

This Order differs from *Crucíferæ* in the capsules being unilocular, in the stamens being indefinite, in the seeds being destitute of an umbilical cord, as well as in the capsules being bladdery and open at the top. It differs in these two last characters from all the neighbouring orders, except *Datísceæ*.

Synopsis of the Genera.

1 Rese'da. Calyx of 4-5-6 narrow segments. Petals 4-5-6 cloven. Capsule bladdery, 3-4 horned, many-seeded.

2 Ochrade'nus. Calyx rotate, 5-toothed, replete with an annular gland. Petals wanting. Berry many-seeded.

I. RESE'DA (from *resedo*, to calm, to appease; the Latins thought it useful as a topical application in external bruises.) Lin. gen. ed. Schrœb. no. 831. Willd. spec. 2. p. 876.

Lin. syst. *Octo-Polyándria. Tri-Tetragýnia.* Calyx divided almost to the base into 4-5-6 narrow segments. Petals cleft, equal in number with the segments of the calyx. Capsule bladdery, with a hole at the top when ripe. Herbaceous or slightly shrubby plants.

§ 1. *Leaves simple, entire. Petals trifid and quinquifid. Torus much dilated on one side.*

1 R. sesamoìdes (Lin. spec. 644.) leaves lanceolate, entire, obtuse, smooth; petals 5; capsule furnished with 4 reflexed horns. ♃. H. Native of the south of France, Spain, and Portugal, on walls and among rubbish. Flowers small, white, in long racemes. Stems prostrate. Calyx reflexed, 3 of the segments pointed upwards, and 2 downwards.

Sesamum-like Mignonette. Fl. June, July. Clt. 1787. Pl. 1 foot long.

2 R. purpura'scens (Lin. spec. 644.) leaves linear, obtuse; flowers pentagynous. ♃. H. Native of the south of Europe, particularly about Montpelier. Stem purplish. Leaves like flax. Flowers of greenish-purple colour, in long spikes.

Purplish Mignonette. Fl. Ju. July. Pl. ½ foot.

3 R. linifo'lia (Horn. hort. hafn. 2. p. 501.) leaves linear-awl-shaped, channelled; capsules 3-toothed. ⊙. H. Native of the south of Europe and Egypt. R. subulàta Delîle. ill. p. 15.

Flax-leaved Mignonette. Fl. July, August. Clt. 1819. Pl. 1 foot.

4 R. glau'ca (Lin. spec. 644.) leaves linear, glaucous, toothed at the base; flowers tetragynous. ♃. H. Native of Spain and Egypt.—Mor. oxon. 3. p. 601. sect. 15. t. 6. f. 4. Flowers pale yellow, disposed in long spikes. Pinnula of leaves not changed into scarious teeth. (*Link.*)

Glaucous Mignonette. Fl. May, Jul. Clt. 1748. Pl. 1 ft.

5 R. dipe'tala (Ait. hort. kew. ed. 1. vol. 2. p. 132.) leaves linear, quite entire, acute; flowers tetragynous, 2-petalled; petals undivided. ♂. G. Native of the Cape of Good Hope. R. Capénsis, Burm. prod. cap. 13. Habit of *R. sesamoìdes*. Stem suffruticose, erect, branched; branches round, smooth. Flowers white, remote, in terminal racemes. Segments of calyx 6, minute, with white margins. Petals cuneated, quite entire. Capsule globose.

Two-petalled Mignonette. Fl. Aug. Clt. 1774. Pl. 1½ foot

6 R. scopa'ria (Brouss. in Willd. enum. 499.) leaves linear, quite entire, smoothish; stem shrubby; branches twiggy; capsules clavate, 3-toothed. ♄. G. Native of Teneriffe. Flowers yellow. This species comes very near *R. glaúca*. Capsule tapering to the base.

Broom Mignonette. Fl. Ju. Sep. Clt. 1815. Shr. 1 foot.

7 R. cane'scens (Lin. syst. 448.) leaves lanceolate, entire, wavy, pilose; branches hairy; capsules 6-toothed. ♃. H. Native of Egypt. R. hexágyna, Forsk. descr. 92. Stem erect. Leaves with a pilose keel, and rather ciliated margins. Flowers in racemes, with white petals and yellow anthers. Clus. hist. 1. p. 296. t. 295. It appears from the description in Lin. spec. 644. that Linnæus intended a very different plant from that which he describes in his systema, as well as in his reference to *Clusius*.

Canescent Mignonette. Fl. May, Aug. Clt. 1597. Pl. 1 foot.

8 R. lute'ola (Lin. spec. 643.) leaves lanceolate, entire, but furnished with a tooth on each side, at the base; calyx 4-cleft, upper petal quinquefid, lateral ones trifid, lower one bifid or simple. ⊙. H. Native of Europe in pastures, fallow-fields, waste-places, and on dry banks and walls. Smith, eng. bot. t. 321. Jacq. aust. 4. t. 352. Flowers yellow, trigynous, in long spikes which are nodding at the top. It is an observation of Linnæus, that the nodding spike of the flower follows the course of the sun, even when the sky is covered; pointing towards the east in the morning, to the south at noon, westward in the afternoon, and north at night. Dyers formerly made considerable use of this plant; for it affords a most beautiful yellow dye for cotton, woollen, silk, and linen. Blue cloths are dipped in a decoction of it in order to become green. The yellow colour of the paint called Dutch-pink is obtained from this plant. The entire plant when it is about flowering is pulled up for the use of the dyers, who employ it

both fresh and dried. In various authors the plant has the names of *Dyers'-weed*, *Yellow-weed*, *Weld*, *Woud*, *Woold*, and *Wild Woad*. The seeds are usually sown after barley is taken off the ground in autumn, or it is very commonly sown with barley in the spring, but the first mode is the best, because the plants make some progress the first year, and in the following season they will be twice the size of those sown in spring. After the ground has been well ploughed and harrowed the seeds should be sown broad-cast, of which one gallon is sufficient for an acre. Unless the ground is very poor it will not require any dung. The best crops, however, will be the result of drilling and cultivating the crop alone. The drills may be a foot apart, and the plants 6 inches distance, in the rows. The plants should be kept clear of weeds by hoeing. When seeds are required a small portion should be left standing for this purpose, and the plants should be pulled as the seeds ripen. The whole crop may be cleared off before the time of sowing wheat, which is the best crop to follow *Dyers'-woold*. The crop is taken by pulling the entire plant; some pull it when in flower, others pull it earlier, but the last appears to be the best. In the execution of the work, the plants are drawn up by the roots in small handfuls, and set up to dry, after being tied with one of the stalks; sometimes, however, they become sufficiently dry without being set up, by turning. These, after they have been completely dried, are tied up into bundles and sold by the name of *Weld-cord*. The demand for it is sometimes very little, while at others it is so great as to raise the price to a high degree. The herb is sometimes gathered green and treated like Woad or Indigo, but in general the dried herb is used by the dyers in a state of decoction. The chief disease of *Weld* is the mildew, to which it is very liable when young, and this is one reason that it is often sown with other crops.

Dyers'-Weed. Fl. Jun. Aug. Britain. Pl. 1 to 3 feet.

9 R. crispa'ta (Link. enum. 2. p. 8.) leaves lanceolate, entire, waved, with 2-glands at the base. ⊙. H. Native of Spain. R. lanceolàta, Lag. Flowers yellow, similar to those of *R. Lutèola*.

Curled-leaved Dyers'-Weed. Fl. Ju. Aug. Clt. 1820. Pl. 1 ft.

10 R. vire'scens (Horn. hort. hafn. 2. p. 501.) leaves linear-lanceolate, smooth, quite entire; capsules 4-toothed. ⊙. H. Native of Spain. Flowers greenish-yellow, in long slender spikes.

Greenish Dyers'-Weed. Fl. Ju. Jul. Clt. 1820. Pl. 1 foot.

11 R. Chine'nsis (Lour. fl. cochin. p. 299.) leaves broad-lanceolate, quite entire, smooth, calyx 5-parted; capsules 3-toothed. ⊙. H. Native of the south of China, in the suburbs of Canton. Flowers yellow, in spikes. This species and the following is very like the *R. Lutèola*, and like it affords a yellow dye.

Chinese Dyers'-Weed. Fl. Ju. Jul. Clt. 1819. Pl. 1 foot.

12 R. Cochin-chine'nsis (Lour. fl. cochin. p. 299.) leaves broad-lanceolate, 5-nerved, quite entire; calyx 5-parted; capsules 3-toothed. ⊙. H. Native of Cochin-china. Flowers trigynous, yellowish, in spikes. Petals jagged. Plant slender.

Cochin-china Dyers'-Weed. Fl. Ju. Jul. Pl. 1 foot.

§. 2. *Leaves entire and trifid on the same plant. Segments of the petals inserted on the back of the claws. Torus much dilated on one side.*

13 R. Mediterra'nea (Lin. syst. 448.) leaves lanceolate, entire, and trifid; calyx 6-parted, larger than the petals. ⊙. H. Native of the north of Africa, Palestine, &c. Jacq. icon. rar. t. 475. Lindl. coll. t. 22. R. tetrágyna, Forsk. descr. 90. Flowers with white petals, the 2 superior ones are 3-parted, the two lateral ones 2-parted; the two lowest ones linear. Capsules 3-horned. Both leaves and stems are scabrous; the uppermost cauline leaves trifid.

Mediterranean Mignonette. Fl. June, Oct. Clt. 1791. Pl. 1 foot.

14 R. odora'ta (Lin. spec. 646.) leaves lanceolate, bluntish, entire or trifid; calyx 6-parted, equal in length to the petals, which are finely cleft into many club-shaped divisions; the two lowest simple; capsules 3-toothed. ⊙. H. Native of the north of Africa, Egypt, &c. Mill. fig. t. 217. Curt. bot. mag. t. 29. Plant diffuse, with a few hairs on the stems. Flowers with yellowish-white petals and saffron anthers, disposed in loose racemes. The two upper petals and the two lateral ones are finely fringed, the two lower ones are very narrow. The luxury of the pleasure garden, says Curtis, is greatly heightened by the delightful odour which this plant diffuses; and as it grows more readily in pots, its fragrance can be conveyed into the house.

Var. β, frutéscens (Ker. bot. reg. 227.) this plant does not appear to differ from the common *Mignonette*, unless that the stems are shrubby, but it is known that if the common *Mignonette* were kept as a green-house plant, and trained up in the same way, it would also become shrubby.

The *Mignonette* is a well known and universal favorite. The flowers are highly odoriferous, and there are very few to whom this odour is offensive. The plant in pots is in great demand in London for rooms and placing in balconies, and forms for these purposes an extensive article of culture among florists and market-gardeners. The seeds are either sown in pots, or transplanted into pots, 4 or 6 plants to a pot 4 inches in diameter. "To obtain plants for flowering from December to February, a sowing should be made in July, in the open ground, and the plants potted in September. The crop for March, April, and May, should be sown in pots not later than the 25th of August; the plants from this sowing will not suffer from exposure to rain whilst they are young; they must, however, be protected from early frosts, like the winter-crop; they are to be thinned in November, leaving not more than 8 or 10 plants in a pot; and at the same time the pots should be sunk 3 or 4 inches in some old tan or coal-ashes, and should be covered with a frame, which it is best to place fronting the west, for then the lights may be left open in the evening, to catch the sun whenever it sets clear. The third, or spring-crop, should be sown in pots, not later than the 25th of February. These must be placed in a frame, on a gentle heat; and as the heat declines, the pots must be let down three or four inches into the dung-bed, which will keep the roots moist, and prevent their leaves turning brown, from the heat of the sun in April and May. The plants thus obtained will be in perfection by the end of May, and be ready to succeed those raised by the autumnal sowing." (Rishon. hort. trans. 2. p. 375.)

The *Tree-Mignonette* should be propagated from seeds sown in spring; it may also be increased by cuttings, which strike root readily. The young plants should be potted singly into small pots, and brought forward by heat on a gentle hot-bed, but they will grow well without artificial heat. As they advance they should be tied to a stick, taking care to prevent the growth of smaller side shoots by pinching them off, but allowing the leaves of the main stem to remain on for a time. When they have attained the height of ten inches, or more, according to the fancy of the cultivator, the shoots must be suffered to extend themselves from the top, but must be occasionally stopped at the ends, to force them to form a bushy head, which by the autumn will be eight or nine inches in diameter, and covered with bloom. Whilst the plants are attaining the proper size, they should be shifted progressively into larger pots, and may be ultimately left in those of about six inches in diameter at the top. (*Sabine, hort. trans.* 3. p. 181.)

Sweet-scented Mignonette. Fl. June, Oct. Clt. 1752 or 1739. Pl. diffuse.

15 R. PHYTEU'MA (Lin. spec. 645.) leaves lanceolate, spatulate, upper ones sometimes a little divided; calyx 5-parted, spatulate, ciliated, much longer than the petals. ⊙. H. Native of France, Austria, Italy, Switzerland, and the Levant. Jacq. aust. 2. t. 132. Plant decumbent, scabrous from short bristles. Flowers with white petals, which are very finely fringed, and yellow anthers. Capsules 3-toothed.

Phyteuma Mignonette. Fl. May, Sept. Cl. 1752. Pl. decumb.

16 R. RAMOSI'SSIMA (Pour. in Willd. enum. p. 499.) leaves linear, undivided, sometimes trifid; stem erect, much branched; calyx 6-parted; capsules obovate, 3-toothed. ♃. H. Native of Spain. R. récta, Lag. Flowers with white petals, which are variously jagged, and yellow anthers.

Much-branched Mignonette. Fl. Ju. Aug. Clt. 1816. Pl. 2 ft.

§ 3. *Leaves all trifid. Petals usually bifid or trifid, when the last is the case the middle segment is very narrow, the lateral ones always falcate. Torus much dilated on one side.*

17 R. SAXA'TILIS (Pour. in Willd. enum. p. 500.) leaves all trifid; segments linear, but those of the lower leaves are lanceolate and wavy; stem simple; calyx 6-parted; flowers pendulous; capsules erect, clavated, 3-toothed? ♂. H. Native of Spain. R. stricta, Pers. ench. 2. p. 10. Petals white, very finely fringed or trifid? Stem erect.

Rock Mignonette. Fl. June, July. Clt. 1816. Pl. 1 foot.

18 R. PRUINÒSA (Delile, ill. ægypt. 15.) hispid and pruinose; leaves all trifid; segments sometimes bifid, sometimes trifid, all obtuse, lateral ones narrow, middle one broad and rounded at the apex; stem and leaves covered with pruinose papillæ, most evident towards the top; calyx 6-parted; petals bifid or trifid; capsules bluntly 3-toothed. ♃. H. Native of Egypt. Flowers yellow.

Frosty Mignonette. Fl. May, July. Clt. 1824. Pl. 1 foot.

19 R. LÆVIGA'TA; leaves all trifid; segments linear or lanceolate, mucronate, upper ones finely ciliated or serrulated; stem much branched; calyx 6-parted, linear. ♂. H. Native of Egypt. A smooth much-branched plant. Stem with a very few minute bristles on the angles. Flowers yellow; petals bifid or trifid. Capsule bluntly 3-toothed. Leaves sometimes simple.

Smoothed Mignonette. Fl. May, Aug. Clt. 1828. Pl. 1 to 2 ft.

20 R. GRA'CILIS (Tenore, prod. app. fl. nap. ex Schlecht. Linnæa 3. p. 100.) stem diffuse, much branched; leaves all trifid; segments linear, slender, intermediate one rarely bifid; capsules clavated, elongated, sharply tricuspidate. ♂. H. Native of Calabria and Lucania. Like *R. lùtea*, but differs in the stems being more branched, as well as in the leaves being all trifid. It differs from *R. saxátilis*, in the stem being branched and diffuse, not simple and straight.

Slender Mignonette. Fl. June, July. Pl. 1 foot.

21 R. LU'TEA (Lin. spec. 645.) smooth; lower leaves pinnatifid, upper ones 3-parted; segments narrow, entire, or wavy; calyx 6-parted; lower petals simple? capsule 3-toothed. ⊙. or ♃. H. Native of many parts of Europe, abundant in Britain on chalky hills and waste places. Jacq. aust. t. 353. Smith, eng. bot. t. 321. Flowers yellowish. Ray and Haller remark, that this plant has an oleraceous taste resembling that of cabbage. Petals bifid or trifid.

Yellow Mignonette or Base Rocket. Fl. July, Aug. Britain. Pl. 1 to 2 feet.

§ 3. *Leaves all pinnate or pinnatifid. Petals 3-parted or 3-lobed.*

22 R. UNDA'TA (Lin. spec. 644.) leaves all pinnatifid; segments linear-lanceolate, mucronate, waved, with scabrous margins; racemes slender, spicate; calyx 5-parted; petals trifid; capsules 3-4-horned. ♂. H. Native of Spain and Italy, and other parts of the south of Europe.—Barrel. icon. rar. 78. t. 588. The leaves of this plant are sometimes interruptedly pinnate, the intermediate leaflets much smaller than the others, and of a different form and more upright. The flowers are said to have 3-4-5 styles; the petals are white and the anthers are yellow. Capsules large.

Waved-leaved Mignonette. Fl. May, Sep. Clt. 1739. Pl. 2 ft.

23 R. PROPI'NQUA (R. Br. in append. to Clapp. and Denh. trav.) this species comes near to *R. undàta*. It is remarkable in having the claws of all the petals simple; that is, neither dilated or thickened, nor having any process or appendage at the point or union, with a trifid lamina, into which they gradually pass. (R. Br. l. c.) ⊙? H. Native near Tripoli and between Tripoli and Mourzuk. Dr. Oudney. The remarkable structure of the petals we think will be found in *R. álba*, *undàta*, and many others.

Related Mignonette. Pl. 1 to 2 feet.

24 R. A'LBA (Lin. spec. 645.) leaves all pinnatifid; segments lanceolate, smooth, rarely waved; racemes dense; calyx 5-6-parted; petals 3-lobed; capsules 4-horned. ♂. H. Native of the south of Europe and north of Africa. R. fruticulòsa, Jacq. icon. rar. 3. t. 474. The leaves are sometimes interruptedly pinnate, with the intermediate ones smallest. Flowers in dense spikes, with white petals and brownish anthers.—Lob. icon. 222. In the Fl. græc. *R. álba* is figured with quinquefid petals; we doubt the correctness of this.

White Mignonette. Fl. May, Sep. Clt. 1596 or 1693. Pl. 2 ft.

25 R. FRUTICULÒSA (Lin. spec. 645.) leaves interruptedly pinnate; segments lanceolate, recurved, with scabrous margins; terminal segment large; stem shrubby at the base; calyx 5-parted; petals 3-lobed; capsules 4-horned, with the horns recurved. ♄. ♃. H. Native of Spain and Sicily. The racemes are rather slender. The petals are white, and the anthers yellowish. We suspect that this and the three preceding species are only varieties.

Small-*shrubby* Mignonette. Fl. May, Sep. Clt. 1794. Pl. 2 ft.

26 R. BIPINNA'TA (Willd. enum. 500.) leaves bipinnatifid, very scabrous; stem suffruticose; racemes densely spicate. ♄. F. Native of Spain on gypsaceous rocks near Aranjuez. Flowers with white trifid petals and yellowish anthers. Very like *R. álba*.

Bipinnate-leaved Mignonette. Fl. Ju. Aug. Clt. 1816. Pl. 2 ft.

27 R. MIRIOPHY'LLA (Tenore, fl. nap. app. prim. p. 28.) leaves pinnate, with 12 pairs of segments, which are linear and blunt, straight and approximate, entire, but the terminal one is 3-lobed; flowers tetragynous; calyx 5-parted, erect. ⊙. H. Native of Naples. Flowers with white 3-parted? petals and yellowish anthers.

Thousand-leaved Mignonette. Fl. June, July. Clt. 1823. Pl. 1 to 2 feet.

28 R. INCI'SA (Tenore, fl. nap. app. prim. p. 28.) leaves interruptedly pinnate, with many pairs of segments; these are linear acute and cut, approximate; flowers tetragynous; calyx 5-parted, erect; petals 3-parted? ⊙. H. Native of Naples. Flowers with white petals and yellow anthers.

Cut-leaved Mignonette. Fl. June, July. Pl. 1 to 2 feet.

Cult. The seeds of these plants only require to be sown in the open ground, and the plants afterwards treated as other hardy annuals and biennials. The suffruticose species require shelter during winter; these are either propagated by seeds or cuttings.

II. OCHRADE'NUS (from *οχρος*, *ochros*, yellow, and *αδην*, *aden*, a gland; colour of the gland, or rather disk of the flower.) Delile. ill. ægypt. 15.

Lin. syst. *Polyándria, Trigýnia.* Calyx rotate, 5-toothed, replete with an annular gland or rather disk. Petals wanting. Berry many-seeded. A small shrub, with numerous twiggy, straight, smooth branches. Leaves linear bluntish, furnished on each side with a glandular tubercle. Flowers in spikes, yellow. Peduncles at length becoming spinescent.

1 O. bacca'tus (Delile. l. c.) ♄. F. Native of Upper Egypt.

Baccate-fruited Ochradenus. Shrub 1 foot.

Cult. See *R. odoràta frutéscens* for the culture and propagation of this plant.

Order XVII. DATI'SCEÆ (this order only contains the genus *Datísca.*) R. Br. in Clapp. and Denh. trav. appendix.

Flowers dioecious from abortion. Male flowers with the calyx of 5 linear equal acute sepals. Corolla wanting. Stamens about 15, inserted in the receptacle, very short; anthers oblong, obtuse, much longer than the calyx, 2-celled, bursting inwards. Female flowers, with a superior, erect, bidentate, minute, permanent calyx. Corolla none. Ovary oblong, inferior. Styles 3, short, cloven; stigmas simple, oblong, shaggy. Capsule prismatic, crowned by the permanent styles, with 3-valves and 1-cell, with a hole at the top as in *Resèda.* Seeds small, numerous, ranged along 3-4 or 5 placentarious nerves in the capsule. Albumen pale, fleshy. Embryo straight, terete, with very short cotyledons, and a long thick centrifugal radicle.

This order comes very near to *Resedàceæ,* but differs in the seeds being furnished with albumen, in the flowers being apetalous, in the calyx being adherent, and in the fruit being inferior. Large coarse perennial herbs, having the appearance of *hemp,* with pinnate leaves and long spiked racemes of insignificant flowers, resembling those of some species of *Resèda;* they appear to be yellowish-green from the colour of the anthers. Ripe seeds of these plants are easily introduced in a living state from their native countries on account of the copious albumen. The genus *Tetrámelis* of R. Br. belongs to this order, and is remarkable in the quaternary division of every part of the dioecious flower. The plant is a native of Java.

I. DATI'SCA (meaning unknown.) Lin. gen. 530. Juss. gen. 445. Gært. fruct. 1. t. 147. t. 30.

Lin. syst. *Diœ'cia, Polyándria.* Character the same as that of the order.

1 D. cannabi'na (Lin. spec. 649.) leaflets deeply serrated, pale-green; stem and leaves smooth. ♃. H. Native of Candia and some other parts in the south of Europe. Alp. exot. t. 294.—Mor. hist. 3. p. 433. sect. 11. t. 25. f. 3-4.

Bastard *Hemp.* Fl. June, Aug. Clt. 1739. Pl. 4 feet.

2 D. hi'rta (Lin. spec. 1469.) leaflets deeply serrated, larger, more alternate, and more decurrent and confluent at the base than in the last species; stem hairy. ♃. H. Native of Pennsylvania. Flowers in terminal panicles.

Hairy-stemmed Bastard Hemp. Fl. June, Aug. Clt.? Pl. 3 to 4 feet.

3 D. Nepale'nsis (D. Don, prod. fl. nep. p. 203.) leaflets 5, ovate-lanceolate, serrated; male flowers octandrous; stem and leaves smooth. ♃. H. Native of Nipaul. This species differs from *D. cannabìna,* in the male flowers having 8 anthers, not 10-15, as well as in the stigmas being much shorter.

Nipaul Bastard Hemp. Fl. June, Aug. Pl. 3 to 4 feet.

Cult. These plants will grow under any circumstances, and are easily increased by dividing at the root when dormant. They are only fit to be planted in shrubberies.

Order XVIII. FLACOURTIA'NEÆ (plants agreeing with *Flacoúrtia* in many important characters). Rich. in mem. mus. 1. p. 366. D. C. prod. 1. p. 255.

Sepals 4-5-7. (f. 55. *b.*), definite in number, connected a little together at the base. Petals equal in number with the sepals and alternating with them, very rarely absent (f. 55. *a.*). Stamens inserted into the thalamus or receptacle, equal in number with the petals, but sometimes double or multiple that number (f. 55. 56. *a.*) and sometimes these are changed into nectariferous scales. Ovary ovate-globose, free, sessile (f. 55. *c.* f. 56. *d.*) or on a very short stipe. Style absent, or when present filiform (f. 56. *f.*). Stigmas equal in number with the valves of the ovary, more or less distinct (f. 56. *e.*) from each other. Fruit 1-celled (f. 56. *g.*) sometimes indehiscent and fleshy, sometimes capsular, 4-5-valved, filled with a fine pulp inside. Seeds few, thick, usually inwrapped in a dry thin pulpy pellicle; these seeds are fixed to the valves of the capsule, not to the margin as in *Capparídeæ,* nor to a longitudinal line as in *Violarièæ* and *Passiflòreæ,* but with the placentas branched in the disk of the valves, and the seeds adhering somewhat irregularly, and as if it were areolately, to these branched placentas. Albumen fleshy, rather oily. Embryo straight, slender, with the radicle turned towards the hilum. Cotyledons flat, oval, leafy. This order contains small tropical trees or shrubs without stipulas. The leaves are alternate, simple, feather-nerved, usually entire and coriaceous, on very short footstalks. Peduncles axillary and many-flowered. Flowers small, insignificant, often of distinct sexes, they are yellow, white, or greenish. Fruit when fleshy eatable. This order is allied to *Capparídeæ* and *Resedàceæ,* but it differs from these as well as from all dicotyledonous plants in the seeds being fixed to branched parietal placentas. Nothing is known of the properties of the plants contained in this order. The seeds are difficult to introduce in a living state from their native countries.

Synopsis of the genera.

Tribe I.

Patrisie'æ. *Flowers hermaphrodite, apetalous. Sepals 5. Fruct capsular or baccate.*

1 Ryanæ'a. Flowers with a petaloid urceolus between the stamens and the pistil. Fruit baccate, indehiscent.

2 Patri'sia. Urceolus wanting. Fruit capsular, dehiscent, papery, 3-5-valved.

Tribe II.

Flacourtie'æ. *Flowers dioecious* (f. 55. *a. b.* f. 56. *a. d.*) *from abortion, apetalous* (f. 56. *a.* f. 55. *a.*). *Fruit baccate* (f. 55. *c.* f. 56. *d.*), *indehiscent.*

3 Flacou'rtia. Stamens densely crowded upon a hemispherical, glandless torus (f. 55. *a.*). Stigmas 4-9 (f. 55. *b.*).

4 Rou'mea. Stamens not inserted upon a dilated torus (f. 56. *a.*), girded at the base by crenated glands. Stigmas capitate, depressed (f. 56. *e.*)

5 Stigmaròta. Stamens as in *Roúmea*. Style crowned by 6 radiant stigmas.

Tribe III.

Kiggelarie'æ. *Flowers dioecious from abortion* (f. 57. *a. b.*) *Petals 5. Fruit baccate, at length dehiscent.*

6 Kiggela'ria. Petals 5, bearing 3 glands at the claw (f. 57.)

7 Melicy'tus. Petals 5, glandless. Stigmas 4-5, radiant.

8 Hydnoca'rpus. Petals 5, furnished each with a scale at the base.

Tribe IV.

Erythrospe'rmeæ. *Flowers hermaphrodite. Petals and stamens 5-7. Fruit baccate, indehiscent.*

9 Erythrospe'rmum. Calyx of 4 sepals, about equal in length with the petals.

Tribe I.

PATRISIE'Æ (plants agreeing with *Patrìsia* in some important characters). D. C. prod. 1. p. 255. Flowers hermaphrodite, apetalous. Sepals 5, coloured on the inside, permanent. Stamens indefinite. Fruit capsular or baccate. Perhaps referable to some genera in *Passiflòreæ* near *Smeathmánnia ?* but the seeds are smooth, not as in *Passiflòreæ*, scrobiculate, wholly fixed to the disk, not fixed longitudinally to the nerves of the valves as in that order.

I. RYANÆ'A (named by Vahl after John Ryan, who collected and sent to him many plants from Guiana and Cayenne). D. C. prod. 1. p. 254. Ryània, Vahl. ecl. 1. p. 51. t. 9. Patrìsia, Rich. act. soc. par. p. 111.

Lin. syst. *Polyándria, Monogýnia.* Urceolus petaloid, situated between the stamens and the pistil. Fruit baccate, indehiscent. Branching shrubs with simple leaves. The name is a little changed to prevent its being confounded with *Riàna*.

1 R. specio'sa (Vahl. l. c.) leaves green on both surfaces, under surface bearing stellate hairs on the ribs; peduncles 1-flowered. ♄. S. Native of the island of Trinidad and in Cayenne in mountain woods. Patrìsia pyrífera, Rich. l. c. Pers. ench. 2. p. 69. Flowers large, somewhat cream-coloured.

Shewy Ryanæa. Fl. July, Sept. Clt. 1823. Shrub 10 feet.

Cult. This beautiful and singular shrub deserves a place in every stove. It will thrive well in vegetable mould mixed with a little sand; and ripened cuttings will strike freely if planted in a pot of sand, which should be plunged in a gentle heat, under a hand or bell-glass.

II. PATRI'SIA (— Patris, who collected numerous plants in Cayenne). H. B. et Kunth, nov. gen. 5. p. 356. D. C. prod. 1. p. 255.

Lin. syst. *Polyándria, Tri-Pentagýnia.* Urceolus none. Fruit capsular, dehiscent, suberose or papery, 3-5-valved.

1 P. bi'color (D. C. prod. 1. p. 256.) leaves white on the under surface from very fine tomentum; peduncles many-flowered. ♄. S. Native of Cayenne and Trinidad. Flowers large, cream-coloured.

Two-coloured-leaved Patrisia. Shrub 8 feet.

2 P. parviflòra (D. C. prod. 1. p. 256.) leaves villous on the under surface without ribs; peduncles 1-flowered. ♄. S. Native of Cayenne. Flowers whitish.

Small-flowered Patrisia. Shrub 12 feet.

3 P. denta'ta (H. B. et Kunth, nov. spec. 5. p. 357.) leaves glabrous on the ribs, on the under surface, and with the veins puberulous; flowers axillary, 1-2, on short pedicels; branchlets somewhat flexuous. ♄. S. Native of sandy shady places between Atures and Maypures on the Orinoco river. Flowers whitish.

Toothed-leaved Patrisia. Tree 30 feet.

4 P. affi'nis (H. B. et Kunth, l. c.) leaves glabrous, with the nerve and veins on the under surface rather hairy, ovate, acuminated, obsoletely denticulated; flowers 1-2, axillary on short pedicels; branchlets somewhat erect. ♄. S. Native on rocks near Carichana on the river Orinoco. Flowers whitish. Root poisonous.

Allied Patrisia. Tree 20 feet.

Cult. The species of *Patrìsia* require to be grown in a mixture of loam and vegetable mould, and ripened cuttings will root freely if planted in a pot of sand, and a hand-glass placed over them, plunged in heat.

Tribe II.

FLACOURTIE'Æ (shrubs agreeing with *Flacoúrtia* in many important characters). D. C. prod. 1. p. 256. Flowers dioecious from abortion (f. 55. *a. b.* f. 56. *a. d.*), petalless (f. 55. *a.* f. 56. *b.*). Stamens indefinite (f. 55. *a.*). Fruit baccate, indehiscent (f. 55. *c.* f. 56. *d.*).

III. FLACOU'RTIA (in honour of Etienne de Flacourt, a Director of the French East India Company, and the commander of an expedition to Madagascar in 1648, of which he afterwards wrote an account, which contained considerable details upon the botany of that country). Lher. stirp. 59. t. 30. D. C. prod. 1. p. 256.

Lin. syst. *Diœ'cia, Polyándria.* Male flowers. Stamens densely crowded upon the hemispherical receptacle (f. 55. *a.*), glandless at the base. Female flowers. Calyx 4-5-cleft, (f. 55. *b.*) deciduous. Stigmas 4-9 (f. 55. *b.*), furnished each with one longitudinal furrow above. Seeds bony. Shrubs thorny. The sepals are whitish and the stamens and anthers are yellow.

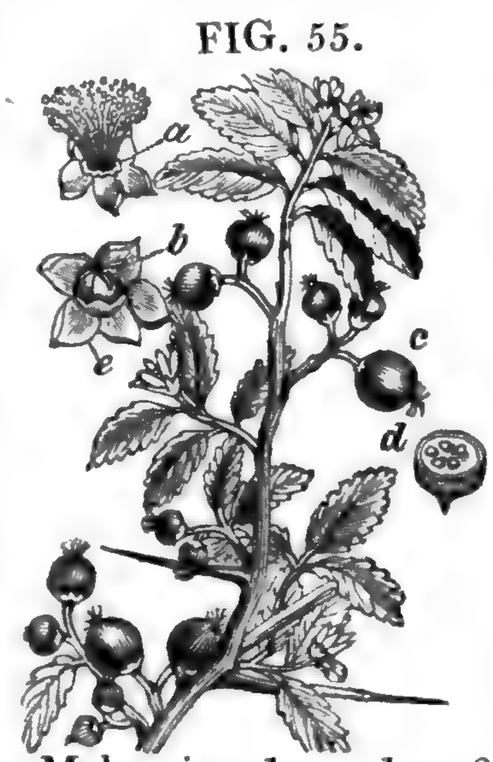
1 F. Ramo'ntchi (Lher. l. c. Lam. ill. t. 826.) leaves roundish-ovate, acute, crenated. ♄. S. Native of Madagascar, where it is called *Ramontchi*. Alamotou, Flac. mad. 124. Flowers yellowish or cream-coloured. The fruit is of the size and shape of a small plum, red when ripe, but at length becoming violet-coloured with a transparent red flesh. The natives eat the fruit; they are sweet, but leave a sharpness in the mouth.

An island on the coast of Madagascar is covered with these trees, and because they resemble the European plum-tree, the sailors have named the island *Isle aux Prunes*, or Plum-tree Island.

Ramontchi Flacourtia. Fl. Ju. Jul. Clt. 1775. Sh. 8 feet.

2 F. sa'pida (Roxb. cor. 1. p. 49. t. 69.) leaves elliptic, repandly-serrated, bluntish at both extremities. ♄. S. Native of the East Indies on mountains. Flowers yellow. Fruit red, the size of a common currant; they are eaten by the inhabitants, and are very palatable. The tree is called *Pedda Canrew* by the Telingas. (f. 55.)

FIG. 55.



Sapid Flacourtia. Fl. Clt. 1800. Tree 12 feet.

3 F. ine'rmis (Roxb. cor. 3. t. 222.) an unarmed tree; leaves elliptic, crenately-serrated, shining; racemes axillary, short; flowers hermaphrodite; style 5-cleft. ♄. S. Native of the Molucca islands. Mal. misc. 1. no. 1. p. 25. Stamens 20-30. Berries reddish-purple, of a pleasant acid taste, for which the tree is cultivated extensively in the Moluccas.

Unarmed Flacourtia. Fl. Feb. Nov. Clt. 1814. Tree 30 ft.

4 F. sepia'ria (Roxb. cor. 1. p. 48. t. 68.) leaves obovate-

oblong, repandly serrated. ♄. S. Native of the East Indies. —Rheed. mal. 2. p. 39. Many of the synonyms given to this plant are probably confused with those of *Elæodéndron Ar'gan.* Fruit red, eatable, and are sold in public markets; they are called *Canrew* by the Telingas. This bush answers well for fences, the spines being very strong.

Hedge Flacourtia. Clt. 1820. Shrub 6 feet.

5 F. CATAPHRA'CTA (Roxb. in Willd. spec. 4. p. 830.) leaves oval-oblong, acuminated, serrated. ♄. S. Native of the East Indies. Flowers yellow. Fruit reddish, when ripe eatable.

All-armed Flacourtia. Clt. 1804. Shrub 8 feet.

6 F. FLAVE'SCENS (Willd. spec. 4. p. 830.) leaves oblong, bluntish, serrated, narrowed at the base. ♄. S. Native of Guinea. Flowers and fruit yellow.

Yellowish Flacourtia. Clt. 1780. Shrub 15 feet.

7 F. RHAMNOI'DES (Burch. cat. afr. austr. no. 4012.) leaves elliptical, somewhat serrated, acutish. ♄. G. Native of the Cape of Good Hope, in woods. Flowers axillary, small, yellowish; pedicels 1-flowered. Berry ovate, red, eatable when ripe.

Rhamnus-like Flacourtia. Clt. 1819. Shrub 4 feet.

8 F. FLEXUÒSA (H. B. et Kunth, nov. spec. 7. p. 239.) branches flexuous, spinose; leaves ovate-oblong, remotely serrated, membranous, smooth, shining: male flowers axillary, aggregate. ♄. S. Native of Mexico. Flowers yellowish.

Flexuous-branched Flacourtia. Shrub 6 feet.

9 F. CELASTRI'NA (H. B. et Kunth, l. c. p. 239.) spines of the branches very long and straight; leaves obovate-roundish, membranous, crenated, smooth, shining; peduncles axillary, usually twin; berry subglobose-elliptical. ♄. S. Native of Mexico. Flowers yellowish. Berries red.

Celastrus-like Flacourtia. Shrub 6 feet.

10 F. PRUNIFO'LIA (H. B. l. c. p. 240. t. 654.) trunk beset with strong spines; branches unarmed; leaves obovate, elliptical, obtuse, coriaceous, smooth, shining, glandularly crenated; racemes axillary, short. ♄. S. Native of New Granada. Flowers yellowish. Berries red, eatable when ripe?

Plum-leaved Flacourtia. Tree 20 feet.

11 F. CORDA'TA (H. B. et Kunth, l. c. p. 241.) unarmed; leaves cordate, acute, crenated, coriaceous, smooth, shining; male flowers aggregate, female ones solitary. ♄. S. Native of Peru. Flowers yellowish. Berries red?

Cordate-leaved Flacourtia. Shrub.

Cult. This genus thrives best in a mixture of loam and peat. Cuttings will root freely planted in a pot of sand, and placed under a hand-glass, in heat.

IV. ROU'MEA (in memory of Philippe Rose Roume, de St. Laurent, once an agent of the French Government in St. Domingo, who was of great service to Poiteau while he travelled there.) Poit. mem. mus. 1. p. 62. t. 4. D. C. prod. 1. p. 256.

FIG. 56.

Lin. syst. *Diœ'cia, Polyándria.* Male flowers with the stamens inserted in a narrow receptacle (f. 56, *a.*) girded at the base by crenated glands. Female flowers. Calyx permanent, 4-5 cleft. Stigmas depressed-capitate at the top, (f. 56, *e.*) Seeds cartilaginous. Thorny shrubs.

1 R. CORIA'CEA (Poit. l. c.) spines of adult branches sometimes large and branched, sometimes small, simple; leaves serrated. ♄. S. Native of St. Domingo, in dry and sunny places. Kœlèra laurifòlia, Willd. (exclusive of the description confused with *Drypètes,*) Bessèra spinòsa, Spreng. pug. 2. p. 91.—Limàcia laurifòlia, Dietr. Flowers greenish-yellow, aggregate. Fruit small, saffron-coloured, without taste.

Leathery-leaved Roumea. Shrub 12 feet.

2 R. INE'RMIS (D. C. prod. 1. p. 256.) spines none; leaves quite entire. ♄. S. Native of Bengal. Bessèra inérmis, Spreng, pug. 2. p. 90. Branches angular from 3 strong nerves running down the stem from each leaf. Flowers 15-20 aggregate, small, on slender pedicels, in the axils of the leaves; greenish-yellow. Male flowers with sessile anthers.

Unarmed Roumea. Shrub 8 feet.

Cult. These plants will thrive best in a mixture of loam and peat. Ripened cuttings will strike freely if planted in a pot of sand, and placed under a hand-glass, in heat.

V. STIGMARO'TA (from *stigma,* a stigma, and *rota,* a wheel; in allusion to the rayed stigmas.) Lour. coch. 2. p. 634. D. C. prod. 1. p. 257.

Lin. syst. *Diœ'cia, Polyándria.* Male flowers as in *Roúmea.* Female flower. Calyx deciduous, 4-5 parted. Style cylindrical, short; stigmas 6, rayed. Berry fleshy, 6-seeded, brownish-purple, eatable; they are sweetish, and somewhat astringent. Perhaps this genus should be joined with *Flacoúrtia,* or *Roúmea?*

1 S. JA'NGOMAS (Lour. l. c.) spines on the female plants simple, on the males branched; leaves ovate, acuminated, serrated; peduncles many-flowered, ♄. G. Native of Cochin-china, from Lour. in Java, and Beleya, from Rumph. 7. p. 36. t. 19. f. 1. and 2. Roúmea Jángomas, Spreng syst. 2. p. 632. *Jangomas* is the name of the tree in Java?

Jangomas Stigmarota. Tree 12 feet.

2 S. AFRICA'NA (Lour. l. c.) differs from the last species in the stem being shrubby and prickly; flowers solitary, terminal; stigmas 6-7. ♄. G. Native of Cochin-china.

African Stigmarota. Shrub 6 feet.

Cult. Should these plants ever be introduced into our gardens, we would recommend that they should be grown in a mixture of loam, peat, and sand; and ripened cuttings to be tried in sand, under a hand-glass.

Tribe III.

KIGGELARIE'Æ (shrubs agreeing with *Kiggelària* in some important characters.) D. C. prod. 1. p. 257. Flowers dioecious from abortion, (f. 57. *c. b.*) Petals 5? alternating with the sepals. Stamens definite, (f. 57. *d.*) Fruit somewhat baccate, at length dehiscent.

VI. KIGGELA'RIA (in memory of Francis Kiggelar, an obscure Dutch botanist, who lived about the end of the seventeenth century. He published a catalogue of the garden of Beaumont, in 1790.) Linn. gen. no. 1128. D. C. prod. 1. p. 257.

Lin. syst. *Diœ'cia, Polyándria.* Petals 5, (f. 57. *b.*) bearing 3 glands at the claw. Male flowers. Stamens 10-20; filaments short; anthers opening by a double chink at the top. Female flowers. Styles 2-5. Shrubs with willow-like leaves, which are somewhat velvety on the under surface, bearing racemes of small insignificant whitish-yellow flowers.

1 K. AFRICA'NA (Lin. spec. 1466.) leaves serrated at length, glabrous and shining on the upper surface; stamens 10; styles 5. ♄. G. Native of South Africa. Lam. ill. t. 821. Lin. hort. cliff. 462. t. 29. herb. citr. 246. t. 12. Flowers greenish-white.

African Kiggelaria. Fl. May, June. Clt. 1683. Shrub 15 feet.

2 K. INTEGRIFO'LIA (Jacq. coll. 2. p. 269. icon. rar. t. 628.) leaves entire, velvety on both surfaces; stamens 20; styles 2, (f. 57. *d.*) ♄. G. Native of the Cape of Good Hope. Flowers whitish.

Entire-leaved Kiggelaria. Fl. May, June. Clt. 1819. Shrub 10 feet.

Cult. These shrubs grow freely in a mixture of loam and peat; ripened cuttings, planted in sand under a hand-glass, will root readily.

FIG. 57.

VII. MELICY'TUS (from μελι, *meli*, honey, and κυτος, *cytos*, a cavity; because of the filaments which are called nectaries by Forster bearing on the tip a meliferous cavity.) Forst. gen. t. 62. D. C. prod. 1. p. 257.

LIN. SYST. *Diœ'cia, Pentándria.* Petals 5, glandless. Male flowers. Stamens 5; filaments club-shaped; anthers adnate. Female flowers. Style very short; stigmata 4-5, rayed.

1 M. RAMIFLÒRUS (Forst. l. c. Lam. ill. t. 812. f. 1.) leaves toothed, oblong-cuneate, smooth on both surfaces. ♄. G. Native of New Zealand. Peduncles aggregate, fasciculate. Flowers very minute, whitish.

Branch-flowered Melicytus. Clt. 1822. Shrub 6 feet.

2 M.? UMBELLA'TUS (Gært. fr. 1. t. 206. t. 44. f. 3.) Perhaps the same as *M. ramiflòrus*, or perhaps a species of *Erythrospérmum?*

Umbellate-flowered Melicytus. Shrub 6 feet.

Cult. This Genus requires the same treatment as *Kiggelària*, which see.

VIII. HYDNOCA'RPUS (from *υδνον, hydnon*, a tuber, and καρπος, *karpos*, a fruit; in allusion to the fruit being crowned by 4 tubercles.) Gært. fruct. 1. p. 288. t. 60. f. 3. D. C. prod. 1. p. 257.

LIN. SYST. *Diœ'cia, Pentándria.* Male flower. Sepals 5, two outer ones ovate. Petals 5, with villous margins, furnished with a scale on the inside. Stamens 5. Female flower? Berry spherical, terminated by 4 reflexed tubercles. Placentas 4, many-seeded. A tree with flexuous branches, and alternate broad leaves.

1 H. INE'BRIANS (Vahl. symb. 3. p. 100.) ♄. S. Native of Ceylon. H. venenàta, Gært. fr. l. c. The fruit, when eaten, occasions giddiness, and is greedily devoured by fishes; but when fish are taken by means of this fruit they are not eatable, as they occasion vomiting and other violent symptoms.

Inebriating Hydnocarpus. Tree 30 feet?

Cult. This tree, if ever it should be introduced to the gardens, will probably thrive in a mixture of loam and peat, and ripened cuttings will root in sand, under a hand-glass, in heat.

Tribe IV.

ERYTHROSPE'RMEÆ (shrubs agreeing with *Erythrospérmum* in some important characters.) D. C. prod. 1. p. 257. Flowers hermaphrodite. Petals and stamens 4-7. Fruit indehiscent, somewhat baccate.

IX. ERYTHROSPE'RMUM (from ερυθρος, *erythros*, red, and σπερμα, *sperma*, a seed; because the seeds are red.) Lam. ill. t. 274. D. C. prod. 1. p. 257.

LIN. SYST. *Tetra-Heptándria, Tetra-Pentagýnia.* Calyx 4-sepalled, deciduous. Petals 4-7, scarcely longer than the calyx. Stamens 4-7: filaments very short. Ovary roundish. Stigmas 3-5. Fruit many-seeded. Very smooth unarmed shrubs. Flowers small, greenish-yellow.

1 E. MACROPHY'LLUM (Poir. suppl. 2. p. 585.) leaves scattered, lanceolate, blunt, mucronate; racemes shorter than the leaves. ♄. S. Native of the Mauritius.

Long-leaved Erythrospermum. Shrub.

2 E. PANICULA'TUM (Poir. l. c.) leaves scattered, ovate, blunt at both ends; racemes panicled, longer than the leaves. ♄. S. Native of the Mauritius.

Var. β, pauciflòrum, (D. C. prod. 1. p. 257.) racemes 2-4-flowered.

Paniculate-racemed Erythrospermum. Shrub.

3 E. ELLI'PTICUM (Poir. l. c. p. 585.) leaves scattered, elliptically-roundish, blunt at both ends; racemes few-flowered, longer than the leaves. ♄. S. Native of the Mauritius.

Var. β, mucronàtum (D. C. prod. 1. p. 528.) leaves ovate-mucronate. ♄. S. Native of Java.

Elliptic-leaved Erythrospermum. Shrub.

4 E. AMPLEXICAU'LE (D. C. prod. 1. p. 852.) leaves scattered, crowded at the top of the branches, oval, cordate at the base; peduncles somewhat umbellate, shorter than the leaves. ♄. S. Native of the Mauritius.

Stem-clasping-leaved Erythrospermum. Shrub.

5 E. PYRIFÒLIUM (Lam. ill. t. 274. f. 1.) leaves scattered, on very short footstalks, blunt at both ends; racemes somewhat terminal, shorter than the leaves. ♄. S. Native of the Mauritius.

Pear-leaved Erythrospermum. Shrub.

6 E. VERTICILLA'TUM (Lam. ill. t. 274. f. 2.) leaves 3 in a whorl, almost sessile, roundish; peduncles corymbosely-umbellate at the top, length of the leaves. ♄. S. Native of the Mauritius and Bourbon. The fruit of this species is referable to the genus *Kiggelària.*

Whorl-leaved Erythrospermum. Shrub.

Cult. These shrubs will thrive well in a mixture of loam, peat, and sand, and ripened cuttings will root if planted in a pot of sand, and placed under a hand-glass, in heat. †

ORDER XIX. BIXI'NEÆ. Kunth. malv. p. 17. nov. gen. amer. 5. p. 331. D. C. prod. 1. p. 259.

Calyx of 4-8 sepals, which are imbricate in the bud, these are sometimes truly distinct, and sometimes they are connected at the base. Petals 5, or wanting, but when present they are very like the sepals. Stamens indefinite in number, inserted in the receptacle or at the bottom of the calyx; filaments free; anthers 2-celled. Ovary superior, sessile, 1-celled. Style 1, undivided, or 2-4-cleft at the apex. Fruit capsular or baccate, 1-2-celled, many-seeded. Seeds fixed to parietal placentas, which are from 1-7 in number, the seeds of all are probably inwrapped in a fleshy membrane. Albumen fleshy or very thin. Embryo inclosed. erectish, or curved with leafy cotyledons, and with the radicle looking towards the hilum (Kunth). Smoothish tropical trees, with alternate, simple, entire, or slightly-lobed leaves, which are generally full of pellucid dots. The stipulas are caducous. The peduncles are axillary or terminal, bracteate, 1 or many-flowered, usually forming terminal panicles. Flowers middle-sized. The genera of this order are very imperfectly known. The habit of the plants come near to *Malvàceæ* and *Flacourtiàneæ*, but the character of the fruit comes nearer to *Cistineæ* and

Flacourtiàneæ. This order is composed of tropical trees and shrubs, not remarkable for either beauty or use. The seeds called *Arnotta* in the shops are the produce of *Bíxa Orellàna*, these are used for colouring cheese. The seeds retain their power of vegetating a considerable time, therefore in most instances they may be introduced from any part of the world in a living state.

Synopsis of the Genera.

* *Petals present.*

1 Bí'xa. Petals and sepals 5. Style long, ligulate at the apex. Capsule 1-celled, 2-valved, prickly.

2 Echinoca'rpus. Calyx 4-parted. Petals 4-5, cut. Style awl-shaped. Capsule woody, 1-celled, 4-valved, prickly.

3 Trichospe'rmum. Sepals and petals 5. Style wanting. Stigma emarginate. Capsule kidney-shaped, 1-celled, 2-valved, hairy.

4 Bana'ra. Calyx 6-parted, permanent. Petals 6. Stigma capitate. Berry very succulent.

5 Læ'tia. Calyx 5-parted. Petals 5, or wanting. Stigma capitate. Berry fleshy, 2-5-valved.

* * *Petals absent.*

6 Hasse'ltia. Calyx 4-parted. Petals wanting. Stigma simple. Fruit 1-2-celled; cells 1-2-seeded.

7 Pro'ckia. Calyx 3-5-parted, permanent. Petals wanting. Stigma entire. Berry dry, 4-6-seeded.

8 Lu'dia. Calyx 5-7-parted, permanent. Petals wanting. Style filiform. Stigma trifid. Berry 6-7-seeded.

9 Aza'ra. Calyx 4-5-parted. Petals wanting. Style awl-shaped. Stigma obtuse. Berry many-seeded.

10 Ku'hlia. Calyx campanulate, 6-8-cleft, closed, permanent, inner segments largest. Corolla none. Fruit 1-celled, many-seeded.

I. BI'XA (*Bixa* is the American name of *B. orellàna.*) Lin. gen. no. 654. H. B. et Kunth, nov. gen. am. 5. p. 353. D. C. prod. 1. p. 259.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 5 sepals; sepals orbicular, tuberculated at the base, deciduous, imbricated in æstivation. Petals 5, obovate. Stamens numerous, hypogynous, free; filaments filiform; anthers ovate. Ovary one. Style one, long, almost ligulate and compressed at the top. Capsule 1-celled, 2-valved; valves covered with bristles on the outside, each bearing a linear placenta on the inside in the middle. Seeds 8-10 on each side of the placenta, clothed with a farinaceous red pulp. Albumen fleshy. Embryo erect. Cotyledons leafy, flat, parallel, transversely plaited in the middle. Gært. fruct. 1. t. 61. Trees with broad cordate leaves, and dichotomous panicles of large reddish flowers, and prickly capsules.

1 B. orella'na (Lin. spec. 730.) leaves cordate, ovate, acuminated, entire or angular, smooth on both surfaces. ♄. S. Native of South America by the sides of bogs and fountains. Cultivated in the West India islands. Sloane, hist. 2. p. 52. t. 181. f. 1. Comm. hort. amst. 1. t. 33. B. Americàna, Poir. dict. 6. p. 229. Corymbs terminal, panicled; peduncles 2-3-4-flowered. Flowers pale peach-coloured. In Holland the seeds of this tree are called *Orleane;* in Germany, *Orleansbaum, Bischofsmutze, Anotta.* In England we have taken the latter of these names, spelling it variously *Arnotto, Anotta, Anota, Annoto.* The French have adopted the Brasilian name *Uruku* or *Urucu*, spelling it *Roucouyer, Roucou*, or *Rocurier des Indes.* The Portuguese have also the same appellation, *Urucu* or *Urucueira.* In Spanish it is *Anato* or *Atolle.* In the Mexican language *Achiotl.* Scalager calls it *Arbor finium regundorum*, because the Mexicans made plans, and marked the boundaries of their lands on tablets with the colour prepared from the pulp which surrounds the seeds. Tournefort named it *Mitella* from the resemblance of the capsule, when open, to a mitre.

The drug called *Arnotta* is thus prepared from the red pulp which covers the seeds. The contents of the fruit are taken out and thrown into a wooden vessel, where as much hot water is poured upon them, as is necessary to suspend the red powder or pulp, and by diligent stirring and pounding the pulp is separated from the seeds, or gradually washed off with the assistance of a spatula or spoon. When the seeds appear quite naked they are taken out, and the wash is left to settle; after which the water is gently poured away, and the sediment put into shallow vessels, to be dried by degrees in the shade. After acquiring a due consistence it is made into balls or cakes, and set to dry in an airy place until it is perfectly firm. Some persons first pound the contents of the fruit with wooden pestles; then covering them with water, leave them to steep six days. This liquor being passed through a coarse sieve, and afterwards through three finer ones, is again put into the vat or wooden vessel, and left to ferment a week. It is then boiled until it is pretty thick, and when cool is spread out to dry, and then made up into balls, which are usually wrapped up in leaves. *Arnotta* of a good quality is of the colour of fire, bright within, soft to the touch, and dissolves entirely in water. It is reputed cooling and cordial, and is much used by the Spaniards in their chocolate and soups, both to heighten the flavour and to give them an agreeable colour. It is esteemed a good antidote to dysentery and disorders of the kidneys, and is recommended as a good stomachic cordial, and a preservative against retention of urine. Mixed with lemon-juice and a gum it makes the crimson paint with which the Indians adorn their persons. It was formerly used by dyers to form the colour called Aurora, but at present it is not held in such high estimation as a dye, though it still maintains its ground with painters. *Arnotta* is well known to be the drug which is used for colouring the cheese in Gloucestershire, under the name of cheese-colouring. It is used in Holland for colouring butter. *Arnotta* gives but a pale brownish yellow colour to water, and is not soluble in that liquid, nor in spirit of wine; but in order to be fit for dyeing, it requires an alkaline menstruum, to which it gives a bright orange colour, and hence it was formerly used as an ingredient in varnishes and lacquers, and in dyeing wax of a vermilion colour; but in dyeing cloths it is of little use, as the colour is discharged by exposure to the air and by soap. The bark of the tree makes good ropes for the common plantation uses in the West Indies; and pieces of the wood are used by the Indians to procure fire by friction. The specific name *Orellàna* is given to this tree because it is believed that it grows principally towards the borders of Orellana in South America.

Arnotta is said to be an antidote to the poisonous juice of Manihot. The liquid formerly sold under the name of "Scot's nankeen dye," seems to be nothing but *Arnotta* dissolved in alkaline ley.

Orellana or Common Arnotta or Anotta-Tree. Fl. May, Aug. Tree 30 feet.

2 B. Urucura'na (Willd. enum. p. 565.) leaves with white scales or dots on the under surface. ♄. S. Native of Brasil. Flowers like the last. *Uruca* or *Uruka* is the Brasilian name of the tree.

Uruca Arnotta. Clt. 1823. Tree?

3 B. platyca'rpa (Ruiz, et Pav. fl. per. 5. t. 459.) capsules nearly kidney-shaped, flat, with very few prickles; pedicels very thick towards the flower; leaves cordate, entire, strongly

ribbed. ♄. S. Native of Peru or Chili. Corymbs terminal, panicled; peduncles 2-3-flowered.

Broad-capsuled Arnotta-Tree. Tree 20 feet.

4 B. ODORA'TA (Ruiz, et Pav. fl. per. 5. t. 460.) leaves cordate, acuminated, with one small lobe on each side, and therefore the leaves appear as if they were 3-lobed. ♄. S. Native of Peru or Chili. Corymbs terminal, panicled; peduncles 2-flowered.

Sweet-scented Arnotta-Tree. Tree 20 feet.

5 B. PURPU REA (Hort.) leaves like those of *Bixa Orellàna*. The flowers and capsules are purple. ♄. S. Native of the East Indies.

Purple Arnotta-Tree. Clt. 1820. Tree 20 feet.

Cult. These trees grow to a large size before they can be got to flower from seed. But if cuttings be taken from a flowering plant and struck, they may be brought to flower when small plants. Loam and peat suit them well, and cuttings root freely in sand under a hand-glass, in heat.

II. ECHINOCA'RPUS (from εχινος, *echinos*, a hedgehog, and καρπος, *karpos*, a fruit; in allusion to the prickly capsules). Blum. bijdr. fl. ind. ned. ex Schlecht. Linnæa. 1. p. 645.

LIN. SYST. *Polyándria, Monogýnia.* Calyx 4-parted, deciduous. Petals 4-5, cut. Stamens numerous, hypogynous; anthers pointed. Ovary 1. Style awl-shaped. Stigma simple. Capsule woody, 4-valved; valves echinated on the outside, but filled with farinaceous pulp in the inside. Seeds arillate at the base, 1 or 2 adhering to the middle of each valve. A tree with alternate, stalked, oval-acute or acuminated leaves, and 1-flowered lateral peduncles.

1 E. SIGUN (Blum. l. c.) ♄. S. Native of Java, where the tree is called *Sigun*.

Sigun. Tree 120 feet.

Cult. For the cultivation and propagation of this tree, see *Bixa*.

III. TRICHOSPE'RMUM (from θριξ τριχος, *thrix trichos*, a hair, and σπερμα, *sperma*, a seed; in allusion to the seeds being ciliated.) Blum. bidjr. fl. ind. ned. ex Schlecht. Linnæa 1. p. 645.

LIN. SYST. *Polyándria, Monogýnia.* Calyx of 5 oval deciduous sepals, which are imbricate in the bud. Petals 5, oval, rather smaller than the calyx. Stamens indefinite, free, hypogynous; anthers twin. Ovary somewhat bilocular, crowned by 2? emarginate stigmas. Capsules kidney-shaped, 2-valved, hairy on the outside, bearing the seeds on linear intervalvular placentas? Seeds numerous, lenticular, arillate, ciliated. Albumen fleshy. A tree with alternate ovate-oblong serrulated leaves, which are cordate at the base, and furnished with 2 glands beneath. Stipulas ovate. Flowers disposed in cymes, which are axillary and solitary.

1 T. JAVA'NICUM (Blum. l. c.) ♄. S. Native of Java. Flowers reddish?

Java Trichospermum. Tree 50 feet.

Cult. This tree will grow well in a mixture of loam and sand; and ripened cuttings will strike freely, if planted in a pot of sand, and placed under a hand-glass, in heat.

IV. BANA'RA (the name of a shrub in Guiana.) Aubl. guian. 1. p. 547. D. C. prod. 1. p. 259.

LIN. SYST. *Polyándria, Monogýnia.* Calyx permanent, 6-parted; lobes rounded. Petals 6, roundish, inserted beneath the disk. Stamens 15 and more, inserted at the edge of the the disk. Ovary orbicular, seated on the disk. Style one. Stigma capitate. Berry scarcely succulent, terminated by the style. Seeds indefinite, striated. A shrub with simple leaves, and panicles of small yellow flowers.

1 B. GUIANE'NSIS (Aubl. l. c. 217.) ♄. S. Native of Cayenne, in woods. Leaves ovate-oblong, acute, denticulated, somewhat tomentose on the under surface. Flowers yellow. Berry black.

FIG. 58.

Guiana Banara. Fl. May. Sh. 10 feet.

2 B. ROXBU'RGHII (Spreng. syst. 2. p. 472.) leaves lanceolate, remotely-toothed, tapering to the base, and quite entire, woolly beneath; panicle axillary, very villous. ♄. S. Native of the East Indies.

Roxburgh's Banara. Sh. 8 feet.

Cult. These shrubs will thrive well in a mixture of loam, peat, and sand; and ripened cuttings will root freely if planted in a pot of sand, and placed under a hand-glass, in heat.

V. LÆ'TIA (in honour of Jean de Laet of Antwerp, a director of the French East-India Company, who published a Latin history of America in folio, dedicated to King Charles I. of England. Haller speaks with respect of his botanical remarks as throwing light upon the plants of Marcgrave, and tending to reconcile his descriptions with those of Clusius and the Spanish botanists.) Lin. gen. no. 651. D. C. prod. 1. p. 260.

LIN. SYST. *Polyándria, Monogýnia.* Calyx 5-parted, marcescent, coloured. Petals 5, or wanting. Stamens indefinite, hypogynous; anthers roundish. Style one; stigma capitate. Capsule fleshy, 3-5-valved, small, globose, acuminated with the style. Seeds many, clothed with a pulpy pellicle. Trees with simple leaves, and axillary peduncles of small whitish flowers with yellow anthers.

* *Flowers apetalous.*

1 L. APE'TALA (Jacq. amer. 167. t. 108.) flowers apetalous; peduncles terminal and axillary, usually 3-flowered; leaves oblong, blunt, serrulated, shining above. ♄. S. Native of Carthagena, in woods, and at the river Magdalena, as well as in Brazil and Peru. H. B. and Kunth, nov. gen. amer. 5. p. 354. Flowers white, like those of *Hawthorn*. Fruit ovate, 4-angled. Mart. fl. bras. 2. p. 78. t. 165. Ruiz, et. Pav. fl. per. 5. t. 467. b.

Petalless Lætia. Fl. Apr. May. Tree 20 feet.

2 L. SCA'BRA (Spreng. syst. 2. p. 609.) leaves oval, somewhat denticulated, opaque, scabrous on the under surface, triple-nerved; peduncles axillary, tern; calyx silky. ♄. S. Native of Hispaniola.

Scabrous Lætia. Shrub.

3 L? GUIDÒNIA (Swz. prod. 83.) flowers petalless; peduncles 1-flowered, terminal; leaves oblong, acuminate, pubescent. ♄. S. Native of Jamaica. Guidònia, Browne, jam. 249. t. 29. f. 4.? Sámyda icosándra, Swz. fl. ind. occ. 3. p. 1962. Style very short. Capsule fleshy, 3-valved. Perhaps a species of Sámyda? The tree is called *Rod-wood* in Jamaica. The wood is used in all sorts of buildings. Flowers white? Fruit beautiful red. *Guidònia* is probably the name of the tree in Jamaica.

Guidonia Lætia. Tree 30 feet.

4 L. THA'MNIA (Swz. fl. ind. occ. 2. p. 950.) flowers petalless; peduncles axillary, many-flowered, sub-divided; leaves oblong, acute, somewhat crenated, shining. ♄. S. Native in the south of Jamaica, in bushy places by the sea side. Thám-

nia, Browne, jam. 245. t. 25. f. 2. Helwíngia, Adans. Flowers about the size of a myrtle, with the calyx purple outside, and white within, with yellow anthers. The specific name is derived from *θαμνος*, a shrub.

Shrubby Lætia. Clt.? Shrub 8 feet.

5 L. PARVIFLÒRA (Spreng, syst. 2. p. 609.) leaves obovate-oblong, rather villous on both surfaces; panicles axillary, tomentose; flowers glomerate. ♄. S. Native of Brazil. Flowers small, white.

Small-flowered Lætia. Shrub 8 feet.

* * *Flowers complete, that is to say, with both petals and sepals.*

6 L. COMPLE'TA (Jacq. amer. 167. t. 183. f. 60.) flowers 5-petalled; leaves ovate, obtuse, serrated, wrinkled, glabrous. ♄. S. Native of Carthagena, in woods. Flowers white? Berry yellowish-red, slightly triangular.

Complete-flowered Lætia. Fl. Ju. July. Shrub 10 feet.

† *Species, the flowers of which are not sufficiently known.*

7 L. HIRTE'LLA (H. B. et Kunth, nov. gen. amer. 5. p. 355.) branchlets hairy, as well as the leaves on the under surface, on the nerves, and veins, oblong, sharply denticulated; peduncles 1-fruited. ♄. S. Native near Cumana. Flowers not seen.

Hairy Lætia. Shrub 8 feet.

8 L. GUAZUMÆFÒLIA (H. B. et Kunth, l. c.) branchlets clothed with rusty tomentum; leaves oblong, bluntish, obsoletely-denticulated, hairy on the under surface, particularly on the nerves and veins; peduncles dichotomous, many-flowered? ♄. S. Native of New Andalusia, near Bordones. Flowers white, with yellow anthers.

Guazuma-leaved Lætia. Tree 30 feet.

Cult. These shrubs will thrive well in a mixture of loam, peat, and sand; and cuttings planted in sand, under a hand-glass, and placed in a moderate heat, will root readily.

VI. HASSE'LTIA (Van Hasselt, a naturalist, sent by the Dutch government to Java.) H. B. et Kunth, nov. spec. amer. 7. p. 236. t. 651.

LIN. SYST. *Polyándria, Monogýnia.* Calyx 4-parted. Petals 4. Anthers 2-celled. Glands 8, perigynous. Style 1. Fruit almost globose, 1-2-celled; cells 1-2-seeded. A tree with oblong, toothed, 5-nerved leaves, with two glands at the base, without stipulas, and umbellate terminal cymes of flowers. Flowers small, with a white calyx.

1 H. FLORIBU'NDA (H. B. l. c.) ♄. S. Native of South America, at the river Magdalena.

Bundle-flowered Hasseltia. Tree 40 feet.

Cult. For the cultivation and propagation of this tree, see *Bixa*.

VII. PRO'CKIA (a name of unknown meaning.) Browne in Lin. gen. no. 674. Lam. dict. p. 625. ill. t. 465. D. C. prod. 1. p. 260.

LIN. SYST. *Polyándria, Monogýnia.* Calyx permanent, 3-5-parted; lobes roundish, unequal. Petals none. Stamens numerous, inserted in the disk; anthers roundish. Ovary one, roundish. Stigma entire. Berry rather dry, 4-6-seeded, roundish, smooth. Shrubs with the habit of *Grèwia*, from America or the Mauritius, with alternate, entire, or toothed leaves. Flowers yellow, sometimes unisexual from abortion.

SECT. I. PROCKIA'RIA (see genus.) D. C. prod. 1. p. 260. Style filiform. Stigma blunt, or acutish.

1 P. CRU'CIS (Lin. spec. 745.) leaves ovate, acuminated, serrated; stipulas somewhat falcate; racemes few-flowered, terminal. ♄. S. Native of the islands of Santa Cruz and Cuba. Calyx 3-4-sepalled. Vahl. symb. 3. p. 69. t. 64. Lindl. bot. reg. t. 972. P. acùta, Moc. et Sesse, fl. mex. icon. ined.? but the leaves are narrower. Flowers yellow.

Var. β, cordàta (D. C. prod. 1. p. 260.) leaves cordate; calyx 4-5-sepalled; stipulas linear. ♄. S. Native of the island of Santa-Cruz. Lam. ill. 465. f. 1.—P. subcordàta, Moc. et Sesse, fl. mex. icon. ined. Flowers yellow.

Santa-Cruz Prockia. Fl. July. Clt. 1823. Shrub 5 feet.

2 P. SEPTENNE'RVIA (Spreng. syst. 2. p. 609.) leaves cordate-oblong, acuminated, serrated, pubescent beneath, 7-nerved; stipulas semi-cordate; racemes lateral, usually 8-flowered, pilose. ♄. S. Native of Brazil. Flowers yellow.

Seven-nerved-leaved Prockia. Shrub 5 feet.

3 P. DELTOÌDES (Lam. ill. t. 465. f. 3.) leaves roundish-deltoid, crenately subsinuated; pedicels axillary, generally in pairs. ♄. S. Native of the Mauritius and Madagascar.

Deltoid-leaved Prockia. Shrub 4 feet.

SECT. II. APHLO'IA D. C. prod. 1. p. 261. Lightfoòtia, Swz. prod. 83. but not of Lher. Style wanting, or scarcely evident. Stigma broad, somewhat orbicular, flattish.

4 P. SERRA'TA (Willd. spec. 2. p. 1213.) leaves oblong-ovate, serrated, acuminated; peduncles lateral, aggregate, 1-flowered. ♄. S. Native of the island of Montserrat. Flowers yellow.

Serrated-leaved Prockia. Clt. 1822. Shrub 3 feet.

5 P. INTEGRIFÒLIA (Willd. spec. 2. p. 1214.) leaves somewhat leathery, oval or obovate, entire or a little toothed, obtuse, or somewhat emarginate; peduncles 1 or 4 together, axillary 1-flowered. ♄. S. Native of the Mauritius. Lightfoòtia integrifòlia, Vahl. symb. 3. p. 70. Flowers yellow.

Var. β, ovàta (Poir. dict. 5. p. 626.) flowers almost disposed in little axillary umbels. ♄. S. Lam. ill. t. 465. f. 2.

Entire-leaved Prockia. Shrub 6 feet.

6. P. THEÆFO'RMIS (Willd. spec. 2. p. 1214.) leaves rather membranous, elliptical-lanceolate, bluntly serrated, somewhat revolute on the margin at the base, and running into the petiole; pedicels 1 to 3, axillary 1-flowered. ♄. S. Native of the island of Bourbon. Lightfoòtia theæfórmis, Vahl. symb. 3. p. 69. Lùdia heterophýlla, Bory. voy. 2. p. 115. t. 24. lower figure. Flowers yellow.

Var. β, laciniàta (Poir. dict. 5. p. 627.) leaves pinnatifid; lobes mucronate, entire, or toothed. ♄. S. Lùdia heterophýlla, Bory. voy. 2. t. 24. upper figure.

Tea-formed Prockia. Clt. 1822. Shrub 12 feet.

† *Species not sufficiently known.*

7 P. LOBA'TA (Poir. dict 5. p. 627.) leaves ovate, acuminate, serrated; peduncles axillary, racemose, 3-5-flowered; stigma almost sessile, 5-lobed. ♄. S. Native country unknown. Lítsea, Lam. ill. 834. Flowers yellow.

Lobed-stigmaed Prockia. Shrub 6 feet.

8 P. MACROSTA'CHYA (Moc. et Sesse, fl. mex. icon. ined. et D. C. prod. 1. p. 261.) leaves ovate-lanceolate, acuminated, quite entire; racemes terminal, elongated, naked; calyx 4-parted, obtuse; fruit 1-seeded. ♄. S. Native of Mexico. A genus probably removed from its proper order. Stamens 12, hypogynous. Style very short; stigma orbicular.

Large-spiked Prockia. Shrub.

9 P. RACEMÒSA (Hort. Lecchi. ex Schlecht. Linnæa, 4. p. 34.) stem and branches scandent, tendrilled at the top; leaves alternate, oblong-ovate, acuminated, toothed. ♄. ◡. S. Native of?

Racemose Prockia. Shrub cl.

Cult. These shrubs thrive well in a mixture of loam, sand,

and peat; and ripened cuttings will root freely, if planted in sand, and placed under a hand-glass, in a moderate heat.

VIII. LU'DIA (from *ludo*, to sport; because of the leaves of *L. heterophýlla* sporting into different forms.) Lam. dict. 3. p. 612. ill. t. 466. D. C. prod. 1. p. 261.

Lin. syst. *Polyándria*, *Monogýnia*. Calyx permanent, 5-7-parted; lobes oval. Petals wanting. Stamens numerous, inserted in the disk; anthers roundish. Ovary one, ovate. Style filiform. Stigma trifid, rarely quadrifid. Berry dry, globose, pointed by the style, 6-8-seeded. Shrubs from the Mauritius, with lateral, almost sessile flowers, and the leaves are often of various forms on the same plant, whence the name.

1 L. heterophy'lla (Lam. l. c. t. 463. f. 1 and 2.) leaves obovate, shining, veiny, those of the young plants small and spinosely-toothed; those of the adult ones larger, and quite entire; pedicels axillary, solitary. ♄. S. Native of the Mauritius, where it is called *Bois sans ecorse*. Lùdia Mauritiàna, Raeusch. from Steud. nom. Flowers yellow.

Variable-leaved Ludia. Fl. Jul. Aug. Clt. 1823. Shrub 5 ft.

2 L. myrtifòlia (Lam. l. c. t. 466. f. 3.) leaves ovate, quite entire, veiny; pedicels axillary, solitary; style incurved. ♄. S. Native of the island of Bourbon. Flowers with white sepals and yellow anthers.

Myrtle-leaved Ludia. Fl. Jul. Aug. Shrub 5 feet.

3 L. sessiliflòra (Lam. l. c.) leaves ovate-oblong, acutish; flowers axillary, almost sessile; style straight. ♄. S. Native of the Mauritius. Lùdia tuberculàta, Jacq. hort. Schœnbr. 1. t. 112. Ovary 1-celled; ovulæ 6, adhering by pairs to the 3-parietal placentas. Flowers with a whitish calyx and stamens, and yellow anthers (f. 59.).

FIG. 59.

Sessile-flowered Ludia. Fl. Jul. Aug. Clt. 1820. Tree 12 feet.

Cult. These shrubs will thrive well in a mixture of loam, sand and peat; and ripened cuttings will root freely if planted in sand and placed under a hand-glass, in heat.

IX. AZA'RA (in honour of Joseph Nicholas Azara, a Spanish promoter of science, but botany in particular.) Ruiz, et Pav. fl. per. prod. 76. t. 36. syst. p. 137. D. C. prod. 1. p. 262.

Lin. syst. *Polyándria*, *Monogýnia*. Calyx 4-6-parted. Petals wanting. Stamens numerous; filaments filiform, free, and are, as well as many capillary threads, rising from the torus. Anthers 2-celled. Style awl-shaped. Stigma blunt. Berry pointed with the style, 1-celled, many-seeded. Placentas 3, parietal. Shrubs from Chili, with twin, unequal leaves, which are bitter to the taste. Flowers small, fragrant, yellow or white.

1 A. serra'ta (Ruiz, et Pav. l. c. and fl. per. 5. t. 465. b.) leaves by pairs, serrated, the larger one lanceolate, the smaller one roundish; corymbs terminal, many-flowered. ♄. G. Native of Chili, in groves, where it is called *Corcolen*. Shrub with a globose tufted head.

Serrated-leaved Azara. Shrub 10 feet.

2 A. integrifòlia (Ruiz, et Pav. syst. p. 138. fl. per. 5. t. 466.) leaves in pairs, quite entire, the larger one obovate, the smaller one roundish; flowers disposed in drooping spikes. ♄. G. Native in groves at Conception in Chili.

Entire-leaved Azara. Fl. Jul. Aug. Tree 18 feet.

3 A. denta'ta (Ruiz, et Pav. l. c. and fl. per. 5. t. 465. a.) leaves in pairs, toothed, the larger one elliptical, the smaller one roundish; flowers umbellate. ♄. G. Native in groves at Conception in Chili.

Toothed-leaved Azara. Shrub 5 feet.

Cult. None of these shrubs have as yet been introduced to the gardens; but should they ever be we would recommend their being grown in loam and sand; and ripened cuttings will root, if planted in sand, placed under a hand-glass, in a moderate heat.

X. KU'HLIA (in honour of Henry Kuhl, a collector of Natural History, sent by the Dutch government to Java, with Hasselt.) H. B. et Kunth, nov. spec. amer. 7. p. 236. t. 652.

Lin. syst. *Polyándria*, *Monogýnia*. Calyx campanulate, 6-8-cleft, closed, permanent, inner segments largest. Corolla wanting. Anthers 2-celled. Stigma obtuse. Fruit 1-celled, many-seeded. Trees with oblong serrated leaves, and panicles of flowers.

1 K. glau'ca (H. B. et Kunth, nov. spec. amer. 7. p. t. 652.) leaves dimidiate at the base, oblong, acutish, remotely serrated, glaucous beneath; flowers in fascicled-panicles. ♄. S. Native of New Granada. Flowers white.

Glaucous-leaved Kuhlia. Tree 20 feet.

2 K. ulmifòlia (H. B. et Kunth, l. c. t. 653.) leaves dimidiate at the base, oblong-lanceolate, acuminated, grossly serrated, green on both surfaces; flowers in panicles. ♄. S. Native of the Alps of Popaya, in South America. Flowers white.

Elm-leaved Kuhlia. Tree 20 feet.

Cult. For the cultivation and propagation of this genus see *Lùdia*.

Order XX. CISTI'NEÆ (plants agreeing with *Cistus* in many important characters.) D. C. prod. 1. p. 263. Císti, Juss. gen. 294. and Cistoìdeæ, Vent. tabl. 3. p. 219, exclusive of the allied genera.—Císti, D. C. fl. fr. 4. p. 811.

Calyx of 5 permanent sepals (f. 60. *a*.), which are continuous with the pedicel, they are usually unequal; the 2 exterior ones are usually much smaller than the others, and even sometimes almost wanting, the three inner ones are twisted when in the bud. Petals 5 (f. 60. *b*.), caducous, equal, twisted before expansion, but in a contrary direction to the sepals. Stamens usually indefinite, hypogynous, erect, free; anthers ovate, 2-celled, and 2-chinked, inserted by the base. Ovary free (f. 60. *d*. Style one, filiform, crowned by a simple stigma. Capsule constantly of 3-5 but rarely of 10 valves, sometimes bearing in the middle of each valve a longitudinal placentarious nerve, and hence the capsule is 1-celled, sometimes these middle nerves jut out more or less into dissepiments, therefore, in this case, the capsule is completely or incompletely many-celled. The seeds are therefore either truly parietal, but sometimes contiguous to the parietal placenta, or fixed to the inner angle of the dissepiment, when there is any; they are very numerous and small. Albumen mealy. Embryo spiral or curved within the albumen. Shrubs or herbs, with simple, feather-nerved, entire or toothed leaves, the first ones always opposite, the rest usually opposite, but sometimes alternate, sometimes naked at the base, but usually furnished with twin leafy stipulas. Racemes generally with the pedicels all to one side and expanding successively from the base; the raceme where the flowers are unexpanded is bent or twisted back in the manner of *scorpion-grass*.

Flowers resembling the *Rose;* petals very fugacious, usually lasting only for a day; they are yellow, white, rose, and purple, with the claws usually of a different colour from the limbs. The branches are usually covered with clammy gluten.

This order is nearly allied to *Violarièæ*, but differs from it in the flowers being always regular, and in the stamens being indefinite. It differs from *Bixíneæ* in the petals being always present, in the different æstivation of the petals, as well as in the albumen being mealy, and in the leaves never being furnished with pellucid dots. The common *Rock-Rose* gives a good idea of this order. The plants are all very ornamental, and are particularly well calculated for ornamenting rock-work or dry banks. The seeds of all retain their vegetative power for years, therefore they are easily introduced in a living state from any part of the world.

The gum called Ladanum is the produce of a species of *Cístus*, it exhales a fragrant perfume when burnt, and possesses highly tonic and stomachic properties.

Synopsis of the Genera.

1 Cístus. Calyx of 5 sepals, 2 outer ones unequal or absent. Capsule covered by the calyx, 10-5-celled, from bearing a dissepiment in the middle of each valve.

2 Helia'nthemum. Calyx of 3 equal sepals or of 5 unequal sepals. Capsule triquetrous, 1-celled, 3-valved, with a narrow dissepiment, or a placentarious nerve in the middle of each valve.

3 Hudso'nia. Calyx of 5 equal sepals. Capsule 1-celled, 3-valved, 1-3-seeded.

4 Le'chea. Calyx of 3 sepals, guarded by 2 bracteas. Petals 3. Capsule 3-valved, with a nerve or narrow dissepiment in the middle of each valve.

I. CI'STUS (κιστος in Greek is derived from κιστη, *kiste*, a box or capsule; because of the remarkable shape of the capsules.) Tourn. inst. 259. t. 136. Gært. fr. t. 76. D. C. fl. fr. 4. p. 811. prod. 1. p. 263.—Císti, spec. Lin.

Lin. syst. *Polyándria, Monogýnia.* Calyx of 5 sepals; sepals disposed in a double series, 2 outer ones unequal, sometimes wanting. Petals 5, equal, somewhat cuneated, caducous. Stamens numerous, usually exserted from the glandular disk. Style filiform. Stigma capitate. Capsule covered by the calyx, 5 or 10 valved, with a seminiferous partition in the middle of each valve, therefore 5 or 10 celled. Seeds ovate, angular. Embryo filiform, spiral. Elegant, erect shrubs or sub-shrubs, with opposite, exstipulate, entire, or somewhat toothed leaves, and axillary, 1 or many-flowered peduncles. Flowers large, beautiful, resembling a *single Rose*, red or white.

Sect. I. Erythroci'stus (from ερυθρος, *erythros*, red, and κιστος, *cistus;* because the flowers of all the species in this section are red or purple.) D. C. prod 1. p. 264. Outer sepals narrowest, and usually smallest, inner ones concave at the base, with scarious margins. Petals rose-coloured, red or purple, with a yellow spot at the base of each. Capsule 5-celled, from having 5 seminiferous partitions, one in the middle of each valve.

* §. 1. *Peduncles 1-flowered, axillary or terminal, solitary or umbellate. Style cylindrical, generally longer than the stamens. Stigma capitate, 5-furrowed.*

1 C. purpu'reus (Lam. dict. 2. p. 14.) leaves oblong-lanceolate, acuminated at both ends, wrinkled; footstalks short, hairy, sheathing; peduncles 1-2 or 3 together. ♄. F. Native of the Levant. Petals reddish-purple, marked at the base with a dark purple spot, imbricate. Flower-bud large. Ker. bot. mag. t. 408. Sweet, cist. t. 17.

Purple-flowered Rock-Rose. Fl. Ju. Jul. Clt. ? Sh. 2 feet.

2 C. heterophy'llus (Desf. fl. atl. 1. p. 411. t. 104.) leaves ovate-lanceolate, on short footstalks which are sheathing at the base; margins revolute; peduncles hairy, leafy, 1-flowered, 1-3 together. ♄. F. Sweet, cist. t. 6. Native of Algiers, on dry hills. Corolla large, red, yellow at the base. Petals imbricate.

Variable-leaved Rock-Rose. Fl. Ju. Jul. Clt.? Shrub 2 feet.

3 C. parvifo'rus (Lam. dict. 2. p. 14.) leaves ovate, acute, somewhat tomentose, drawn out into the footstalks at the base, and somewhat connate; peduncles 1 or 3 together, almost terminal. ♄. F. Native of Crete. Sweet, cist. t. 14. Smith, fl. græc. t. 495. Corolla small, purplish. Petals distinct.

Small-flowered Rock-Rose. Fl. Ju. Jul. Clt. ? Shrub 3 feet.

4 C. complica'tus (Lam. dict. 2. p. 14.) leaves roundish-ovate, bluntish, approximate, clothed with white tomentum, under surface reticulated; footstalks dilated at the base, with pilose margins, channelled above and sheathing at the base; peduncles short, 1-flowered, 3 or 4 together, somewhat terminal. ♄. F. Native of the Levant; also of the mountains of Valentia, in Spain. Flowers small, rose-coloured, or purplish.

Complicated Rock-Rose. Fl. Ju. Jul. Clt. 1818. Sh. 3 feet.

5 C. villo'sus (Lam. dict. 2. p. 12.) leaves roundish-ovate, wrinkled, tomentose and hairy, stalked; footstalks furrowed, connate at the base; peduncles 1-flowered, 1 or 3 together; sepals villous. ♄. F. Native of Italy, Spain, and Barbary. Cístus pilòsus, Lin. spec. 737. Duh. arb. 1. p. 67. t. 64. Petals large, reddish-purple, spreading, imbricate at the base.

Villous Rock-Rose. Fl. Ju. Jul. Clt. 1640. Sh. 3 feet.

6 C. rotundifo'lius (Sweet, cist. t. 75.) leaves roundish-ovate, obtuse, flat, wrinkled, reticulately veined, clothed on both surfaces with fascicled hairs; petioles furrowed, somewhat sheathing at the base; peduncles very hairy, rather cymose; sepals cordate, acute, pilose; petals imbricate. ♄. F. Native of the south of Europe. Cístus villòsus, β, viréscens, D. C. prod. 1. p. 264. ?—Barrel. icon. 1315. Petals purple, with a yellow mark at the base of each.

Round-leaved Rock-Rose. Fl. June, Sept. Clt. 1640. Sh. 1 foot.

7 C. Cre'ticus (Lin. spec. 1. p. 738.) leaves spatulate-ovate, tomentosely-hairy, wrinkled, drawn out along the short footstalk, waved on the margin; peduncles 1-flowered; sepals villous. ♄. F. Native of Crete and Syria. Jacq. icon. rar. 1. t. 95. Sweet, cist. t. 63. Smith, fl. græc. 495.—Buxb. cent. 3. p. 34. t. 64. f. 1. Petals purple, yellow at the base, imbricate. Sepals acuminate. Capsule pilose, round.

Var. β, *crispàtus* (D. C. prod. 1. p. 264.) leaves waved or curled. Flowers purple.

Var. γ, *Taúricus* (D. C. prod. 1. p. 264.) leaves flat, very villous on the under surface, as well as sepals. ♄. F. Native of Tauria. Cístus Créticus, Bieb. Flowers purple.

Cretan Rock-Rose. Fl. Ju. July. Clt. 1731. Shrub 2 feet.

8 C. inca'nus (Lin. spec. 737.) leaves spathulate, tomentose, wrinkled, somewhat 3-nerved, sessile, somewhat connate at the base, upper ones narrower; peduncles 1-3-flowered. ♄. F. Native of Spain, and France about Narbonne. Curt. bot. mag. t. 43. Smith, fl. græc. 494. Petals emarginate, reddish-purple, imbricate.

Hoary Rock-Rose. Fl. Ju. Aug. Clt. 1596. Shrub 3 feet.

9 C. cane'scens (Sweet, cist. t. 45.) leaves oblong-linear, bluntish, tomentose, hoary, waved, rather 3-nerved, sessile, somewhat connate at the base; peduncles terminal, 1-flowered, or somewhat cymose; sepals ovate, acute, nerved, clothed with starry

pubescence; petals obovate, distinct. ♄. F. Native of the south of Europe. Petals crenulated, of a darkish-purple, tinged with blue and with a yellow spot at the base of each. Cístus. Mas. Clus. hist. p. 69. icon. C. incànus β, D. C. prod. 1. p. 264.

Canescent-leaved Rock-Rose. Fl. May, June. Clt.? Sh. 2 ft.

10 C. undula'tus (Dun. ined. in D. C. prod. 1. p. 264.) leaves sessile, linear-oblong, acute, with waved margins, 3-nerved at the base; peduncles solitary, each furnished with a bractea; sepals taper-pointed, villous. ♄. F. Native? Flowers purple, with a yellow mark at the base of each petal. Perhaps only a cultivated variety of *Cístus críspus*.

Waved-leaved Rock-Rose. Fl. June, July. Clt.? Shrub 2 ft.

11 C. cri'spus (Lin. spec. 738.) leaves sessile, linear-lanceolate, undulately-curled, 3-nerved, wrinkled, pubescent; flowers almost sessile, 3 or 4 together, somewhat umbellate. ♄. F. Native of the south of France, Spain, and Portugal. Cav. icon. 2. p. 57. t. 174. Sweet, cist. 22. Petals purple.

Curled-leaved Rock-Rose. Fl. Ju. Aug. Clt. 1656. Shrub 2 ft.

12 C. a'lbidus (Lin. spec. 737.) leaves sessile, oblong-elliptical, hoary-tomentose, somewhat 3-nerved; flowers 3 or 8, terminal, somewhat umbellate; outer sepals largest. ♄. F. Native of France about Narbonne, Spain, and Portugal. Petals pale-purple, yellow at the base, imbricate.

White-leaved Rock-Rose. Fl. Ju. Aug. Clt. 1640. Shrub 2 ft.

13 C. candidi'ssimus (Dun. ined. in D. C. prod. 1. p. 264.) leaves ovate-elliptical, acute, densely clothed with hoary tomentum, 3-nerved; footstalks short and sheathing at the base, with pilose margins; peduncles solitary, 1-flowered, shorter than the leaves; outer sepals one-half shorter than the rest. ♄. F. Native of the Grand Canary Island in elevated pine forests. Flowers pale rose-coloured. Petals distinct. Sweet, cist. t. 3.

Whitest-leaved Rock-Rose. Fl. Ju. Aug. Clt. 1817. Sh. 4 ft.

14 C. vagina'tus (Ait. hort. kew. 3. p. 304.) leaves lanceolate, acute, 3-nerved, hairy, under surface reticulated; footstalks furrowed, dilated, and sheathing at the base, with pilose margins; peduncles 3-flowered, axillary or terminal, long, bracteate at the base. ♄. F. Native of the island of Teneriffe. Jacq. hort. Schœnbr. 3. p. 17. t. 282. Sweet, cist. 9. Cístus symphytifòlius, Lam. dict. 2. p. 15. Corolla yellowish at the base, the rest pale-purple. Petals imbricate.

Sheathed-petioled Rock-Rose. Fl. April. June. Clt. 1779. Shrub 2 feet.

15 C. seri'ceus (Vahl. symb. 1. p. 37.) leaves ovate, tomentose, 3-nerved, lower ones on footstalks, upper ones sessile; peduncles hairy. ♄. F. Native of Spain.—Barrel. icon. 1315. Hairs of the peduncles long, purplish. Petals and filaments purple. Anthers yellow.

Silky-leaved Rock-Rose. Fl. Ju. Jul. Clt. 1826. Shrub 3 ft.

16 C. hy'bridus (Vahl. symb. 1. p. 37.) leaves ovate, hoary, on footstalks; branches beset with yellow scales; peduncles elongated, subracemose, hairy; outer sepals caducous. ♄. F. Native of Spain. Petals purple.

Hybrid Rock-Rose. Fl. June, July. Shrub 3 feet.

§ 2. *Peduncles cymose. Style almost wanting. Stigma capitate, shorter than the stamens.*

17 C. cymòsus (Dunal, ined. in D. C. prod. 1. p. 265.) leaves broad-ovate, twisted at the top, acutish, under surface wrinkled and hoary; footstalks dilated at the base, and somewhat sheathing, furrowed above; peduncles cymose, 5-10-flowered, hoary, axillary or terminal. ♄. F. Native of?—formerly cultivated in the garden of Cels, under the name of *Cístus incànus*. Petals purple, with a yellow mark at the base of each.

Cymose-flowered Rock-Rose. Fl. June, Aug. Shrub 3 feet.

Sect. II. Ledònia (ληδον, *ledon*, a name given by Dioscorides to a tree that produces a substance like ladanum, which is supposed to be *Cístus Lèdon*.) D. C. prod. 1. p. 265. Sepals 5, 2 outer ones largest, and very much pointed, or wanting. Petals white or whitish, with a yellow or purple mark at the base of each. Stamens numerous, longer than the pistil. Stigma almost sessile, large, capitate. Capsules 5 or 10-celled, from being furnished with 5 or 10 seminiferous partitions, one in the middle of each valve. Shrubs or sub-shrubs. Leaves usually covered with clammy gluten.

§ 1. *Peduncles 1-flowered, or many-flowered, cymose. Sepals 5, outer ones usually cordate at the base, and pointed at the apex. Capsules 5-celled.*

* *Peduncles naked at the base, usually bearing beneath their middle two opposite small leaves.*

18 C. salvifòlius (Lin. spec. 738.) leaves stalked, ovate, obtuse, wrinkled, under surface tomentose; peduncles long, white from tomentum, 1-flowered, articulated above, solitary or tern. ♄. H. Native of Switzerland, south of France, Italy, Greece, Spain, and Portugal. Cav. icon. 2. p. 31. t. 137. Jacq. coll. 2. p. 120. t. 8. Sweet, cist. 54. Smith, fl. græc. t. 497. Cístus fémina, Clus. hist. 1. p. 70. icon. Flowers middle-sized, white. (f. 60.)

FIG. 60.

Var. α, *erectiúsculus* (D.C. prod. 1. p. 265.) stem erectish.

Var. β, *ochroleùcus* (D.C. prod. l. c.) flowers cream-coloured.

Sage-leaved Rock-Rose. Fl. Ju. Aug. Clt. 1548. Shrub 2 feet.

19 C. obtusifòlius (Sweet, cist. t. 42.) leaves almost sessile, tapering to the base, ovate-oblong, obtuse, wrinkled, clothed with starry pubescence; margins somewhat denticulated; peduncles terminal, cymose, many-flowered; outer sepals broadly-cordate, acute; petals obcordate, imbricated. ♄. F. Native of Crete. Petals white, with a yellow spot at the base of each.

Obtuse-leaved Rock-Rose. Fl. June, Aug. Clt.? Sh. 1 to 1½ ft.

20 C. Cupania'nus (Presl. ex Spreng. syst. append. p. 206.) stem erect; leaves stalked, cordate-ovate, acute, wrinkled, reticulately-veined, upper surface scabrous, under surface covered with fascicled hairs, margin fringed; peduncles pilose, 2-3-flowered; sepals villous, acuminated; petals imbricated. ♄. F. Native of Sicily. Flowers white, with a spot of yellow at the base of each petal. Sweet, cist. t. 70.

Cupani's Rock-Rose. Fl. Ju. July. Clt.? Shrub 2 feet.

21 C. acutifòlius (Sweet, cist. t. 78.) leaves cordate-ovate, 3-nerved, reticulately-veined, pubescent on both surfaces; branches twiggy, diffuse, rather prostrate; peduncles tomentose, generally 3-flowered; sepals cordate, acute, shining, rather pilose, ciliated; petals obcordate, imbricated at the base. ♄. H. Native —? Petals white, yellow at the bottom. C. salvifòlius β, humifûsus, D. C. prod. 1. p. 265.

Acute-leaved Rock-Rose. Fl. May, Sept. Clt. 1548. Sh. rather procumbent.

22 C. Corbarie'nsis (Pourr. in herb. D. C. prod. 1. p. 265.) leaves stalked, somewhat cordate, ovate, acuminated, with fringed margins, wrinkled on both surfaces and very glutinous; peduncles long, 1-5-flowered. ♄. H. Native of the south of France on the mountains called Les Corbieres, and in Spain. Sweet, cist. 8. C. hýbridus, Pourr. chlor. narb. p. 36. not of Vahl. C. salvifòlius β, D. C. fl. fr. 4. p. 813. Petals white, imbricate.

Corbiere Rock-Rose. Fl. May, June. Clt. 1656. Shrub 2½ ft.

23 C. Florenti'nus (Lam. dict. 2. p. 17.) leaves narrow-lanceolate, wrinkled, reticulated on the under surface, almost sessile; peduncles villous, generally 3-flowered. ♄. H. Native of Italy. Sweet, cist. t. 59. Petals white, yellow at the base, imbricate. Sepals acuminate.

Florentine Rock-Rose. Fl. June, Jul. Clt. 1825. Shrub 3 ft.

24 C. Monspelie'nsis (Lin. spec. 737.) leaves linear-lanceolate, sessile, 3-nerved, clammy, villous on both surfaces; peduncles pilose cymose, somewhat secund. ♄. H. Native of the south of France, Spain, and Portugal. Lam. ill. t. 477. f. 4. Cav. icon. 2. t. 137. Jacq. coll. 2. t. 8. Sweet, cist. t. 27. Smith, fl. græc. t. 493. Flowers middle-sized, white. Petals imbricate, crenate.

Montpelier Rock-Rose. Fl. June, July. Clt. 1656. Shrub 4 ft.

25 C. platyse'palus (Sweet, cist. t. 47.) leaves oblong-lanceolate, sessile, wrinkled, 3-nerved, villous on both surfaces; peduncles cymose, and are as well as the calyxes villous; sepals acuminated, outer ones broadly-cordate; petals obcordate, distinct. ♄. F. Native of Crete. Petals white, with a yellow spot at the base of each.

Broad-sepalled Rock-Rose. Fl. June, July. Clt. —? Shrub 3 or 4 feet.

26 C. Le'don (Lam. dict. 2. p. 17.) leaves connate, oblong-lanceolate, nerved, upper surface smooth shining, under surface silky villous; flowers corymbosely-cymose; peduncles and calyx clothed with silky villi. ♄. H. Native of the south of France. Duh. arb. 1. p. 168. t. 66. Petals white, with a yellow mark at the base of each. C. undulàtus, Link?

Ledon Rock-Rose. Fl. June, Aug. Clt. 1730. Shrub 1 foot.

27 C. hirsu'tus (Lam. dict. 2. p. 17.) leaves sessile, oblong, blunt, hairy; peduncles short, 1-flowered, or cymose many-flowered; capsules small, covered by the large, hairy, pyramidal calyx. ♄. H. Native of France near Landerneau, and on the mountains of Spain. Sweet, cist. 19. Lèdon IV. Clus. hist. 1. p. 78. Petals white, with a yellow mark at the base of each, imbricate.

Hairy Rock-Rose. Fl. June, July. Clt. 1656. Shrub 2 feet.

28 C. sideri'tis (Presl. ex Spreng. syst. append. p. 204.) decumbent; leaves stalked, obovate, a little wrinkled, covered with hoary tomentum on the under surface; peduncles elongated, 1-2-flowered, articulated above, and are as well as the calyx tomentose; flowers nodding before expansion. ♄. H. Native of Sicily. Flowers white.

Sideritis-like Rock-Rose. Fl. June, Aug. Shrub decumbent.

29 C. la'xus (Ait. hort. kew. 3. p. 305.) leaves on short footstalks, ovate-lanceolate, acuminated, with wavy, somewhat toothed margins, smoothish, upper ones hairy; flowers cymose; peduncles and calyx hairy. ♄. H. Native of Spain and Portugal. Sweet, cist. 12. Cístus Capénsis, Lin. spec. 736.? from Burm. herb. Flowers white, with a yellow spot at the base of each petal. Petals imbricate.

Lax-flowered Rock-Rose. Fl. Ju. Aug. Clt. 1656. Sh. 3 feet.

30 C. parvifo'lius (Sweet, cist. p. 8.) stem erect, much branched; branches rather crowded, erect, densely woolly; leaves small, ovate, acute, rounded at the base, waved, wrinkled, netted with veins, slightly crenulated on the margins, hairy on both surfaces, rather hoary; peduncles axillary, 1-3-flowered, nodding before expansion; sepals acuminated, and clothed with stellate hairs. ♄. H. Native of the south of Europe. Flowers white.

Small-leaved Rock-Rose. Fl. Ju. Aug. Clt.? Sh. 2 feet.

31 C. oblongifo'lius (Sweet, cist. t. 67.) erect; branches hispid-villous; leaves on short footstalks, oblong-lanceolate, obtuse, pubescent and waved at the margins, under surface veiny; peduncles cymose; petals concave, imbricated. ♄. H. Native of Spain.? Petals white, with a yellow spot at the base of each.

Oblong-leaved Rock-Rose. Fl. Ju. Jul. Clt.? Sh. 4 feet.

32 C. asperifo'lius (Sweet, cist. t. 87.) leaves almost sessile, ovate-lanceolate, acute, 3-nerved, wrinkled, smoothish, with wavy margins, somewhat denticulated, ciliated, netted with veins beneath, with the nerves and veins rough; flowers cymose; peduncles and calyxes hairy; petals imbricate. ♄. H. Native of? Petals white, yellow at the base, and tinged with red at the top.

Rough-leaved Rock-Rose. Fl. May, Aug. Clt.? Sh. 2 feet.

33 C. psilose'palus (Sweet, cist. t. 33.) leaves on short footstalks, oblong-lanceolate, 3-nerved, acute, with undulated margins, which are somewhat denticulated and ciliated, rather hairy; flowers somewhat cymose; peduncles hairy-tomentose; sepals with long points, glabrous, shining, with ciliated edges; petals broad-cuneated, imbricated. ♄. H. Native? Petals white, with a yellow mark at the base of each.

Smooth-sepalled Rock-Rose. Fl. Ju. Aug. Clt.? Sh. 2 or 3 ft.

* * *Peduncles with small, concave, coriaceous, yellowish, decussate, caducous bracteoles at the base; and with two larger opposite ones beneath the middle.*

34 C. longifo'lius (Lam. dict. 2. p. 16.) leaves on short footstalks, oblong-lanceolate, with waved and pubescent margins, under surface veiny; peduncles cymose. ♄. H. Native of Spain and south of France, about Narbonne. Cístus nígricans, Pourr. act. toul. 3. p. 311. Flowers white, with a yellow mark at the base of each petal.

Long-leaved Rock-Rose. Fl. Ju. Aug. Clt.? Shrub 4 feet.

35 C. populifo'lius (Lin. spec. 736.) leaves stalked, cordate, acuminate, wrinkled, smooth; flowers cymose; peduncles bracteate; bracteas oblong; sepals acuminate, clammy. ♄. H. Flowers white. Petals distinct.

Var. β, mìnor (D. C. prod. 1. c.) peduncles and calyx smoothish, shining, clammy. ♄. H. Native of the south of France, Spain, and Portugal. Lèdon latifòlium, 2 Clus. hist. 1. p. 78. Cístus populifòlius, Cav. icon. 3. t. 215. Sweet, cist. t. 23.

Poplar-leaved Rock-Rose. Fl. May, Ju. Clt. 1656. Sh. 3 ft.

36 C. latifo'lius (Sweet, cist. 15.) leaves stalked, broad, cordate, acute, with curled, waved, denticulated, ciliated margins; peduncles bracteate, long, somewhat cymose, pilose; sepals broad-cordate, villous; petals imbricated. ♄. F. Native of Barbary. Cístus populifòlius, var. *a*, màjor, D. C. prod. 1. p. 266. Petals white, with a yellow spot at the base of each.

Broad-leaved Rock-Rose. Fl. May, Ju. Clt. 1656. Sh. 3 ft.

§. 2. *Peduncles bracteate; bracteas caducous, decussate, lower ones smaller, 1-flowered, axillary solitary, or terminal umbellate. Calyx of 3-sepals. Capsules 5-10-celled.*

* *Stigma large, sessile.*

37 C. laurifo'lius (Lin. spec. 736.) leaves stalked, ovate-lanceolate, 3-nerved, upper surface glabrous, under surface tomentose; footstalks dilated and connate at the base; capsules 5-celled. ♄. H. Native of the south of France and Spain. Sweet, cist. t. 52.—Clus. hist. 1. p. 78. f. 1. Flowers white, with a yellow mark at the base of each petal.

Laurel-leaved Gum-Cistus. Fl. Ju. Aug. Clt. 1731. Sh. 4 ft.

38 C. Cy'prius (Lam. dict. 2. p. 16.) leaves stalked, oblong-lanceolate, upper surface glabrous, under surface clothed with hoary tomentum; peduncles generally many-flowered; petals spotted; capsules 5-celled. ♄. H. Native of the island of Cyprus. Sweet, cist. 39. C. ladaníferus, Sims, bot. mag. t. 112. Perhaps Cístus stenophýllus, Link enum. 2. p. 74.? Flowers white, with a dark spot at the base of each petal. Petals imbricate.

Cyprus Gum-Cistus or Rock-Rose. Fl. Ju. Jul. Clt. 1800. Shrub 4 feet.

39 C. ladanìferus (Lin. spec. 737.) leaves almost sessile, connate at the base, linear-lanceolate, 3-nerved, upper surface glabrous, under surface tomentose; capsule 10-celled. ♄. F. Native of Spain and Portugal, on hills. Petals imbricate.

Var. α, *albiflòrus* (D. C. prod. 1. p. 266.) petals white, yellow at the base. Sweet, cist. t. 84. Lèdon. I. Clus. hist. 1. p. 78. icon.

Var. γ, *maculàtus* (D. C. prod. l. c.) petals white, each marked near the base with a dark blood-coloured spot. Sweet, cist. t. 1. C. ladaníferus β, planifòlius, Ait. hort. kew. 3. p. 305.

The *Cístus ladaníferus* and *Lèdon* produce the gum Ladanum, but not in such quantities as *C. Créticus*. The resin which is secreted from the leaves and other parts of the shrub is scraped off by means of a kind of rake, called in Candia, *Ergatiri*, to which numerous leathern thongs are appended instead of teeth. This instrument being drawn backwards and forwards over the plant from time to time collects the resin. Dioscorides says they gather the Ladanum by means of goats, which browzing on the leaves of the shrub, return to the stable with their beards loaded with a fat substance, which the peasants rake off with a kind of comb made on purpose. The chief use of this gum in modern practice is in fumigations, cephalic and stomachic plasters, its fragrant smell having made it a constant ingredient in such preparations; sometimes it is used in torches. It was formerly exhibited as a pectoral and astringent in catarrhal affections, dysenteries, and several other diseases. The best is in dark-coloured masses of the consistence of soft plaister, growing still softer on being handled. The other is in long rolls, coiled up and much harder than the preceding, and not so dark. It should be observed that Ladanum gives out its active matter to spirit of wine, which dissolves nearly the whole of the pure Ladanum into gold-coloured liquor, and little or nothing to water, from its being entirely resinous, and consequently not soluble in water.

Ladanum-bearing Rock-Rose or Gum-Cistus. Fl. Ju. July. Clt. 1629. Shrub 4 feet.

** *Stigma capitate, small. Style cylindrical, equalling the stamens in length.*

40 C. Clu'sii (Dunal, ined. D. C. prod. 1. p. 266.) erect; leaves somewhat 3-nerved, linear, with revolute margins, under surface canescent; flowers somewhat capitate; calyx 3-5-sepalled, pilose; sepals ovate, acute; capsules 5-celled. ♄. F. Native of Spain and Barbary. Sweet, cist. t. 32. Cístus Libanòtis, β, Lam. dict. 2. p. 18. Desf. atl. 1. p. 412, exclusive of the synonym. C. undulàtus, Link. Lèdon. VII. Clus. hist. 1. p. 80. icon. Bracteas pilose, broad-ovate, acuminated, ciliated, caducous, somewhat longer than the peduncles. Petals white. Habit of *Heliánthemum Libanòtis*, with the character of *Ledònia*.

Clusius's Rock-Rose. Fl. Ju. Jul. Clt. 1810. Shrub 2 feet.

* *A species not sufficiently known.*

41 C. Co'rsicus (Lois. in ann. soc. lin. par. vol. 4.) leaves opposite stalked, ovate, acuminated, rather tomentose, reticulated with veins beneath; peduncles usually 1-flowered, and are, as well as the calyx villous; branches and leaves rough from starry small hairs. ♄. H. Native of Corsica. Perhaps a species of *Heliánthemum*.

Corsican Rock-Rose. Shrub.

Cult. The species of the genus *Cístus* or *Rock-Rose* deserve to be cultivated in every garden for the beauty of their flowers and leaves. The greater part of those marked frame shrubs will survive a severe winter if planted against a south wall so as to be covered with mats in severe frosts; but notwithstanding, we would recommend a plant of each of these tenderer sorts to be kept in the green-house during winter, and to be planted out in the spring. They may be either increased by seeds or layers, or by ripened cuttings, taken off in July or August, which if planted thinly under a hand-glass will root readily.

II. HELIA'NTHEMUM (from ηλιος, *helios*, the sun, and ανθος, *anthos*, a flower; because the flowers open with the rising of the sun in the morning, and the petals fall off with the setting of the sun in the evening. The flowers of *Heliánthemum*, as well as *Cístus*, only last for a few hours while the sun shines; but if the weather is dull, and the sun does not make its appearance, the flowers do not open, but will remain unexpanded. Should this continue for several days together, they will decay in the bud.) Tourn. inst. 248. t. 128. Gært. fr. 1. p. 371. t. 76. D. C. fl. fr. 4. p. 815. prod. 1. p. 266. Císti species, Lin.

Lin. syst. *Polyándria*, *Monogýnia*. Calyx of 3 equal sepals; but when 5, they are disposed in a double series, the two outer sepals are usually smaller than the inner ones, very rarely larger. Petals 5, usually regularly denticulated at the top. Stigma capitate. Style sometimes almost wanting, sometimes straight, sometimes oblique, and sometimes bent at the base. Ovary triquetrous. Capsule 3-valved; valves with a narrow dissepiment, or a seminiferous nerve in the middle of each. Seeds angular, smooth. Albumen mealy. Embryo uncinately-inflexed, as in. H. vulgàre, Gært. 1. p. 371. t. 76. f. 11. Erect or trailing herbs, subshrubs, or shrubs. Leaves opposite and alternate, with or without stipulas, 3-nerved, or feather-nerved. Pedicels usually furnished with bracteas at the base, sometimes opposite the bracteas, or opposite the leaves, sometimes solitary, sometimes umbellate, and sometimes racemose; racemes secund, sometimes corymbose, sometimes paniculate; and before the flowers expand the racemes at the top are bent or twisted backwards, and become gradually erect as the flowers expand. Flowers yellow, red, or white.

This genus is divided into three particular series, viz.—

I. Style straight, erect, almost wanting, or shorter than the stamens. Stigma capitate. Sect. I. II. and III., *Halìmium*, *Lecheoìdes*, and *Tuberària*, belong to this.

II. Style straight, erect, equal with or longer than the stamens. Sect. IV. and V., *Maculària*, and *Brachypétalum*, belong to this.

III. Style bent at the base. Sect. VI. VII. VIII. and IX., *Eriocárpum*, *Fumàna*, *Pseudocístus*, and *Euheliánthemum*, belong to this.

Sect. I. Hali'mium (αλιμος, *halimos*, marine; habitation of plants by the sea-side). D. C. prod. 1. p. 267. Calyx usually of 3 equal sepals, rarely of 5 unequal sepals, but when this is the case the two outer ones are small. Petals rarely white, usually yellow, wedge-shaped, truncate, and usually marked at the base with a dark-bloody or intense yellow spot. Style straight, short, or almost wanting. Stigma capitate, somewhat 3-lobed. Seeds few, blackish, minutely muricated, somewhat angular. Erect shrubs. Leaves opposite, 3-nerved, without stipulas, pilose or tomentose. Peduncles 1-3-flowered, axillary, solitary, or umbellate, rarely panicled.

* *Style short, straight.*

1 H. Libanòtis (Willd. enum. 570.) erect, smoothish, branched; leaves sessile, linear, with revolute margins, upper surface brownish-green, under surface somewhat canescent; bracteas oblong-linear, shorter than the peduncles; peduncles solitary, 1-flowered; calyx of 3 sepals, smooth, shining, ovate-acuminate. ♄. F. Native of Portugal and Mauritania. Cístus Libanòtis, Lin. spec. 739. Brot. fl. lus. 2. p. 261.; but not of Lam. nor Desf.—H. rosmarinifòlium, Lag. in litt. but not of

Pursh.—Barrel. icon. 294.—Lèdon VIII. Clus. hist. I. p. 80. icon. Petals yellowish. Style one-half shorter than the stamens. Stigma small.

Rosemary-leaved Sun-Rose. Fl. Ju. July. Clt. 1752. Shrub 1 foot.

2 H. UMBELLA'TUM (Mill. dict. no. 5.) suffruticose, branched, younger branches tomentosely-pilose, clammy; leaves sessile, linear-oblong, with revolute margins, clammy, under surface tomentose; peduncles 1-flowered, disposed in whorled racemes, terminal, umbellate; calyx 3-sepalled, villous. ♄. F. Native of France, Spain, and Portugal. Cístus umbellàtus, Lin. spec. 739. Petals white, imbricate. Style one-half shorter than the stamens. Stigma small.

Var. a, eréctus (D. C. prod. 1. p. 267.) stem erect; leaves on the under surface clothed with greenish tomentum. Sweet, cist. 5. Cístus umbellàtus, Lam. dict. 2. p. 18.—Cístus verticillàtus, Brot. fl. lus. 2. p. 262. Lèdon X. Clus. hist. 1. p. 80.

Var. β, subdecúmbens, (D. C. prod. 1. p. 267.) stem somewhat decumbent: leaves somewhat ciliated, clothed with white tomentum on the under surface. Cístus umbellàtus, *a*, Lam. dict. 2. p. 18. Brot. fl. lus. 2. p. 262.

Umbellate-flowered Sun-Rose. Fl. June, August. Clt. 1731. Shrub 1 foot.

3 H. OCYMOI'DES (Pers. ench. 2. p. 76.) erect, branched; branches hoary; cauline leaves obovate, or ovate-oblong, 3-nerved, almost sessile, green, those of the branches are stalked and keeled on the back, reflexed at the top, hoary on both surfaces; peduncles long, branched, paniculate; pedicels opposite, somewhat umbellate; calyx of 3 much-pointed sepals. ♄. F. Native of Spain and Portugal. Cístus ocymoìdes, Lam. dict. 2. p. 18. Cístus sampsucifòlius, Cav. icon. 1. p. 65. t. 96.—Clus. hist. 1. p. 72. icon. Petals distinct, yellow, spotless, or marked with a dark purple spot at the base of each. Stamens dark purple at the top, and yellow at the base.

Var. a, peduncles glabrous.

Var. β, branches and peduncles rather hairy.

Ocymum-like Sun-Rose. Fl. June, August. Clt.? Shrub 3 feet.

* * *Style almost none; stigma large.*

4 H. ALYSSOI'DES (Vent. choix. t. 20.) erect, much branched, diffuse, spreading; branches hoary, tomentosely-hairy at the top; leaves sessile, tapering towards the base, oblong-ovate, bluntish, covered with short hairs, younger ones rather hoary, adult ones green; peduncles terminal, solitary, or umbellate, 1-2-flowered, longer than the leaves; calyx 3-sepalled, acuminated, hairy. ♄. F. Native of Spain and west of France. Cístus alyssoìdes, *a*, Lam. dict. 2. p. 20. D. C. fl. fr. 4. p. 818. Petals yellow. Flower-bud of an intense purple-colour at the top.

Alyssum-like Sun-Rose. Fl. June, Aug. Clt.? Shrub 3 ft.

5 H. RUGÒSUM (Dunal, ined. in. D. C. prod 1. p. 268.) erect; branches rather hairy, clothed with leprous tomentum, scabrous, of a brownish-grey colour; leaves sessile, tapering out into the footstalks at the base, obovate-oblong, bluntish, rather oblique, with the margins somewhat denticulated, and a little curled, tomentose on both surfaces, wrinkled, under surface hoary; peduncles terminal, axillary, or umbellate, 1-3-flowered, hairy, shorter than the leaves; calyx 3-sepalled, hairy. ♄. F. Native of Spain. Sweet, cist. t. 65. Petals yellow, crenulated, imbricate, with a large dark mark at the base.

Wrinkled-leaved Sun-Rose. June, August. Clt. 1800. Shrub 3 feet.

6 H. MICROPHY'LLUM (Sweet, cist. t. 96.) much branched, erect; branches blackish-grey, hairy-tomentose at the apex; leaves almost sessile, obtuse, keeled, tapering to the base, obscurely greyish, tomentose; flowers terminal, panicled; peduncles hairy-tomentose; pedicels 1-3-flowered, very short; calyx of 3 sepals, very hairy; petals cuneated, distinct. ♄. F. Native of the west of France, near Bordeaux. H. rugòsum, *β.* microphýllum, D. C. prod. 1. p. 268. H. alyssoìdes, *β.* microphýllum, D. C. fl. fr. suppl. p. 622. A weak shrub. Petals yellow, with a dark purple spot at the base of each.

Small-leaved Sun-Rose. Fl. June, August. Clt. 1800. Shrub 2 feet.

7 H. SCABRÒSUM (Pers. ench. 2. p. 76.) erectish; branches pilosely-tomentose, scabrous, canescent; leaves sessile, tapering to the base, oblong-ovate, acutish, roughish, 3-nerved, with waved revolute margins, upper surface green, under surface clothed with grey tomentum; peduncles terminal, 1-2-flowered, shorter than the leaves; calyx 3-sepalled, hairy; petals distinct. ♄. F. Native of the north of Portugal. Sweet, cist. 81. Cístus scabròsus, Ait. hort. kew. 2. p. 236. Brot. fl. lus. 2. p. 265. Flowers yellow.

Rough Sun-Rose. Fl. June, Aug. Clt. 1775. Shrub 3 ft.

8 H. ALGARVE'NSE (Dun. ined. in D. C. prod. 1. p. 268.) stem branched; leaves sessile, ovate-lanceolate, obtuse, hoary on the under surface, upper surface green, pilose; peduncles somewhat panicled, pilose; calyx 3-sepalled, acute, hairy. ♄. F. Native of Portugal, in the Algarves. Sweet, cist. t. 40. Cístus Algarvénsis, Curt. bot. mag. 627. H. Algarvénse, Tourn. inst. 250.? Branches, leaves, peduncles, and sepals, beset with long loose hairs. Petals yellow with a dark base, crenated, at length distinct.

Algarve Sun-Rose. Fl. June, August. Clt. 1800. Shrub 3 feet.

9 H. FORMÒSUM (Dunal. ined. and D. C. prod. 1. p. 268.) erect; branches tomentosely-villous, canescent; leaves on short footstalks, obovate-lanceolate, tomentosely-villous, younger ones hoary; peduncles and calyxes villous; calyx 3-sepalled. ♄. F. Native of Portugal. Cístus formòsus, Curt. bot. mag. 264. Petals large, yellow, marked with a black spot at the base of each.

Beautiful Sun-Rose. Fl. May, July. Clt. 1780. Shrub 4 feet.

10 H. ATRIPLICIFÒLIUM (Willd. enum. 569.) erect; branches white from leprous tomentum; leaves stalked, broad-ovate, bluntish, waved at the base, covered with leprous tomentum on both surfaces; peduncles racemose, hairy; calyx hairy, 3-sepalled, rarely 5-sepalled, with the two outer ones very minute. ♄. F. Native of Spain. Cístus atriplicifòlius, Lam. dict. 2. p. 19.—Barrel. icon. t. 292. Upper leaves sessile. Pili long, rufescent. Petals large, yellow.

Atriplex-leaved Sun-Rose. Fl. Ju. July. Clt. 1656. Shrub 4-6 feet.

11 H. LASIA'NTHUM (Pers. ench. 2. p. 76.) stem suffruticose, much branched; branches dark-cinereous, at top tomentose-hairy; leaves almost sessile, ovate-oblong, often blunt, keeled, of an obscure greyish colour, tomentose; peduncles 1-2-flowered, hairy, very short; calyx usually 3-sepalled, very hairy. ♄. F. Native of Spain. Cístus lasiánthus, Lam. dict. 2. p. 19.—Barrel. icon. t. 289? Peduncles, calyxes, and younger leaves beset with long white hairs. Calyx sometimes 5-sepalled, with the two outer sepals very narrow and smoothish at the top. Petals yellow, with or without a dark spot at the base of each.

Hairy-flowered Sun-Rose. Fl. Ju. Jul. Clt. 1826. Shrub 3 ft.

12 H. INVOLUCRA'TUM (Pers. ench. 2. p. 76.) branched, erect; branches rather greyish, tomentose; lower leaves stalked, somewhat ovate, small, hoary-tomentose, upper ones oblong-lanceolate, sessile, greenish, and roughish; peduncles very short, surrounded by the leaves; calyx 5-sepalled, inner ones hoary-tomentose, outer ones linear, smoothish, and greenish. ♄. F.

Native of Spain and Portugal. Cístus involucràtus, Lam. dict. 2. p. 20. Axillary branchlets leafy. Flowers yellow.

Involucrated-flowered Sun-Rose. Fl. June, July. Clt. 1826. Shrub 2 feet.

13 H. CHEIRANTHOÏ'DES (Pers. ench. 2. p. 76.) erect, branched; younger branches villously-tomentose, hoary; leaves tomentose, hoary; oblong-lanceolate, tapering out into the footstalk; peduncles very short, 2-flowered; calyx somewhat villous, 5-sepalled, outer sepals very minute. ♄. F. Native of Spain. Sweet, cist. t. 107. Cístus cheiranthoïdes, Lam. dict. 2. p. 19. Cístus elongàtus, Vahl. symb. 1. p. 38?—Cístus halimi folio II. Clus. hist. 1. p. 71. Floral leaves small, alternate. Flowers yellow, without a dark spot at the base of each petal, imbricate.

Wallflower-like Sun-Rose. Fl. July, Aug. Clt. 1800. Shrub 3 feet.

14 H. CA'NDIDUM (Sweet, cist. t. 25.) erect; branches leprously-white, as well as the leaves on both surfaces, which are obovate-lanceolate, tapering to the base, somewhat stalked, upper surface pilose, under surface scabrous from papillæ, rather 3-nerved; floral ones opposite, sessile, and green on both surfaces; peduncles long, rather panicled, glabrous or with a few scattered hairs; calyxes with 3 or 5 acute sepals, villous; petals imbricated. ♄. F. Native of Spain. Petals bright yellow, with a dark velvety spot at the base of each, edged with purple.

Whitened Sun-Rose. Fl. June, Aug. Clt.? Shrub 2 to 3 ft.

15 H. HALIMIFÒLIUM (Willd. enum. 569.) erect, branched; branches leprously-white at the top, as well as the leaves on both surfaces; leaves on very short footstalks, ovate-oblong, tapering to the base; peduncles long, branched, somewhat panicled, leprously-white; calyx leprous, 5-sepalled, two outer ones very narrow, linear, ♄. F. Native of Spain and Portugal by the sea-side. Sweet, cist. t. 4. Cístus halimifòlius, Lin. spec. 738.—Cístus folio halimi I. Clus. hist. 1. p. 71. Floral leaves small, alternate. Petals yellow, spotless, or each marked with a small dark-bloody spot at the base, imbricate. Capsule 2-3-valved.

Var. β, obtusifòlium (D. C. prod. 1. p. 269.) leaves obtuse. ♄. F. Growing along with var. α.

Sea-Purslane-leaved. Fl. Ju. Aug. Clt. 1656. Shrub 3 feet.

SECT. II. LECHEOÏ'DES (from *Lechea* and *idea*, similar; plants with the habit of *Lèchea.*) D. C. prod. 1. p. 269. Calyx 5-sepalled, two outer sepals narrow, linear, 3 inner ones acute, with scarious margins. Petals yellow. Style almost wanting, or very short, erect. Stigma large, capitate. Ovary triangular. Capsule smooth, shining 3-valved, 1-celled. Seeds rufescent, small. Stems herbaceous or suffruticose, ascendant or erect, usually dichotomous. Lower leaves opposite, cauline ones alternate, feather-nerved, on short footstalks or sessile, without stipulas.

* *Peduncles many-flowered, axillary, or terminal. Flowers small, crowded, yellow.*

16 H. CORYMBÒSUM (Michx. fl. bor. amer. 1. p. 307.) suffruticose, branched, erect; branches dichotomous, rather pubescent, somewhat tomentosely-cinereous at the top; cauline leaves alternate, oblong-lanceolate, bluntish, under surface clothed with woolly tomentum, upper leaves with revolute margins; corymbs fastigiate, crowded; calyx tomentosely-hairy, canescent, outer sepals linear, blunt, inner ones ovate, acute, somewhat shorter than the capsule. ♄. H. Native of New Jersey and Georgia. Style very short.

Corymb-flowered Sun-Rose. Fl. July, Aug. Shrub 1 foot.

17 H. ROSMARINIFÒLIUM (Pursh, fl. amer. sept. 2. p. 364.) erect, branched, dichotomous; branches very erect, pubescent; leaves oblong-linear, with the margins usually revolute, under surface clothed with hoary tomentum; axillary branchlets on very short peduncles, 1-3-flowered, shorter than the leaves; inner sepals ovate, acute, 3 times smaller than the petals. ♃. H. Native of Georgia, Canada, and about Boston. Lèchea màjor, Bigel. fl. bost. p. 29. Flowers minute, crowded. Capsule shining, triquetrous, rufous. Petals pale yellow.

Rosemary-leaved Sun-Rose. Fl. July, Aug. Clt. 1823. Pl. 1 ft.

18 H. GLOMERA'TUM (Lag. in litt.) suffruticose, erect, somewhat dichotomous; branches rather tomentosely-cinereous; leaves lanceolate-oblong, tapering to the base, under surface hoary; racemes axillary or terminal, many-flowered, smaller than the leaves; flowers glomerate. ♄. F. Native near Acapulca and Cimupan in New Spain. Sweet, cist. t. 110. Cístus glomeràtus, Lag. gen. et spec. p. 16. Flowers small.

Glomerate-flowered Sun-Rose. Fl. July, Aug. Clt. 1823. Shrub ¾ foot.

* * *Peduncles 1-flowered, bractless, situated on the branches.*

19 H. RAMULIFLÒRUM (Michx. fl. amer. bor. 1. p. 307.) erect, beset with powdery pili, branched at the top, somewhat dichotomous; branchlets twiggy, bearing flowers; cauline leaves lanceolate-elliptic or oblong, acute, with the margins scarcely revolute, under surface hoary-tomentose; flowers stalked, solitary; inner sepals broad-ovate, acuminated; capsule globose, length of calyx. ♃. H. Native of Carolina. Cístus virgàtus, Thibaud, ined. Peduncles and calyxes pilose. Style very short, erect.

Branch-flowered Sun-Rose. Fl. Ju. Aug. Clt. 1823. Pl. 1 ft.

20 H. CANADE'NSE (Michx. fl. bor. amer. 1. p. 308.) ascendant; branches erect, hairy; cauline leaves oblong-lanceolate, acute, hairy, under surface palest; peduncles hairy, 1-flowered, solitary; inner sepals broad-ovate, acuminated; capsules shorter than the calyx. ♃. H. Native of Canada and Carolina. Sweet, cist. 21. Cístus Canadénsis, Willd. spec. 2. p. 1199. Calyx hairy. Petals obcordate, imbricate.

Canadian Sun-Rose. Fl. July, Aug. Clt. 1799. Pl. 1 foot.

21 H. BRASILIE'NSE (Pers. ench. 2. p. 77.) suffruticose; branches simple, hairy; leaves ovate-oblong, acute, sessile, hairy; peduncles and calyxes hairy, canescent; peduncles solitary, 1-flowered; inner sepals ovate, acuminated. ♄. F. Native of Brasil on the mountains. Sweet, cist. t. 43 Cístus Brasiliénsis. Lam. dict. 2. p. 22. Cístus alternifòlius, Vahl. symb. 1. p. 38.

Brasilian Sun-Rose. Fl. Ju. July. Clt. 1823. Shrub ½ foot.

22 H. POLYGALÆFO'LIUM (Sweet, cist. t. 11.) suffruticose, flexuous, ascending, branched; branches weak, hairy-tomentose, rather hoary; cauline leaves sessile, alternate, acute, ciliated, shining, lower ones oblong-lanceolate, upper ones lanceolate-linear; peduncles 1-flowered, longer than the leaves, and are as well as the calyxes hairy-canescent; inner sepals ovate, lanceolate, acuminated; petals obcordate, concave, crenulated, imbricate at the base. ♄. F. Native of Brasil.

Milkwort-leaved Sun-Rose. Fl. Ju. July. Clt. 1823. Sh. ½ ft.

23 H. CAROLINIA'NUM (Michx. fl. bor. amer. 1. p. 307.) herbaceous, hairy, erect; leaves tomentosely-hairy, rather denticulated, green on the upper surface, on short footstalks, blunt, lower ones opposite, obovate, the rest alternate, oblong-ovate; peduncles solitary, 1-flowered, clothed with white hairs; calyx hairy; inner sepals oblong, acute. ♃. H. Native of Carolina and Georgia. Vent. cels. 74. icon. Sweet, cist. t. 99. Flowers large, with the petals slightly imbricate at the base.

Carolinian Sun-Rose. Fl. July, Aug. Clt. 1823. Pl. ¾ foot.

24 H. A'STYLUM (Moc. et Sesse, fl. mex. icon. ined. and D. C. prod. 1. p. 284.) stems diffuse, rather herbaceous, dwarf; leaves generally alternate, stipulate, ovate-oblong; sepals 5, the

2 outer ones linear, small; style none; stigma somewhat 3-lobed. —Native of New Spain.

Styleless Sun-Rose. Shrub.

25 H. tripe'talum (Moc. et Sesse, fl. mex. icon. ined. et D. C. prod. 1. p. 284.) stems numerous, erect, slender; leaves alternate, linear, without stipulas; sepals 5, outer 2 linear, small; petals 3.—Native of Mexico.

Three-petalled Sun-Rose. Shrub.

26 H. obcorda'tum (Moc. et Sesse, fl. mex. icon. ined. and D. C. prod. 1. p. 284.) erect, suffruticose; leaves alternate, oblong, stipulate, somewhat fascicled; sepals 3; petals 5, obcordate. ♄. G. Native of Mexico.

Obcordate-petalled Sun-Rose. Shrub.

Sect. III. Tubera'ria (meaning unknown). D. C. prod. 1. p. 270. Calyx 5-sepalled, 2 outer sepals smaller or larger, usually spreading. Petals yellow, often marked with a dark-purple spot at the base of each, entire, denticulated, or serrated. Stamens numerous, much longer than the pistil. Style straight, almost wanting. Stigma capitate. Capsule 3-valved. Seeds minute, yellowish. Roots perennial woody, or herbaceous, annual or biennial. Stems herbaceous, erect, or adscendant. Leaves 3-nerved, opposite, without stipulas, upper ones sometimes alternate, and usually furnished with stipulas; stipulas long, linear, acute. Flowers somewhat panicled or racemose, secund, with or without bracteas.

* *Perénnia. Leaves without stipulas. Stems pilose at the base and smooth at the top. Flowers few, bracteate, disposed in something like panicles.*

27 H. globulariæfòlium (Pers. ench. 2. p. 77.) perennial; stems ascendant, simple, rather naked at the top; radical leaves on long footstalks, obtuse, rather spatulate; cauline leaves sessile, acute, all hairy; pedicels few, furnished with bracteas at the base, disposed in something like a cyme; calyx glabrous. ♃. F. Native of the north of Portugal. Cístus globulariæfòlius, Lam. dict. 2. p. 22. Petals spotted or spotless. Stamens violet-coloured.

Globularia-leaved Sun-Rose. Fl. July. Clt. 1826. Pl. ½ ft.

28 H. Tubera'ria (Mill. dict. no. 10.) perennial; stems ascendant, almost simple; radical leaves ending in the footstalk, ovate-oblong, 3-nerved, tomentosely-hairy, canescent, under surface nerved, upper surface furrowed; cauline leaves sessile, almost smooth, lanceolate, upper ones alternate; pedicels few, furnished with bracteas at the base, disposed in something like a panicle; calyx smooth, shining. ♃. F. Native of Provence, Italy, Spain, and Portugal. Sweet, cist. t. 18. Cístus Tuberària, Lin. spec. 741. Cav. icon. 1. p. 65. t. 67. Petals distinct.

Tuberaria or Plantain-leaved Sun-Rose. Fl. July, Aug. Clt. 1752. Pl. ¾ foot.

29 H. lignòsum (Sweet, cist. t. 46.) stem tetragonal, shrubby, clothed with rough scaly bark; branches ascending, covered with hispid hairs; leaves ovate-oblong, ending in the petiole, 3-nerved, also beset with hispid hairs, canescent, under surface nerved, upper surface furrowed; floral leaves sessile, glabrous, oblong-lanceolate, uppermost ones alternate; pedicels few, furnished with bracteas at the base, rather panicled, about the length of the calyx; petals obovate, distinct, spreading. ♄. F. Native of the south of Europe.

Woody Sun-Rose. Fl. Jul. Aug. Clt. 1809. Shrub 1 foot.

** *Annua? Superior leaves usually furnished with stipulas. Racemes secund, terminal.*

30 H. bupleurifòlium (Dunal. ined. and. D. C. prod. 1. p. 270.) perennial? stem erect, pubescent at the base, upper part glabrous, rather shining; leaves oblong, acute, smooth, long, ending in the footstalk; cauline leaves opposite, uppermost ones alternate, stipulate; peduncles long, pilosely-pubescent; pedicels and calyx hairy. ♃? F. Native of Spain and Portugal. Cístus bupleurifòlius, Lam. dict. 2. p. 22. Pedicels bractless. Outer sepals ovate, obtuse, one-half shorter than the inner ones, which are acute. Stipulas long, almost linear.

Bupleurum-leaved Sun-Rose. Fl. July, Aug. Pl. ¾ foot.

31 H. heterodóxum (Dunal, ined. in herb. Banks and D. C. prod. 1. p. 270.) erect, hairy; hairs long, whitish; leaves sessile, oblong-lanceolate, tomentosely-scabrous, with the nerves on the upper surface, hairy; lower leaves opposite, upper ones alternate, stipulate; racemes secund, hairy, bractless; flowers on very short pedicels, approximate, somewhat imbricate; outer sepals largest, covering the inner ones, appearing like bracteas. ⊙? H. Native of the north of Africa near Valle, also in Spain. H. imbricàtum, Lag. in litt. Outer sepals hairy on both surfaces; inner ones smooth and shining on the inner surface, with membranous margins. Capsules acutish. Seeds numerous, somewhat globose, of an obscure yellow-glaucous colour, minutely muricated.

Heterodox Sun-Rose. Fl. Jul. Aug. Pl. ¾ foot.

32 H. plantagí'neum (Pers. ench. 2. p. 77.) erect, hairy; leaves elliptic-lanceolate, opposite, sessile, 3-nerved, under surface villously-tomentose, and hairy on the nerves; upper surface beset with simple appressed hairs; uppermost leaves oblong-linear, stipulate, somewhat alternate; racemes short, without bracteas; outer sepals smoothish, narrow-linear, nearly equal in length with the inner ones which are hoary-villous; petals denticulated. ⊙. H. Native of Crete, Corsica, Spain, and north of Africa. Cístus plantagíneus, Willd. spec. 2. p. 1197. Cístus serràtus, Desf. atl. 1. p. 416. exclusive of the synonym of Cav. Cístus guttàtus γ, Lam. dict. 2. p. 23. Plant covered with white hairs. Petals yellow, without spots.

Plantain-like Sun-Rose. Fl. Ju. Aug. Clt. 1823. Pl. ¾ ft.

33 H. gutta'tum (Mill. dict. no. 18.) rather hairy; leaves opposite, sessile, oblong-linear, 3-nerved, villously-hairy, uppermost ones alternate; racemes loose, bractless; pedicels filiform, almost naked; outer sepals one half shorter than the inner ones. ⊙. H. Native of France, Italy, Spain, Portugal, and Turkey in dry places. In Anglesea and Jersey in sandy pastures, rare. Cístus guttàtus, Lin. spec. 2. p. 742. Smith, engl. bot. 544. Fl. græc. t. 498. Curt. lond. fasc. 6. t. 33. Cístus acuminàtus, Viv. fragm. 13. t. 14. f. 1?

Var. α, Colúmnæ (D. C. prod. 1. p. 71.) petals entire and spotted at the base. Hel. flòre maculòso, Column. ecphr. 2. p. 78. t. 77. Cístus guttàtus, Smith, fl. græc. t. 498.

Var. β, Cavanellèsii (D. C. prod. l. c.) petals spotted at the base and jagged at the top. Cístus serràtus, Cav. icon. 2. p. 57. f. 1. but not of Desf.

Var. γ, Lamárckii (D. C. prod. l. c.) petals marked with a small spot at the base of each, or almost without the spot. Cístus guttàtus, β, punctàtus. Lam. dict. 2. p. 23. Perhaps H. punctàtum, no. 36.

Var. δ, exstipulàtum (D. C. prod. l. c.) stem almost simple; leaves without stipulas.

Var. ε, fulcràceum (D. C. prod. l. c.) stem branched, 2-3-forked; upper leaves furnished with long stipulas.

Spotted-petalled Sun-Rose. Fl. Ju. Aug. Britain. Pl. ½ ft.

34 H. eriocau'lon (Dunal, ined. and D. C. prod. 1. p. 271.) branched, di-trichotomous, very hairy; leaves oblong-linear, narrow, hairy, opposite, upper ones stipulate, extreme ones alternate; racemes simple, bractless; pedicels long, filiform, pilose; outer sepals narrow. ⊙. H. Native of Spain and France. Sweet, cist. t. 30. Cístus serratiflòrus, herb. Lamb. H. semistipulàtum, Lag. in litt. Hairs on the stem whitish, slender, spreading. Hairs on the leaves pressed. Petals yellow, with a dark spot at the base of each, serrated, distinct.

Hairy-stemmed Sun-Rose. Fl. Ju. Aug. Clt. 1817. Pl. ½ to 1 ft.

35 H. INCONSPI'CUUM (Thib. ined. in Pers. ench. 2. p. 77.) branched, di-trichotomous, rather hairy, slender; leaves oblong-linear, narrow, hairy, opposite, upper ones stipulate, extreme ones alternate; racemes long, filiform; pedicels short, secund; flowers minute; petals oblong-linear, smaller than the calyx, outer ones with pilose edges. ⊙. H. Native of Spain and Corsica. H. præ'cox, Saltzm. exsic.

Inconspicuous Sun-Rose. Fl. Ju. Aug. Clt. 1819. Pl. ¼ ft.

36 H. PUNCTA'TUM (Willd. enum. 570.) branched, dichotomous, rather tomentosely pubescent, somewhat cinereous; leaves oblong, feather-nerved, rather cinereous, covered with short, roughish, stellate hairs; lower leaves opposite, obtuse, upper ones alternate, acutish, stipulate; racemes long, pubescent, cinereous, few-flowered. ⊙. H. Native of the west of France. Sweet, cist. t. 61. Cístus punctàtus, Willd. spec. 2. p. 1199. Peduncles rarely bearing a large bract or small leaf in the middle. Pedicels filiform, long. Petals serrulated, small, yellow, with a darker spot on the base of each, distinct.

Dotted-petalled Sun-Rose. Fl. Ju. Jul. Clt. 1816. Pl. ½ ft.

SECT. IV. MACULA'RIA (from *macula*, a spot, in allusion to the petals having a dark spot at the base of each). D. C. prod. 1. p. 271. Calyx 5-sepalled, 2 outer sepals narrow, 3 inner ones striated. Petals yellow, with a dark spot at the base of each. Style straight and erect, twice the length of the ovary, almost equal in length to the stamens. Stigma small, somewhat 3-lobed. Capsule smooth. Subshrubs or herbs. Leaves on footstalks, feather-nerved, narrow, without stipulas. Flowers terminal, solitary, or racemose. Racemes few-flowered; pedicels secund, bracteate at their base; bracteas small, awl-shaped.

37 H. LUNULA'TUM (D. C. fl. fr. 4. p. 816.) stem suffruticose, twisted, branched; branchlets pubescent, filiform; leaves flat, oblong, acuminated at the base, with the margins usually ciliated; flowers solitary, or from 2-4 flowers in a sort of racemed umbel, terminal, on short pedicels. ♄. H. Native of the Alps of Piedmont. Cístus lunulàtus, All. auct. p. 30. t. 2. f. 3. Calyx when in flower reflexed. Petals yellow, almost entire or much crenulated, each marked with a copper-coloured moon-shaped spot towards the claw.

Var. α; upper surface of leaves green, under surface whitish.
Var. β; leaves smaller, and hoary on both surfaces.

Lunulate-marked-petalled Sun-Rose. Fl. June, Aug. Clt. 1826. Pl. ¼ foot.

38 H. PETIOLA'TUM (Thib. in Pers. ench. 2. p. 77.) stem twisted at the base; branches generally dichotomous, ascendant, slender, leprously-tomentose, cinereous; leaves oblong-linear, acute, drawn out at the base into the long footstalk, leprously-tomentose on both surfaces, under surface hoary, upper surface greenish-glaucous; racemes small, few-flowered; pedicels and calyx pubescent. ⊙. H. Native of Spain. Petals, stamens, and pistil unknown.

Long-stalked-leaved Sun-Rose. Fl. June, July. Pl. ½ foot.

SECT. V. BRACHYPE'TALUM (from βραχυς, *brachys*, short, and πεταλον, *petalon*, a petal; because the petals are shorter than the sepals). D. C. prod. 1. p. 271. Calyx 5-sepalled, outer sepals minute, inner sepals 3-nerved, acuminated. Petals yellow, sometimes with a small dark spot at the base of each, usually shorter than the calyx. Stamens few, 10-20, surrounding the ovary. Style straight, erect, thickened at the top. Stigma simple. Ovary triquetrous, with the angles usually pilose. Capsule triquetrous, rather shining. Seeds numerous, minute, pale, angular. Annual herbs, with stalked, stipulate, feather-nerved, somewhat denticulate, opposite leaves, floral ones alternate. Stipulas oblong-linear, upper ones longest. Peduncles 1-flowered, short, solitary, rarely axillary, usually almost opposite the leaves or opposite the bracteas, somewhat erect, horizontal, or bent backwards.

* *Peduncles erectish, shorter than the leaves. Inner sepals 3-nerved.*

39 H. VILLÒSUM (Thib. in Pers. ench. 2. p. 78.) stem tomentose, hairy, somewhat cinereous; leaves stalked, oblong-lanceolate, somewhat denticulated, villously tomentose on both surfaces, but much more so on the under surface, stipulate; racemes long, secund, revolute at the top before flowering, axillary and terminal; peduncles erect, villously-cinereous, generally opposite the bracteas; calyx oblong, acuminated, villous. ⊙. H. Native of Spain. Cístus villòsus, Thib. herb. Lag in litt. not of Lam. Cístus ánnuus, Lamb. herb. Bracteas sessile, ovate-oblong, sometimes sparingly toothed. Petals lanceolate, narrow, for the most part denticulated, shorter than the sepals.

Var. α; stem very simple, erect.
Var. β; stem branched at the base; branches long, simple, ascendant.

Villous Sun-Rose. Fl. June, Aug. Clt. 1823. Pl. ½ foot.

40 H. NILO'TICUM (Pers. ench. 2. p. 78.) branches erect or ascendant, rather tomentose or villous, cinereous; leaves on short footstalks, opposite, oblong-elliptical, tomentosely-villous, upper ones alternate, opposite the flowers, all stipulate; peduncles erect, and are as well as the pointed calyx tomentosely-hairy. ⊙. H. Native of Egypt, Barbary, Spain and South of France. Cístus Nilóticus, Lin. mant. 246.

Var. α, eréctum (D. C. prod. 1. p. 272.) stem erect, simple, or branched; branches ascendant; peduncles and calyxes villously-hairy.

Var. β, màjus (D. C. prod. 1. c.) stem erect, branched; branches ascendant, and are as well as the leaves and peduncles rather tomentose. This variety has, from high cultivation, become larger in all its parts than the other varieties.

Var. γ, procúmbens (D. C. prod. 1. c.) stems procumbent, ascendant, tomentosely-hairy, rather hoary; leaves tomentose on both surfaces, but especially on the under surface. Cístus ledifòlius, Gouan. fl. monsp. p. 264? Ger. gallo-prov. p. 392. no. 2. Perhaps a distinct species.

Nilotic Sun-Rose. Fl. June, Aug. Clt. 1817. Pl. ½ to 1 ft.

41 H. LEDIFÒLIUM (Willd. enum. 571.) erect, puberulous; leaves stalked, oblong-elliptic, opposite, somewhat denticulated, smoothish, stipulate; peduncles erect, smoothish, shorter than the calyx; calyx pointed, rather pubescent. ⊙. H. Native of the south of France and Spain. In England on Brent downs, Somersetshire. Sweet, cist. 41. Cístus ledifòlius, Lin. spec. 742. Smith, engl. bot. t. 2414. Cístus ánnuus, folio ledi. Lob. icon. 2. p. 118. Very like *H. Nilóticum*. Flowers pale-yellow. Petals distinct.

Ledum-leaved Sun-Rose. Fl. June, July. Britain. Pl. ½ to 1 foot.

** *Peduncles horizontal, longer than the leaves or bracteas. Flowers erect; inner sepals 3-nerved.*

42 H. INTERME'DIUM (Thib. ined. and D. C. prod. 1. p. 272.) erect, branched; branches slender, erect, or spreading, ascendant, somewhat cinereously-villous; leaves stalked, obovate-oblong, bluntish, rather denticulated, veiny, tomentose, stipulate; stipulas linear-oblong, upper ones scarcely twice the length of the footstalks; peduncles and calyxes cinereously-villous, generally opposite the leaves; calyx oblong. ⊙. H. Native of Spain near Aranjuez. Cístus salicifòlius, Cav. icon. no. 156. t. 144. Plant somewhat cinereous. Floral leaves or bracteas, alternate, linear-oblong, usually stalked, furnished with 1-2 stipulas, sometimes solitary, entire, or cut, generally shorter than the peduncles. Flowers slender.

Intermediate Sun-Rose. Fl. Ju. July. Clt. 1759. Pl. ½ foot.

43 H. DENTICULA'TUM (Thib. in Pers. ench. 2. p. 78.) branched, erect, or spreading; branches erect or ascendant, tomentosely-pubescent, somewhat cinereous at the top; leaves on short footstalks, obovate-oblong, acutish, somewhat denticulated, tomentose, upper surface greenish, under surface hoary; stipulas linear, upper ones one-half shorter than the leaves; peduncles opposite the bracteas; bracteas alternate, a little cut. ⊙. H. Native of the south of France. Cístus salicifòlius, Gouan. herb. p. 34 ? Bracteas rather ovate, often cut, sessile, without stipulas. Calyxes hoary on the outside before expansion.

Denticulated-leaved Sun-Rose. Fl. Ju. Jul. Clt. 1818. Pl. 1 ft.

44 H. SALICIFÒLIUM (Pers. ench. 2. p. 78.) branched; branches erect or ascendant, rather hairy; leaves on short footstalks, obovate-oblong, acutish, denticulated, rather tomentose, greenish on the upper surface; stipulas linear-oblong, upper ones one-half shorter than the leaves; peduncles and calyxes hairy, generally opposite the bracteas; bracteas ovate, acuminated, sessile, entire. ⊙. H. Native of Spain and Italy. Sweet, cist. t. 71. Cístus salicifòlius, Lin. spec. 742. Cav. icon. 2. p. 35. t. 144. Smith, fl. græc. t. 499. H. ánnuum, etc. Seg. ver. 3. p. 297. t. 6. f. 3 ? Branches, peduncles, and calyxes beset with slender white hairs. Petals imbricate at the base.

Var. β, latifòlium (D. C. prod. 1. p. 273.) the whole plant is larger, leaves and bracteas tomentose, greenish. ⊙. H. Native of the Levant.

Willow-leaved Sun-Rose. Fl. Ju. July. Clt. 1759. Pl. ½ ft.

* * * *Peduncles drooping before the expansion of the flowers, but erect when in flower, and retroflexed after flowering. Inner sepals 4-nerved.*

45 H. SANGUI'NEUM (Lag. in litt. and D. C. prod. 1. p. 273.) stem red, dwarf, clothed with clammy pubescence; leaves stalked, opposite, ovate, blunt, roughish, lower ones without stipulas, blood-coloured on the under surface, upper ones stipulate; stipulas oblong-linear, blunt, stalked, scarcely shorter than the leaves; peduncles beset with clammy hairs, axillary, and opposite the leaves; fructiferous peduncles bent backwards. ⊙. H. Native of Spain near Chamartin. Cístus sanguíneus, Lag. gen. et spec. nov. p. 17. varied. ann. 2. no. 19. p. 40. H. retrofráctum, Pers. ench. 2. p. 78. Cístus pusíllus, herb. Lamb. Leaves all opposite. Peduncles always axillary or opposite the leaves. Inner sepals striated.

Bloody-stemmed Sun-Rose. Fl. June, Aug. Clt. 1826. Pl. ¼ to ¾ foot.

46 H. ÆGYPTI'ACUM (Mill. dict. no. 23.) stem pubescent, erect, or ascendant; leaves on short footstalks, linear-oblong, opposite, narrow, with revolute margins, bluntish, cinereous beneath, opposite, upper ones alternate; stipulas linear, awl-shaped; peduncles filiform, pubescent; calyxes ovate-oblong, inflated, inclosing the petals. ⊙. H. Native of Egypt, Barbary, and Spain. Cístus Ægyptìacus, Lin. spec. 742. Jacq. obs. 3. p. 17. t. 68. Peduncles thickened, sometimes opposite to the short linear bracteas. Outer sepals narrow, short, inner ones with 4 ciliated nerves. Petals lanceolate, very short.

Egyptian Sun-Rose. Fl. Ju. Jul. Clt. 1764. Pl. ¾ foot.

SECT. VI. ERIOCA'RPUM (from *εριον, erion*, wool, *καρπος, karpos*, a fruit; because the capsules are pilose). D. C. prod. 1. p. 273. Calyx of 5 sepals; sepals beset with silky hairs on the outside, or rather tomentose, shining on the inside, the two outer ones minute, linear, the three inner ones ovate, furnished with 4-5-stripes. Petals a little longer than the calyx. Style erectish, bent at the base. Ovary pilose or villous. Capsule pilose. Seeds numerous, rufescent, small. Subshrubs with round branches, younger ones clothed with cinereous pubescence. Leaves opposite and alternate, bluntish, under surface cano-cinereous. Stipulas linear, shorter than the footstalks. Racemes secund, small, opposite the leaves; flowers crowded, small, sessile, or larger on short pedicels.

47 H. LÍPPII (Pers. ench. 2. p. 78.) stem erect, pubescent, whitish, somewhat bifid or rather dichotomous; leaves opposite and alternate, on short footstalks, elliptic-lanceolate or linear-oblong, obtuse, rather scabrous, glaucescent, under surface canescent; stipulas narrow, erect, length of the footstalks; racemes short; flowers sessile, crowded, bracteate at the base; bracteas very minute. ♄. F. Native of Egypt. Cístus Líppii, Lin. mant. 245. Vahl. symb. 1. p. 39. Sepals pubescent, inner ones obtuse, furnished with 4-5 ribs. Petals ovate, yellow, scarcely longer than the calyx. Stamens usually 10, shorter than the petals.

Lipp's Sun-Rose. Fl. Ju. Jul. Clt. 1820. Shrub 1 foot.

48 H. SESSILIFLO'RUM (Pers. ench. 2. p. 78.) erect, much branched; branches pubescent; leaves opposite and alternate, linear, clothed with very short cinereous tomentum, with revolute margins; stipulas linear, small; racemes short; flowers sessile, furnished with minute bracteas. ♄. F. Native of the North of Africa, on arid hills. Cístus sessiliflòrus, Desf. fl. atl. 1. p. 427. t. 106. Sepals pubescent, inner ones blunt. Petals yellow, a little longer than the calyx.

Sessile-flowered Sun-Rose. Fl. Ju. Aug. Sh. 1 to 2 feet.

49 H. RUFICO'MUM (Spreng. syst. 2. p. 589.) stem densely clothed with canescent starry fascicles of hairs; leaves on short footstalks, lower ones elliptical, obtuse, flat, upper ones narrow, linear, stipulate, and all clothed with starry hairs beneath; with the margins somewhat revolute; flowers approximate, racemose; calyx beset with brownish bristles. ♄. F. Native of the North of Africa, in Libya. Flowers yellow. Cístus ruficòmus, Viv. fl. lib. spec. p. 27. t. 14. f. 5.

Brown-haired Sun-Rose. Shrub 1 foot.

50 H. LANUGINO'SUM (Spreng. syst. 2. p. 589.) branched; clothed all over with soft canescent hairs; leaves opposite, on short footstalks, elliptical, densely clothed with wool; floral leaves sessile, lanceolate, alternate, stipulate; flowers distant in a secund raceme, reflexed before expansion; inner sepals ovate-lanceolate, 3-nerved, outer sepals linear-lanceolate, about equal in length to the inner ones; petals about the length of the calyx. ♄. F. Native of the North of Africa, in Libya. Cístus lanuginòsus, Viv. fl. lib. spec. p. 28. t. 14. f. 1. Flowers yellow.

Woolly Sun-Rose. Shrub 1 foot.

51 H. ELLÍPTICUM (Pers. ench. 2. p. 78.) stem branched, erect, cinereous; leaves opposite, elliptical, clothed with whitish leprous-tomentum, obtuse, with revolute margins; stipulas linear, small; racemes few-flowered; flowers sessile, somewhat alternating with the bracteas. ♄. F. Native of Barbary and Egypt. Sweet, cist. t. 108. Cístus ellípticus, Desf. fl. atl. 1. p. 418. t. 107. H. Líppii, Delile, ægyp. 93. Cístus stipulàris α, Forsk. ægyp. p. 101. Sepals villously-tomentose, inner ones ovate, bluntish. Petals pale yellow, a little longer than the calyx, imbricate. Upper leaves alternate.

Elliptical-leaved Sun-Rose. Fl. Ju. Jul. Shrub ¾ foot.

52 H. MICRA'NTHUM (Spreng. syst. 2. p. 588.) plant clothed with starry hairs; leaves linear, obtuse, lower ones on short stalks, opposite, nearly all flat, upper ones alternate, with revolute margins, floral ones sessile, linear, acute; stipulas linear-lanceolate, a little longer than the footstalks of the leaves; flowers racemose, distant; sepals large, 3-5-nerved, ovate, acute, longer than the petals; petals elliptical, length of the stamens. ♄. F. Native of the North of Africa, in Libya. Cístus micránthus, Viv. fl. lib. p. 28. t. 14. f. 4. Petals like those of *H. Surrejànum*, yellow.

Small-flowered Sun-Rose. Shrub ¾ foot.

53 H. KAHÍRICUM (Del. fl. ægyp. 93. t. 31. f. 2.) stem much branched, twisted at the base; branches ascendant; lower leaves opposite, the rest alternate, obovate, with revolute margins, hoary, stipulate, under surface nerved; racemes secund; flowers on short pedicels; pedicels and calyxes villous; sepals acute; capsule oblong, villous. ♄. F. Native of Egypt. Cístus stipulàtus β, Forsk, ægyp. 101. Petals approximate at the top.

Cairo Sun-Rose. Fl. Ju. Jul. Clt. 1820. Shrub 1 foot.

54 H. CONFE'RTUM (Dunal, ined. and D. C. prod. 1. p. 274.) stem naked at the base, branched; branches clothed with very short cinereous tomentum; leaves lanceolate elliptical, bluntish, minutely tomentose on both surfaces, upper surface green, under surface canescent; stipulas linear, small; racemes small, secund, opposite the leaves and terminal; flowers crowded, almost sessile; calyxes pilose; inner sepals acute. ♄. F. Native of Teneriffe. Petals yellow.

Crowded-flowered Sun-Rose. Fl. Ju. Jul. Clt. ? Sh. 1 foot.

55 H. CANARIE'NSE (Willd. enum. 571.) stem procumbent; branches rather tomentose, hoary; leaves stalked, opposite and alternate, somewhat ovate-elliptic, obtuse, covered with very short glaucous tomentum on both surfaces, under surface hoary-cinereous; stipulas awl-shaped, shorter than the footstalks; racemes terminal erect, furnished with minute bracteas; flowers on short pedicels; pedicels hoary-tomentose. ♄. F. Native of Grand Canary and Lancerotta Island, in arid places. Cístus Canariénsis, Jacq. icon. 1. p. 97. misc. 2. p. 339. H. canéscens, Mœnch. Calyx glaucous; inner sepals ovate, bluntish. Petals yellow.

Canary-Island Sun-Rose. Fl. Ju. July. Clt. 1790. Shrub trailing.

56 H. MUCRONA'TUM (Dunal. ined. and D. C. prod. 1. p. 274.) stem erectish, spreading; branches tomentosely-hairy, hoary; leaves stalked; ovate-elliptical, ventricose, mucronate, upper surface green and roughish from stellate hairs, under surface tomentose, hoary; stipulas awl-shaped, pilose, shorter than the footstalks; racemes generally terminal; flowers on short pedicels; pedicels tomentosely-hairy. ♄. F. Native of Teneriffe. Calyx clothed with silky hairs; sepals broad-ovate, bluntish. Petals yellow.

Mucronate-leaved Sun-Rose. Fl. Ju. Jul. Sh. 1 to 1½ foot.

57 H. DISTA'CHIUM (Roth. in ann. bot. 2. p. 34. under *Cístus*.) stem suffruticose, stipulate, erect; leaves opposite, oval-oblong, hoary; racemes terminal, leafy, 2-parted; flowers opposite the leaves. ♄. F. Native of Portugal.

Two-spiked Sun-Rose. Shrub 1 foot.

SECT. VII. FUMA'NA (meaning unknown.) D. C. prod. 1. p. 274. Calyx twisted at the apex before expansion, 5-sepalled; 2 outer sepals narrow, small, 3 inner ones ovate, acuminated, 4-5-veined, with scarious margins. Petals yellow, small, almost twice the length of the sepals. Stamens few. Style straight, rather longer than the stamens, when in flower oblique, after flowering erectish. Stigma capitate, fringed, somewhat 3-lobed. Capsule 3-valved, open, spreading; seeds few, blackish or rufescent, angular. Stems suffruticose. Leaves linear, sessile or sub-sessile, narrow. Pedicels 1-flowered, drooping before the expansion of the flower; when in flower erect, but afterwards reflexed.

* *Leaves alternate, without stipulas.*

58 H. ERICOÌDES (Dunal, ined. et D. C. prod. 1. p. 274.) stem erect; leaves alternate, umbricate, semi-cylindrical, short, smoothish; peduncles solitary, 1-flowered, opposite the leaves or terminal, longer than the leaves; capsules open, naked? ♄. F. Cístus ericoìdes, Cav. icon. 2. p. 56. t. 172. Cístus calycìnus, of many authors, not as is seen in Lin. mant. 565. Leaves with rather revolute margins.

Var. a, glàbrum (D. C. prod. 1. p. 174.) branches and peduncles glabrous. ♄. F. Native of Spain.

Var. β, pubéscens (D. C. l. c.) summits of the branches pubescent as well as peduncles. ♄. F. Native of the Kingdom of Naples.

Heath-like Sun-Rose. Fl. Ju. Aug. Clt. ? Sh. 1 to 1½ foot.

59 H. FUMA'NA (Mill. dict. no. 6.) stem branched, twisted, rather diffuse, erectish; lower branches procumbent; leaves alternate, linear, with pilose, roughish, rather involute margins; lower leaves short, crowded, upper ones scattered and longer; peduncles solitary, 1-flowered, rarely rameal, usually almost opposite the leaves or terminal, longer than the leaves; capsules open, naked. ♄. F. Native of the south of France, Spain, Portugal, Switzerland, Gothland and Italy. Sweet, cist. t. 16. Cístus Fumàna, Lin. spec. 740. Jacq. aust. t. 252. Cístus hùmilis, seu chamæcístus ericæ fòlio, luteus erectior, Bauh. pin. 466. Magn. bot. 69. Pedicels and calyxes sparingly pilose.

Var. a, màjus (D. C. prod. 1. p. 275.) leaves larger. Cístus Fumàna A. Desf. atl. 1. p. 414. t. 105, exclusive of the synonym of Lin. and Barrel. Petals of all the varieties imbricate.

Var. β, mìnus (D. C. l. c.) leaves somewhat filiform. Barrel. icon. 286. and 446.

Var. γ, virgàtum (D. C. l. c.) branches twiggy. H. fumanoìdes, formerly in the Paris garden.

Fumana Sun-Rose. Fl. June, July. Clt. 1752. Shrub 1 foot.

60 H. PROCU'MBENS (Dun. ined. and D. C. prod. 1. p. 275.) stem procumbent, branched; branches elongated, younger ones hoary; leaves alternate, linear, rather lax, with the margins pilose, as well as under surface; pili strigose; peduncles almost axillary, shorter than the leaves; capsules open, bearing the seeds. ♄. F. Native of the south of France, Italy, and Tauria. Sweet, Cist. t. 68. Barrel. icon. t. 445. Cístus hùmilis sive chamæcístus ericæ folio humilior, Magn. bot. p. 69. Capsules larger. Nerves of calyx strigose. Petals imbricate.

Procumbent heath-like Sun-Rose. Fl. June, August. Clt. ? Shrub procumbent.

** *Leaves alternate, stipulate.*

61 H. ARA'BICUM (Pers. ench. 2. p. 80.) stem hairy, ascendant; branches twiggy; leaves alternate, linear-oblong, hairy, almost sessile; peduncles solitary, 1-flowered, almost opposite the leaves, rameal or terminal; calyxes hairy. ♄. F. Native of Arabia, Italy, and Spain. Sweet, cist. t. 97. Cístus Arábicus, Lin. spec. 745. Smith, fl. græc. t. 503. Cístus ferrugíneus, Lam. dict. 2. p. 25. Cístus Sàvi, Bertol. H. viscídulum, Stev. Upper leaves largest. Stipulas ovate acuminated. Petals distinct.

Arabian Sun-Rose. Fl. Ju. July. Clt. 1826. Shrub ½ foot.

62 H. LÆ'VIPES (Willd. enum. 570.) stem ascendant; leaves stipulate, setaceous, glaucous, smoothish; buds leafy, axillary; stipulas long, filiform; peduncles long, disposed in secund racemes; pedicels glabrous, and bracteate at the base; calyxes hairy. ♄. F. Native of the south of Provence, Spain, and Dalmatia, on rocks exposed to the sun. Sweet, cist. t. 24. Cístus læ'vìpes, Lin. spec. 739. Jacq. hort. Schœnb. t. 158. Cav. icon. 2. p. 56. t. 173.—Ger. gallo-prov. p. 394. no. 6. t. 14.

Var. a, peduncles pubescent.

Var. β, peduncles almost glabrous.

Smooth-peduncled Sun-Rose. Fl. June, August. Clt. 1690. Shrub 1½ foot.

*** *Leaves opposite and alternate, furnished with stipulas.*

63 H. LÆ'VE (Pers. ench. 2. p. 78.) stem erectish, glabrous, branched; branches erect; leaves linear, sessile, glabrous, with

revolute margins, keeled, opposite, upper ones alternate, stipulate; stipulas long, awl-shaped; peduncles solitary, 1-flowered, sub-terminal; calyxes smooth. ♄. F. Native of Spain, on hills. Cístus lævis, Cav. icon. 2. p. 35. t. 145. f. 1. exclusive of the synonym of Barrel.

Smooth Sun-Rose. Fl. Ju. July. Clt. 1826. Shrub 1 foot.

64 H. VIRIDE (Tenor. prod. fl. neap. p. 31.) stem ascendant, glabrous; leaves opposite, linear, with revolute margins, glabrous, green, somewhat mucronate, stipulate; stipulas awl-shaped, much smaller than the leaves; peduncles racemose, beset with clammy villi, as well as the calyx. ♄. F. Native of Sicily. Leaves pale-green.

Green-leaved Sun-Rose. Fl. June, July. Clt. 1825. Shrub 1 foot.

65 H. JUNIPERINUM (Lag. in litt. and D. C. prod. 1. p. 275.) stem ascendant, branched; leaves linear-awl-shaped, ciliated, mucronate, flat, with rather revolute margins, opposite; upper leaves alternate; stipulas awl-shaped, upper ones longest; peduncles racemose, and are, as well as the calyxes, clothed with clammy hairs. ♄. F. Native of the south of France, Italy, and the kingdom of Tunis. Cístus lævipes, Durand! Gouan. fl. monsp. 263? Cístus Mauritánicus, Thib.! ined.—Barrel. icon. t. 443. Bracteas solitary, linear.

Juniper-like Sun-Rose. Fl. June, August. Clt. 1800. Shrub 1 foot.

66 H. BARRELIERI (Tenor. prod. fl. neap. p. 31.) stem erect; branches villously pubescent; leaves linear-oblong, narrowed at the base, pubescent, with revolute and ciliated margins, opposite; upper leaves alternate; stipulas linear-awl-shaped, mucronate, erect; peduncles racemose, few-flowered, and are, as well as the calyxes, beset with clammy villi. ♄. F. Native of Italy and Spain.—Barrel. rar. icon. 416.—Sims, bot. mag. 2371.

Barrelier's Sun-Rose. Fl. June, August. Clt. 1820. Shrub 1 foot.

67 H. SYRTICUM (Spreng. syst. 2. p. 593.) hairy; branches spreading, clothed with appressed white hairs; leaves almost sessile, opposite, flattish, linear-elliptical, beset with scattered hairs, hoary underneath, with revolute margins; upper leaves linear, and more acute; stipulas leaf-like, but not above half the size of the leaves, but the upper ones are about equal in size to the leaves; flowers disposed in a short secund raceme. Sepals 5, densely beset with bristles, inner ones roundish-ovate, 5-nerved, outer ones round and very short. ♄. F. Native of the North of Africa, in the Great Syrtis. Cístus Sýrticus, Viv. fl. lib. p. 27. t. 14. f. 2. Flowers violet?

Syrtic Sun-Rose. Shrub 1 foot.

68 H. THYMIFÒLIUM (Pers. ench. 2. p. 79.) stems procumbent; branches pubescent; leaves almost linear, very short, pubescent, opposite, upper ones alternate; stipulas mucronate, erect; peduncles few-flowered, clothed with clammy villi. ♄. F. Native of Spain. Sweet, cist. t. 102. Cístus thymifòlius, Lin. spec. 743. Smith, fl. græc. t. 500—Barrel. icon. rar. t. 444. H. glutinòsum, *β*. fl. fr. 4. p. 821. Young leafy shoots in the axils of the leaves. Petals imbricate.

Thyme-leaved Sun-Rose. Fl. June, Aug. Clt. 1658. Shrub procumbent.

69 H. GLUTINÒSUM (Pers. ench. 2. p. 79.) stem ascendant; branches clothed with clammy hairs, somewhat cinereous; leaves almost linear, with revolute margins, villous, clammy, somewhat cinereous, opposite, upper ones alternate; lower stipulas minute, the rest long, loose; peduncles and calyxes villous, clammy; petals distinct. ♄. F. Native of the south of France, and Spain. Sweet, cist. t. 83. Cístus glutinòsus, Lin. mant. 246.—Barrel. icon. rar. 512. t. 415? Cav. icon. 2. t. 145. f. 2. Petals pale yellow, crenulated at the top.

Clammy Sun-Rose. Fl. May, Sept. Clt. 1790. Shrub 1 ft.

SECT. VIII. PSEUDOCÍSTUS (from *ψευδης*, *pseudes*, false, and *κιστος*, *cistos*; False Cistus.) D. C. prod. 1. p. 276. Calyx of 5 sepals, outer sepals narrow, minute, inner ones 4-veined. Petals yellow, small, scarcely twice the length of the sepals. Style twisted at the base, and bent inwards at the apex, usually shorter than the stamens, rarely longer. Stigma capitate, 3-lobed. Capsule small. Seeds few, rather rufescent. Perennial herbs, or subshrubs. Leaves stalked, feather-nerved, opposite, usually without stipulas, rarely with stipulas at the summits of branches. Flowers secund, racemose, or panicled. Pedicels bracteate at the base, recurved before flowering, when in flower erect, but afterwards reflexed. Bracteas sessile, linear-lanceolate.

70 H. MÓLLE (Pers. ench. 2. p. 76.) suffruticose; branches almost simple, pilose; leaves roundish-ovate, obtuse, stalked, hairy-tomentose on both surfaces, soft; racemes simple, and are, as well as calyxes, hairy-tomentose, cinereous. ♄. F. Native of Spain. Cístus móllis, Cav. icon. 3. p. 31. t. 262. f. 2. Bracteas awl-shaped, minute, pilosely-tomentose, cinereous.

Soft-leaved Sun-Rose. Fl. June, August. Clt. 1817. Shrub 1 foot.

71 H. ORIGANIFÒLIUM (Pers. ench. 2. p. 76.) stem suffruticose, di-trichotomous; leaves stalked, ovate, pilose on both surfaces; racemes short, terminal; petals scarcely longer than the calyx. ♄. F. Native of Spain. Cístus origanifòlius, Lam. dict. 2. p. 20. Cav. icon. 3. p. 31. t. 262. f. 1. Calyx oblong. Petals one-half smaller than those of *H. mólle*.

Marjoram-leaved Sun-Rose. Fl. June, July. Clt. 1795. Shrub ½ foot.

72 H. DICHÓTOMUM (Dunal, ined. and D. C. prod. 1. p. 276.) suffruticose; branches dichotomous, smoothish; leaves minute, ovate, acute, glabrous, with revolute margins, on short foot-stalks; racemes slender, few-flowered. ♄. F. Native of Spain. Cístus dichótomus, Cav. icon. 3. p. 32. t. 263. f. 1. Flowers small, deep yellow, hardly the size of those of *Spérgula nodòsa*. Leaves small, having the appearance of those of *Thymus piperélla*.

Dichotomous-branched Sun-Rose. Fl. June, August. Clt. 1826. Shrub 1 foot, prostrate.

73 H. ŒLANDICUM (D. C. fl. fr. 4. p. 817.) stem suffruticose, procumbent, branched; leaves lanceolate-elliptical, bluntish, green on both surfaces, usually glabrous, sometimes ciliated, stalked, upper leaves sessile; racemes simple, few-flowered; calyx somewhat globose-ovate. ♄. H. Native of the Alps of Europe, especially the north of France, Œland, Switzerland, and Austria. Sweet, cist. t. 85. Cístus Œlándicus, Lin. spec. 741. Chamæcístus, 2. Clus. hist. p. 73. icon. Bracteas minute, sessile, linear-oblong. Flowers few, approximate. Petals distinct.

Œland Sun-Rose. Fl. June, August. Clt. 1816. Shrub trailing.

74 H. PULCHELLUM (Sweet, cist. t. 74.) stem suffruticose, procumbent, branched; branches clothed with hoary tomentum; leaves roundish or ovate, obtuse, upper surface green, beset with hispid hairs, under surface clothed with hoary tomentum, with the margins a little revolute; racemes simple; calyxes pilose, hoary; petals imbricate. ♄. H. Native of Germany? H. alpéstre, Spreng. syst. 2. p. 590. but not of others. Flowers yellow.

Neat Sun-Rose. Fl. June, August. Clt. 1820. Shrub procumbent.

75 H. ALPESTRE (Dunal, ined. and D. C. prod. 1. p. 276.) stem suffruticose, procumbent, branched; branches pilosely-hairy; leaves greenish on both surfaces, oblong-elliptical, rather glabrous, or with hairs in fascicles, stalked, upper leaves almost sessile; pedicels and calyxes pilosely-hairy; hairs cinereous. ♄. H. Native of Germany, Switzerland, Italy, France, on rocks. Cístus alpéstris, Crantz. austr. p. 103. t. 6. f. 1. Wahl.

helv. p. 103. Cístus Œlándicus, Jacq. austr. t. 399. Petals twice the length of calyx, imbricate.

Var. α, *glabràtum* (D. C. prod. 1. p. 277.) leaves smoothish, oblong-elliptical, bluntish, with pilose footstalks.

Var. β, *elongàtum* (D. C. prod. l. c.) branches elongated; leaves acute, pilose on both surfaces. Cístus Seguièri, Pourr. ined.

Var. γ, *canéscens* (D. C. prod. l. c.) younger leaves, peduncles, and calyxes pilose, cinereously-canescent. Cístus Œlándicus, Gouan. fl. monsp. p. 263?

Alp Sun-Rose. Fl. Ju. Aug. Clt. 1818. Shrub procumbent.

76 H. PENICILLA'TUM (Thib. ined. and D. C. prod. 1. p. 277.) suffruticose; branches procumbent, long, hispid; leaves green, with the nerves on both surfaces hispid, as well as the margins, lower leaves stalked, ovate, smaller, upper ones linear-oblong, almost sessile; racemes simple, and are as well as the calyxes hispid; flowers minute. ♄. H. Native of Spain, as well as the south of France. Cístus echioìdes, Lam. dict. 2. p. 21? Cístus A'nglicus, Lin. mant. 245? Plant with the habit of *Myosòtis Láppula*.

Pencilled-leaved Sun-Rose. Fl. June, Aug. Clt. 1826. Shrub trailing.

77 H. OBOVA'TUM (Dunal, ined. and D. C. prod. 1. p. 277.) suffruticose; branches spreading, somewhat dichotomous, clothed with cinereous tomentum towards the apex; leaves obovate or oblong, obtuse, green on both surfaces, ciliated, pilosely-strigose, lower leaves minute; racemes simple, 3-flowered; bracteas green; calyxes pilose, cinereous. ♄. F. Native of Spain near Aranjuez. Cístus Itálicus, Lin. spec. 740. exclusive of the synonyms. Leaves ending in the short footstalks.

Obovate-leaved Sun-Rose. Fl. June, July. Clt. 1826. Shrub ½ to 1 foot.

78 H. ITA'LICUM (Pers. ench. 2. p. 76.) suffruticose; branches simple, erect, long, pilosely-tomentose; leaves pilosely-hispid; hairs strigose, appressed, lower leaves ovate, smaller, upper ones lanceolate, oblong or oblong-linear; racemes simple, and are as well as calyxes pilosely-hispid, canescent. ♄. H. Native of the Mediterranean in dry regions. Cístus Itálicus, Lin. spec. 740. Cístus marifòlius, Bieb. fl. taur. cauc. 2. p. 8.—Barrel. icon. rar. 510. t. 366.

Var. α, *strigòsum* (D. C. prod. 1. p. 277.) leaves greenish on both surfaces, strigosely-pilose; peduncles and calyxes pilosely-tomentose, hoary. H. strigòsum, Fisch. in litt.

Var. β, *candidíssimum* (D. C. prod. l. c.) leaves, peduncles, and calyxes clothed with white tomentum.

Var. γ, *álbidum* (D. C. prod. l. c.) leaves whitish-tomentose on the under surface.

Italian Sun-Rose. Fl. Jul. Sept. Clt. 1799. Shrub ½ to 1 ft.

79 H. VINEA'LE (Pers. ench. 2. p. 77.) suffruticose, procumbent; branches ascendant, pilosely-tomentose, canescent; leaves ovate-oblong, upper surface green, strigosely-pilose, under surface tomentose, hoary; racemes simple, few-flowered, and are as well as the calyxes pilosely-tomentose, canescent. ♄. H. Native of the south of Germany, Switzerland, France, and Spain. Sweet, cist. t. 77. Cístus vineàlis, Willd. spec. 2. p. 1195. Perhaps a variety of *H. cànum*. Petals distinct.

Vineyard Sun-Rose. Fl. Ju. July. Clt. 1817. Trailing shrub.

80 H. CA'NUM (Dunal, ined. D. C. prod. 1. p. 277.) stem suffruticose, procumbent, branched, ascendant, pilosely-tomentose, hoary; leaves obovate, ovate, ovate-oblong or elliptical, pilose, upper surface green, under surface somewhat tomentose, hoary; racemes simple; pedicels and calyxes pilose, canescent; petals distinct. ♄. F. Native of the south of France and Germany. Sweet, cist. 56. Cístus cànus, Lin. spec. 740. Jacq. aus. t. 277. All. pedm. no. 1664. t. 45. Chamæcístus 3, Clus. hist. p. 74. Leaves variable, on the margin and middle nerve, on the under surface, as well as every where over the upper surface, covered with strigose pili. Ovary triquetrous, with marginate pilose angles. Perhaps Cistus marifòlius, Smith, eng. bot. 396.

Hoary Sun-Rose. Fl. June, July. Clt. 1772. Shrub procumbent.

81 H. MARIFÒLIUM (D. C. fl. fr. 4. p. 817.) suffruticose, procumbent; leaves without stipulas, stalked, ovate-cordate or ovate, acutish, upper surface green, pilose, under surface hoary; racemes solitary, simple, few-flowered, terminal. ♄. H. Native of Italy, Spain, and south of France. Cístus marifòlius, Lin. spec. 741. but not of Bieb. fl. taur. cauc.—Barrel. icon. rar. 521. t. 441. Calyxes ovate-oblong.

Marum-leaved Sun-Rose. Fl. June, July. Clt. 1817. Shrub trailing ½ foot.

82 H. SE'RRÆ (Cambess. in mem. mus. 14. p. 216. t. 11.) stem humble, erect, suffruticose, branched; leaves opposite, without stipulas, on short footstalks, somewhat cordate-ovate, fleshy, glaucous; flowers in racemose-corymbs; ovary 3-celled; style jointed at the base; stigma thickened. ♄. F. Native of the larger islands between Palma and a place called Prat in the sand by the sea-side. Leaves glabrous, rather hairy on the margins. Flowers yellow.

Serra's Sun-Rose. Fl. March, April. Shrub ½ foot.

83 H. RUBE'LLUM (Presl. ex Spreng. syst. 2. p. 591.) leaves ovate-roundish or oblong, acute, upper surface dark-red and smooth, under surface hoary, tomentose; flowers racemose, pendulous; calyx hairy. ♄. F. Native of Sicily.

Red-leaved Sun-Rose. Shrub ½ foot.

84 H. ROTUNDIFÒLIUM (Dunal, ined. and D. C. prod. 1. p. 277.) stem suffruticose, branched at the base; branches simple, tomentose, hoary, for the most part decumbent at the base; leaves on short footstalks, upper surface greenish-glaucous, under surface clothed with white tomentum, lower leaves almost round, the rest ovate, uppermost ones stipulate; stipulas small, oblong, deciduous; racemes solitary in twos or threes, somewhat panicled, crowded, terminal; calyxes hairy. ♄. F. Native of Spain and Barbary. Cístus nummulàrius, Cav. icon. 2. p. 34. t. 142. Desf. atl. 1. p. 423. exclusive of the synonyms of Linnæus and Magnol.

Round-leaved Sun-Rose. Fl. Ju. July. Shrub decumbent.

85 H. CRASSIFÒLIUM (Pers. ench. 2. p. 77.) stem suffruticose, erect, rather glabrous; leaves somewhat fleshy, on short footstalks; lower leaves ovate, acute, without stipulas, upper ones oblong-linear, stipulate; racemes short, rather umbellate; calyxes pilose at the base. ♄. F. Native of Barbary and Spain. Cístus glaúcus, Desf. atl. 1. p. 418. but not of Cav. H. Sétxe, Lag. in litt. on account of the plant being called *Setxe* in the kingdom of Valentia in Spain. Leaves rather pilose on the upper surface at the margins, as well as on the under surface on the middle nerve. Footstalks with a few long white hairs.

Thick-leaved Sun-Rose. Fl. May, Jul. Clt. 1818. Shrub 1 ft.

86 H. PANICULA'TUM (Dunal, ined. and D.C. prod. 1. p. 278.) suffruticose, procumbent; branches ascendant and erect, floriferous branches long, upper part stipulate; leaves stalked, ovate, bluntish, rarely roundish, upper surface green, under surface hoary; racemes opposite and tern, panicled. ♄. F. Native of Spain and Sicily on mountains. Cístus marifòlius herb. Thib. Cístus nummulàrius var. Lag. in litt. H. sp. nova Schouw. in litt. Stipulas minute, linear, acute. Flowers small.

Panicled-flowered Sun-Rose. Fl. June, Aug. Clt. 1826. Shrub procumbent.

87 H. POLYA'NTHOS (Pers. ench. 2. p. 78.) stem suffruticose, erect, hairy; leaves stalked, lower ones ovate, obtuse, smaller, under surface hoary, tomentose, stem ones ovate-oblong or lanceolate, greenish on both surfaces, with ciliated margins, stipulate; stipulas longer than the footstalks; racemes hairy, pani-

cled; pedicels filiform, and are as well as calyxes hairy. ♄. F. Native of the North of Africa. Cístus polyánthos, Desf. fl. atl. 1. p. 420. t. 108.

Many-flowered Sun-Rose. Fl. June, July. Shrub 1 foot.

88 H. CINE'REUM (Pers. ench. 2. p. 76.) stem suffruticose, erect, branched; branches opposite, hoary; leaves ovate, acute, tapering into the footstalk, densely-tomentose, and cinereously-hoary, without stipulas; upper leaves stipulate; racemes panicled, axillary opposite, or terminal in threes; calyxes hispid. ♄. F. Native of Spain. Cístus cinèreus, Cav. icon. 2. p. 33. t. 141. Flowers small. Petals entire.

Var. β, Lagascànum (D. C. prod. 1. p. 278.) stems slender; calyxes less hairy than in var. *α*. Lag. in litt.

Grey-leaved Sun-Rose. Fl. June, July. Clt.? Sh. 1 foot.

89 H. PILOSELLOI'DES (D. C. prod. 1. p. 284.) suffruticose, without stipulas; leaves elongately-elliptic, obtuse on long footstalks, upper surface green, under surface hoary-tomentose, both sides hairy; flowers in panicles. ♄. H. Native of the Pyrenees on rocks exposed to the sun. Cístus piloselloìdes, Lapeyr. abr. 301. Flowers yellow.

Pilosella-like Sun-Rose. Shrub.

90 H. SQUAMMA'TUM (Pers. ench. 2. p. 78.) stem suffruticose; branches long, erect, rather woody, silvery, leprous; leaves stalked, oblong, obtuse, leprously-silvery, stipulate; stipulas small, sessile, acute, marcescent; racemes axillary, solitary, and in threes terminal; pedicels approximate, secund, bracteate at the base; bracteas marcescent; calyxes leprous. ♄. F. Native of Spain and Barbary. Cístus squammàtus, Lin. spec. 743. Cav. icon. 2. t. 139. Desf. fl. atl. 1. p. 416.—Barrel. icon. rar. t. 328. bad. Branches 4-angled at the base. Plant covered with leprous round scales, which are depressed in the centre. Style twisted at the base, bent, longer than the stamens. Leafy branches axillary.

Scaly Sun-Rose. Fl. June, July. Clt. 1815. Shrub ¾ foot.

SECT. IX. EUHELIA'NTHEMUM (from *ευς*, *eus*, genuine, *ηλιος*, *helios*, the sun, and *ανθος*, *anthos*, a flower; that is to say, genuine species of Sun-Rose.) D. C. prod. 1. p. 278. Calyx of 5 sepals, rather twisted at the top, before expansion; outer sepals usually spreading, much smaller than the inner ones, which are usually 2 or 4 ribbed, furrowed, with scarious margins, with the inner surface shining,, and with the angles generally pilose. Petals 2, 3, or 4 times longer than the calyx. Stamens numerous. Style bent at the base, but somewhat club-shaped at the apex. Stigma simple. Capsule covered by the calyx, 3-valved, 1-celled, opening at the apex. Seeds few, convex on the outside, and angular on the inside. Subshrubs, with the stems branched from the base; branches numerous, erect or procumbent, but generally ascendant. Leaves opposite, on short footstalks, lower ones smallest, usually with revolute margins, stipulate; stipulas linear-lanceolate. Racemes terminal, secund, simple, curved backwards before flowering, after flowering erect, elongated. Pedicels laterally bracteate at the base, drooping before flowering, when in flower erect, after flowering recurved or reflexed.

* *Petals yellow.*

91 H. LAVANDULÆFÒLIUM (D. C. fl. fr. 4. p. 820.) stem suffruticose, erect, branched; branches long, terete, canescent; leaves oblong-linear, with revolute margins, under surface tomentose, hoary, younger leaves canescent on both surfaces; stipulas and bracteas linear, acute, ciliated; racemes 1-3 terminal; flowers crowded; calyxes glaucous; sepals ciliated, outer ones minute, these become reflexed after flowering, inner sepals 2-nerved, oblique, acute. ♄. H. Native of the south of France, Barbary, Spain, and Syria, in dry places. Cístus lavandulæfòlius, Lam. dict. 2. p. 25.—Barrel. icon. t. 288. Furnished with axillary leafy branches.

Var. β, Syrìacum (D. C. prod. 1. p. 279.) leaves rather flat, upper surface greenish-grey. Cístus Syrìacus, Jacq. icon. rar. t. 96.

Var. γ, Thibaùdi (Pers. ench. 2. p. 79.) racemes long, erect. Cístus racemòsus. Cav. icon. 2. p. 33. t. 140. Perhaps the same plant after flowering.

Lavender-leaved Sun-Rose. Fl. June, July. Clt. 1739. Shrub 1 foot.

92 H. BROUSSONE'TII (Dunal, ined. et D. C. prod. 1. p. 279.) stem shrubby, branched; branches opposite; leaves flat, on short footstalks, oblong-lanceolate, bluntish, tomentose on both surfaces, under surface hoary, upper surface greenish-grey; stipulas and bracteas caducous, linear, rather tomentose; racemes short, branched; flowers secund; calyxes oblong, acute; inner sepals 4-nerved, rather tomentose, yellowish. ♄. F. Native of the island of Teneriffe. Style twice the length of stamens, almost erect. Stipulas somewhat falcate.

Broussonet's Sun-Rose. Fl. June, July. Shrub 1 foot.

93 H. STŒCHADIFÒLIUM (Pers. ench. 2. p. 79.) stem erect; branches hoary, tomentose; leaves oblong-linear, bluntish, somewhat tomentose on both surfaces, under surface hoary, upper surface greenish-grey, with revolute margins; stipulas rather villous, linear-lanceolate; racemes revolute before flowering; flowers crowded; calyxes villous; outer sepals ciliated, green, inner ones acuminated, hoary. ♄. H. Native of Spain and Corsica. Sweet, cist. icon. ind. Cístus stœchadifòlius, Brot. fl. lus. 2. p. 270.

French-Lavender-leaved Sun-Rose. Fl. Ju. Jul. Clt. 1816 Sh. 1 ft.

94 H. CRÒCEUM (Pers. ench. 2. p. 79.) stem shrubby, somewhat procumbent, branched; branches simple, erect, hoary, tomentose; leaves rather tomentose, under surface canescent, upper surface glaucous, with revolute margins; lower leaves almost round, middle ones elliptic, obtuse, upper ones lanceolate, acutish; stipulas and bracteas erect, linear-oblong, villous, rather greenish; calyxes yellowish-glaucous, minutely pubescent. ♄. H. Native of Spain and Barbary. Sweet, cist. t. 53. Cístus cròceus, Desf. fl. atl. 1. p. 422. t. 110. Lower stipulas minute. Petals yellow, very much imbricated.

Var. α, stipulas longer than the footstalks of the leaves.

Var. β, stipulas setaceous, shorter than the footstalks of the leaves.

Var. γ, branches procumbent; leaves smaller; racemes few-flowered.

Saffron-coloured-flowered Sun-Rose. Fl. June, July. Clt.? Shrub procumbent.

95 H. ANDERSÒNI (Sweet, cist. t. 89.) stem suffruticose, procumbent, branched; branches ascending, canescently tomentose; leaves oblong-lanceolate, acutish, rather tomentose, grey above, and canescent beneath, with the margins a little revolute; stipulas linear, awl-shaped, ciliated, a little longer than the petioles; calyx tomentose; petals imbricate. ♄. H. Flowers yellow. This is a hybrid from *H. cròceum*, fertilized by the pollen of *H. pulveruléntum*.

Anderson's Sun-Rose. Fl. May, Aug. Clt. 1827. Sh. ascendant.

96 H. NUDICAU'LE (Dunal, ined. and D. C. prod. 1. p. 279.) stem shrubby, branched; branches smooth at bottom, but hoary-villous at the top; leaves oblong-lanceolate, with revolute margins, tomentose on both surfaces, under surface hoary, upper surface yellowish-green; stipulas linear, longer than the petioles; calyxes profoundly sulcate, hardly pubescent, with elevated pilose nerves. ♄. H. Native of Spain, on mountains in the kingdom of Valentia. Petals yellow. Perhaps a variety of *H. cròceum*?

Naked-stemmed Sun-Rose. Fl. June, July. Clt. 1826. Shrub procumbent.

97 H. GLAU'CUM (Pers. ench. 2. p. 78.) stem suffruticose, branched; branches ascendant, hoary-tomentose, hispid at the top; leaves ciliated on their margins, scarcely revolute, tomentose on both surfaces, under surface hoary, upper surface greenish-glaucous; lower leaves round, the rest elliptic, or lanceolate-oblong; stipulas and bracteas pubescent, green; pedicels and calyxes beset with white hairs. ♄. H. Native of Spain and Italy. Sweet, cist. t. 111. Cístus glaúcus, Cav. icon. 3. p. 31. t. 261. but not of Desf. Petals sulphur-coloured.

Var. α, *acutiúsculum* (D. C. prod. 1. p. 279.) upper leaves oblong, rather acuminated, upper surface glaucescent; calyxes clothed with soft hairs.

Var. β, *obtusiúsculum*, upper leaves oblong-elliptical, bluntish, upper surface roughish, green; calyxes somewhat hispid.

Glaucous Sun-Rose. Fl. June, August. Clt. 1815. Shrub 1 foot.

98 H. TOMENTO'SUM (Dunal, ined. and D. C. prod. 1. p. 279.) stem suffruticose, branched; branches elongated, ascendant, somewhat canescent; leaves lanceolate-oblong, usually with revolute margins, under surface hoary-tomentose, upper surface smoothish, green; calyxes furrowed, with elevated pilose nerves. ♄. H. Native of Spain and France: in Britain, on the mountains of Scotland. Smith, eng. bot. 2208.—Scop. carn. t. 24? Pedicels hoary, pilosely-tomentose. Bracteas smooth. Calyx violaceous. Petals yellow, imbricate. Stipulas a little fringed.

Tomentose Sun-Rose. Fl. July. Scotland. Shrub trailing.

99 H. BARBA'TUM (Pers. ench. 2. p. 79. Sweet, cist. t. 73.) stem suffruticose, erect, much branched; branches clothed with fascicled hairs; leaves hairy, green on both surfaces; lower ones roundish-ovate, upper ones elliptical; stipulas oblong, ciliated, hairy, longer than the footstalks of the leaves; racemes long, hairy, bearded, many-flowered; calyxes warted, hairy; petals crenulated, imbricate at the base. ♄. H. Native of the south of Europe. Cístus barbàtus, Lam. dict. 2. p. 24. Petals yellow.

Bearded-racemed Sun-Rose. Fl. June, July. Clt. 1820. Shrub 1 foot.

100 H. LEPTOPHY'LLUM (Dunal, ined. and D. C. prod. 1. p. 279.) stem suffruticose, woody, rather procumbent, branched; branches ascendant, rather tomentose, greyish; leaves narrow, oblong-linear, tapering into the short footstalks, with revolute margins, under surface covered with short cinereous tomentum, upper surface smoothish, green; stipulas awl-shaped, pilose, scarcely longer than the footstalks; racemes long; calyxes covered with long hairs. ♄. H. Native of Spain. Sweet, cist. t. 20. Cístus angustifòlius, Lag. in litt. but not of Jacq. Cístus stœchadifòlius, Hortul. Calyxes furrowed. Petals yellow, imbricate. Bracteas minute. Racemes loose.

Slender-leaved Sun-Rose. Fl. June, July. Clt. 1818. Shrub procumbent.

101 H. ACUMINA'TUM (Pers. ench. 2. p. 79.) branches erect, pilose at the base and the apex, middle naked; leaves on long footstalks, oblong, with revolute margins, green on both surfaces, pilose, under surface rather tomentose; stipulas smoothish, linear, longer than the footstalks of the leaves; racemes rather hairy, few-flowered, loose; calyxes smooth, shining, transparent. ♄. H. Native of the fields about Nice. Cístus serpyllifòlius, Balb. ined. Cístus acuminàtus, Viv. fragm. 13. t. 14. f. 1. is truly distinct from this plant, and is evidently a variety of *H. guttàtum*, or an allied species.

Acuminate Sun-Rose. Fl. June, July. Clt. 1820. Shrub 1 foot.

102 H. SERPYLLIFO'LIUM (Mill. dict. no. 8.) stem suffruticose; branches ascendant, glabrous at the base and pilose at the apex; leaves oblong-elliptical, with rather revolute margins, under-surface hoary-tomentose, upper surface intensely green, shining, at first rather pilose, afterwards almost smooth; stipulas and bracteas green, ciliated; calyxes canescent, with inconspicuous down, and with the nerves sparingly pilose. ♄. H. Native of the alps of Styria and Austria, as well as on the mountains of Spain. Sweet, cist. t. 60. Cístus serpyllifòlius, Lin. spec. 743. As in the preceding and following plants, the lower leaves are smaller, orbicular, and ovate. Petals distinct.

Wild-thyme-leaved Sun-Rose. Fl. May, Sept. Clt. 1731. Shrub procumbent.

103 H. VULGA'RE (Gært. fruct. 1. p. 371. t. 76.) stem suffruticose, procumbent, branched; branches elongated; leaves scarcely revolute at the margins, under surface cinereously-hoary, upper surface green, pilose, somewhat ciliated; lower leaves somewhat orbicular, middle ones ovate-elliptical, upper ones oblong; stipulas oblong-linear, ciliated, longer than the footstalks of the leaves; racemes loose; pedicels and calyxes pilose. ♄. H. Native of dry and hilly pastures throughout Europe; common in Britain. Cístus Heliánthemum, Lin. spec. 1. p. 744. Fl. dan. t. 101. Smith, engl. bot. 1321. Curt. fl. lond. fasc. 5. t. 36. Petals yellow, entire, with a fulvous base, imbricate.

Var. α; branches rather tomentose, pubescent; stipulas hardly longer than the footstalks of the leaves.

Var. β; branches glabrous at the base, pubescent at the top; stipulas 2 or 3 times longer than the footstalks of the leaves.

Var. γ, *flore-pleno*; flowers double. Sweet, cist. t. 64.

Common Sun-Rose. Fl. May, September. Britain. Shrub trailing.

104 H. SURREJA'NUM (Mill. dict. no. 15.) stem suffruticose, procumbent; leaves ovate-oblong, rather pilose; racemes many-flowered, terminal; petals narrow lanceolate, jagged. ♄. H. Native of England in the county of Surrey, near Croydon. Sweet, cist. t. 28. Cístus Surrejànus, Lin. spec. 743. Smith, engl. bot. 2207.—Dill. elth. 177. t. 145. f. 174. Stipulas linear-lanceolate, length of petioles. Calyxes pilose. Petals distinct.

Surrey Sun-Rose. Fl. July, Oct. England. Shrub ¾ foot.

105 H. OVA'TUM (Dunal. ined. and D. C. prod. 1. p. 280.) stem suffruticose, procumbent, much branched; branches villous, leaves elliptic-lanceolate, tapering into the footstalks, bluntish, silky-villous on both surfaces, ciliated; stipulas somewhat longer than the footstalks of the leaves villously-ciliated; peduncles 1-3-flowered, terminal; calyxes rather villous. ♄. H. Native on the mountains between Viterbo and Ronciglione, and in the Alps about Genoa. Cístus ovàtus, Viv. frag. 1. p. 6. t. 8. f. 2. Hairs white, silky.

Ovate-leaved Sun-Rose. Fl. June, Aug. Clt. 1818. Shrub procumbent.

106 H. GRANDIFLÒRUM (D. C. fl. fr. 4. p. 821.) stem suffruticose, ascendant; branches hairy; upper leaves flattish, oblong, rather pilose, upper surface green, under surface sometimes pale-cinereous; stipulas ciliated, rather longer than the footstalks of the leaves; flowers large; calyxes rather hairy. ♄. H. Native of the Pyrenees. Sweet, cist. t. 69. Cístus grandiflòrus, Scop. carn. ed. 2. no. 648. t. 25. Differing from *H. vulgàre*, in being larger in all its parts. Peduncles and calyxes covered with spreading hairs. Flowers cream-coloured Petals imbricate.

Large-flowered Sun-Rose. Fl. June, Aug. Clt. 1800. Sh. ¾ ft.

107 H. OBSCU'RUM (Pers. ench. 2. p. 79.) stem suffruticose, ascendant, much branched; branches hairy; leaves elliptical, hairy on both surfaces, greenish, upper ones elliptic; stipulas ciliated, longer than the footstalks; racemes long; calyxes hairy. ♄. H. Native of Europe in woods. H. obscùrum α, D. C. fl. fr. 6. p. 624. The lower leaves are roundish and ovate, as well as in the preceding and following species.

Obscure Sun-Rose. Fl. May, Aug. Clt. 1816. Shrub ascendant ½ to 1 foot.

108 H. TAU'RICUM (Fisch. mss. Sweet, cist. t. 105.) stem suffruticose, much branched, procumbent, branches procumbent, beset with long hairs; leaves oblong-lanceolate, with rather revolute margins, pilose on both surfaces, green above and paler beneath; stipulas lanceolate-linear, ciliated, longer than the petiole; flowers large; calyx shining, rather hairy; petals imbricate. ♄. H. Native of Tauria. Petals pale-yellow.

Taurian Sun-Rose. Fl. May, Oct. Clt. 1820. Shrub procumbent.

109 H. LU'CIDUM (Horn. cat. hort. hafn. 498.) stem suffruticose, procumbent; leaves stipulate, ovate, green, glossy, with revolute margins. ♄. H. Native of? Flowers yellow.

Shining-leaved Sun-Rose. Fl. May, June. Clt. 1826. Shrub procumbent.

110 H. NUMMULA'RIUM (Mill. dict. no. 11.) stem suffruticose; branches procumbent, hairy; lower leaves orbicular, upper ones oblong-linear, hairy, under surface greenish-cinereous; stipulas linear-oblong, twice the length of the footstalks of the leaves; racemes and calyxes hairy. ♄. H. Native of the south of France and in Italy. Sweet, cist. t. 80. Cistus nummulàrius α, Lin. spec. 743. not of Desf. and Cav. H. obscùrum β, nummulàrium, D. C. fl. fr. 6. p. 624. H. angustifòlium of many botanic gardens. Petals slightly imbricate.

Money-wort-leaved Sun-Rose. Fl. June, Aug. Clt. 1752. Shrub procumbent.

111 H. ANGUSTIFÒLIUM (Pers. ench. 2. p. 79.) stem suffruticose, diffuse; branches rather tomentose, cinereous; leaves on short footstalks, upper ones linear-oblong, with revolute margins, acutish, under surface clothed with canescent tomentum, upper surface rather hispid; stipulas pilose, longer than the footstalks; racemes loose; calyxes pubescent, rather hairy; hairs deciduous. ♄. H. Native of —? Probably the same as the preceding species. Cistus angustifòlius, Jacq. vind. 3. t. 53. Petals narrow at the base, rather unguiculate, distinct from each other.

Narrow-leaved Sun-Rose. Fl. Ju. Aug. Clt. 1800. Shrub 1 ft.

112 H. OBTUSIFÒLIUM (Dunal. ined. and D. C. prod. 1. p. 281.) stem suffruticose, branched; branches tomentose, hoary; leaves small, stalked, linear-oblong, obtuse, with revolute margins, under surface hoary-tomentose, upper surface green and beset with long scattered white hairs; stipulas green, oblong-linear, flat, obtuse, scarcely ciliated, length of footstalks; calyxes hispid. ♄. H. Native of the island of Cyprus. Cistus ciliàtus, Cas. Rostung in litt. not of Desf. Petals yellow.

Blunt-leaved Sun-Rose. Fl. June, Aug. Shrub 1 foot.

113 H. HI'RTUM (Pers. ench. 2. p. 79.) stem suffruticose, branched; branches ascendant, numerous, tomentosely-hairy, cinereous; leaves ovate or oblong, with revolute margins, under surface canescent, upper surface greenish-cinereous; stipulas narrow, rather longer than the footstalks of the leaves; calyxes densely covered with white hairs; petals obcordate, imbricate. ♄. F. Native of Spain and south of France. Sweet, cist. t. 109. Cistus hírtus, Lin. spec. 744. Smith, fl græc. t. 501. exclusive of synonym of Barrelleir, Cav. icon. 2. p. 37. t. 146. Calyxes small. Flowers large, deep yellow.

Var. α, Bæ'ticum (D. C. prod. 1. p. 281.) leaves ovate-oblong, upper surface green. H. Bæ'ticum, Hort. madr.

Var. β, aúreum (D. C. prod. l. c.) leaves linear-oblong, with revolute margins, canescent on both surfaces. H. aùreum, Thib. ined. Pers. ench. 2. p. 78.

Var. γ, teretifòlium (D. C. prod. l. c.) branches hoary-tomentose; leaves revolute on the under surface, almost terete, thickish, obtuse, hoary. Cistus aúreum β teretifòlium, Pers. ench. 2. p. 78.

Hairy Sun-Rose. Fl. Ju. July. Clt. 1759. Shrub 1 foot.

114 H. LAGA'SCÆ (Dunal, ined. and D. C. prod. 1. p. 281.) branches ascendant, tomentosely-hairy, hoary; leaves linear, obtuse, with very revolute margins, almost terete, rather hairy, greenish; stipulas flat, scarcely pilose, twice the length of the footstalks of the leaves; pedicels hispid, whitish; calyxes shining, furrowed; nerves ciliated with white hairs. ♄. F. Native of Spain. H. hírtum var.? Lag. in litt. Calyxes small. Leaves short.

Lagasca's Sun-Rose. Fl. Ju. Aug. Clt. 1826. Sh. ½ to 1 ft.

* * *Petals white, rose-coloured, red, pale-sulphur coloured, or variegated with these colours.*

115 H. VIOLA'CEUM (Pers. ench. 2. p. 78.) stem erect or ascendant, much branched; branches opposite; branchlets slender, tomentosely-hairy, hoary; leaves small, almost linear, obtuse, with revolute margins, somewhat tomentose on both surfaces, under surface canescent; stipulas minute, pilose, racemes few-flowered, loose; calyxes smooth, violaceous, nervedly furrowed. ♄. F. Native of Spain. Cistus violàceus, Cav. icon. 2. p. 38. t. 147. Petals white.

Violaceous-calyxed Sun-Rose. Fl. Ju. July. Clt. 1826. Shrub ½ to 1 foot.

116 H. RACEMÒSUM (Dunal, ined. and D. C. prod. 1. p. 281.) stem shrubby, branched; branches erect, terete, hoary-tomentose; leaves on short footstalks, narrow-linear or linear-lanceolate, with revolute margins, under surface hoary, upper surface greenish, shining; stipulas awl-shaped, longer than the footstalks of the leaves; pedicels hoary; calyxes nervosely-furrowed, brownish-violet. ♄. F. Native of Spain, Barbary, Teneriffe. Sweet, cist. t. 82. Cistus racemòsus, Lin. mant. 76? Lam. dict. 2. p. 25. Vahl. symb. 1. p. 39. Willd. spec. 2. p. 1208. exclusive of synonyms of Cav. and Barrel. Petals white, yellow at the base, imbricate.

Racemose-flowered Sun-Rose. Fl. June, July. Shrub 1 foot.

117 H. FARINÒSUM (Sweet, cist. p. 18.) stem shrubby, erect, branched, tomentosely-hoary; leaves on short footstalks, linear or lanceolate-linear, with revolute margins, hoary, and powdered on both surfaces; stipulas awl-shaped, longer than the footstalks of the leaves; calyx powdery, as well as beset with very short hairs. ♄. F. Native of Spain. H. racemòsum β, farinòsum, D. C. prod. 1. p. 281. Flowers white.

Mealy Sun-Rose. Fl. June, July. Clt.? Shrub 1 foot.

118 H. STRI'CTUM (Pers. ench. 2. p. 79.) stem suffruticose, erect, branched; branches straight, hoary-tomentose; leaves almost sessile, very narrow, linear-awl-shaped, with revolute margins, canescent; stipulas linear, setaceous; calyxes pilose, nervously-striated, yellowish, smoothish. ♄. F. Native of Spain. Cistus stríctus, Cav. icon. 3. p. 32. t. 263. f. 2. Petals white.

Straight-branched Sun-Rose. Fl. June, July. Clt. 1820. Shrub ½ to 1 foot.

119 H. PILÒSUM (Pers. ench. 2. p. 79.) stem suffruticose, branched; branches erectish; leaves linear or linear-oblong, hoary on both surfaces, and bristly at the apex; stipulas awl-shaped; calyxes rather pilose, nervously-striated. ♄. F. Native of Spain and the south of France. Sweet, cist. t. 49. Cistus pilòsus, Lin. spec. 744. α.? Chamæcistus 4. Clus. hist. 1. p. 74. Petals white.

Var. α; leaves linear, hoary; calyxes pilose, somewhat glaucous.

Var. β; leaves linear-oblong; calyxes shining, smoothish, acutish, with hairy nerves.

Pilose Sun-Rose. Fl. May, July. Clt. 1731. Shrub 1½ foot.

120 H. LINEA'RE (Pers. ench. 2. p. 78.) stem suffruticose; branches elongated, ascendant, rather hoary, tomentose; leaves linear, greenish-hoary, with revolute margins; stipulas linear-awl-shaped; racemes loose, twiggy, few-flowered; calyxes striated, glabrous, with the nerves somewhat violaceous; sepals acute. ♄. F. Native of Spain and the south of France. Sweet, cist. 48. Cistus lineàris, Cav. icon. 3. p. 8. t. 216.

Cístus pilòsus, D. C. fl. fr. 5. p. 823? Calyx larger than in the preceding species. Petals white.

Var. β; angles or nerves of calyx pilose.

Linear-leaved Sun-Rose. Fl. Ju. Aug. Clt. 1818. Sh. 1 ft.

121 H. VIRGA'TUM (Pers. ench. p. 79.) stem suffruticose, with twiggy, hoary, ascending or erect branches; leaves linear, hoary on the under surface, with revolute margins; stipulas linear-awl-shaped; calyxes hoary, powdery, pubescent. ♄. H.

Var. α, *albiflòrum* (D. C. prod. 1. p. 282.) leaves green on the upper surface; petals white. ♄. H. Native of Barbary. Cístus virgàtus, Desf. atl. 1. p. 432.

Var. β, *ròseum* (D. C. prod. 1. c.) leaves canescent on both surfaces; petals rose-coloured, imbricate. ♄. H. Native of? Sweet, cist. t. 79.

Twiggy Sun-Rose. Fl. May, Jul. Clt. 1818. Sh. ¾ foot.

122 H. APENNI'NUM (D. C. fl. fr. 4. p. 824.) stem suffruticose, branched; branches spreading, hoary-tomentose; leaves stalked, oblong-linear, with the margins scarcely revolute, under surface tomentose, upper surface glaucescent, but at length becoming smooth; stipulas awl-shaped, longer than the footstalks of the leaves; calyxes covered with very short villi, striated, cinereously-glaucous, bluntish. ♄. H. Native of Spain, France, Italy, and Germany on dry hills in places exposed to the sun. Sweet, cist. t. 62. Cístus Apennìnus, Lin. spec. 744.? Dill. elth. 170. Cístus híspidus β, Lam. dict. 2. p. 26. Petals white, distinct.

Var. α, leaves flattish.

Var. β; leaves linear, narrow. Cístus pilòsus. Thib. herb. Gouan. fl. monsp. p. 265?

Apennine Sun-Rose. Fl. May, Jul. Clt. 1731. Sh. ½ foot.

123 H. HI'SPIDUM (Dunal, ined. and D. C. prod. 1. p. 282.) stem suffruticose, branched; branches ascending, hoary-tomentose; leaves stalked, oblong, bluntish, somewhat mucronate, with revolute margins, under surface hoary, upper surface roughish, greenish-glaucous; calyxes covered with long hairs. ♄. H. Native of the south of France. Cístus híspidus, Lam. 2. p. 26. Brot. fl. lus. 2. p. 271. Cístus pilòsus β, Gouan. fl. monsp. p. 265. H. marjoranæfòlium β. D. C. fl. fr. suppl. p. 625. Petals white, imbricate.

Hispid Sun-Rose. Fl. May, July. Clt. 1816. Sh. ½ to 1 ft.

124 H. PULVERULE'NTUM (D. C. fl. fr. 4. p. 823.) stem suffruticose, much branched, prostrate; branches hoary-tomentose; leaves oblong-linear, with revolute margins, obtuse, under surface hoary, upper surface glaucous; stipulas subulate, ciliated, longer than the footstalks of the leaves; calyxes hoary, minutely tomentose-pubescent. ♄. H. Native of France on sterile hills. Sweet, cist. t. 29. Cístus pulveruléntus, Pour. act. toul. 3. p. 311. Cístus polifòlius, Lam. dict. 2. p. 26. but not of Lin. Petals white.

Powdered-leaved Sun-Rose. Fl. May, June. Clt.? Shrub prostrate.

125 H. MACRA'NTHUM (Sweet, cist. t. 103.) stem suffruticose; branches procumbent, rather tomentose; leaves flat, ovate-oblong, acutish, smooth above and densely tomentose beneath, pale, cinereous; stipulas rather pilose, about equal or longer than the petioles; calyx striated, pilose; petals distinct. ♄. H. Native of? Flowers whitish, but yellow at the base.

Var. β, *múltiplex* (Sweet, cist. t. 104.) lower leaves roundish; flowers double, whitish, but yellow towards the base of the petals.

Large-flowered Sun-Rose. Fl. May, Sept. Clt.? Shrub procumbent.

126 H. RHODA'NTHUM (Dunal, ined. and D. C. prod. 1. p. 282.) stem suffruticose, procumbent; branches rather tomentose, and hoary; leaves oblong, with revolute margins, under surface hoary-tomentose, upper surface greenish-glaucous; stipulas awl-shaped, pilose and bristly at the top; calyxes covered with short, white tomentum. ♄. H. Native of Spain. Sweet, cist. t. 7. Cístus ròseus, Jacq. hort. vind. 3. p. 65? Cístus angustifòlius, formerly in hort. reg. paris. Cístus pilulíferus. Thib. ined. Very like *H. pulveruléntum*, but the flowers are rose-coloured. Petals imbricate.

Var. α, *oblongifòlium* (D. C. prod. 1. p. 283.) branches clothed with canescent tomentum; leaves oblong; flowers rose or red-coloured.

Var. β, *subhirsùtum* (D. C. prod. l. c.) branches clothed with canescent tomentum; leaves and calyxes rather hairy; flowers rose-coloured or red.

Var. γ, *cárneum* (Lag. in litt. D. C. prod. l. c.) branches almost glabrous; leaves almost linear; pedicels hoary-tomentose; flowers flesh-coloured. Probably a distinct species.

Red-flowered Sun-Rose. Fl. May, July. Clt. 1800. Shrub procumbent.

127 H. CANE'SCENS (Sweet, cist. t. 51.) stem suffruticose, branched, diffuse; branches ascending, rather tomentose, canescent; leaves flat or hardly revolute at the margins, under surface tomentosely-hoary, upper surface greenish-glaucous; lower leaves ovate-oblong, obtuse, upper ones lanceolate, acute; stipulas linear, ciliated, somewhat longer than the footstalks; calyxes smoothish, but with the nerves pubescent; petals imbricated. ♄. H. Native? Petals reddish-crimson, with a small orange spot at the base of each.

Canescent-leaved Sun-Rose. Fl. May, Aug. Clt.? Shrub procumbent.

128 H. CONFU'SUM (Sweet, cist. t. 91.) stem suffruticose; branches procumbent, smoothish, rather tomentose at the apex; leaves oblong, ovate, bluntish, rather flat, under surface tomentose, hoary, upper surface glabrous, green; stipulas and bracteas linear, green, ciliated; calyxes striated, smoothish, rather shining; petals slightly imbricate. ♄. H. Native of France and Spain. H. polifòlium, D. C. prod. 1. p. 283. Petals white, yellow at the base.

Confused Sun-Rose. Fl. May, July. Clt.? Shrub procumbent.

129 H. LANCEOLA'TUM (Sweet, cist. t. 100.) stem suffruticose, much branched, procumbent; branches ascending, smoothish, hoary-tomentose at the apex; leaves lanceolate, acute, with somewhat revolute margins, green and smoothish above, but hoary-tomentose beneath: stipulas awl-shaped, linear, longer than the footstalks of the leaves; sepals smoothish or rather pilose; petals imbricate. ♄. H. Native of? Petals white, marked with yellow at the base. Stamens yellow.

Lanceolate-leaved Sun-Rose. Fl. May, August. Clt. 1818. Shrub procumbent.

130 H. POLIFÒLIUM (Pers. ench. 2. p. 80.) stem suffruticose, branched; branches procumbent, densely tomentose, leaves oblong-linear, with revolute margins, hoary-tomentose on both surfaces; stipulas narrow, linear, obtuse, longer than the petioles, and are as well as bracteas tomentose and ciliated; petals distinct, crenulated. ♄. H. Native of England on stony hills near the sea-side, particularly on Brent Downs, Somersetshire, also at Babbicome near Newton Abbot, and Tor Hill, near Torquay, Devonshire. Cístus polifòlius. Lin. spec. 745. Smith, engl. bot. 1322.—Dill. elth. 175. t. 145. f. 172. Flowers white, marked with yellow at the base.

Polium-leaved Sun-Rose. Fl. May, Aug. England. Shrub procumbent.

131 H. MUTA'BILE (Pers. ench. 2. p. 79.) stem suffruticose; branches procumbent, rather tomentose; leaves flat, ovate-oblong; acutish, upper surface glabrous, under surface tomentose, pale-cinereous; stipulas rather pilose, generally equal in length with the footstalks of the leaves or longer; calyxes striated, smoothish; petals imbricate. ♄. H. Native of Spain. Sweet, cist. 106. Cístus mutábilis, Jacq. icon. rar. 1. t. 99. Misc. 2. p. 340. Very nearly allied to *H. polifòlium*.

Var. α; flowers white.

Var. β; flowers smaller, rose-red. Sweet, cist. t. 106.

Var. γ; flowers double, rose or red-coloured.

Changeable-flowered Sun-Rose. Fl. June, Aug. Clt. ? Shrub procumbent.

132 H. VARIEGA'TUM (Sweet, cist. t. 38.) stem suffruticose, procumbent; branches tomentose, rather hoary, diffusely-procumbent; leaves lanceolate, acute, flattish, under surface hoary-tomentose, upper surface green, rather scabrous; stipulas linear, ciliated, longer than the petioles; calyxes covered with short violaceous tomentum; petals imbricate, undulated. ♄. H. Native? Perhaps a hybrid. Petals variegated with white and red.

Variegated-flowered Sun-Rose. Fl. May, Oct. Clt. ? Shrub procumbent.

133 H. VERSI'COLOR (Sweet, cist. t. 26.) stem shrubby, erect; branches ascending, rather hoary from stellate down; leaves oblong, flat, or concave above, under surface hoary-tomentose, upper surface green, glabrous; stipulas oblong-linear, ciliated, bristly at the top, somewhat longer than the leaves; calyxes covered with short tomentum; petals imbricate. ♄. F. Native of the south of Europe.—Barrel. icon. 440. Petals changing from a copper to a flesh-colour.

Party-coloured flowered Sun-Rose. Fl. June, Aug. Clt.? Shrub 1 to 1½ foot.

134 H. SULPHU'REUM (Willd. enum. suppl. 39.) stems branched, procumbent; leaves lanceolate, flat, upper surface green, under surface paler, but beset with stellate pubescence on both surfaces: racemes terminal, few-flowered. ♄. H. Native of Spain. Sweet, cist. t. 37. Petals distinct, sulphur-coloured.

Sulphur-coloured-flowered Sun-Rose. Fl. June, July. Clt. 1795. Shrub procumbent.

135 H. STRAMÍNEUM (Sweet, cist. t. 93.) stems branched, elongated, procumbent, tomentosely-pubescent at the apex; leaves flat, or with the margins scarcely revolute, green above and pilose, hoary-tomentose beneath, lower ones roundish-ovate, obtuse, upper ones oblong-lanceolate, acutish; stipulas lanceolate, acute, ciliated, twice the length of the petioles; racemes many-flowered; calyx striated, smoothish; petals obovate, spreading, distinct. ♄. H. Native? Petals straw-coloured, with orange filaments.

Var. β, múltiplex (Sweet, cist. t. 94.) stems ascending at the top; leaves smaller; flowers double, straw-coloured, orange-coloured at the base of the petals.

Straw-coloured-flowered Sun-Rose. Fl. May, Aug. Shrub procumbent.

136 H. DIVERSIFÒLIUM (Sweet, cist. t. 95.) stem suffruticose, ascending, branched; branches rather tomentose, erectly ascending; leaves stalked, green and hairy above, hoary-tomentose beneath, lower ones oval or oblong, obtuse, flat, upper ones linear-lanceolate, ciliated, 3-4-times longer than the petiole; sepals pilose; petals crenulated, distinct. ♄. H. Native of? Petals dark flesh-coloured, with a copper-coloured mark near the base.

Var. β, múltiplex (Sweet, cist. t. 98.) flowers larger, double, and of a deeper purplish-red, intermixed with lighter coloured ones.

Diverse-leaved Sun-Rose. Fl. May, Aug, Clt. ? Shrub.

137 H. ERIOSE'PALON (Sweet, cist. t. 76.) stems branched, procumbent, rather tomentose, hoary at the apex; leaves lanceolate, acute, with somewhat revolute margins, green on both surfaces and beset with starry hairs; stipulas linear, acute, ciliated, twice as long as the footstalks of the leaves; racemes terminal, many-flowered; calyxes clothed with woolly hairs; petals obovate, crenulated, distinct at the base. ♄. H. Native? Petals of a pale sulphur-colour, with a yellow mark at the base of each.

Woolly-sepalled Sun-Rose. Fl. Ju. Aug. Clt.? Shrub procumbent.

138 H. RO'SEUM (D. C. fl. fr. 4. p. 822.) stem suffruticose, rather procumbent, somewhat tomentose; leaves ovate-lanceolate, tomentose on the under surface, green above, hairy; stipulas lanceolate-linear, ciliated; pedicels and calyxes pilosely-hairy. ♄. H. Native of the south of Europe. Sweet, cist. t. 55. Cístus ròseus, All. ped. 2. p. 105. t. 45. f. 4, but not of Jacq. Very near to *H. vulgàre*. Petals imbricate at the base.

Var. β, múltiplex (Sweet, cist. t. 86.) flower semi-double, pale rose-coloured. Leaves broader and blunter.

Rose-coloured-flowered Sun-Rose. Fl. Jun. July. Clt. 1815. Shrub trailing, ½ foot.

139 H. FŒ'TIDUM (Pers. ench. 2. p. 79.) stem suffruticose, procumbent, pilosely-hairy; leaves oblong, green on both surfaces, hairy, roughish; stipulas hairy, linear, longer than the footstalks of the leaves; pedicels and calyxes rather hairy. ♄. H. Native of —? Cístus fœ'tidus, Jacq. icon. rar. 1. p. 98. misc. 2. p. 341. Plant with the smell of *Bryònia*. Petals like those of *H. vulgàre*, but white.

Fetid Sun-Rose. Fl. May, Jul. Clt. 1800. Shrub procumbent.

140 H. CILIA'TUM (Pers. ench. 2. p. 79.) stem suffruticose, decumbent; branches hoary-tomentose; leaves ovate-lanceolate or lanceolate-oblong, with the margins scarcely revolute, under surface hoary-tomentose, upper surface hairy; stipulas greenish, longer than the footstalks of the leaves; calyxes membranous; inner sepals nervosely-furrowed: nerves elevated, covered with glandular hairs. ♄. F. Native of Spain, North of Africa, as well as Italy. Cístus ciliàtus, Desf. atl. 1. p. 421. t. 109. Petals rose-coloured.

Ciliated-leaved Sun-Rose. Fl. May, July. Shrub decumbent, ½ foot.

141 H. HYSSOPIFÒLIUM (Tenor. syn. fl. neap. p. 48.) stem suffruticose, ascending; branches hairy-tomentose; lower leaves oval, upper ones oblong-lanceolate, green on both surfaces, flat, hairy; calyxes hairy; petals imbricate. ♄. H. Native of Naples in Abruzzo.

Var. α, crocàtum (Sweet, cist. t. 92.) flowers saffron-coloured, more or less with a ferruginous tint.

Var. β, cùpreum (Sweet, cist. t. 58.) flowers of a reddish copper-colour.

Var. γ, múltiplex (Sweet, cist. t. 72.) flowers double, of a reddish copper-colour.

Hyssop-leaved Sun-Rose. Fl. May, Aug. Shrub ¾ foot, procumbent at the base.

142 H. CU'PREUM (Sweet, cist. t. 66.) stem suffruticose, procumbent; branches ascending, rather tomentose, adult ones glabrous; leaves oblong-lanceolate, channelled, upper surface green, hairy; under surface hoary-tomentose; stipulas lanceolate, acute, ciliated, bristly at the apex, twice as long as the footstalks at the leaves; calyxes tomentosely-pilose; petals imbricated. ♄. H. Native of —? Petals dark copper-coloured, with a darker mark at the base of each.

Copper-coloured-flowered Sun-Rose. Fl. May, Aug. Clt.? Shrub procumbent.

143 H. VENU'STUM (Sweet, cist. t. 10.) stem suffruticose, ascending, branched; branches glabrous, warted, somewhat tomentose at the apex; leaves oblong-lanceolate, acute, flat, or hardly revolute on the margins, but denticulately-scabrous, under surface hoary-tomentose, upper surface green, shining; stipulas lanceolate, hairy, ciliated, twice as long as the footstalks of the leaves; inner sepals membranous, with hairy warted nerves; petals imbricated. ♄. H. Native of —? Petals crimson, inclining to orange.

Charming Sun-Rose. Fl. May, Aug. Clt.? Shrub 1 foot.

144 H. A'SPERUM (Lag. ined. and D. C. prod. 1. p. 283.) stem suffruticose, branched; branches long, ascending and erect,

somewhat tomentose, roughish, cinereous; leaves stalked, oblong, acuminated, with revolute margins, under surface hoary-tomentose, upper surface green and somewhat tomentose, roughish; stipulas awl-shaped, bristly at the apex; angles of calyx beset with long hairs. ♄. F. Native of Spain. Cístus hírtus, Thib. herb. Petals white.

Var. β, *Roussæ'i* (D. C. prod. 1. p. 283.) stem, leaves, and calyxes densely clothed with white hairs. ♄. F. Native of the Levant. Rousseau.

Rough Sun-Rose. Fl. Ju. Aug. Shrub 1 foot.

145 H. MILLE'RI (Sweet, cist. t. 101.) stem suffruticose, procumbent; branches hairy-tomentose; leaves oblong, bluntish, flat, green on both surfaces, hairy; stipulas falcate, longer than the petioles; calyxes hairy; petals imbricate. ♄. H. Native of — ? Flowers saffron-coloured, with a dark mark at the base of each petal.

Miller's Sun-Rose. Fl. May, Jul. Clt.? Shrub procumbent.

146 H. MARJORANÆFÒLIUM (D. C. fl. fr. 6. p. 625. var. *a*.) suffruticose, erect, much branched; branches hairy-tomentose; leaves stalked, ovate-oblong, acutish, with revolute margins, under surface hoary-tomentose, upper surface greenish-glaucous, tomentosely-hairy; stipulas awl-shaped, bristly; calyxes densely clothed with white hairs. ♄. H. Native of the south of France. Cístus marjoranæfòlius, Gouan. herb. p. 26.?

Marjoram-leaved Sun-Rose. Fl. May, Ju. Clt. 1818. Sh. ½ ft.

147 H. HIRSU'TUM (D. C. prod. 1. p. 284.) suffruticose, stipulate, hairy; leaves stalked, under surface hoary; lower leaves rounded, upper ones lanceolate, acute; flowers secund in terminal racemes. ♄. H. Native on rocks on the Eastern Pyrenees. Cístus hirsùtus, Lapeyr. abr. 303, but not of Lam. Flowers large, white.

Hairy Sun-Rose. Fl.? Shrub ¾ foot.

† *Species not sufficiently known.*

148 H. FU'GAX (D. C. prod. 1. p. 284.) stem herbaceous; leaves rather ovate, pilose; flowers fugacious. ♂. H. Native on Mount Baldo. H. fugàcium, Mill. dict. no. 19. Perhaps the same as *H. guttàtum*?

Fugacious-flowered Sun-Rose. Fl. Ju. Jul. Clt.? Pl. ½ foot.

149 H. CISTIFÒLIUM (Mill. dict. no. 9.) stems procumbent, suffruticose, glabrous; leaves ovate-lanceolate, opposite, longer than the peduncles. ♄. H. Native of Germany. Flowers yellow.

Cistus-leaved Sun-Rose. Fl. Ju. Aug. Clt.? Shrub procumbent.

150 H. OLIGOPHY'LLUM (Clark, in Spreng. new entd. 3. p. 163, under the name of *Cistus*,) shrubby, stipulate; leaves stalked, ovate-lanceolate, without nerves, very entire, scabrous, with revolute margins; peduncles 1-flowered. ♄. F. Native near Jaffa. Petals yellow.

Few-leaved Sun-Rose. Shrub.

151 H.? FASCICULA'TUM (Mill. dict. no. 22.) leaves narrow, in facicles; pedicels elongated, lateral and terminal. ♂. G. Native of the Cape of Good Hope. Flowers very fugacious, pale straw-coloured.

Fascicular-leaved Sun-Rose. Plant.

Cult. The hardy shrubby kinds of this genus are amongst the most beautiful little shrubs for ornamenting rock-work. The frame and green-house kinds should be planted in pots in a mixture of sand, loam, and peat, so that they may be protected during winter by a frame; the smaller kinds of these may be planted out on rock-work during the summer months. Ripened cuttings will strike root freely, if planted under a common hand-glass in a sheltered situation, in August or September; or they may be raised by seeds, which ripen in abundance. The perennial and biennial herbaceous kinds should be grown in pots, (so that they may be protected by a frame during winter), in a mixture of sand, loam, and peat; they are easily increased by seeds. The annual kinds are all beautiful plants, and the seed requires to be sown in the open border: they prefer a light rich soil. All the species of *Heliánthemum* deserve to be cultivated in every collection on account of the elegance and various hues of their blossoms.

III. HUDSO'NIA (in honour of William Hudson, a London apothecary, and author of Flóra Anglica, 1762 and 1778, 8vo.) Lin. mant. 11. Nutt. gen. amer. 2. p. 4. D. C. prod. 1. p. 284.

LIN. SYST. *Polyándria, Monogýnia.* Petals 5 (f. 61. *a. b.*). Stamens 15-30; filaments filiform; anthers small, longitudinally dehiscent. Style straight, simple (f. 61. *e.*), equalling the stamens in length. Stigma simple. Capsule 1-celled, 3-valved, 1-3-seeded, oblong or obovate, coriaceous, smooth or pubescent. Seeds granulated. Embryo immersed in a horny albumen. Small tufted heath-like sub-shrubs. Leaves alternate, small, awl-shaped or needle-shaped, imbricated, without stipulas. Flowers yellow, almost sessile or on short peduncles; peduncles 1-flowered, terminal, or lateral, solitary, or aggregate.

1 H. ERICOI'DES (Lin. mant. 74.) pubescent; stems suffruticose, erect; branches elongated; leaves filiform, awl-shaped, rather imbricated; peduncles solitary, rising laterally from the leafy bud; calyx cylindrical, obtuse; capsules pubescent, always 1-seeded; valves oblong. ♄. F. Native of New Jersey and Virginia in pine woods. Willd. hort. berl. t. 15. Sweet, cist. t. 36. Leaves permanent. Stamens about 15. Peduncles 5 or 8 lines long. According to Nuttal, this plant, which is a native of New Jersey, has aggregate instead of solitary peduncles; therefore his plant may be a distinct species. Flowers yellow (f. 61.).

FIG. 61.

Heath-like Hudsonia. Fl. May, July. Clt. 1805. Shrub 1 ft.

2 H. NUTTA'LLII (Sweet, cist. p. 19.) equally pubescent; stem erect, much branched; leaves about 2-lines long, filiform, rather imbricate, but distinct from the stem; pedicels lateral, crowded, when in fruit from 5 to 8 lines long; calyx cylindrical, obtuse, pubescent, with the segments oblique and convolute, the 2 smaller ones hardly visible when in fruit, but sufficiently distinct in the unexpanded flowers; capsules cylindrical-oblong, externally pubescent, always 1-seeded; valves oblong, the central suture obsolete. ♄. F. Abundant over the barren sandy woods of New Jersey, Delaware, Maryland, and Virginia (Nutt.) H. ericoìdes, Nutt. gen. amer. 2. p. 4. Whether this plant is identical with the *H. ericoìdes* of Lin. it is impossible to say.

Nuttall's Hudsonia. Fl. May, June. Shrub 1 foot.

3 H. MONTA'NA (Nutt. gen. 2. p. 5.) almost smooth; stems tufted, decumbent; leaves long, awl-shaped, filiform, rather imbricated; peduncles terminal, solitary; calyxes campanulate, woolly; segments taper-pointed, subulate; capsules villous, usually 3-seeded; valves ovate. ♄. F. Native of North Carolina on the summits of mountains. Stamens 25-30. Seeds rather angular. Flowers yellow. Leaves longer, and capsules larger than in the rest of the species.

Mountain Hudsonia. Fl. May, July. Shrub decumbent.

4 H. tomentòsa (Nutt. gen. 2. p. 5.) tufted and hoary-tomentose; stems intricate, dense; leaves minute, densely imbricated, ovate, acute; flowers aggregate, almost sessile; calyxes rather cylindrical, with obtuse partitions; capsules 1-seeded; valves ovate, smooth. ♄. F. Native of New Jersey, Delaware, and Maryland, &c. in the sea-sand. Sweet, cist. t. 57. Stamens 14-18. Flowers yellow.

Tomentose Hudsonia. Fl. May, July. Clt. 1826. Shrub 1 foot.

5 H. austra'lis (Spreng. syst. 2. p. 452.) smoothish, erect; leaves linear-lanceolate, clothed beneath with scattered spreading hairs; flowers terminal, solitary, stalked; calyx taper-pointed, rather hairy. ♄. G. Native of Monte Video.

Southern Hudsonia. Shrub 1 foot.

Cult. Hudsònia is a genus of pretty little shrubs, with the appearance of heath, which are rather difficult to cultivate: they thrive best in peat soil, in a shady situation, and should be protected under glass during winter, for this purpose they had better be grown in pots. They may be either increased by layers, or ripened cuttings planted in sand under a hand-glass.

IV. LE'CHEA (in honour of G. Leche, a Swede, professor of natural history at Abo, and author of observations on rare plants; died 1764.) Lin. gen. no. 142. Gært. fruct. 2. t. 129. D. C. prod. 1. p. 285.

Lin. syst. *Tri-Dodecándria, Monogýnia.* Calyx 3-sepalled, guarded by bracteas or the 2-outer sepals. Petals 3, lanceolate. Stamens 3-12, usually disposed in a ternary number. Ovary 1, somewhat 3-sided. Stigmas 3, scarcely distinct. Capsules 3-valved; valves bearing a dissepiment or nerve in the middle of each. Seeds very few, usually 8, fixed to the dissepiment or nerve. Albumen fleshy. Embryo straightish, dorsal with an inferior radicle. Cotyledons ovate-oblong. Inconspicuous North American herbs, with numerous small white or yellow flowers; lower branches usually differing from the floriferous ones, they are like those of *Thymus serpýllum.*

1 L. villòsa (Ell. sketch. 184.) hairy; leaves oblong-lanceolate, mucronate; panicle leafy, pyramidal; branches bearing flowers at the top; flowers disposed in fascicled-racemes, secund, on very short pedicels. ♃. H. Native from Canada to Florida in gravelly woods. L. màjor, Pursh, fl. amer. sept. 1. p. 90. but not of Lin. L. mìnor, Lin. from Smith.—Lam. ill. t. 52. f. 2. from Pursh. Flowers white or yellow.

Var. β, mucronàta (Raf. prec. 37.) pilose; stem straight, simple; racemes compound; flowers bracteolate. ♃. H. Native of New Jersey in woods.

Villous Lechea. Fl. July, Aug. Clt. 1780. Plant 2 feet.

2 L. mi'nor (Pursh, fl. amer. sept. 1. p. 91.) smoothish; leaves linear-lanceolate, acute; panicle leafy; branches elongated, bearing flowers on all sides; flowers on very short pedicels; stems assurgent. ♃. H. Native from Canada to Pennsylvania on dry gravelly hills.—Lam. ill. t. 52. f. 1. from Pursh. Flowers white or yellow. This plant is lower in growth and larger in fruit than the preceding.

Smaller Lechea. Fl. July, Aug. Clt. 1802. Plant ½ foot.

3 L. racemulòsa (Mich. fl. bor. amer. 1. p. 77.) covered with appressed pubescence; leaves linear, acute, ciliated; panicle slender, much branched, pyramidal; racemes nakedish; flowers small, alternate, pedicellate; stem erect. ♃. H. Native of sandy fields from New Jersey to Carolina. Pursh. fl. amer. sept. 1. p. 91. suppl. 3. p. 340.—Guara, Lam. ill. t. 281. f. 3. Flowers white or yellow.

Racemulose Lechea. Fl. July, Aug. Clt.? Pl. ¾ foot.

4 H. thymifòlia (Mich. fl. bor. amer. 1. p. 77.) covered with appressed white villi; leaves linear, acute; panicle leafy, elongated, with short branches; flowers disposed in lateral and terminal fascicles; pedicels very short; flowers small, hoary-tomentose; stem erect. ♃. H. Native of dry barren woods on slate hills, from Virginia to Carolina. Lower branches creeping, very like those of *Thymus serpýllum,* which is the case with most of the species of this genus. Pursh. fl. amer. sept. 1. p. 91. L. mìnor, Walt. car. 83. from Ell. sketch. p. 185. Flowers white or yellow.

Thyme-leaved Lechea. Fl. July, Aug. Clt. 1823. Pl. ½ ft.

5 L. tenuifòlia (Mich. fl. bor. amer. 1. p. 77.) sparingly pilose; leaves very narrow; panicle divaricate, nakedish; branchlets alternate; pedicels elongated, spreading; stem erect. ♃. H. Native of dry gravelly hills from Virginia to Georgia. L. juncifòlia, Walt. car. 83? from Ell. sketch. 185. Lower branches furnished with linear leaves, by which it is easily distinguished from the rest. Pursh. fl. amer. sept. 1. p. 91. Flowers white or yellow.

Fine-leaved Lechea. Fl. May, July. Clt. 1823. Pl. ¾ foot.

6 L.? verticilla'ta (Willd. spec. 1. p. 495.) stem hispid; leaves oblong-ovate, serrulated; flowers in whorles. ♃. S. Native of the East Indies. Habit of *Spermacócce,* and most likely a species of the latter genus. Flowers white?

Whorled-flowered Lechea. Pl. ½ foot.

N. B. *Lèchea Chinénsis* of Lour. is a species of *Commelìna.*

Cult. Lèchea is a genus of small herbaceous perennial plants, which succeed best when grown in small pots planted in a mixture of light turfy loam and peat. They may be either increased by seeds or by cuttings planted in sand under a hand-glass.

Order XXI. VIOLARIE'Æ (plants agreeing with *Vìola* in many important characters.) D. C. fl. fran. 4. p. 801. Juss. ann. du mus. 18. p. 4. p. 476.

Calyx of 5 permanent sepals, equal (f. 65. *a.* f. 66. *c.*) or unequal, (f. 64. *c.* f. 62. *a.*) usually with membranous margins, free or connected at the base, imbricate in the bud; and therefore they are disposed in a double series, as in Tribe *Viòleæ,* 3 in the outer series, and 2 in the inner. Petals 5, alternating with the sepals (f. 65. *b.*) hypogynous, inserted in the thalamus, usually marcescent, and obliquely convolute in the bud, sometimes equal (f. 66. *b.* f. 65. *b.*) sometimes unequal (f. 62. *c.* f. 63. *c.*), but when they are unequal the lower one is in the form of a labellum (f. 64. *c.*), furnished with a spur or hollow at its base (f. 64. *b.* f. 63. *c.*). Sometimes there is a staminiferous urceolus and sometimes filiform appendages between the petals and the stamens. Stamens 5, inserted in the thalamus or calyx, alternating with the petals; anthers 2-celled (f. 65. *e.*) opening inwards by 2 longitudinal chinks; these are appressed to the ovary, usually free, but sometimes they are more or less connate at the base into a monadelphous disk; filaments usually dilated, sometimes from the base in this case, bearing the anthers at the very base (f. 64. *d.*), sometimes they are unguiculated at the base, but they are dilated at the top, and therefore bearing the anthers a little higher up at the tops of the claws (f. 66. *a.*), in either case the filaments are drawn out beyond the anthers into an arid membrane, more or less imbricately girding the style, rarely awl-shaped but never terminated by the anthers; two of which in the irregular flowers are usually drawn out downwards into a filiform ap-

pendage (f. 64. *e.*) or nectarial glands, which are drawn in within the spur or hollow (f. 63. *d.*). Ovary 1-celled, many-seeded (f. 62. *g.* f. 66. *d.*) or rarely 1-seeded from abortion. Placentas 3, parietal, one in the middle of each valve, opposite the 3 exterior petals. Style 1, permanent, usually declinate, perforated, and recurved at the top, and therefore the stigma is somewhat lateral (f. 64. *f.*). Capsule 3-valved (f. 62. *g.*), the valves generally opening from the apex to the base, usually with elasticity. The seeds have 3 coverings, the outer one is membranous, more or less thickened at the hilum into a caruncle; umbilical vessel united with the epidermis from the hilum to the vertex of the seed, forming a line which is hardly prominent, expanded into a wrinkled areola at the top. Testa crustaceous, brittle, usually smooth, but sometimes striated, rarely scrobiculate; inner membrane very thin, adhering, usually dotted with brown in the vertex. Albumen fleshy. Embryo straight in the axis of the albumen, with the radicle towards the base of the seed, not towards the hilum, with an inconspicuous plumule, and usually flat cotyledons. Herbs, sub-shrubs, or middle-sized shrubs, with alternate, rarely opposite leaves, simple, usually involute before expansion, all furnished with stipulas. Flowers erect or drooping, pedunculate, axillary; peduncles sometimes solitary or numerous, 1-flowered, and bibracteolate; sometimes branched, with the pedicels 1-flowered, and bibracteolate, rising singly from the axillæ of the bracteas.

This order comes very near *Polygàleæ*, *Droseràceæ* and *Passiflòreæ*, but differs from *Polygàleæ* in the fruit being 1-celled, not 2-celled, in the leaves being furnished with stipulas, not exstipulate, as well as in the anthers being 2-celled, not 1-celled. It differs from *Droseràceæ* in the style being solitary, not 3-6, and in the embryo being elongated, as well as in the leaves being involute before expansion, not circinal, and furnished with stipulas, not exstipulate. It differs from *Passiflòreæ* in the fruit being capsular, not baccate, and in the stamens being hypogynous, not perigynous, as well as in the anthers being adnate to the middle of the filaments, not fixed by the middle; stigmas 1, not 3. The genus *Hymenanthèra* agrees with *Polygàleæ* in the pericarp being 1-seeded; seed pendulous, or the pericarp, according to Mr. Brown, is 2-celled, and the cells 1-seeded. The genus *Calýptrion*, and some species of *Noiséttia*, agree with *Passiflòreæ* in having twining stems.

This is a very favourite order with gardeners, consisting, as it chiefly does, of violets; a great part of which are hardy, herbaceous plants. The tribe *Alsodíneæ* consists of tropical trees and shrubs of little beauty, with regular flowers. The roots of all the herbaceous and annual kinds act as emetics like the *Ipecacuanha*.

Synopsis of the Genera.

Tribe I.

Vio'leæ (*D. C. prod.* 1. *p.* 288.). *Petals 5, unequal* (f. 64. *c.*). *Sepals* 5 (f. 64. *a.*), *in two series, 3 in the outer and 2 in the inner, the last are narrower than the outer series. Pericarp 3-valved* (f. 64. *k.*), *dehiscent, with a placenta in the middle of each valve* (f. 62. *g.*). *Stamens alternating with the petals; filaments dilated, free, or rarely joined, drawn out beyond the anthers; therefore the anthers appear as if fixed to the middle of the filaments on the inner side; cells of anthers opening slowly into 2-valves.*

1 Caly'ptrion. Sepals nearly equal (f. 62. *a.*). Lower petal large, drawn out into a pouch at the base. Stamens free; appendages of 4? anterior anthers, long and filiform, bearded. Capsule trigonal, 1-3 or many-seeded (f. 62. *g.*). Climbing shrubs.

2 Noise'ttia Sepals unequal (f. 63. *e.*). Lower petal large (f. 63. *b.*), drawn out at the base into a long cylindrical tube (f. 63. *c.*). Stamens free; appendages of the 2 anterior anthers awl-shaped. Capsule obsoletely trigonal, many-seeded. Erect or climbing shrubs.

3 Schweigge'ria. Sepals unequal (f. 64. *a.*) 3 exterior ones hastately biauriculate at the base. Lower petal large, cordate (f. 64. *b.*), drawn out at the base into an unequal-sided spur (f. 64. *e.*). Stamens free, pressed to the ovary; appendages of 2 anterior anthers, awl-shaped] (f. 64. *e.*). Little trees.

4 Vìola. Calyx with unequal sepals, all drawn out at the base more or less into ear-like appendages. Lower petal drawn out at the base into a hollow spur. Stamens approximate, the 2 anterior anthers furnished with long awl-shaped appendages. Capsule trigonal; valves opening with elasticity. Usually herbs, rarely small shrubs.

5 Erpe'tion. In every respect the same as *Vìola*, but the sepals are hardly drawn out at the base, and the lower petal is not drawn out into a spur at the base; but furnished with a small gibbosity. Anthers without appendages. Creeping herbs.

6 So'lea. Calyx hardly equal. Lower petal large, with a gibbous base. Stamens approximate, with a nectarial gland on the outside of two of the filaments. A pilose, erect herb.

7 Pomba'lia. Sepals of calyx large, with prickly margins. Lower petal long, somewhat gibbous at the base. Stamens free; two of the filaments are furnished each with a nectarial gland at the base. Capsule as in *Vìola*. Erect, villous herbs.

8 Pígea. Sepals unequal. Lower petal very large, gibbous at the base. Stamens free, lobes of anthers ending in a bristle. Capsules trigonal. Herbs or sub-shrubs.

9 Ionídium. Sepals unequal. Lower petal large, rather gibbous or concave at the base. Stamens approximate, the 2 anterior filaments usually furnished each with a nectarial gland at the base. Capsule, as in *Vìola*, elastic. Herbs or sub-shrubs.

10 Hyba'nthus. Sepals unequal. Lower petal long, saccate at the base. Stamens connate at the base, the 2 inferior filaments bearing each a large shell-formed gland at the base. Capsule obovate, few-seeded. Inelegant shrubs, usually spinose.

11 Anchie'tia. Calyx deeply 5-parted, unequal. Lower petal large, unguiculate, with a spur at the base. Anthers almost sessile; 2 lower ones on very short filaments, each drawn out into a filiform appendage on the back. Capsule large, inflated, many-seeded. Erect or climbing shrubs.

TRIBE II.

ALSODÍNEÆ (*R. Br. congo. p.* 21.) *Petals equal* (f. 65. *b.*). *Stamens usually connected at the base, or adnate, to an elevated urceolus which is situated between the petals and the stamens.*

12 GONOHO'RIA. Sepals imbricate. Stamens free, approximate. Lobes of the anthers ending in a bristle. Ovary villous. Capsule 3-valved, few-seeded. Shrubs.

13 RINO'REA. In every respect the same as the last genus, but the filaments are dilated from the base into an acuminated ligula, not unguiculate, rather connate at the base.

14 ALSO'DEA. Sepals acute, imbricate. Filaments connate at the base into an urceolus which girds the ovary. Lobes of anthers usually drawn out at the apex into a bristle. Capsule bluntly trigonal, few-seeded. Large shrubs.

15 CERANTHE'RA. Sepals acute. Urceolus toothed, connected with the petals at the base, situated between the petals and the stamens. Filaments unguiculate at the base. Lobes of anthers ending in a bristle. Ovary ovate. Large shrubs.

16 PENTA'LOBA. Sepals erect. Petals approximate at the base, reflexed at the top. Urceolus 5-toothed, bearing the filaments between these teeth. Ovary pilose. Capsule 5-lobed, 1-celled, 5-seeded. A large shrub.

17 SPATULA'RIA. Calyx 5-parted (f. 66. *c.*), unequal, deciduous. Petals rather unequal (f. 66. *b.*,) inserted in the base of the calyx, with long spatulate claws, which are connivent. Anthers drawn out at the apex into a membranous point (f. 66. *a.*). Capsule many-seeded (f. 66. *d.*). An erect shrub.

18 HYMENANTHE'RA. Sepals imbricate. Petals at length reflexed. Structure of stamens as in *Viola*, but they are joined at the base into a monadelphous disk, with a scale at the back of each. Capsule rather baccate, 2-celled; cells 1-seeded. Large, branched, erect shrubs.

19 PIPA'REA. Sepals 5, equal, permanent, at length reflexed. Filaments 10-15, awl-shaped, all joined together at the base, closely girding the ovary. Capsule ovate, triquetrous, 1-3-celled, opening laterally from the top, densely clothed on the inside with brown velvetty down, bearing the seeds in the middle of the valves, one in each. Large shrubs.

Tribe I.

VIO'LEÆ (plants agreeing with *Viola* in having irregular flowers.) D. C. prod. 1. p. 288. Petals unequal (f. 64. *d.*). The three outer sepals usually broader than the two inner ones (f. 64. *a.*). Pericarps 3-valved, dehiscent, with a placenta in the middle of each valve (f. 62. *g.*). Stamens alternating with the petals; filaments dilated, drawn out beyond the anthers, free, (approximate or coarctate) or rarely joined. Cells of anthers at length 2-valved.

I. CALY'PTRION (καλυπτρα, *calyptra*, a hood or cover, and ιον, *ion*, a violet; in allusion to the hood-like spur at the base of the lower petal.) Ging. mss. D. C. prod. 1. p. 288. Corynóstylis, Mart. fl. bras. 1. p. 25.

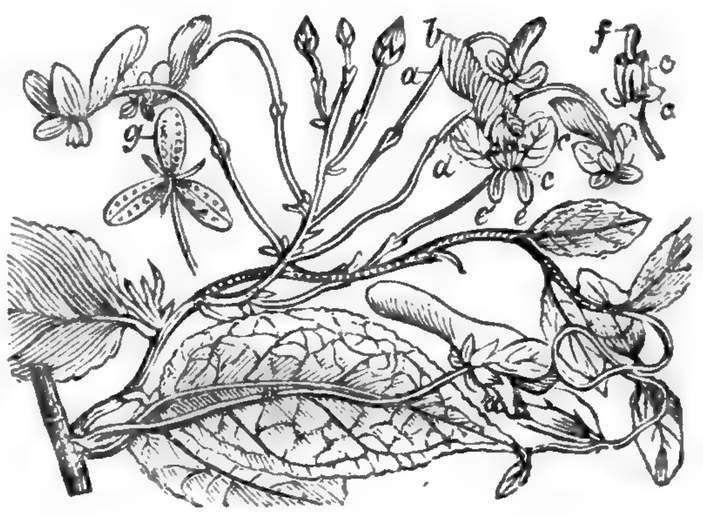
LIN. SYST. *Pentándria, Monogýnia.* Calyx small, running into the pedicel at the base. Sepals 5, almost equal (f. 62. *a.*), the 2 lower ones somewhat unequal-sided. Petals 5, the lower one large, drawn out behind into a large hollow pouch, which is compressed on the sides, and constricted in the middle, twisted, many-nerved; limb involute in æstivation, but spreading in the more advanced state, usually waved, erose or lobed. The 2 lateral petals hardly shorter than the lowest one (f. 62. *d.*), spreading; the rest small, and very short (f. 62. *e, e.*), and bent upwards, all generally villous. Stamens 5, 4 of which are connate; filaments dilated from the base, oblong; bearing the anthers low down; anthers twice the length of the ovary (f. 62. *c.*), with parallel lobes; the 4 ? anterior ones are drawn out on the outside into short bearded recurved appendages; these appendages are drawn in within the pouch. Capsule ligneous, 1-celled, 3-valved (f. 62. *g.*). Seeds numerous, large, rather square, compressed, wrinkled, fixed to the valves. Climbing shrubs, with alternate leaves and deciduous stipulas. Flowers large, white, disposed in axillary racemes. Pedicels with a bractea at the base of each, and bibracteolate in the middle.

Obs. Under *Viola Hybánthus*, Willd, there are four specimens very different from each other, joined, and probably belonging to three distinct genera. Compare Mayer, esseq. p. 123.

* 1. *Flowers large in racemes, or axillary and solitary on the branchlets.*

1 C. AUBLE'TII (Ging. mss. and D. C. prod. 1. p. 289.) stem striated, covered with white spots; leaves oblong-ovate, acuminated, serrated; flowers in fascicled racemes; sepals ovate, obtuse; spur of flower hardly inflated at the throat. ♄. ◡. S. Native of Guiana, Cayenne, island of Trinidad, and Brasil. Viola Hybánthus, Aubl. guian. 2. p. 811. t. 319. May fl. prim. esseq. p. 123. not of Willd. nor Pers. Ionídium Aublétii, Röm. and Schult. syst. 5. p. 397. Viola laurifòlia, Smith in Rees' cyclop. Corynóstylis Hybánthus, Mart. fl. bras. 1. p. 26. t. 17 and 18. Seeds large, roundish, chesnut-coloured. Flowers large, white (f. 62.).

FIG. 62.



Aublet's Hooded-violet. Clt. 1823. Sh. climbing.

2 C. BERTE'RII (Ging. mss. and D. C. prod. 1. p. 289.) stem striated, covered with white spots; leaves ovate, acuminated, entire; sepals ovate, acute; throat of spur inflated. ♄. ◡. S. Native of South America.

Var. a, Magdalenénse (D. C. prod. 1. c.) racemes axillary. Native of Baranquilla on the banks of the river Magdalena in inundated places. Viola scándens, Bert. ined. Flowers large, white.

Var. β, Mexicànum (D. C. prod. 1. c.) racemes terminal on the top of the branchlets; flowers larger. Native of Mexico. Moc. et Sesse. Viola cucullàta, Moc. et Sesse, fl. mex. ined. icon. Perhaps a distinct species. Flowers very large, white.

Bertero's Hooded-violet. Shrub climbing.

3 C.? CITRIFÒLIUM (Ging. mss. and D. C. prod. 1. p. 289.) stem ? leaves oblong, obtuse, quite entire; sepals ovate, acute; flowers solitary; capsules obsoletely 3-sided; seeds oblong, compressed. ♄. ◡. S. Native of Cumana. Viola arborescens, Lœfl. itin. p. 282. C. Loeflíngii, Spreng.

Citron-leaved Hooded-violet. Shrub climbing.

4 C.? ORINOCE'NSE (H. B. et Kunth, nov. gen. amer. 5. p. 384.) stem angular, puberulous; leaves serrulated, ovate-oblong, acute, obtuse at the base, upper surface glabrous, under surface pubescent; flowers solitary? ♄. ◡. S. Native of humid places near St. Fernando de Atabapo, Mission. del. Orinoco. Very

like *C. Aublétii*, according to Kunth, Vìola excélsa, Willd. herb. ex Rœm. and Schult. syst. 5. p. 391. Flowers large, white.

Orinoco Hooded-violet. Shrub climbing.

§ 2. *Flowers small, disposed in axillary crowded fascicles.*

5 C.? FRANGULÆEÒLIUM (Ging. mss. and D. C. prod. 1. p. 289.) stem twining to the right; leaves oblong-elliptical, acute, rounded at the base, obsoletely serrulated, puberulous on both surfaces; flowers disposed in crowded fascicles, exceeding the footstalks of the leaves; sepals narrow, acuminated; lower petal emarginate at the top; spur (hood) obtuse, flattened on the sides; stamens furnished with very long smooth appendages. ♄. ⌒. S. Native in the Andes about Popayan at the height of 6016 feet. Noiséttia frangulæfòlia, H. B. et Kunth. nov. gen. amer. 5. p. 384. t. 499. *a* and *b* f. 1. Flowers like those of *Noiséttia* but the habit of the plant agrees with *Calýptrion*.

Frangula-leaved Hooded-violet. Shrub twining.

† *Doubtful Species.*

6 C.? DIA'NDRUM (Ging. mss. and D. C. prod. 1. p. 289.) stem herbaceous, creeping; leaves oblong; peduncles solitary; lower petal trifid. ♃. S. Vìola diándra, Allemand in Lin. syst. 669. Ionídium diándrum, Rœm. et Schult. syst. 5. p. 399. Flowers white?

Diandrous Hooded-violet. Pl. creeping or twining.

Cult. Elegant climbing shrubs, well adapted for covering rafters in stoves. A rich light soil will suit them best, and young cuttings will root freely if planted in a pot of sand, placed under a hand-glass, in heat.

II. NOISE'TTIA (in honour of Louis Noisette, an eminent French cultivator and writer on fruit-trees, author of Le Jardin Frutier, 2. fasc. in 4to. 1813). H. B. et Kunth, nov. gen. amer. 5. p. 382. exclusive of the synonym of Aublet, Bigelòwia, D. C. mss. but not of Sprengel.

LIN. SYST. *Pentándria*, *Monogýnia*. Calyx middle-sized, running into the pedicel at base; sepals 5 (f. 63. *e.*), unequal, 2 lower ones usually with unequal sides. Lower petal large (f. 63. *b.*), with the limb involute in æstivation, drawn out behind into a long straight cylindrical tube (f. 63. *c.*); 2 lateral petals short, ascending, the rest smaller, all smooth? Stamens free; filaments dilated at the base and furnished with a membrane at the top, bearing the anthers low down; anthers hardly longer than the ovary, with sub-sagittate lobes, the two anterior anthers drawn out on the back into nectariferous awl-shaped appendages (f. 63. *g.*), which are drawn in, within the tube. Ovary superior; ovulæ usually 12-30? rather pear-shaped (H. B. et Kunth. l. c.). Capsule 1-celled, 3-valved, membranous, ovate, obsoletely 3-sided, veiny, with linear placentas; valves few-seeded. Erect or scandent shrubs, with twiggy branches. Leaves alternate, simple, stalked, feather-nerved. Stipulas in pairs, usually running down the stem. Flowers on pedicels; pedicels many, or from abortion solitary, bibracteolate towards the middle, but not jointed, disposed in axillary crowded fascicles. Flowers of a pale colour.

1 N. LONGIFO'LIA (H. B. et Kunth. nov. gen. amer. 5. p. 382. t. 499. b & f. ii.) stem shrubby, striated, simple or branched; leaves lanceolate, serrated, acute, tapering into the short footstalks at the base; flowers in bundles; peduncles bractless; spur awl-shaped, length of pedicel; sepals lanceolate, acuminated, 2 lower ones unequal-sided, eared on the outside at the base; lower petal obcordate, lateral ones oblong, obtuse, the rest ovate; ovary many-seeded; stigma hooked. ♄. S. Native of Cayenne. Vìola longifòlia, Poir. dict. 8. p. 649. Ionídium longifòlium, Rœm. et Schultz. syst. 5. p. 398. Flowers cream-coloured or white.

Long-leaved Noisettia. Clt. 1824. Shrub 1 to 1½ foot.

FIG. 63.

2 N. ORCHIDIFLO'RA (Ging. mss. et D. C. prod. 1. p. 290.) stem slender, smooth; leaves lanceolate, serrulated, on long footstalks; flowers 4-6 in a fascicle; spur obtuse, a little shorter than the pedicel. ♄? S. Native of Guiana. Vìola orchidiflòra, Rudge, pl. guian. rar. 1. p. 11. t. 10. Ionídium orchidiflòrum, Rœm. et Schult. syst. 5. p. 400. Flowers cream-coloured or white (f. 63.).

Var. β; leaves lanceolate, acuminated, serrated, tapering at the base into the long footstalk, glabrous; flowers 3-4 lines long, 3-4 in each fascicle; capsules 3-sided, straw-coloured, 2-3-seeded, with ovate, veiny, glabrous valves. ♄. S. Native of Guiana.

Orchis-flowered Noisettia. Shrub 1½ foot.

3 N. GALEOPSIFO'LIA (St. Hil. in mem. mus. 11. p. 461.) stems somewhat herbaceous, simple, triangular, a little winged; leaves lanceolate, rather acuminated, acute, serrated; flowers in racemose bundles; peduncles bractless; ovary usually containing 15 seeds. ♃. S. Native of Brasil in old woods on the eastern part of the province of Minas-Geraes, near the village called Rio-Vermelho. N. longifòlia, Nees et Mart. in nov. act. Bonn. 12. p. 48. but not of Kunth. Root yellow. Petals pale yellow, but pale scarlet at the apex.

Hemp-Nettle-leaved Noisettia. Fl. April. Pl. 1 to 1½ foot.

4 N.? ROQUEFEUILLA'NA (St. Hil. in mem. mus. 11. p. 462. t. 22. f. c.) plant glabrous, stems shrubby, round, climbing, branched; leaves ovate or oblong, or elliptical-lanceolate, acuminated, rather acute at the base, crenate-serrated; peduncles bracteate; flowers usually disposed in racemes. ♄. ⌣. S. Native of Brasil in old woods on Mount Tejuca near Rio Janeiro. A climbing shrub. Perhaps a species of *Anchìtia*.

Roquefeuille's Noisettia. Fl. Aug. Shrub climbing.

5 N. ACUMINA'TA (D. C. mss. and prod. 1. p. 290.) leaves lanceolate, on short footstalks, ciliated, toothed, drawn out at the apex into a long, entire acumen; pedicels solitary, a little shorter than the leaves; capsules ovate. ♄? F. Native of North America. Violæoìdes, Mich. ined. Perhaps a variety of *N. orchidiflòra*.

Acuminated-leaved Noisettia. Shrub 2 feet.

Cult. These curious plants will grow freely in light rich soil, and young cuttings will strike root freely if planted in a pot of sand, placed under a hand-glass, in heat. The climbing species is well fitted for covering rafters in stoves.

III. SCHWEIGGE'RIA (in honour of Aug. Frid. Schweigger, Professor at Regiomonti in Sicily). Spreng. ex St. Hil. mem. mus. 11. p. 454. Glóssarrhen, Mart. fl. bras. 1. p. 22. D. C. prod. 1. p. 290.

LIN. SYST. *Pentándria*, *Monogýnia*. Sepals of calyx very unequal, running into the peduncle at the base, 3 exterior sepals large (f. 64. *a.*), longer than the petals, usually cordate, acuminated, hastately 2-eared at the base, lower ones unequal-sided, with the spur between, with the auricles of the exterior ones stretched out, and usually rounded; 2 inner sepals very small and very narrow. Petals 5, unequal, with 3-nerved claws; 2 upper ones shortest, 2 lateral ones longer than the upper ones (f. 64. *c c.*), lowest one large (f. 64. *b.*), with the limb involute in æstivation, bicallose at the base, and drawn out behind into a hollow spur (f. 64. *e.*). Filaments of stamens separated and dilated at the base, oblong, pressed to the ovary, each furnished with a membrane at the apex, bearing the

anthers low down; lobes of anthers drawn out at the top? diverging, but approximate at the base; 2 anterior filaments bearing on their back nectariferous awl-shaped appendages, which are drawn in within the spur (f. 64. *e.*). Stigma ascending, usually drawn out downwards into a somewhat spatulate appendage, somewhat inflexed at the top (f. 64. *f.*). Capsule 1-celled, 3-valved, many-seeded (f. 64. *k.*); seeds fixed to the middle of the valves. Branched shrubs with reddish bark, about 6 feet high. Leaves simple, alternate, serrated, deciduous, feather-nerved; stipulas small. Peduncles solitary, 1-flowered, axillary, bracteate. This is an intermediate genus between *Noiséttia* and *Viola*, differing from both in the form of the calyx.

1 S. floribu'nda (St. Hil. mem. mus. 11. p. 456. t. 22. b.) leaves ovate-oblong, tapering to both ends, acute, and acutely serrate-toothed; peduncles axillary. ♄. S. Native of Brasil on mountains near Rio Janeiro. Flowers white; lower petal cuneated, streaked with yellow and red at the base. Glóssarrhen floribúndus, Mart. fl. bras. 1. p. 22. t. 15.

Bundle-flowered Tongue-violet. Fl. Sept. Oct. Sh. 4-5 feet.

2 S. pauciflòra (Mart. fl. bras. 1. p. 23. act. bonn. 12. p. 48. under Glóssarhen) leaves tapering much to the base, obovately-spatulate, obtuse, crenately serrulated; peduncles axillary. ♄. S. Native of Brasil in the province of Bahia in shady stony places at the river Atahype. Flowers white (f. 64.).

Few-flowered Tongue-violet. Fl. Dec. Sh. 4 to 6 feet.

Cult. These beautiful shrubs will thrive in a mixture of loam, sand, and peat, and young cuttings will strike root readily if planted in sand under a hand-glass, in heat.

FIG. 64.

IV. VI'OLA (*ιον*, *ion*, a violet, in Greek. The ancients feigned that violets were the first food of the cow Io, one of Jupiter's mistresses). Tourn. inst. 419. t. 236. D. C. prod. 1. p. 291. Viola, spec. Lin.

Lin. syst. *Pentándria*, *Monogýnia*. Sepals unequal, all more or less drawn out downwards into ear-like appendages, (produced from the dilatation of the nerves,) erect after flowering. Petals unequal, convolute in æstivation, with 3-nerved claws, lower one drawn out downwards, more or less into a hollow spur. Stamens approximate or coarctate (not joined) inserted on the top of the teeth of a pentagonal, 5-toothed torus. Filaments dilated at the base, oblong, or triangular, bearing the anthers low down; lobes of anthers spreading at the base; the 2 anterior stamens bearing on their back 2 nectariferous, filiform appendages of various shapes, which are drawn in within the spur. Ovary sometimes superior, sometimes girded round at the base by a concave torus, and therefore in this case appears half inferior. Valves of capsule elastic, contracting at maturity and ejecting the seeds. Seeds horizontal, manifestly carunculate, more or less egg-shaped and shining. Embryo oblong; radicle rather terete; cotyledons usually oblong-orbicular, flattish, scarcely longer than the radicle. Elegant, low herbs, for the most part perennial, rarely annual, sometimes with a very short or subterraneous stem, these are called stemless, sometimes caulescent, rarely shrubby. Leaves alternate, marcescent. Peduncles solitary, axillary 1-flowered, furnished with 2 little bracteas, not jointed, reflexed at the top. Flowers drooping. Seminal leaves oblong or ovate, stalked; primordial leaves opposite, rarely meeting together. The roots of all the species act as emetics, some are used as a substitute for ipecacuanha, and it has been ascertained by analysis that they contain the same principle. In medicine the flowers of violets act as a laxative, and the syrup is used by chemists to detect an acid or an alkali; for this purpose the *V. odoràta* is cultivated to some extent at Stratford upon Avon.

We have here followed M. Gingins in the arrangement of the species according to the form of the stigmas, but whether this character has been sufficiently ascertained in all the species we are not at present able to say.

Sect. I. Nomi'nium (a name applied by old authors to some kinds of violets). Ging. mss. D. C. prod. 1. p. 291. Stigma beaked, with a little chink or hole situated on the apex of the beak, which is more or less recurved, sometimes marginated below, hence flattish and oblique, sometimes without the margin, and thence rather convex below. Style tapering from the top to the base. Stamens oblong, approximate. Torus flattish. Capsules usually 3-sided. Seeds 15-27. Seminal leaves usually obovate or oblong.

§ 1. *Stigmas depressed at the top, or marginated in the orb below. Stemless herbs.*

* *Roots (Rhizomas?) toothed, more or less fleshy, usually oblique.*

† *Leaves pedate, or lobed.*

1 V. peda'ta (Lin. spec. 1323.) stigma large, compressed at the sides, obliquely truncate at the top, and perforated, with a very short beak; leaves full of pellucid dots, pedately many-parted; segments linear-lanceolate, variously lobed; stipulas pectinately jagged, adhering a considerable way; petals all smooth, superior one truncate; sepals lanceolate, acute, ciliated, emarginate behind. ♃. H. Native from New England to Carolina, on dry sandy hills and in fields. Curt. bot. mag. 89. Andr. bot. rep. t. 153. Flowers large, beautiful blue, with a white base.

Var. a, *linearíloba* (D. C. prod. 1. p. 291.) leaves pedately 5-7 parted; partitions multifid; lobes linear-lanceolate, entire, ciliated. Curt. bot. mag. t. 89. Sweet, fl. gard. t. 69. Flowers pale blue. Native of Virginia.

Var. β, *ranunculifòlia* (Ging. mss. and D. C. prod. l. c.) leaves deeply lobed. V. ranunculifòlia, Poir. dict. 8. p. 626? Flowers whitish? Perhaps the same as the following.

Pedate-leaved Violet. Fl. May, June. Clt. 1759. Pl. ½ ft.

2 V. septenlòba (Le Conte in ann. lyc. new york, 2. p. 141.) quite smooth, shining; leaves rather succulent, ovate, cordate, toothed, lower ones entire, the rest pedately 7-lobed; middle lobe large; peduncles somewhat tetragonal, longer than the leaves; sepals lanceolate, entire behind; petals all entire, upper one large, villous at the base, 2 lateral ones densely bearded. ♃. H. Native of North America in Carolina and Georgia, in pine-woods. Flowers large, 2 inches in diameter, blue, but white at the base, and marked with darker lines. This plant comes very near in habit to *V. pedàta*, but is much stronger, and is more worthy of that name than the plant that bears it.

Var. β, *albiflòra* (Le Conte, l. c.) flowers white.

Seven-lobed-leaved Violet. Fl. April, June. Clt. Pl. ½ foot.

3 V. pedati'fida; leaves pedately 3-parted, middle partition trifid, lateral ones bifid, all lobed. Very like *V. pedàta*, but differs in the two lateral petals being bearded. ♃. H. Native of North America. Flowers beautiful blue.

Pedatifid-leaved Violet. Fl. May, June. Clt. 1826. Pl. ¼ ft.

4 V. digita'ta (Pursh. fl. amer. sept. 1. p. 171.) leaves palmately 5-7-lobed, tapering into the petiole behind; lobes entire. ♃. H. Native of Virginia. Flowers pale blue.

Digitate-leaved Violet. Fl. May. Clt.? Pl. ¼ foot.

5 V. FLABELLIFO'LIA (Lodd. bot. cab. 777.) stigma as in *V. pedàta;* style pubescent; leaves pedately 5-7-parted; partitions cuneated, cut; stipulas jagged, adhering a considerable way; petals smooth. 4. H. Native of North America. V. pedàta, var. bícolor, Pursh, fl. amer. sept. 1. p. 171. V. atropurpùrea, Raf. in litt. Flowers large, pale blue, ornamented with dark purple at the edge, and velvety at the bottom.

Fan-leaved Violet. Fl. May, June. Clt. Pl. $\frac{1}{4}$ foot.

6 V. PALMA'TA (Lin. spec. 1323.) nearly smooth, or sometimes a little pubescent; stigma capitate, recurved, beaked, depressed, marginate; rhizoma fleshy, thick; leaves hastately-cordate, palmately-lobed; lobes polymorphous (rarely undivided); sepals ciliated, ovate-lanceolate, entire behind; lateral petals bearded, with the claws of all keeled. 4. H. Native of North America. Flowers blue.

Var. α, vulgàris (Elliot, sket. 1. p. 300.) outer lobes of leaves with small acute segments at the base.

Var. β, fràgrans (Elliot, l. c.) leaves more dissected; flowers fragrant. Native near Savannah.

Var. γ, dilatàta (Elliot, l. c.) pubescent; leaves profoundly dissected. Common in Carolina and Upper Georgia. This is the type of the species, according to Schwein.

Var, δ, variegàta; leaves of 2 formes, later ones 3-lobed; lateral lobes deeply lobed, middle lobe large and not so deeply lobed as the lateral ones; flowers variegated with blue and white. 4. H. Native of North America. Sepals not ciliated.

Palmate-leaved Violet. Fl. May, June. Clt. 1752. Pl. $\frac{1}{2}$ foot.

7 V. HETEROPHY'LLA (Muhl. cat. ex Le Conte in ann. lyc. new york, 2. p. 139.) smooth; leaves cordate, elongated-ovate, rather acute, crenate-toothed, entire, and somewhat palmately 5-lobed, with the intermediate lobe much larger and broader than the rest; peduncles somewhat tetragonal, longer than the leaves; sepals awl-shaped, emarginate behind; petals all entire, veined, white at the base, superior petal villous at the base, lateral ones bearded, and with the inferior one marked with a few blue lines. 4. H. Native of North America in Georgia and Carolina, in humid places and in rice grounds. V. palmàta var. heterophýlla, Elliot, D. C. Leaves esculent and mucilaginous.

Var. β, albiflòra (Le Conte, l. c.) flowers white; leaves entire, but when in flower a little lobed. Leaves esculent and mucilaginous, which is the case with most of the violets of this section.

Various-leaved Violet. Fl. April, May. Clt.? Pl. $\frac{1}{2}$ foot.

8 V. CONGE'NER (Le Conte in ann. lyc. new york, 2. p. 140.) always villous; leaves broad-ovate, cordate, rather kidney-shaped, deeply crenate-toothed, so as to appear lobed; petioles very villous; peduncles somewhat tetragonal, shorter than the leaves; sepals ciliated, ovate, obtuse, entire behind; petals all entire, veined, white at the base, upper petal narrowest, sometimes rather villous at the base; lateral ones densely bearded, and with the inferior one marked with a few blue lines. 4. H. Native of North America along with *V. palmàta*, but is easily distinguished at first sight by the yellowish-green colour of its leaves. Flowers blue, white at base, or of a deep-violet. Perhaps the same as the following.

Congener Violet. Fl. March, July. Clt. Pl. $\frac{1}{2}$ foot.

9 V. TRI'LOBA (Schwein. amer. journ. 5. no. 1.) stigma capitate, recurved, beaked, depressed; rhizoma fleshy, thick; leaves smooth, of two forms, some of them nearly kidney-shaped, others 3-lobed; lateral lobes small, sub-divided. 4. H. Native of Carolina, in fertile woods and meadows. Flowers deep blue. V. palmàta, var. tríloba, Ging. mss. in D. C. prod. 1. p. 292.

Three-lobed-leaved Violet. Fl. April, June. Pl. $\frac{1}{2}$ foot.

†† *Leaves cordate, entire.*

10 V. ASARIFÒLIA (Pursh. fl. amer. sept. 2. p. 732. not of Muhl.) stigma globose, not marginate; rhizoma very thick, coral-formed; leaves large, cordately kidney-shaped, undivided, crenately-toothed, pubescent; lateral petals bearded; pedicels shorter than the leaves. 4. H. Native from Virginia to North Carolina, in low, rich woods and meadows. Flowers blue.

Asarabacca-leaved Violet. Fl. May, Ju. Clt. 1820. Pl. $\frac{1}{4}$ ft.

11 V. PAPILIONA'CEA (Pursh. fl. amer. sept. 1. p. 173.) stigma triangular, marginate; rhizoma fleshy, thickish; leaves triangularly-cordate, acute, crenated, rather cucullate, smoothish; 3 lower petals connivent, bearded beneath the middle, 2 upper ones reflexed. 4. H. Native of North Carolina, and near Philadelphia, in humid places. Rœm. et Schult. syst. 5. p. 356. V. barbàta, Willd. MSS.? Flowers blue, striated, and bearded with yellow down.

Var. α, sepals acuminated; leaves triangularly-cordate, acuminated.

Var. β? sepals ovate; leaves cordate, acutish.

Butterfly Violet. Fl. May, June. Clt. 1800. Pl. $\frac{1}{4}$ foot.

12 V. AFFI'NIS (Le Conte in ann. lyc. new york, 2. p. 138.) plant smooth; leaves ovate, cordate, rather acuminated, crenate-toothed; peduncles somewhat tetragonal, shorter than the leaves; sepals ovate-lanceolate, either entire or emarginate behind, rather blunt; petals entire, veiny, 2 lateral ones bearded, 4. H. Native of North America. V. cucullàta, Schweinitz and Torrey. V. soròria, Pursh. fl. amer. sept. 1. p. 173. V. papilionàcea var. β, D. C. prod. 1. p. 292. Flowers blue, white at the bottom, upper petal villous as well as the rest, lateral ones bearded, lower one marked with a few blue lines.

Neighbouring Violet. Fl. April, June. Clt. 1802. Pl. $\frac{1}{2}$ ft.

13 V. CUCULLA'TA (Ait. hort. kew. 3. p. 288.) stigma triangular, marginated; rhizoma fleshy, thick; leaves smooth, cordate, acute, serrated, cucullate at the base; peduncles longer than the petioles; limb of lower petal narrow, beardless, with the 2 lateral ones bearded, all obliquely twisted; claws of all keeled. 4. H. Native of North America, in wet places, common. Flowers blue, white at the base. Sims, bot. mag. 1795. V. oblíqua, Pio. diss. p. 12. t. 3. f. 1. V. cucullàta, β, glabérrima, D. C. prod. 1. p. 292. Sepals subulate, emarginate behind.

Var. β, hispídula (D. C. prod. l. c.) leaves with a short acumen, rather hispid on the upper surface. Flowers blue?

Var. γ, cordifórmis (D. C. prod. l. c.) leaves cordate, hardly acuminate, rather hispid on the upper surface; rhizoma perpendicular, blackish. Perhaps a species.

Hooded-leaved Violet. Fl. April, Ju. Clt. 1762. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

14 V. IMBE'RBIS (Ledeb. fl. alt. 1. p. 257. icon. fl. pl. ross. alt. ill. t. 236.) stemless; leaves cordate, acute, serrated, rather pilose; peduncles length of leaves, furnished with bracteas in the middle; sepals lanceolate, acuminated, ciliated at the base; petals oblong, obtuse, beardless; spur elongated, blunt, a little incurved. 4. H. Native of Siberia Altaica. Flowers violaceous. Like *V. macróceras*, but the petals are not bearded.

Beardless-petalled Violet. Fl. April, May. Pl. $\frac{1}{2}$ foot.

15 V. OBLI'QUA (Ait. hort. kew. 3. p. 288.) stigma triangular, marginated; rhizoma fleshy, thick; leaves smooth, cordate, acute, crenately-serrated, flattish; flowers erect; peduncles length of leaves; petals obliquely twisted; lateral ones very narrow, and longer than the rest, bearded beneath the middle. 4. H. Native from Pennsylvania to Virginia, in wet shady places. Flowers white, with purple and yellow veins. Víola cordàta, Walt. car. 219.?

Oblique-petalled Violet. Fl. April, June. Clt. 1762. Pl. $\frac{1}{2}$ ft.

•• *Roots wrinkled, more or less ligneous, and branched.*

† *Leaves pinnate, or lobed.*

16 V. PINNA'TA Lin. spec. 1323.) stigma triangular, emar-

ginated; root divided, rather woody; leaves pinnately many-parted; partitions many-lobed; sepals ovate; 2 lateral petals bearded; seeds turbinate, foveolate at the base, reddish. ♃. H. Flowers pale blue, with darker veins. This species is smaller than *V. pedàta;* leaves generally as deeply divided into about 5 segments, which are either 3-cleft or pinnatifid, as well as jagged, and very narrow.

Var. α, *Sibírica,* (D. C. prod. 1. p. 293.) leaves pinnate-parted; partitions pinnatifid, densely ciliated; capsules more acute, and the seeds are smaller than in Var. β. Native of Siberia. Gmel. sib. 4. p. 101. t. 48. f. 4.

Var. β, *Europæ'a* (D. C. prod. l. c.) leaves pinnatifid; fissures many-lobed, remotely ciliated; capsules obtuse; seeds large. Native of the mountains of Switzerland and Savoy. All. miscell. taur. 3. p. 181. t. 5. f. 2. Hall, hist. no. 561.

Pinnate-leaved Violet. Fl. May, June. Clt. 1752. Pl. ½ ft.

17 V. disse'cta (Led. fl. alt. 1. p. 255. icon. pl. fl. ross. alt. ill. t. 232.) stemless; leaves 3-parted; segments multifid, toothed, smooth; sepals ovate-lanceolate, acute, rather shorter than the spur; 2 lateral petals bearded. ♃. H. Native on the Altaian mountains, about Barnaoul, and elsewhere. V. multifída, Willd. herb.—Gmel. sib. 4. p. 101. no. 66. Flowers largeish, violet. Root (rhizoma?) horizontal, branched.

Dissected-leaved Violet. Fl. May. Pl. ¼ foot.

18 V. dactyloi'des (Rœm. et Schult. syst. 5. p. 351.) stigma marginated; root divided, hard; leaves palmately 5-7-cleft; leaflets oblong-lanceolate, grossly serrated, under surface villous; sepals ovate; 2 lateral petals bearded. ♃. H. Native of birch forests about Irkoutck and Nertschinsk-Sawod. V. palmàta, Patrin. herb. Gmel. sib. 4. p. 100. t. 49. f. 3. Flowers pale blue, with darker veins.

Finger-grass-leaved Violet. Fl. April, June. Clt. 1820. Pl. ¼ to ½ foot.

†† *Leaves ovate-cordate, or lanceolate.*

19 V. variega'ta (Fisch. in litt. et D. C. prod. 1. p. 293.) style marginated; root sub-divided, hardish; leaves ovate-cordate, or roundish; capsules obtuse; seeds ovoid, reddish. ♃. H. Native of Dahuria. V. maculàta, Patrin. herb. but not of Cav. Stipulas lanceolate, ¾-adhering, denticulated. Leaves violaceous on the under surface, obscurely green on the upper surface, white at the veins, and rather hispid. Spur cylindrical, straight, length of sepals. In fruit-bearing plants the leaves are large, roundish, almost glabrous. Flowers pale violet, very like those of *V. pinnàta.* Capsules obovate-trigonal.

Variegated-leaved Violet. Fl. May, June. Clt. 1817. Pl. ¼ foot.

20 V. calthæfo'lia (Poir. dict. 8. p. 627.) leaves ovate-cordate, obtuse, somewhat crenated, rather hairy; peduncles shorter than the leaves. ♃. H. Native? Perhaps the same as *V. asarifòlia?* Capsules ovate-triquetrous. Seeds globose. Flowers blue. Lateral petals bearded?

Caltha-leaved Violet. Pl. ½ foot.

21 V. phyteumæfo'lia (D. C. in herb. Lamb.) pubescent; stigma? leaves oblong-ligulate, obliquely cordate at the base, obtuse at the apex; peduncles twice the length of the leaves; sepals lanceolate, acute; spur blunt, shorter than the sepals; petals obovate-oblong, lower one retuse, lateral ones bearded; stipulas linear, entire, acute. ♃. F. Native of New Holland. Peduncles 6-9 inches high. Flowers about the size of those of *V. calcaràta.* Like *V. ovàta.*

Phyteuma-leaved Violet. Pl. ½ foot.

22 V. primulæfo'lia (Lin. spec. 1324. exclusive of the synonym of Gmel.) stigma marginate; root fibrous, rather branched; leaves smoothish, ovate, rather cordate at the base, running down into bordered footstalks, obscurely crenate; stipulas free; sepals smooth, lanceolate, rather obtuse; 2 lateral petals bearded at the base, lower one acuminated. ♃. H. Native of Pennsylvania, Virginia, Carolina, and New Jersey, in humid places. Flowers small, white, veined, the lower petal with dark purple.

Var. α, *cordàta* (D. C. prod. 1. p. 293.) smoothish. footstalks shorter than the leaves; scapes twice the length of the leaves. ♃. H. Native of North Carolina. V. primulæfòlia, Ait. hort. kew. ed. 2. vol. 2. p. 45? Schwein. amer. journ. 5. no. 1. p. 48. V. cordàta, Watl.? ex Bosc. Flower blueish, sweet-scented.

Var. β, *Bóscii* (D. C. prod. l. c.) smoothish; footstalks almost none; scapes hardly exceeding the leaves. ♃. H. Native of Carolina. Pl. 6 inches high.

Cowslip-leaved Violet. Fl. April, June. Clt. 1783. Pl. ¼ to ½ foot.

23 V. lanceola'ta (Lin. spec. 1323.) stoloniferous; stigma marginate, beaked; leaves lanceolate, tapering to both ends; stipulas free; sepals lanceolate; 2 lateral petals bearded. ♃. H. Native of North America in humid places. V. lanceolàta, Lin. spec. exclusive of the Siberian variety. Lodd. bot. cab. t. 211. Sweet, fl. gard. 174. Flowers white, the lower and lateral petals painted with purple veins. Leaves serrated.

Var. β, leaves ovate, truncate at base. ♃. H. Native of Georgia and Carolina. Perhaps a variety of *V. primulæfòlia.*

Spear-leaved Violet. Fl. June, July. Clt. 1759. Pl. ¼ foot.

24 V. attenua'ta (Sweet, hort. brit. p. 37.) smooth; leaves lanceolate, acute, and somewhat serrated, gradually tapering down the petiole; peduncles scarcely longer than the leaves; segments of the calyx acute; petals beardless, 2 upper ones roundish; stigma recurved, distinctly beaked, capitate, not marginate. ♃. H. Native of North America, from Canada to Pennsylvania, in overflowed meadows. Flowers white, scentless; the upper petal painted with purple veins. V. lanceolàta, Pursh, fl. amer. sept. 1. p. 172. Nutt. gen. amer. 1. p. 150. but not of Lin.

Attenuate-leaved Violet. Fl. Ju. July. Clt. 1759. Pl. ¼ ft.

25 V. Patrínii (D. C. mss. and prod. 1. p. 293.) stigma triangular, marginated; trunk of root hardish; leaves ovate-lanceolate, truncate at the base; sepals lanceolate; 2 lateral petals bearded; stipulas one-half adhering. ♃. H. Native of Siberia. V. prunellæfòlia, Fisch, in litt. Flowers pale blue. Petioles 3 or 4 times longer than the leaves.

Patrin's Violet. Fl. June, July. Clt. 1822. Pl. ¼ foot.

26 V. longisca'pa (D. C. in herb. Lamb.) smooth; stigma? leaves oblong, rounded at both ends, somewhat attenuated at the base, almost entire, or with 1-3 teeth on each side at the base; peduncles twice the length of the leaves; sepals ovate-lanceolate, obtuse, entire; petals all smooth; spur a hollow pouch, not half the length of the sepals. ♃. F. Native of New Holland. Peduncles 8 inches high. Flowers about the size of those of *V. blánda.*

Long-scaped Violet. Pl. ¾ foot.

27 V. cæspito'sa (D. Don, prod. fl. nep. p. 205.) smooth; leaves oblong, obtuse, crenulate, rounded at the base; petioles winged, 3-times shorter than the leaf; scapes exceeding the leaves in length; segments of the calyx lanceolate, acute; petals obovate, entire, 2 lateral ones bearded. ♃. F. Native of Nepaul, at Chitlong. V. primulæfòlia, Hamilt. mss. V. Patrínii, γ, Nepaulénsis, D. C. prod. 293. Flowers violaceous.

Tufted Violet. Fl. April. Clt. 1824. Pl. ½ foot.

28 V. Chine'nsis; root annual; leaves oblong-ovate, rather cordate, smooth, crenated, running into the petiole at the base; peduncles long; petals all beardless. ⊙. H. Native of China, near Canton, in uncultivated places. Flowers purple, sweet-scented. V. primulæfòlia, Lour.

Chinese Violet. Fl. June, July. Pl. ½ foot.

29 V. acu'ta (Bigel ex Spreng. syst. append. p. 96.) leaves

ovate-lanceolate, bluntish, obsoletely crenated, running down the petiole at the base; stipulas linear-lanceolate; petals acute, beardless; spur very short. 4. H. Native of North America, in Massachusetts. Flowers blue? Stigma unknown.

Acute-leaved Violet. Pl. ¼ foot.

30 V. ova'ta (Nutt. gen. 1. p. 148.) villous; stigma marginate; trunk of root thick, somewhat fleshy; leaves ovate, subcordate, rather acute, crenate, usually lacerately toothed at the base, tapering abruptly into the footstalk, which is therefore winged, conspicuously pubescent on either side; scape shorter than the leaves; sepals lanceolate; stipulas lanceolate, long; petals obovate, the two lateral ones bearded. 4. H. Native on dry hills from Canada to Virginia; abundant near Philadelphia, on the shelving rocks which border the Schuylkill; also in sandy fields of New Jersey. V. primulæfòlia, Pursh. fl. amer. sept. 1. p. 173. Bigel. fl. bost. 59. V. ciliàta, Muhl. V. fimbriátula, Smith in Rees' cycl. Flowers bright blue, large.

Var. β, Belvisiàna, (D. C. prod. 1. p. 294.) very hairy; footstalks hardly any; peduncles shorter than the leaves; flowers smaller than in var. α. Native of the higher mountains of Virginia.

Ovate-leaved Violet. Fl. April, May. Clt. 1783. Pl. ¼ ft.

31 V. spatula'ta (Willd. herb. ex Spreng. syst. 1. p. 798.) leaves spatulate, almost sessile, nearly entire, and are, as well as the scapes, hoary-villous; spur short, bluntish; stigma unknown. 4. H. Native of Persia.

Spatulate-leaved Violet. Pl. ¼ foot.

32 V. sagitta'ta (Ait. hort. kew. 3. p. 287.) stigma marginate; trunk of root fibrous; leaves ciliated, oblong, sagittately-cordate at the base, subserrated, and cut at the base, sometimes slightly pubescent; stipulas free; sepals smooth, lanceolate, acute; petals obovate, the 2 lateral ones bearded at the base. 4. H. Native on dry hills from New England to Virginia. Flowers blue; lower petal white towards the bottom, with purple veins; the rest longer, narrower, and white towards the base. There is a variety of this plant, with the base of the leaves truncate, and tapering more or less abruptly at the base, pubescent. V. sagittæfòlia, Sal. prod. 130. Sepals emarginate behind.

Var. β, emarginàta (Nutt. gen. 1. p. 147.) leaves triangularly-cordate, or hastate, lacerately toothed near the base, and running into a narrow margin on the petiole, under surface glabrous, upper surface usually pubescent; scapes longer than the leaves; petals obovate, all emarginate and bidentate, lowest cucullate, the 3 lower, and sometimes the 2 upper, pubescent; stigma beaked, depressed horizontally, marginate around. 4. H. Native of New Jersey, in sandy fields, near Philadelphia, and also on the banks of the Schuylkill. Flowers of a fine deep blue.

Arrow-leaved Violet. Fl. Apr. July. Clt. 1775. Pl. ½ ft.

33 V. emargina'ta (Le Conte in ann. lyc. new york, 2. p. 142.) smooth; leaves rather succulent, oblong-ovate, cordate, toothed, sometimes ciliated, superior ones unequally and deeply-toothed at the base, and usually running into the petiole at the base, with the mid-rib very prominent; petioles sometimes rather villous; peduncles tetragonal, longer than the leaves; sepals lanceolate, acute, emarginate behind; petals all emarginate, villous, lower as well as lateral petals bearded. 4. H. Native of North America in dry woods, from New Jersey to Carolina. V. dentàta, Pursh. fl. amer. sept. 1. p. 172. V. sagittàta, var. γ, dentàta, Schwein. amer. journ. no. 2. D. C. prod. 1. p. 294. Flowers blue, white at the base, upper petal with a few purple veins.

Emarginate-petalled Violet. Fl. April, June. Clt. Pl. ½ foot.

34 V. betonicæfo'lia (Smith, in Rees' cycl. no. 7.) plant rather downy; stigma triangular, marginated; trunk of root ligneous, almost simple, blackish; leaves smoothish, or slightly downy, linear oblong, obtuse, regularly crenate, cordate, slightly dilated at the bottom, abruptly tapering into the base; stipulas free; sepals lanceolate; capsule oblong, trigonal, with somewhat obtuse valves; seeds turbinate, brownish-red when ripe. 4. G. Native of New Holland, at Botany Bay and Port Jackson. V. longifòlia, R. Br. ined. Flowers apparently light purple, not much veined. Scapes always densely downy, longer than the leaves.

Betony-leaved Violet. Fl. Apr. July. Clt. 1820. Pl. ¼ ft.

* * * *Roots somewhat fusiform.*

35 Phili'ppica (Cav. icon. rar. 6. p. 19. t. 529. f. 2.) stigma marginate; roots fusiform, almost simple; leaves ovate-oblong, obtuse, crenate, rather villous on the under surface, tapering abruptly at the base into a shorter footstalk; stipulas adnate; sepals ovate-lanceolate; petals ovate, obtuse; seeds almost globose, brownish-red. 4. F. Native of the islands of Manila and Luzon, amongst stones. Scapes double the length of the leaves, with 2 linear opposite bracteas in the middle of each. Differing from *V. betonicæfòlia* in the form of the roots, and from *V. Gmeliniàna* in the form of the leaves, and straight, not recurved spur. Flowers of a violaceous-red colour.

Philippin Violet. Fl. May, June. Clt.? Pl. ¼ foot.

36 V. gmelinia'na (Rœm. and Schult. syst. 5. p. 354.) stigma marginate; roots fusiform, almost simple; leaves obovate-oblong, hairy, tapering into the footstalk at the base; stipulas adnate, ciliated? sepals ovate-oblong, rather obtuse. 4. H. Native in dry places in Dahuria and Siberia. V. fusifórmis, Smith, in Rees' cycl.—Gmel. sib. 4. p. 99. t. 49. f. 2. Flowers pale blue or purple, larger than those of *V. lanceolàta.*

Var. β, scorpiurifòlia (D. C. prod. 1. p. 294.) rather hispid; sepals acuminate, longer than in var. α; leaves obovate-oblong; capsules ovate-trigonal, rather obtuse; seeds dark reddish, with a white caruncle at the base. 4. H. Native of Siberia, at Nerschinsky-sawod, Fisch.

Var. γ, elongàta (Ging. mss.) leaves cordately elliptical. 4. H. Native of humid places near Irkoutck. Gmel. fl. sib. 4. p. 99.

Var. δ, cordifòlia (Ging. mss.) leaves cordate; sepals acuminate. 4. H. Native on the Ural mountains. V. suàvis, Fisch, in litt. Roots subdivided. Stigma depressed. Perhaps a species?

Gmelin's Violet. Fl. June, July. Clt. 1820. Pl. ¼ foot.

* * * * *Roots (or rhizomas) jointed.*

37 V. palu'stris (Lin. spec. 1324.) stigma marginate; roots articulated, scaly; leaves cordately kidney-shaped, smooth; stipulas broad-ovate, acuminated; sepals ovate-obtuse; 2 lateral petals with a hairy central line; capsules oblong, trigonal; seeds ovoid dark-greenish. 4. H. Native throughout Europe, in mossy bogs and humid meadows; plentiful in Britain, chiefly, though not exclusively, in the northern and mountainous counties.

Var. α, vulgàris (D. C. prod. 1. p. 294.) flowers pale blue; petals obovate. V. palústris, Smith, eng. bot. t. 444. Curt. lond. fasc. 3. t. 58.

Var. β, Pennsylvánica (D. C. prod. l. c.) flowers purplish; petals almost orbicular. 4. H. Native of North America. V. cucullàta, Bigel. in litt. Perhaps a distinct species.

Marsh Violet. Fl. May, June. Britain. Pl. ¼ foot.

38 V. bla'nda (Nutt. gen. 1. p. 150.) stigma capitate, marginate; roots jointed; leaves cordately-kidney-shaped, slightly pubescent on the under surface, pressed to the ground; stipulas ovate-lanceolate, acute; sepals linear-oblong, obtuse; petals smooth. 4. H. Native of North America, in wet places and bog-meadows, from New York to Carolina. V. blánda, Willd. hort. berl. 1. t. 24.? Flowers white, with a few blue lines, sweet-scented.

Pretty Violet. Fl. May, July. Clt. 1802. Pl. ¼ foot.

39 V. ROTUNDIFO'LIA (Michx. fl. bor. amer. 2. p. 150.) stigma capitate, round, recurved at the apex, but without a beak; roots jointed, scaly; leaves large and round, constantly pressed to the ground, with pubescent petioles, with the recess becoming at length closed, under surface glabrous; stipulas subulate-lanceolate; sepals oblong, narrow, obtuse; 2 lateral petals bearded and striated; spur almost obliterated. ♃. H. Native near Philadelphia, on the shady banks of Wishahikon-creek, always under the shade of *A'bies Canadénsis*; it has been found in similar situations in North Carolina. The flowers are of a pale yellow, and appear before the complete expansion of the leaves upon short peduncles; the 2 lateral petals are a little bearded, and striated with 3 stripes upon each, the uppermost one interrupted by a line of pubescence, the lowest petal very small, and also striated; the stripes are bifid, and crossed by two callous converging lines near the base.

Var. β, pàllens (Banks, herb. et D. C. prod. 1. p. 295.) glabrous; sepals acuminated. ♃. H. Native of Labrador and Kamtschatka. Perhaps the same as var. *α*? or perhaps a distinct species.

Round-leaved Violet. Fl. May, Sept. Clt. 1800. Pl. $\frac{1}{4}$ foot.

40 V. CLANDESTI'NA (Pursh. fl. amer. sept. 1. p. 173.) stigma marginate? roots jointed, scaly; leaves almost orbicular, bluntish, crenate-serrated, these serratures are glandular; peduncles branched, 2-8-flowered; petals linear, scarcely longer than the calyx. ♃. H. Native on the high mountains of Pennsylvania, in shady beech-woods, among rotten wood, and rich vegetable mould. This singular species differs from all the rest, in producing its flowers as it were under-ground, as they always are covered with rotten wood or leaves; they are of a chocolate brown, very small; the seed-vessel buries itself still deeper in the ground, and is large in proportion to the plant. The inhabitants know it by the name of *Heal-all*, being used by them in curing all kinds of wounds or sores. Pursh. According to Bigelow, the flowers are at first large yellow, but when the leaves become stately, or at a later period of growth, it produces small inconspicuous greenish flowers, and creeping stolons.

Clandestine Violet. Fl. June, Sept. Clt. 1800. Pl. $\frac{1}{4}$ foot.

41 V. VILLO'SA (Walt. fl. carol. p. 212.) pubescent; stigma not margined all round, beaked; trunk of root oblique, wrinkled; leaves roundish-cordate, crenate-serrated, pubescent on both surfaces; sepals oblong; stipulas lanceolate, toothed; lower petal beardless, 2 lateral ones bearded; capsules smoothish. ♃. H. Native of North America, on shady hills. Schwein. amer. journ. 5. no. 1. spec. 9. Flowers blue, elegantly striped and bearded with yellow down. Leaves purplish beneath, lying on the ground.

Villous Violet. Fl. June, July? Pl. $\frac{1}{4}$ foot.

42 V. LECONTEA'NA; smooth; leaves ovate, acuminated, crenated, sometimes rather villous above; petioles long, spotted with red; peduncles somewhat tetragonal, equal with or higher than the leaves, spotted; flowers sweet-scented; sepals lanceolate; petals all entire, green at the base, lateral ones sometimes rather pubescent at the base. ♃. H. Native of North America in humid woods, in the state of New York and New Jersey, and from Pennsylvania to Virginia. V. oblìqua, Pursh. fl. amer. sept. 1. p. 172? V. amœ'na, Le Conte, ann. lyc. new york, 2. p. 144. Flowers white, with purple and yellow veins.

Le Conte's Violet. Fl. April, May. Clt. Pl. $\frac{1}{2}$ foot.

43 V. SORO'RIA (Willd. hort. berl. 1. t. 72.) stigma depressed, not margined all round, beaked; leaves orbicularly-cordate, crenate-serrate, under surface glabrous, usually violaceous, upper surface villous; stipulas minute, awl-shaped; petals oblong, lower and 2 lateral ones bearded. ♃. H. Native of Pennsylvania, &c. in overflowed meadows. V. cordifòlia, Schwein and Torrey. V. villòsa, Nutt. gen. 1. p. 148. Flower reddish-blue, white at the base. Petioles and scapes hairy.

Var. β, Nuttállii; petals obovate; leaves thickish, cordate, acutish, lying on the ground; sepals short and narrow, smooth. ♃. H. Native in woods on the banks of Schuylkill, near Philadelphia. Peduncles longer than the leaves. V. villòsa *β*, cordifòlia, Nutt. gen. 1. p. 148.

Sister Violet. Fl. May, June. Clt. 1802. Pl. $\frac{1}{4}$ foot.

44 V. CORDA'TA (Walt. car. p. 219.) stigma? Leaves broad-cordate, acute, crenated, smooth; peduncles very long; sepals acute; lateral petals bearded. ♃. H. Native of North America. Flowers blue?

Cordate-leaved Violet. Pl. $\frac{1}{4}$ foot.

45 V. A'SPERA (Ging. mss. and D. C. prod. 1. p. 295.) rather hispid; stigma recurved, with a shortish beak, somewhat depressed at the top, naked; leaves profoundly cordate, crenate, pubescent, longer than the scapes; sepals linear, obtuse, hairy; stipulas setosely jagged; petals oval, 2 lateral ones much bearded; nectaries conical, falcate. ♃. F. Native of Upper Nipaul. Very like *V. hírta*, but differing in the form of the stigma. Flowers cream-coloured or almost white. A dwarf tufted herb.

Rough Violet. Fl. April, June. Clt. 1824. Pl. $\frac{1}{4}$ foot.

46 V. SE'RPENS (Wall. fl. ind. 2. p. 449.) smoothish; stigma marginate? stems slender; leaves profoundly-cordate; sepals lanceolate, acute; stipulas lanceolate, toothed; flowers minute; 2 lateral petals bearded in the middle; spur short, very blunt. ♃. F. Native of Nipaul. Perhaps the same as *V. rèpens*. Buchan in herb. Lamb.? Flowers white, with a feeble blue tinge, scentless.

Creeping Violet. Fl. April, June? Pl. $\frac{1}{2}$ foot.

§ 2. *Stigmas convex, immarginate below.*

* *Capsules turgid-roundish. Stems almost wanting.*

47 V. JAPO'NICA (Langsdorff, ex Fisch. in litt.) glabrous; leaves cordate; stipulas linear-lanceolate, jagged; sepals lanceolate, acute; spur thick, obtuse, straight, one half shorter than the petals. ♃. H. Native of Japan near Nagasaki. V. odoràta, Thunb. fl. jap. 326? Flowers blue.

Japan Violet. Fl. Ap. Jul. Clt. 1818. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

48 V. CANE'SCENS (Wall. fl. ind. 2. p. 450.) plant stemless, clothed with glaucous pubescence; leaves cordately-reniform, obtuse, stipulas fringed with long ciliæ; peduncles erect, longer than the leaves; sepals linear, acute; petals thrice as long as the calyx, the upper two wedge-shaped and puberulous at the base, two lateral ones rather narrower and bearded at the base. ♃. F. Native in Nipaul on Mount Nag-Urjoon. Flowers small, scentless, pale violet. Style flattish.

Canescent Violet. Fl. March, April. Pl. $\frac{1}{2}$ foot.

49 V. HI'RTA (Lin. spec. 1324.) plant villous or pubescent; stigma hooked, acute, naked; leaves cordate; sepals ovate, obtuse, with ciliated margins; stipulas with glandular teeth; 2 lateral petals bearded along the middle; spur somewhat conical; nectaries glabrous; capsules turgid, hairy; seeds turgid, brown. ♃. H. Native almost throughout the whole of Europe in groves and thickets. In England in Oxfordshire, Cambridgeshire, Essex, and Kent; at Marham, Norfolk; near Bury, Suffolk; on St. Vincent's Rocks, Bristol, on a chalky or limestone soil. Smith, engl. bot. t. 894. Curt. fl. lond. fasc. 1. t. 64. Fl. dan. t. 618. Flowers light greyish-blue, streaked with black, scentless. Scapes taller than the leaves, furnished with 2 narrow opposite bracteas below the middle. Stolons short, not rooting. This plant varies much in habit as well as in the shape of the leaves according to soil and situation.

Var. β, alpìna (D. C. prod. 1. c.) leaves broad-cordate, with a

short acumen; violaceous beneath the footstalks. ♃. H. Native in the Alps of Savoy at St. Bernard. There is a variety with the sinus more or less cut, and with the footstalks more or less dilated at the apex.

Var. γ, *álba* (D. C. prod. l. c.) leaves cordate, very minute; flowers white; spur lilac. ♃. H. Native on dry meadows. Seeds turgid, brown. Later leaves largest.

Var. δ, *scàbra* (D. C. prod. l. c.) leaves acuminated; sepals acute, ex Braun. ♃. H. Native about Salzburg. V. scàbra, Braun. in flora, 1820. p. 469.

Hairy Violet. Fl. April, May. Britain. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

50 V. ambi'gua (Walds. et Kit. hung. 2. p. 190.) stoloniferous leaves smooth, oblong-cordate; lobes inflexed, cucullate; sepals obtuse; 2 lateral petals bearded. ♃. H. Native of Hungary and Germany. Flowers blueish. Petioles winged.

Ambiguous Violet. Fl. April, June. Pl. creeping.

51 V. campe'stris (Bieb. fl. cauc. 1. p. 171.) stigma hooked, naked; leaves cordate, oblong, hairy; 2 lateral petals bearded in the middle; stolons none. ♃. H. Native of Tauria and Iberia in meadows and fields. V. hírta, Pall. ined. Perhaps the same as *V. Pyrenìaca* and *V. collìna*. Besser, cat. hort. crem. anno. 1816. p. 151. Very like *V. hírta*, but the leaves are narrower, less hairy, and on shorter petioles. Flowers truly sweet-scented, pale-purple. V. hírta β, frágrans, D. C. prod. 1. p. 295. Sepals obtuse. Root perpendicular.

Field Violet. Fl. June, July. Clt. Pl. $\frac{1}{4}$ foot.

52 V. Pyreni'aca (Ramond, in D. C. fl. fr. 4. p. 803.) stigma hooked, naked; leaves broad, somewhat cordate; footstalks dilated at the apex; sepals ovate, obtuse. ♃. H. Native of the Pyrenees on rocks. Flowers blue, sweet-scented. This is not a variety of *V. palústris* nor of *V. canìna*, but probably the same as *V. hírta, var. alpìna?* Seeds unknown.

Pyrenean Violet. Fl. April, June. Clt. 1817. Pl. $\frac{1}{4}$ foot.

53 V. hu'milis (H. B. et Kunth, nov. gen. amer. 5. p. 369. t. 492. f. 1.) very smooth; leaves roundish-ovate, obtuse, rounded at the base, truly cordate; stipulas dentately ciliated at the apex; calyxes acutish; stigma hooked, acute; petals all smooth; ovary smooth; spur short, rounded, spreading, with the appendages rounded at the apex, one half shorter than the cells of anthers. ♃. F. Native of Mexico near Real del Monte, at the height of 3218 feet. Flowers white, with yellow veins.

Dwarf Violet. Fl. April, July. Clt. 1824. Pl. $\frac{1}{4}$ foot.

54 V. Hookeria'na (H. B. et Kunth, nov. gen. amer. 5. p. 369. t. 492. f. 2.) very smooth; leaves kidney-shaped, profoundly cordate; stipulas dentately-ciliated; calyxes acute; stigma hooked, truncate at the apex; petals all smooth; ovary smooth; spur short, rounded, with the appendages rounded at the apex, one half shorter than the cells of anthers. ♃. F. Gathered along with *V. hùmilis*. Flowers violaceous.

Hooker's Violet. Pl. $\frac{1}{4}$ foot.

55 V. odora'ta (Lin. spec. 1324.) stigma hooked, naked; leaves roundish-cordate, crenate, smoothish; sepals ovate, obtuse; 2 lateral petals with a hairy line; spur very blunt; capsules turgid, hairy; seeds turbinate, whitish; stolons long, creeping, and rooting. ♃. H. Native in groves and hedges almost throughout the whole of Europe, and in Siberia, China, and Japan? In Britain frequent. Smith, engl. bot. t. 894. Curt. fl. lond. fasc. 1. t. 63. Fl. dan. t. 309. Sturn. deutch. fl. icon. good. Flowers sweet-scented, resembling that of *orise-root* or *Mignonette*.

M. Boullay has discovered *Violine*, which exists in all parts of the plant. It is an alkaline substance, and forms salts by its union with acids; it is soluble in alcohol, but hardly so in water. It is procured in the form of yellow powder. This substance is very active and poisonous according to M. Orfila.

Var. α, *vulgàris* (D. C. prod. 1. p. 296.) flowers deep-purplish-blue, pale and streaked in the mouth. The flowers of this plant impart their colour and flavour to aqueous liquors; a syrup made from the infusion has long had a place in the shops, and is said to be an agreeable and useful laxative for children, but it is chiefly valued as a delicate test of the presence of uncombined acids or alkalies, the former changing its blue to a red, and the latter to a green. There can be no doubt but this is the *ιον πορφυρεον* of Dioscorides, who speaks of the ivy-like leaves and very sweet-scented purple flowers, which he recommends for sore throats and for children in the falling sickness.

Var. β, *cærùlea* (Sweet, hort. brit. p. 37.) flowers blue.

Var. γ, *purpùreo-plèna* (Sweet, l. c.) flowers double, purple.

Var. δ, *cærùleo-plèna* (Sweet, l. c.) flowers double, blue.

Var. ε, *pállido-plèna* (Sweet, l. c.) flowers double, pale-blue. This variety is commonly called *Neapolitan Violet* in gardens.

Var. ζ, *álba* (D. C. prod. 1. p. 296.) flowers white. Plentiful about Dorking in Surrey, in hedges. V. álba, Bess. fl. gall. 1. p. 171. This is probably a distinct species.

Var. η, *álbo-plèna* (Sweet, l. c.) flowers double, white.

Var. ι, *variegàta* (D. C. prod. l. c.) flowers variegated, Tourn. inst. 419.

Var. λ, *cornùta;* all the petals horned, like that of *Linària pilòria*.

Sweet-scented Violet. Fl. Mar. May. Brit. Pl. $\frac{1}{2}$ ft. trailing.

56 V. sua'vis (Bieb. suppl. p. 162.) stigma hooked, naked; leaves reniform-cordate, crenate, pubescent; sepals obtuse; 4 upper petals narrowest, lower one emarginate, 2 lateral ones with a hairy line; stolons long, creeping, and rooting. ♃. H. Native of Tauria. Flowers pale-blue, white at the base, sweet-scented.

Sweet Violet. Fl. Mar. May. Clt. 1820. Pl. $\frac{1}{2}$ foot.

* * *Capsules oblong, trigonal. Perhaps the 2 lateral petals of all are bearded.*

† *Stems herbaceous.*

57 V. Kroke'ri (Gmel. syst. 412.) stigma hooked; stem procumbent; leaves cordately kidney-shaped, bluntish; sepals lanceolate, acute; capsule trigonal, pubescent. ♃. H. Native of Bohemia. V. purpuráscens, Schm. fl. boh. 1. cent. 3. p. 49. t. 311. Flowers purplish.

Kroker's Violet. Fl. May, June. Clt. 1820. Pl. procumbent.

58 V. uligino'sa (Bess. prim. fl. gall. 169.) stigma somewhat reflexed, naked; stems stoloniferous, and are as well as the footstalks glabrous; leaves ovate, obtuse, somewhat cordate at the base; spur short, conical; sepals obtuse. ♃. H. Native of Parma, also of Carniolia, Carinthia, Lusatia in bogs. V. uliginòsa, Schrad. in Rœm. et Schult. syst. p. 357.; but this plant is said by Link to be without runners. Perhaps *V. scaturiginòsa*, Wallr. sched. 1. p. 97.? Flower purplish. Petals naked.

Swamp Violet. Fl. April, May. Clt. 1823. Pl. $\frac{1}{4}$ foot.

59 V. Langsdo'rffii (Fisch. ined. D. C. prod. 1. p. 296.) stigma marginate? somewhat reflexed, obtuse; stems at length elongated, with the base oblique; leaves roundish-cordate, smoothish; stipulas ovate, setaceously acuminated, and with bristly teeth at the base; sepals ovate, rather acute; limb of lower petal somewhat rhomboidal; spur broadly saccate, very blunt. ♃. H. Native of the island of Unalaschka. Flowers blue.

Var. α, almost stemless; capsules oblong-trigonal, obtuse; seeds large, somewhat pear-shaped, brown. V. odoràta, var. in herb. Banks.

Var. β; caulescent? V. pedunculàris, Langsdorff ex Fisch. in litt.

Langsdorff's Violet. Fl. June, July. Clt. 1823. Pl. $\frac{1}{2}$ foot

60 V. mira'bilis (Lin. spec. 1326.) stigma somewhat reflexed, naked; stems rigid and are as well as footstalks villous;

leaves smooth, cordately kidney-shaped, acuminated, crenate; stipulas awl-shaped, entire; 3 large sepals, oblong-acuminate; spur cylindrical, obtuse, long; valves of capsule very much pointed; seeds pear-shaped, brown. ♃. H. Native of woods and bushy places of mountains nearly throughout the whole of the temperate and colder parts of Europe, particularly Germany and Sweden, also of Siberia. Flowers pale blue; the lower petal streaked with violaceous veins. The specific name alludes to the fruit being produced by apparently imperfect flowers, but this occurs in several other species of *Violet*.

Var. α, cauléscens (D. C. prod. 1. p. 297.) radical flowers corollate, usually abortive, cauline ones petalless, bearing seeds. Jacq. fl. aust. 1. p. 19. Dill. elth. 408. t. 303. f. 390.

Var. β, acaúlis (D. C. prod. l. c.) peduncles all radical, Gmel. fl. bad. 3. p. 519. in obs.

Wonderful Violet. Fl. July, August. Clt. 1732. Pl. 1 to 1¼ foot.

61 V. Magella'nica (Forst. in comm. Goett. 9. p. 41. t. 8.) stigma? stem very short; leaves kidney-shaped, hairy; stipulas lanceolate, acute, entire; sepals ovate-lanceolate, acuminated; spur saccate. ♃. F. Native of the Straits of Magellan. Flowers large, yellow, streaked with brown veins. Petals smooth on the inside, or the 2 lateral ones are bearded. Spur short, blunt.

Magellan Violet. Pl. ¼ foot.

62 V. macula'ta (Cav. icon. 6. p. 20. t. 539.) stigma rather flat at the apex; stem short; leaves ovate, crenate, smooth, spotted beneath; stipulas ovate, fringed; sepals lanceolate, acuminated; stamens emarginate at the apex; spur short, obtuse. ♃. F. Native of Chili as well as of the Straits of Magellan. Petals much bearded on the inside with clubbed pili, the large petal obcordate, streaked with red lines. Flowers yellow. In the specimens we have seen the leaves are cordate and the 2 lateral petals bearded.

Var. β, megaphýlla (D. C. mss. and prod. 1. p. 297.) trunk of root long, terete; leaves elliptical or roundish-ovate. ♃. F. Native in woods at Duclos Bay, in the Straits of Magellan. V. pyrolæfòlia, var. α, Poir. dict. 8. p. 636, exclusive of the country. V. glandulòsa, Dombey. herb. V. lùtea megaphýllos, Commers.

Spotted-leaved Violet. Pl. ½ foot.

63 V. microphy'lla (Poir. dict. 8. p. 636.) stigma rather flat at the apex; stem none; trunk of root very short; leaves ovate-lanceolate, crenulated, thickish, pubescent; petioles stipulate at the base; scape filiform, exceeding the leaves; sepals acute; lateral petals bearded; spur obtuse. ♃. F. Native of Patagonia on hills about Boucault Bay. V. pyrolæfòlia, Poir. dict. l. c. V. lùtea microphýllos, Commers. herb. Flowers yellow.

Small-leaved Violet. Pl. ¼ foot.

64 V. Commerso'nii (D. C. mss. and prod. 1. p. 297.) stigma —? stem very short; stipulas broad-ovate, entire? sepals oblong-lanceolate, bluntish. ♃. F. Native on the higher mountains in the Straits of Magellan, above Fort Gallant. Flowers white. Lateral petals bearded?

Commerson's Violet. Pl. ¼ foot.

65 V. ra'dicans (D. C. mss. and prod. 1. p. 297.) trunk of root horizontal, fibry; stigma marginate, short-beaked; leaves ovate-lanceolate, tapering abruptly at the base or somewhat cordate, serrated; stipulas linear, awl-shaped, with bristly serratures; sepals linear, acute; flowers minute; petals beardless? lower one smaller; spur almost none. ♃. H. Native of South Carolina. Flowers yellowish? or blue.

Rooting Violet. Fl. Ju. July. Clt. 1823. Pl. ¼ foot.

66 V. glandulífera (Wall. fl. ind. 2. p. 452.) stigma —? stems erect, very slender; leaves broad, kidney-shaped, toothed, hairy, dotted with glands underneath, the lower ones shorter than the petioles, the uppermost much longer; peduncles axillary, as long or longer than the footstalks; stipulas ovate, entire, glandular; spur very short. ♃. H. Native of the frigid regions of Gosaingsthan. Perhaps belonging to this section.

Gland-bearing Violet. Fl. July. Pl. ½ foot.

67 V. Hamiltonia'na (D. Don. fl. nep. p. 206.) plant smooth; stems creeping; leaves kidney-shaped, crenulated; stipulas lanceolate, acute, toothed; peduncles hardly longer than the leaves; sepals lanceolate, acute; spur short; throat bearded. ♃. F. Native in Nipaul. Perhaps belonging to this section.

Hamilton's Violet. Pl. ¼ foot.

68 V. arcua'ta (Blum. bijdr. ex. Schlecht. Linnæa. 1. p. 645.) stems decumbent, smooth; leaves kidney-shaped-orbicular, acutish, serrated, with the veins pubescent; stipulas ovate-oblong, ciliated, 3-nerved, somewhat serrated at the base. ♃. S. Native of Java. Flowers blue? Stigma unknown.

Arched Violet. Pl. decumbent.

69 V. inconspi'cua (Blum. l. c.) style incurved; capsules elliptically-trigonal; radical leaves hastately-cordate, crenulated, tapering a little into the petiole. ♃. S. Native of Java. Perhaps this and the preceding belong to section *Leptídium*.

Inconspicuous Violet. Pl. ¼ foot.

70 V. stria'ta (Ait. hort. kew. ed. 1. vol. 3. p. 290.) stigma papillose, rather reflexed, with a bluntish beak; stems branched, flexuous; leaves ovate-cordate, acuminated, smoothish; stipulas ovate-lanceolate, dentately-jagged; sepals ovate-lanceolate, ciliated, emarginate behind; capsules shortish, with rather obtuse valves, 3-7-seeded. Seeds roundish, rufous. ♃. H. Native in woods from Pennsylvania to Carolina. V. débilis, Mich. not of Pursh, many species are confused under V. striàta. See Schwein. amer. journ. Flowers whitish streaked with purple veins. Two lateral petals bearded.

Streaked-flowered Violet. Fl. June, July. Clt. 1772. Pl. ¾ ft.

71 V. dicho'toma (Moc. et Sesse, mex. ined. and D. C. prod. 1. p. 297.) stigma? stem dichotomous; branches spreading; leaves cordate; stipulas oblong, setosely-jagged at the top; sepals lanceolate, acute. ♃. G. Native of Mexico. Very nearly allied to *V. striàta*. Flower violaceous. V. pedunculàta, Lamb. herb.

Dichotomous-branched Violet. Pl. 1 foot.

72 V. ochroleu'ca (Schwein. amer. journ. l. c.) stigma tubular, curved a little, pubescent on the summit, stems assurgent; leaves cordate, acuminated, serrated, with the nerves rather pubescent on the under side; stipulas oblong, large, remotely toothed; sepals very narrow-lanceolate, acuminated; flowers large; lateral petals densely bearded; spur long. ♃. H. Native of North America, along the river called Dam-river, and in the Saura mountains, but according to Pursh, from Pennsylvania to Virginia in shady woods. Flowers cream-coloured, with purple veins. V. striàta, Pursh. fl. bor. amer. 1. p. 174. Nutt. gen. 1. p. 150. Perhaps only a variety of *V. striàta*.

Cream-coloured-flowered Violet. Fl. May, July. Clt. 1772. Pl. ½ foot.

73 V. Muhlenbergia'na (Ging. mss. and D. C. prod. 1. p. 297.) stems flexuous, assurgent, simple; leaves cordate-orbicular, acuminated, crenated, smooth; spur very short, obtuse, stipulas oblong, toothed; sepals subulate; lateral petals bearded; root fascicular. ♃. H. Native of Pennsylvania and New Jersey. V. uliginòsa ex Muhl. cat. no. 18, not of Schrad. nor Bess. See Schwein. l. c. Perhaps a variety of *V. dichótoma*. V. conspérsa, Reichb. Flowers blueish. Spur long, obtuse. Stigma beaked, ciliated below.

Muhlenberg's Violet. Fl. May, Jul. Clt.? Plt. ½ foot.

74 V. Lewisia'na (Ging. mss. and D. C. prod. 1. p. 298.) stems decumbent, stoloniferous; leaves kidney-shaped and cordate; stipulas large, ovate, very long and densely ciliated; flowers small, lower petal very minute, equal with the lateral

ones, which are furnished each with a white beard; spur shortish. ♃. H. Native of North America, on rocks in the Saura mountains. V. rèpens, Schwein. l. c. Flowers cream-coloured.

Lewis's Violet. Pl. decumbent.

75 V. RIVINIA'NA (Rchb. icon. t. 75. 94, 95.) stem erect, branched; leaves profoundly cordate, ovate, crenated, pubescent above; stipulas linear, fringed; peduncles elongated; superior appendages of calyx angular, permanent; capsule acute. ♃. H. Native of Europe in groves. This species differs from *V. canìna* in the stipulas being finely fringed and the leaves being profoundly cordate, as well as in the capsule being acute. Perhaps *V. sylvéstris* of Kit. and *V. cordàta* of Willd. are identical with this species. Spur curved?

Rivinus's Violet. Fl. April, Aug. Pl. $\frac{1}{4}$ foot.

76 V. CANÌNA (Lin. spec. 1324.) stigma papillose, somewhat reflexed; adult stems ascending, branched, glabrous; leaves oblong, heart-shaped; stipulas acuminated, serrated, or finely jagged; bracteas awl-shaped, entire; sepals awl-shaped; peduncles glabrous; capsules elongated, with acuminated valves; seeds pear-shaped, brown. ♃. H. Native in woods, hedges, thickets, and heathy grounds nearly throughout the whole of Europe, Japan, Persia, and the North-west coast of North America; also in the Canary Islands; common in Britain. Smith, eng. bot. t. 620. Curt. lond. fasc. 2. t. 61. fl. dan. t. 1453. V. sylvéstris, Lam. fl. fr. 2. p. 680. V. neglécta, Schm. fl. boh. no. 1. p. 51. t. 313. but not of Bieb. There are many varieties of this plant differing in height and form of leaves. Flowers blue, with purple lines in the mouth, and a greenish, white, abrupt spur.

Var. β, *mìnor* (D. C. fl. fr. suppl. p. 617.) stem very short; leaves kidney-heart-shaped, smoothish. ♃. H. Native of the Pyrenees and Swiss Alps.

Var. γ, *álba* (D. C. prod. 1. p. 298.) flowers white. ♃. H. Native of Britain. V. canìna flore albo, Dill. in Ray's synops. 364?

Var. δ, *macrántha* (D. C. prod. 1. p. 298.) flowers twice or thrice larger than in the other varieties.

Var. ε? *Japónica* (D. C. prod. 1. c.) leaves scarcely cordate at the base. ♃. H. Native of Japan near Nagasaki.

Dog Violet. Fl. Apr. Aug. Britain. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

77 V. FLAVICÓRNIS (Smith, engl. fl. 1. p. 304.) stigma —? stems ascending, woody, somewhat angular, much branched; leaves cordate, coriaceous, smooth and even; stipulas and bracteas fringed; sepals lanceolate; peduncles erect; capsules shorter and rounder than in *V. canìna*. ♃. H. Native of England in pastures, and on banks in a gravelly soil, about Mitcham, Surrey, and Norwich. Dill. in Ray's synops. 364. t. 24. f. 1. Flowers half the size of *V. canìna*, of a rather deeper blue, with a short, blunt, yellowish spur.

Yellow-spurred Violet. Fl. May, Jun. England. Pl. $\frac{1}{4}$ foot.

78 V. NEGLE'CTA (Bieb. fl. taur. 1. p. 172.) stigma —? stem erect, angular; leaves cordate, smooth, with rather scabrous margins; flowers all corollate; stipulas toothed on one side only; peduncles furnished with bracteas in the middle. ♃. H. Native of Tauria on the high mountains of Tschaturdag and Agudag, in woods. Larger than *V. canìna*, and the flowers are constantly white.

Neglected Violet. Fl. May, June. Clt. 1817. Pl. $\frac{1}{4}$ foot.

79 V. EPI'PSILA (Ledeb. in Link, enum. 1. p. 241.) stigma flat, with an incurved beak; stem trailing; leaves cordate-roundish, scarcely acuminated, glabrous; segments of calyx obtuse, drawn out at the base into bearded auricles; spur short, blunt. ♃. H. Native of Siberia. Corolla pale blue, with the 2 lateral petals slightly bearded. The name is probably derived from επι, *upon*, and ψιλικος, *naked, lightly armed*, in allusion to the sepals being bearded.

Hairy-sepalled Violet. Fl. May, Jul. Clt. 1822. Pl. $\frac{1}{4}$ foot.

80 V. PALMA'RIS (Hamilt. mss. ined. and D. C. prod. 1 p. 298. D. Don, prod. p. 205.) stigma —? stems branched; branches weak, sarmentose; leaves cordate, acuminated, crenated, rather pilose, on long petioles; stipulas linear-lanceolate, somewhat serrated; sepals lanceolate, acute, glabrous, bidentate at the base; petals elliptical, puberulous above; spur saccate. ♃. F. Native of Nipaul at Narainhetty, and near Bheempedi. Flowers yellow.

Hand-high Violet. Fl. Apr. Dec. Clt. 1824. Pl. $\frac{1}{2}$ foot.

81 V. ADU'NCA (Smith, in Rees' cycl.) stigma —? stem simple, ascending; leaves somewhat heart-shaped, obtuse, crenate, downy, dotted; stipulas fringed; peduncles longer than the leaves; nectaries hooked; sepals much drawn out at the base; spur long, recurved; two lateral petals downy at the base. ♃. H. Native of North America on the west coast. Habit of *V. canìna*, and the whole herb is minutely speckled like it, but is easily distinguished by the strongly recurved spur, as well as in the whole plant being more or less downy. Flowers blue?

Hooked-spurred Violet. Pl. $\frac{1}{4}$ foot.

82 V. DIFFU'SA (Ging. mss. and D. C. prod. 1. p. 298.) stigma somewhat capitate, with a very short, blunt, naked, beak; stems simple, decumbent; leaves ovate, crenate, tapering into the footstalks, with the nerves and margins pilose; stipulas lanceolate, toothed, ciliated; sepals lanceolate, acute; nectaries broad at the base, emarginate above on the outside. ♃. F. Native of Nipaul. Very like *V. Nuttállii* of Pursh. Flowers yellow.

Diffuse Violet. Pl. $\frac{1}{4}$ foot.

83 V. PURPURA'SCENS (Schmidt, fl. boh. ex Spreng. syst. 1. p. 799.) stem procumbent; leaves reniform, cordate, bluntish; calyx acute; capsule pubescent; spur short, blunt. ♃. H. Native of Bohemia. Flowers purplish. Stigma unknown.

Purplish Violet. Pl. procumbent.

84 V. FRA'GRANS (Sieb. ex Spreng. syst. 1. p. 799.) stem simple, 1-flowered; leaves spatulate-oblong, stalked, nerveless, rather villous; sepals acute; spur short. ♃. H. Native of Crete. Flowers blue? sweet-scented. Stigma unknown.

Fragrant Violet. Pl. $\frac{1}{4}$ foot.

85 V. ROSTRA'TA (Pursh. fl. amer. sept. 1. p. 174.) stigma beaked; beak somewhat erect, acute, naked; stems simple, decumbent; leaves cordate, glabrous, serrated; stipulas lanceolate, awl-shaped, serrately-ciliated, glabrous; spur straight, obtuse, longer than the corolla. ♃. H. Native on shady rocks near Easttown, Pennsylvania, and on the Alleghany mountains. Flowers pale-blue, externally purple; petals all beardless; stigma clavate, without a beak. (Nutt.) Peduncles long.

Beaked-spurred Violet. Fl. May, June. Pl. $\frac{1}{4}$ foot.

86 V. DE'BILIS (Pursh, fl. amer. sept. 1. p. 174. not of Michx.) stigma papillose, recurved, beaked; stems almost simple, decumbent; leaves reniform-cordate, acutish, smoothish, serrulate or crenate; stipulas lanceolate, serrate-ciliated; sepals lanceolate, glabrous; petals oblong, 2 lateral ones bearded; spur long. ♃. H. Native in low grounds from Pennsylvania to Carolina. V. canìna, Walt. fl. carol. 219. Flower small, pale-blue.

Weak-stemmed Violet. Fl. May, July. Clt. 1820. Pl. $\frac{1}{4}$ foot.

87 V. ARENA'RIA (D. C. fl. fr. 4. p. 806.) glaucous, pubescent; stigma papillose, somewhat recurved; stems simple, rather erect; leaves cordate-roundish; stipulas erect, ciliately-serrated; sepals lanceolate-oblong, acute; capsules turbinately-elliptical, obtuse, pubescent; seeds ovate, chesnut-coloured. ♃. H. Native of sandy places in Vallais, Alps of Piedmont, Provence, about Moscow, and in the Caucasus. V. Allìoni, Pio. diss. p. 20. t. 1. f. 2. V. glaúca, Bieb. suppl. p. 165? V. rupéstris, Schm. fl. boh. cent. 3. t. 1. p. 50. t. 312.? V. pusílla, Schleich. in litt. V. lívida, Kit. V. nummularifòlia, Schleich. Plant glaucous. Flowers blue. Spur obtuse.

Var. β, aprìca (D. C. prod. 1. p. 298.) very small, and almost stemless. ♃. H. Native on hills at Lobenheim and Benstadt. V. hírta aprìca, Spreng. nov. prov. 43. no. 97.

Sand Violet. Fl. May, July. Clt. 1823. Pl. ¼ foot.

88 V. sarmentòsa (Bieb. fl. taur. 1. p. 172.) hairy; stigma? stem filiform, undivided, procumbent; leaves roundish, hairy, crenate; stipulas small, toothed; peduncles shorter than the leaves; sepals awl-shaped. ♃. H. Native of Caucasus. V. arenària γ sarmentòsa, D. C. prod. 1. p. 298. Flowers blue. Spur obtuse, short.

Sarmentose Violet. Fl. May, July. Clt. Pl. decumbent.

89 V. rupe'stris (Schmidt. fl. boh. ex Spreng. syst. 1. p. 799.) stem simple, pruinose, pubescent; leaves cordate-roundish, smoothish, crenulated; stipulas lanceolate, serrated. ♃. H. Native of Bohemia. Flowers blue. Stigma unknown.

Rock Violet. Fl. May, July. Pl. ¼ foot.

90 V. pu'mila (Vill. dauph. 2. p. 266. cat. strasb. p. 288. t. 5.) smoothish; stigma papillose, somewhat reflexed; stems branched, diffuse, procumbent; leaves ovate-lanceolate; footstalks marginate; stipulas ovate-lanceolate, toothed or cut; spur cylindrical, somewhat recurved at the apex, obtuse, yellowish, scarcely the length of sepals; valves of capsule rather erect, glabrous, truncate at apex; seeds ovate, of a black-chesnut colour. ♃. H. Native of Dauphiny in Vascony; on dry heaths in Germany, Switzerland, and Piedmont. Flowers pale-blue, with a hairy throat.

Var. α, lancifòlia (D. C. prod. 1. p. 299.) leaves lanceolate, gradually tapering into the footstalk at the base. V. lancifòlia, Thore, chlor. land. 357.

Var. β, ericetòrum (D. C. prod. 1. c.) leaves truncate at the base or somewhat cordate, but tapering abruptly into the footstalk. Native of turfy heaths. V. ericetòrum, Schrad. ined.

Var. γ, littoràlis (D. C. prod. 1. c.) stem elongated; leaves cordate, ovate; flowers apetalous. Native on the coast of the Baltic sea near Warnemunde. V. littoràlis, Spreng. nov. prov. p. 43.

Dwarfish Violet. Fl. May, June. Clt. 1818. Pl. ¼ foot.

91 V. Schmidtia'na (Rœm. et Schult. syst. 5. p. 363.) stigma hooked; leaves cordate, acuminate, rather crenate; bracteas approximating the flower; lower petal truncate. ♃. H. Native of Bohemia and Austria. V. nummulàrium, Schmidt. boh. no. 246. Stoloniferous. Spur short. Flowers blue.

Schmidt's Violet. Fl. May, Jul. Clt.? Pl. ¼ foot.

92 V. monta'na (Lin. spec. 1325.) smooth; stigma papillose, somewhat reflexed; stems simple, erect; lower leaves cordate, upper ones ovate, acute; footstalks marginate; stipulas oblong, toothed, or cut on one side; 2 lateral petals bearded; spur conical, truncate, erect, greenish, shorter than the acute sepals; valves of capsule arched, rather acute; seeds ovate, of a chesnut-colour. ♃. H. Native of the temperate parts of Europe and Siberia, particularly Lapland, Austria, Germany, and on mount Baldo. Sims, bot. mag. 1595.—Riv. t. 119.—Morr. hist. 2. p. 475. sect. 5. t. 7. f. 7. Flowers pale-blue.

Var. α, stricta (D. C. prod. 1. p. 299.) stems strict; lower leaves cordate, smooth. V. stricta, Horn. hafn. V. Hornemanniàna, Rœm. et Schult? V. montàna α, fl. fr. 4. p. 807. Native of mountainous meadows and thickets.

Var. β, pubéscens (D. C. prod. 1. c.) stems strict; lower leaves cordate, pubescent. V. erécta, Gerard. in litt.

Mountain Violet. Fl. May, July. Clt. 1683. Pl. 1 foot.

93 V. persicifòlia (Roth. Hoffm. fl. germ. 311.) puberulous; stigma papillose, somewhat reflexed; stem simple, erect, rather flexuous; leaves oblong-lanceolate, obtuse, serrated, smoothish, running into the petiole at the base; stipulas large, cut; sepals ovate-lanceolate; spur short, blunt; 2 lateral petals bearded. ♃. H. Native of Germany and Siberia. Flowers blue. V. montàna β, persicifòlia, D. C. prod. 1. p. 299. V. praténsis. Mer. et Koch. This species differs from *V. montàna*, in the leaves always tapering gradually into the petioles, not cordate at the base.

Peach-leaved Violet. Fl. May, July. Clt. 1683. Pl. 1 ft.

94 V. la'ctea (Smith, fl. brit. 1. p. 247.) smooth; stigma papillose, somewhat reflexed; stems ascending, simple; leaves ovate-lanceolate, bluntish, lower ones small, ovate; footstalks marginate; stipulas jagged; sepals long, linear. ♃. H. Native on mountainous boggy heaths in Switzerland, France, and Britain; on the sides of bogs on Waterdown forest, near Tunbridge, at Pendarvis, Cornwall; and in hilly pastures near Peebles, Scotland. Smith, engl. bot. t. 445. V. Lusitánica, Brot. phyt. p. 39. t. 17. V. montàna γ, láctea, D. C. prod. 1. p. 299. V. stagnìna, Kit. Flowers milk-white, or of a very pale-blue, with purplish streaks. Two lateral petals bearded.

Milk-coloured-flowered Violet. Fl. May, June. Britain. Pl. ¼ foot.

95 V. Ru'ppii (All. pedm. 2. no. 1646. t. 26.) smooth; stigma papillose, somewhat reflexed; stems procumbent; lower leaves cordate, upper ones lanceolate; footstalks marginate; stipulas jagged; sepals lanceolate, acute. ♃. H. Native of the Alps of Piedmont. Lod. bot. cab. t. 686. V. cordàta, Willd.? V. Brossonetiàna, Rœm. et Schult. Flowers pale-blue or white.

Ruppius's Violet. Fl. May, June. Clt. 1822. Pl. procumbent.

96 V. lancifòlia (Besser, gal. no. 256.) stem erectish; leaves cordate-oblong, crenulated, rather pilose, dotted; stipulas lanceolate, toothed; sepals acute; spur emarginate, 2-lobed; petals bearded. ♃. H. Native of Podolia. V. floribúnda, Fisch, mss.? Flowers blue. Stigma unknown.

Lance-leaved Violet. Pl. ¼ foot.

†† *Stems shrubby.*

97 V. decu'mbens (Lin. fil. suppl. 397.) stigma hooked, naked; stems much branched, procumbent; leaves linear, very narrow, entire, crowded; stipulas linear-awl-shaped, adhering; spur tubular, obtuse, straight, scarcely the length of sepals. ♃. G. Native of the Cape of Good Hope on Hottentot mountains. Flowers blue, with a pale-green spur.

Decumbent Violet. Fl. June, July. Clt. 1819. Shrub decumbent.

98 V. scrotifórmis (D. C. mss. and prod. 1. p. 299.) stigma? stems branched; leaves linear, bluntish, entire; lower ones remote; stipulas awl-shaped, adhering; spur saccate; auricles scarcely exceeding the sepals. ♄. G. Native of the Cape of Good Hope. Flowers pale-blue.

Scrotum-formed Violet. Fl. June, July. Shrub ½ foot.

99 V. arbore'scens (Lin. spec. 1325.) stigma hooked, naked; stems branched, erect, roundish, pubescent; leaves lanceolate, tapering to the base; stipulas oblong, adhering; spur cucullate, obtuse, scarcely exceeding the auricles of the calyx; valves of capsule boat-shaped, obtuse, few-seeded; seeds ovate, and before the opening of the capsule they are of a darkish-purple, afterwards quite black, with white caruncles. ♄. G. Native among stones and in the fissures of rocks and amongst gravel, in the south of Europe and north of Africa. Flowers pale blue.

Var. α, linearifòlia (D. C. prod. 1. p. 299.) covered with pruinose papillæ; leaves long, linear, entire. Native of Corsica.

Var. β, integrifòlia (D. C. prod. 1. c.) leaves lanceolate, entire. Native in the sand on the shores of the Mediterranean, and on rocks in Spain. V. Hispánica frúticans, Barrel. icon. t. 568.

Arborescent Violet. Fl. April, May. Clt. 1779. Shrub 1½ ft.

100 V. suberòsa (Desf. atl. 2. p. 313.) stigma hooked, naked; stems branched; branches usually decumbent, tubercled; leaves narrow-lanceolate, serrated, smooth, tapering into the petiole at the base, crowded on the tops of the branches; sti-

pulas awl-shaped, entire; spur obtuse, very short. ♄. G. Native of the north of Africa in fissures of rocks. V. arboréscens γ serratifòlia, D. C. prod. 1. p. 299. Flowers small, pale-blue, sometimes white.

Var. β, *latifòlia;* leaves rhomboidal-spatulate, remotely-toothed. ♄. G. V. arboréscens δ, D. C. prod. 1. p. 299.

Corky Violet. Fl. April, May. Shrub decumbent.

101 V. arbòrea (Forsk. fl. yem. CXX.) stigma? stem round at the base, angular at the top, erect, simple; leaves oblong, pointed at both ends, remotely toothed; stipulas awl-shaped, entire; spur very blunt, small. ♄. F. Native of Arabia in Yemen. Perhaps the same as *V. suberòsa*. Flowers probably pale-blue.

Tree Violet. Fl. April, June. Shrub 1½ foot.

Sect. II. Dischi'dium (from δις, *dis*, twice, σχιζω, *schizo*, to cut; in allusion to the 2-lobed stigma.) Ging. mss. D. C. prod. 1. p. 300. Stigmas without a beak, more or less 2-lobed at the apex, with a little hole situated between the lobes. Style tapering from the top to the bottom. Seeds oblong, approximate. Torus flattish. Capsules usually trigonal, few-seeded. Seminal leaves usually roundish. Small stemless plants, or with very short stems. Petals of all probably smooth.

102 V. pygmæ'a (Poir. dict. 8. p. 630.) stigma 2-lobed? lobes diverging; trunk of root thick, perpendicular; leaves much crowded, linear, acute, sessile, with scabrous margins; sepals linear; spur shortish; petals apiculate, smooth. ♃. H. Native on the Andes of Peru in the coldest places. V. alpìna, Ruiz, et Pavon, in herb. Deless. ined. Flowers apparently purple.

Pygmy Violet. Pl. 1 inch.

103 V. coty'ledon (Ging. mss. and D. C. prod. 1. p. 300.) stigma bifid; lobes reflexed; trunk of root thick, twisted; leaves much crowded, rhomb-spatulate, tapering at the base into the footstalk a long way, smooth, with cartilaginous entire margins; sepals linear; spur very short. ♃. G. Native on high mountains in Chili. Capsule trigonal, oblong, with the peduncles spirally twisted at the top; seeds ovate, 9-10, dark. Flowers probably purple.

Cotyledon Violet. Pl. ¼ foot.

104 V. tridenta'ta (Menzies, ined. and D. C. prod. 1. p. 300.) stigma? stems much branched, procumbent; leaves crowded, obovate-wedge-shaped, 3-toothed at the apex, coriaceous, smooth; sepals ovate, obtuse; spur very short. ♄. F. Native of Statenland on the peaks of mountains among snow. A tufted plant, more resembling *A. saxífraga* than *A. vìola*.

Three-toothed-leaved Violet. Shrub ¼ foot.

105 V. Wallichia'na (Ging. mss. and D. C. prod. 1. p. 300.) stigma bifid? lobes lamellated, divaricating; leaves reniform or cordate, hairy on the nerves; stipulas lanceolate, denticulated; sepals awl-shaped; spur awl-shaped, length of petals. ♃. H. Native of Nipaul towards the summit of Sheopore. Habit of *V. biflòra*. Flowers like those of *V. rostràta*. V. renifórmis, Wall. fl. ind. 2. p. 451. Stem beset with a few shining hairs. Spur jointed, descending; nectary elongated, capillary; lower petal obovate-wedge-shaped, apiculated. Flowers small, yellow, sweet-scented.

Wallich's Violet. Pl. 2 inches.

106 V. biflòra (Lin. spec. 1326.) stem erect, about 2-flowered; stigma bifid; lobes thick, diverging; leaves reniform, serrated, smooth; stipulas ovate; sepals linear; petals smooth; spur very short; seeds round-ovoid, brownish, obscurely dotted. ♃. H. Native on humid mountains almost throughout the whole of Europe, Siberia, and the western coast of North America. Sims, bot. mag. 2089. Fl. dan. t. 46.—Pluk. alm. t. 233. f. 7. and t. 234. f. 1. Flowers small, yellow, with the lip streaked with black. Roots creeping. There is a variety of this plant bearing only one flower on each stem. See J. Bauh. hist. 3. p. 545. f. 1.

Two-flowered Violet. Fl. April, May. Clt. 1752. Pl. 3 inches.

107 V. Caleya'na; caulescent; stems slender, spotted; leaves reniform-cordate, or cordate, mucronulate, crenated; stipulas lanceolate, acute, with one tooth on each side at the base; peduncles longer than the leaves; sepals lanceolate, entire, acute; petals smooth; spur a hollow pouch. ♃. F. Native of New Holland. Habit of *V. biflòra* and the flowers are about the same size. Stigma unknown.

Caley's Violet. Pl. ¼ to ½ foot.

Sect. III. Chamæmela'nium (from χαμαι, *chamai*, dwarf, and μελας μελανος, *melas melanos*, black, in opposition to the next section.) Ging. mss. and D. C. prod. 1. p. 300. Stigma round, capitate, ornamented on both sides below with a fascicle of hairs, and with a minute sublateral hole at the tip. Style compressed, clavate. Stamens oblong, approximate. Torus flattish. Capsules usually trigonal. Seminal leaves usually roundish. Two lateral petals bearded at the base.

108 V. tripartì'ta (Ell. sket. 1. p. 302.) leaves 3-5, lobed, pubescent; lobes lanceolate-toothed; stipulas ovate, entire or serrulated; sepals acute. ♃. H. Native of Georgia near Athens. Flowers yellow, on long slender peduncles. Perhaps V. hastàta var. β villòsa of Le Conte.

Three-parted-leaved Violet. Fl. May, July. Clt. 1823. Pl. ¼ foot.

109 V. Nutta'llii (Pursh, fl. amer. sept. 1. p. 174.) smooth; stem simple, erectish; leaves lanceolate-ovate, entire or obscurely toothed, tapering down the footstalk, with the nerves and margins pubescent; stipulas long, linear-lanceolate, entire; sepals lanceolate, acute, entire behind; lateral petals bearded. ♃. H. Native on the banks of the Missouri near the confluence of Rock River. Flowers small, yellow, but purplish on the under side. This is the only species of Violet on the plains of the Missouri from the confluence of the river Platte to Fort Mandan.

Nuttall's Violet. Fl. May, June. Clt. 1812. Pl. ½ foot.

110 V. præmo'rsa (Doug. mss. in bot. reg. 1254.) stemless; peduncles longer than the leaves; leaves ovate-oblong, hairy, entire; stipulas lanceolate, quite entire; sepals linear, pilose. ♃. H. Native of North America on the banks of the river Columbia, and the plains of the river Aguilar in California. Flowers yellow; petals beardless? the lower one streaked at the base. Root thick, fleshy, præmorse. Like *V. Nuttállii*.

Præmorse-rooted Violet. Fl. April, May. Clt. 1828. Pl. ¼ ft.

111 V. hasta'ta (Mich. fl. bor. amer. 2. p. 149.) smooth; stem simple, erect; leaves cordate-ovate, rarely halbert-shaped, serrated, smooth; stipulas small, awl-shaped, toothed; sepals lanceolate, acute, sub-dentate; spur very short. ♃. H. Native of North America in Georgia near Athens, but according to Pursh. on high mountains from Pennsylvania to Carolina. Elliot. sket. p. 151. Flowers yellow, purplish on the under side. Leaves usually marked with discoloured dots.

Var. β, *glabérrima* (D. C. prod. 1. p. 300.) leaves rhomboidal-lanceolate. ♃. H. Native of North Carolina in woods and on hills.

Halbert-leaved Violet. Fl. May, Ju. Clt. 1823. Pl. ¼ to ½ ft.

112 V. Canade'nsis (Lin. spec. 1326.) smooth; leaves ovate, cordate, crenated, acuminated, with downy nerves; stipulas lanceolate, entire, membranous; sepals lanceolate, awl-shaped, entire; petals entire; spur very short, somewhat saccate; capsules oblong, trigonal, very blunt; seeds roundish-ovate, chesnut-coloured. ♃. H. Native of North America on mountains in shady woods, in rich moist situations from Canada to Carolina. Flowers outside purplish-blue, inside white and elegantly veined, sweet-scented. Stigma a little pubescent.

Var. α; stipulas narrow-lanceolate. V. Canadénsis, Ell. sket. p. 301.

Var. β; stipulas ovate-lanceolate, ciliated; bracteas ciliated in the middle. V. albiflòra, Link. enum. 1. p. 241. Flowers pure white.

Canadian Violet. Fl. June. Clt. 1783. Pl. 1 to 2 feet.

113 V. pube'scens (Ait. hort. kew. ed. 1. v. 3. p. 290.) villous; stems simple, rather decumbent; leaves cordate, acuminated, serrated; stipulas large, ovate, serrated at the top or entire; sepals oblong-lanceolate; spur very short, somewhat saccate; ovary smooth. ♃. H. Native of North America in shady woods, among rocks, particularly limestone rocks, from New York to Virginia, abundant about Philadelphia. Flowers yellow. Stigma with two tufts of hairs. Sweet, fl. gard. t. 223.

Pubescent Violet. Fl. June, July. Clt. 1772. Pl. ¼ foot.

114 V. erioca'rpa (Schwein, amer. journ. 5. no. 1.) roughish; stems assurgent, branched; leaves cordate, acute, sometimes reniform; stipulas ovate-serrate; spur very short, somewhat saccate; fruit densely villous. ♃. H. Native of North Carolina. Sweet, fl. gard. t. 102. V. pubéscens β. Ker. bot. reg. 390. Flowers yellow. This plant differs from *V. Pennsylvánica*, in the whole plant being villous, not pubescent, as well as in the stem being branched. Stigma with 2 lateral tufts of hairs.

Woolly-fruited Violet. Fl. June, July. Clt. 1823. Pl. ¼ ft.

115 V. Pennsylva'nica (Mich. fl. bor. amer. 2. p. 149.) pubescent; stem simple, erect; leaves cordate, acuminated, serrated; stipulas oblong-ovate, serrated at the apex or entire; spur short; ovary densely villous. ♃. H. Native of North America, abundant about Philadelphia. Flowers yellow. Stigma ornamented with 2 lateral tufts of hairs.

Pennsylvanian Violet. Fl. June, July. Clt. 1772. Pl. ¼ ft.

116 V. uniflòra (Lin. spec. 1327.) radical leaves reniform, stem ones ovate, acuminated, deeply-toothed, pubescent; stipulas lanceolate-awl-shaped, furnished with glandular teeth; sepals ovate: spur broad, short, saccate. ♃. H. Native of Siberia in boggy places.—Gmel. fl. sib. 4. p. 101. t. 48. f. 5. Flowers yellow. Leaves large, two on the top of each stem.

One-flowered Violet. Fl. June, July. Clt. 1774. Pl. ½ foot.

117 V. macro'ceras (Ledeb. icon. pl. fl. ross. alt. ill. t. 219.) stemless, smooth; leaves cordate, crenate-serrated, acute; peduncles almost equal in length to the leaves; sepals bluntish, smooth, shorter than the thick, cylindrical spur; two lateral petals bearded; stigma bearded. ♃. H. Native of Siberia in humid places on the banks of rivulets near Buchtorninsk. Root thick, articulated. Flowers violet, sweet-scented. Like *V. Kamtschática* of Ging. We have placed this plant in this section on account of its having a bearded stigma.

Long-horned Violet. Fl. April, May. Pl. ¼ foot.

Sect. IV. Mela'nium (a name given to *V. tricolor* by some old botanists; it is derived from μελας μελανος, *melas melanos*, black; because of the dark colour of the flowers of some of the varieties of that plant.) D. C. mss. and prod. 1. p. 301.—Jàcea, D. C. fl. fr. Violæ tricolòres of old authors. Stigma urceolate, ornamented on both sides below, with a fascicle of hairs, and furnished with a large aperture with a lip at the bottom. Style tapering from the top to the bottom. Stamens triangular, connected. Torus concave, and therefore the ovary appears half inferior. Capsules obsoletely 6-sided. Seeds very numerous, 40-60. Seminal leaves usually ovate. The 3 lower petals have bearded claws. Stipulas all toothed or bristly-serrated.

118 V. nummulariifòlia (All. ped. no. 1640. t. 9. f. 4.) very smooth; stems branched, decumbent; leaves roundish, entire; stipulas lanceolate, 3-cleft or bristly-toothed; sepals oblong; spur shortish. ♃. H. Native on rocks in the Alps of Piedmont and Dauphiny. D. C. fl. fr. 4. p. 804. Flowers blue, with darker stripes.

Var. β, *mínima* (D. C. prod. 1. p. 301.) ♃. H. Native of the Alps of Corsica.—Bocc. mus. 2. p. 163. t. 127.

Money-wort-leaved Violet or Pansy. Fl. May, June. Clt. 1820. Pl. ¼ foot.

119 V. alpi'na (Jacq. obs. 1. p. 21. t. 11.) stem very short; leaves tufted, ovate-roundish, somewhat cordate, crenated, on long footstalks; stipulas lanceolate, scarcely toothed, adhering; sepals oblong, bluntish; spur tubular, blunt, shorter than the sepals. ♃. H. Native on the summits of the loftiest mountains of Austria, and the Carpathian mountains. Flowers dark-blue, with darker stripes.

Alpine Violet or Pansy. Fl. July, Aug. Clt. 1823. Pl. ¼ ft.

120 V. cornu'ta (Lin. spec. 1325.) root fibrous, stems ascending, diffuse; leaves cordate-ovate, crenated, ciliated; stipulas obliquely-cordate, toothed, ciliated; sepals awl-shaped; spur awl-shaped, elongated and abrupt at the base. ♃. H. Native of Switzerland and the Pyrenees, and on mount Atlas. D. C. fl. fr. 4. p. 810. Curt. bot. mag. t. 791. A tufted plant, with pale-blue flowers.

Horned Violet or Pansy. Fl. May, July. Clt. 1776. Pl. ½ ft.

121 V. Ceni'sia (All. ped. no. 1641.) trunk of root somewhat fusiform, woody; stems diffuse, procumbent, undivided; leaves spatulate-ovate, entire; stipulas obovate, stalked, undivided; calyxes pubescent; spur tubular, awl-shaped, acute, thrice as long as the hind lobes of the calyx. ♃. H. Native on rocks in the Alps of Switzerland, Piedmont, and Provence. Flowers blue.

Var. α, *ovatifòlia* (D. C. prod. 1. p. 301.) leaves all oval, hardly pubescent. V. Cenísia, All. fl. ped. t. 22. f. 6. D. C. fl. fr. 4. p. 805.

Var. β, *diversifòlia* (D. C. prod. l. c.) lower leaves ovate, upper ones oblong, tomentosely-pubescent. ♃. H. Native of the Pyrenees. V. Cenísia, Lapeyr. abr. Like *V. Cheiranthifòlia*.

Mount-Cenis Violet or Pansy. Fl. June, July. Clt. 1759. Pl. ¼ foot.

122 V. Valde'ria (All. ped. 2. p. 98. t. 24. f. 3.) trunk of root fusiform; stems diffuse, procumbent, undivided; leaves all oblong and rather hispid and sinuated; stipulas palmate; spur tubular, slender, longer than the calyx. ♃. H. Native of Piedmont. Flowers purple. Perhaps only a variety of the last.

Valderian Violet or Pansy. Fl. Ju. Jul. Clt. 1759. Pl. ¼ ft.

123 V. minu'ta (Bieb. fl. taur. 1. p. 173.) stems simple, one-flowered, flaccid; leaves roundish, crenated; stipulas ovate, entire, ciliated; spur scarcely the length of sepals. ♃. H. Native of Iberia. Perhaps a variety of *V. alpìna*. Flowers blue, about the size of those of *V. odórata*.

Minute-flowered Violet, or Pansy. Pl. 1 inch.

124 V. gra'cilis (Smith, fl. græc. t. 222.) root creeping, stem branched, angular, diffuse; leaves lanceolate, somewhat crenate, the upper ones crowded, opposite, either smooth or downy; stipulas deeply 3-cleft; spur slender, much longer than the auricles of the calyx, which are toothed. ♃. H. Native on mount Etna. V. calcaràta, var. ε. Æthnénsis, D. C. prod. 1. p. 302.—Cup. pamph. ed. bonon. t. 138. Bracteas toothed at the base in a hastate manner. Flowers about the size of *V. lùtea*, of a dull purplish blue, occasionally yellow.

Slender Violet, or Pansy. Fl. June, July. Pl. ½ foot.

125 V. cheiranthifo'lia (H. B. pl. æqu. 1. p. 111. t. 32.) velvety; root thick, woody; stems ascending; leaves lanceolate, quite entire, tapering into the footstalk; stipulas linear; spur tubular, rather acute, scarcely the length of the sepals. ♃. G. Native of the Canary Islands, at the top of the mountain called Pico-Teyde. Flowers violaceous.

Cheiranthus-leaved Violet, or Pansy. Pl. ½ foot.

126 V. CALCARA'TA (Lin. spec. 1325.) root fibrous, diffuse; stems short, simple, tufted; leaves spatulate-roundish, or elongated, crenate; stipulas palmatifid, or trifid; sepals oblong, glandularly-denticulated; spur awl-shaped, longer than the calyx; nectary scarcely twice the length of stamens; seeds ovate. 4. H. Native in pastures on the higher mountains from Austria to Provence, D. C. fl. fr. 4. p. 810. A very variable species.

Var. β, Hallèri (D. C. prod. 1. c.) stem short; stipulas cut, hardly ciliated; flowers large blue.—Hall. hist. no. 566, var. *a*. p. 243. t. 17. 4. H. Native with the last.

Var. γ, albiflòra (D. C. prod. 1. c.) stem short; stipulas cut, scarcely ciliated; flowers large, white. 4. H. Native of the Alps of Savoy.—Hall. hist. no. 566. var. *β*, III.

Var. δ, Bertolònii (D. C. prod. 1. p. 302.) stems elongated; lower leaves ovate, upper ones elongated, and are, as well as palmatifid stipulas, smoothish. 4. H. Native in the Apennines, about Genoa, on the top of mount Scaggia. V. Bertolònii, Pio. diss. 34. t. 3. f. 2.—Cup. pamph. ed. bonon. t. 99. Flowers large, purple.

Var. ζ? decipiens (D. C. prod. 1. c.) stems elongated; leaves and stipulas hispid; sepals lanceolate, rather hispid. Flowers blue? 4. H. Native in the Eastern Pyrenees. V. hìspida, Lapey. abr. 123.

Spurred Violet, or Pansy. Fl. March, July. Clt. 1752. Pl. ¼ to ½ foot.

127 V. VILLARSIA'NA (Rœm. et Schult. syst. 5. p. 388.) pubescent; stem short; leaves radical, primordial ones ovate-rounded, the rest of the lower ones lanceolate, upper ones oblong and linear-lanceolate; stipulas pinnatifid; lower petal oblique, truncate. 4. H. V. calcaràta, Vill. dauph. 2. p. 666. Flowers blue. Spur awl-shaped, longer than the sepals.

Villars's Violet. Fl. May, July. Pl. ¼ foot.

128 V. Zo'YSII (Wulf. in Jacq. coll. 4. p. 295. t. 11. f. 1.) root fibrous; stem quite simple, hardly so long as the footstalks; leaves ovate, crenate, smooth; stipulas elliptical-lanceolate, undivided, nearly entire; spur thrice as long as the auricles of the calyx. 4. H. Native of the Alps of Carinthia and Carniola. This plant is easily distinguished from *V. calcaràta*, by the stipulas never being lobed, although in some instances there will be found a slight lateral notch. The plant, moreover, is smaller, perfectly smooth, and green, never glaucous, and the spur rather thicker. Petals large, yellow, with black lines at the bottom, sometimes partly tinged with blue.

Baron de Zoys's Pansy. Fl. March, July. Clt. Pl. ¼ foot.

129 V. ORE'ADES (Bieb. fl. taur. suppl. 167.) stem short; leaves oblong; stipulas pinnatifid; segments obtuse; sepals acute, denticulated; spur tubular, obtuse, length of the calyx; 2 lateral petals bearded. 4. H. Native of Tauria, on the tops of mountains. Perhaps merely a variety of *V. amœ'na?* Flowers purple or yellow.

Oreades Violet, or Pansy. Fl. May, July. Clt. 1818. Pl. ¼ ft.

130 V. AMŒ'NA (Sym. syn. ex Smith, bot. no. 1287. in a note) stem short; leaves round; stipulas pinnatifid; lobes obtuse; sepals ovate-lanceolate, acute, entire; spur tubular, obtuse, length of the calyx. 4. H. Native on mountains in Scotland. Flowers very large, purple; petals roundish.

Pleasing Violet, or Pansy. Fl. June, July. Scotland. Pl. ¼ to ½ foot.

131 V. ALTAI'CA (Ker. bot. reg. t. 54.) stem short; leaves oval; stipulas cuneiform, with acute teeth; sepals acute, denticulated; spur very short, scarcely so long as the appendages of the sepals. 4. H. Native on the Altaian mountains. Sims, bot. mag. t. 1776. V. grandiflòra, Sievers. V. Pallásii and V. chrysántha, Fisch. cat. hort. gorenk. Root creeping, slender, hard. Flowers large, yellow. Stigma urceolate.

Var. β, purpùrea, (D. C. prod. 1. p. 302.) Flowers large, purple. V. Altaìca purpùrea. Fisch in litt.

Altaian Yellow Violet, or Pansy. Fl. March, June. Clt. 1805. Pl. ¼ foot.

132 V. GRANDIFLÒRA (Lin. mant. 120.) stems angular, unbranched, tufted; leaves ovate-oblong, crenate; stipulas pinnatifid, somewhat lyrate; bracteas minute, with a tooth on each side at the base; spur twice the length of the hind lobes of the calyx; sepals much toothed, and dilated at the base; spur cylindrical, slightly curved. 4. H. Native of Siberia? The whole plant is like *V. lùtea*, but every part is twice the size, and the stipulas are very distinct, being pinnatifid in their lower half only, not palmate. Flowers large, yellow, with the two lateral sepals bearded at the base, and marked like the lip with a few black lines. This is probably the *V. chrysántha* of Fisch. in litt.

Great-flowered Violet, or Pansy. Fl. April, July. Clt. Pl. ½ foot.

133 V. SUDE'TICA (Willd. enum. suppl. 12.) root fibrous, diffuse; stems almost simple; leaves ovate-oblong; stipulas palmatifid, with entire lobes; sepals lanceolate; petals wedge-shaped, crenated, with long distinct claws; spur awl-shaped, acutish, stretched out, longer than the ears of the sepals; seeds ovate. 4. H. Native in meadows on the Alps and mountains of Europe, particularly Germany. V. grandiflòra, D. C. fl. fr. 5. p. 620. and almost of all other authors. V. saxátilis, Schmidt, fl. boh. p. 233. Flowers large, yellow.

Var. β, calaminària (D. C. prod. 1. p. 303.) stems ascending; leaves rather remote, ovate; flowers yellow. 4. H. Native in dry pastures, and among reeds near water. V. lùtea, D. C. fl. fr. 5. p. 619. exclusive of the synonymes.

Var. γ? mèdia (D. C. prod. 1. c.) stems elongated, erectish; leaves remote; flowers purple. 4. H. Native on the mountains of Jura and Auvergne.

Var. δ, ramòsior (D. C. prod. 1. c.) stems branched; leaves rather remote, ciliated; flowers 3-coloured. 4. H. Native about Verviers, (Lejeune.) V. Rothomagénsis, var. D. C. fl. fr. 5. p. 619. Perhaps a variety of *V. tricolor*, or perhaps a known species.

German Violet, or Pansy. Fl. May, August. Clt. 1805. Pl. ¼ to ½ foot.

134 V. LU'TEA (Huds. ed. 1. p. 331.) root fibrous, slender; stems triangular, simple; leaves ovate-oblong, crenate, fringed; stipulas palmatifid; sepals lanceolate, acute; petals wedge-shaped, with long distinct claws; spur the length of calyx. 4. H. Native in moist mountainous pastures in Wales, north of England, and in Scotland. Smith, eng. bot. 721. V. grandiflòra, Huds. ed. 2. p. 380. Flowers yellow, larger than those of *V. tricolor*, with blackish, branched, radiating lines; the lateral petals are palest, the two upper ones sometimes purple. When all are purple, as sometimes happens, Hooker says this is the *V. amœ'na* of authors. All the petals are bearded at the base.

Yellow Violet, or Pansy. Fl. May, September. Britain. Pl. ¼ foot.

135 V. PROSTRA'TA (Rœm. et Schult. syst. 5. p. 582.) root simplish, stems decumbent; lower leaves roundish, upper ones oval, all of which are rather cordate, and grossly crenate, rather hairy; stipulas pinnatifid, with the middle lobe oblong, and entire; spur hardly stretched, obtuse. 4. H. Native on tops of mountains in the Island of Teneriffe, as well as in the Apennines. V. Ludovícea, Jan. in litt. Petals cream-coloured, streaked with black.

Prostrate Violet, or Pansy. Fl. June, September. Clt. 1824. Pl. ¼ foot.

136 V. ROTHOMAGE NSIS (Desf. cat. 153.) hispid, or pilose; root rather fusiform; stems zigzag, branched, diffuse; leaves

ovate, but the lower ones are somewhat cordate, crenate, fringed; stipulas pinnatifid, rather lyrate; spur tubular, obtuse, shorter than the sepals; nectaries shorter than the stamens; seeds oblong-obovate. ♃. H. Native on cretaceous rocks, and in fields from Rouen to Melda. D. C. fl. fr. 4. p. 809. Pio. diss. t. 2. Sims, bot. mag. 1498. V. híspida, Lam. fl. fr. 2. p. 679. V. pilòsa, Donn, cant. ed. 3. p. 40. Scarcely differing from *V. trícolor*. Flowers bright blue, the side petals and lip striped with black. Bracteas near the flower, large, lanceolate, with a tooth on each side.

Rouen Violet, or Pansy. Fl. April, Aug. Clt. 1781. Pl. ½ ft.

137 V. declina'ta (Walds. et Kit. hung. 3. p. 248. t. 223.) root rather fusiform; stem branched, declinate; leaves lanceolate, oblong, smooth, crenate; stipulas pinnatifid, ciliated; spur thick, blunt; sepals elongated. ♃. H. Native of Hungary, Transylvania, and Italy, among broken rocks. V. trícolor, ϑ, declinàta, Ging. mss. in D. C. prod. 1. p. 303. Flowers pale blue, larger than the calyx.

Declinate Violet, or Pansy. Fl. May, August. Clt. 1817. Pl. ½ foot.

138 V. tri'color (Lin. spec. 1326.) root somewhat fusiform; stems branched, diffuse; lower leaves ovate-cordate, deeply crenate; stipulas runcinately-pinnatifid, with the middle lobe crenated; petals incumbent, with short claws; spur thick, obtuse, not stretched out; nectaries short; seeds oblong-ovate. ⊙. H. Native in cultivated fields and gardens throughout Europe, Siberia, and North America; plentiful in Britain. Smith, eng. bot. t. 1287. Woodv. suppl. t. 252. Curt. lond. fasc. 1. t. 65. Bracteas very small, scarcely evident. Petals very variable in colour and size. This is a very variable species, or more probably a heterogeneous mass of species collected.

Heart's-ease has ever been a favourite flower with the people, and has many provincial names, all bearing some allusion to love. In days of superstition it was called *Herb Trinity*; probably from the three-coloured flowers. *Heart's-ease* is the general name by which it is now known; its more elegant name, *Pansies*, is from the French *pensée*. The meaning is alluded to by Shakspeare, in Hamlet,—"There's *pansies*, that's for thoughts."

Heart's-ease was represented by old writers on the Materia Medica, as a powerful medicine in epilepsy, ulcers, scabies and cutaneous complaints. Haase, who administered it in various and in large doses, extended its use to many chronic disorders; and from the great number of cases in which it proved successful, it seems to deserve farther trial. *Heart's-ease*, when strongly bruised, exhales a smell resembling peach-kernels. Distilled with water, whether it be fresh or dried, it gives a little volatile oil, of a very acrid taste, having the above-mentioned smell. The corolla yields to water a highly colouring principle.

Var. α, *horténsis* (D. C. prod. 1. p. 303.) petals intensely velvety, much larger than the calyx. Fl. dan. 603.

Var. β, *degèner*, (D. C. l. c.) somewhat branched; flowers 3-coloured, rather velvety; petals a little larger than the calyx; stipulas large. In cultivated fields.

Var. γ, *alpéstris* (D. C. l. c.) stem elongated; leaves remote; flowers sulphur-coloured, spotted with purple, larger than the calyx. In meadows on the Alps. V. lùtea, Tratt. tab. 43. V. lùtea and saxátilis, Schmidt, fl. boh. no. 257 and 259?

Var. δ, *crassifòlia* (D. C. l. c.) leaves large, thickish; flowers yellow, scarcely larger than the calyx. In Neustria, by the sea-side.

Var. ε, *calycìna* (D. C. l. c.) leaves large, ovate, rather crowded: calyx large. In the mountains of Teneriffe.

Var. ζ, *appendiculàta* (D. C. l. c.) leaves tapering to both ends; calyx drawn out much at the base, larger than the corolla. Between Bagdad and Kermancha. Perhaps the same as ε, *calycìna*.

Var. η, *purpùrea* (D. C. l. c.) leaves ovate; sepals shortish, broad, drawn out much at the base; flowers purple, larger than calyx. In Armoracea.

Var. ι, *ovatifòlia* (D. C. l. c.) stems diffuse, branched; leaves ovate; flowers 3-coloured, scarcely longer than the lanceolate sepals.

Var. κ, *arvénsis*, (D. C. l. c.) stems branched, assurgent; petals yellowish, blue, or purple spotted. Frequent in sandy cultivated fields. V. arvénsis, Sibth. 84.—Riv. pentap. Jorr. t. 122.—Math. valgr. 2. p. 525. f. Pet. h. brit. t. 37. f. 9. This is most likely a distinct species.

Var. λ, *sabulòsa* (D. C. l. c.) stems many, diffuse; leaves remote, ovate, elongated; sepals narrow-lanceolate, hardly shorter than the corolla. In sand by the sea-side in Belgium and France. Perhaps V. Bannática, Kit.

Var. μ, *graciléscens* (D. C. l. c.) stems almost simple, elongated, erect; sepals narrow, usually longer than the two-coloured corolla. In fields near Bern.

Var. ν, *triméstris* (D. C. l. c.) stem erect, very slender; stipulas very small; sepals linear. About Lisbon. V. trícolor triméstris flore variorum colorum elegans, Grisl. vir. lus.

Var. ξ, *hírta* (Ging. mss. et D. C. l. c.) velvety-hairy; flowering earlier than April. Stipulas pinnatifid at the base. In Vallais. Perhaps V. Kitaibeliàna, Rœm. et Schult. syst. 5. p. 383.

Var. ο, *bellioìdes* (D. C. l. c.) rather hispid; stems very short; leaves roundish, crowded; petals shorter than the calyx. In sandy places about Montpelier, and in the Nebrodes of Sicily. V. párvula, Tineo. pug. sic. 5. no. 3.

Three-coloured Violet, Heart's-ease, or Pansy, &c. Fl. April, October. Britain. Pl. ¼ to ½ foot.

139 V. tene'lla (Poir. in. Lam. dict. no. 53.) lower leaves roundish, minute, upper ones somewhat alternate, oblong, obtuse, all smooth and entire; peduncles rather longer than the leaves. ⊙. H. Native of Syria. V. trícolor, var. π. nàna, D. C. prod. 1. p. 303. This plant is rather remarkable in having the lower leaves opposite. The cotyledons remain even to the time of flowering.

Tender violet. Fl. May, July. Pl. 2 inches.

140 V. bi'color (Pursh. fl. amer. sept. 1. p. 174.) mostly smooth; stem triquetrous, erect, simple, leafy; leaves toothed, radical ones roundish, or spatulate, upper ones ovate, or lanceolate; petioles short; stipulas large, pinnatifid or palmate, middle lobe longer and broader, the rest linear-oblong, all obtuse, and ciliated; peduncles tetragonal, much longer than the leaves; sepals ovate-lanceolate, acuminated, ciliated, emarginate behind; two lateral petals bearded; stigma rather pubescent, hardly beaked. ⊙. H. Native of North America, in fields in New Jersey, New York, and of Pennsylvania and Virginia. V. ténella, Le Conte in ann. lyc. new york, 2. p. 152. V. arvénsis, Elliot. Flowers white, tinged or veined with blue or purple, yellow at the base. According to Pursh. there are specimens in Mr. Lambert's Herbarium, gathered by Pallas in Siberia, which correspond with the North American plant.

Two-coloured Violet. Fl. May, July. Pl. ½ foot.

Sect. V. Lepti'dium (from λεπτος, *leptos*, slender; form of style.) Ging. mss. D. C. prod. 1. p. 304. Stigma proboscis-like, truncate, with a minute hole at the tip. Style awl-shaped, flexuous. Stamens oblong, approximate, 2 of which are usually furnished with longer terminal appendages than the others. Torus flattish. Capsule 3-lobed or triangular, few-seeded. The petals of all are perhaps smooth.

141 V. rube'lla (Cav. icon. 6. p. 20. t. 531. f. 1.) stems erect; leaves ovate or oblong, acute, crenate-serrate, shorter than the peduncle; stipulas lanceolate, setaceously-toothed;

spur conical, short. ♄. G. Native in Chili about San Carlos. Flowers reddish. Membranes of stamens obtuse.

Var. α, latifòlia (Ging. in Schlecht. Linnæa. 1. p. 410.) leaves ovate-oblong; peduncles nearly equal in length to the leaves. ♄. G. In St. Carlos de Chili.

Var. β, angustifòlia (Ging. l. c.) leaves lanceolate, ; peduncles longer than the leaves. ♄. G. In Chili at Talcaguana.

Red-flowered Violet. Shrub 1 foot.

142 V. corchorifo'lia (Domb. herb. et D. C. prod. 1. p. 304.) pubescent; stems erect; leaves ovate, acute, crenate-serrate, unequal at the base, with the serratures exserted and apiculated; stipulas lanceolate, setaceously-jagged; spur very broad, saccate; capsules ovate, trigonal. ♄. G. Native in Peru about Huanaco. V. punìcea, Ruiz et Pav. in herb. Lamb. Flower vermilion. Leaves rather cordate at the base.

Corchorus-leaved Violet. Shrub 1-2 foot.

143 V. Chamissonia'na (Ging. mss. in Schlecht. Linnæa. 1. p. 408.) stem shrubby, oblique; leaves ovate, acuminated, tapering into the petiole at the base, serrated; serratures remote, appressed; stipulas lanceolate, lacerately-toothed; spur short, broadly saccate; membranes of stamens all obtuse. ♄. G. Native of the island of O Wahu. Plant smooth. The leaves resemble those of *Prùnus doméstica.* Flowers violet, sweet-scented. Sepals lanceolate, acuminate.

Chamisso's Violet. Shrub ½ foot.

144 V. capilla'ris (Pers. ench. 1. p. 256.) shrubby, climbing, smoothish; branches angular; leaves ovate, unequal at the base, somewhat cordate, sharply serrated, with the serratures exserted; stipulas oblong, acute, trifidly awned at the top, peduncles shorter than the leaves; sepals acute; lower petal obovate, roundish, apiculate; spur very short, saccate; terminal membranes of 2 lower stamens elongated, awl-shaped; nectariferous appendages broad, rounded at the base, truncate at the top, shorter than the cells; seeds with fuscous dots. ♄. ⏑. S. Native of New Granada. V. stipulàris, H. B. et Kunth, nov. spec. amer. 5. p. 372. but not of Swartz. Flowers pale blue.

Capillary-jagged-stipuled Violet. Sh. climbing.

145 V. seto'sa (Smith, in Rees' cycl.) shrubby, branched, smoothish; branches flexuous; leaves ovate, acute, serrated, 4 times longer than the petiole; stipulas lanceolate, with capillary serratures; peduncles equal or double the length of the leaves; sepals lanceolate, acute; spur short, saccate. V. stipulàris, Cav. icon. 6. p. 20. t. 531. ♄. G. Native of Chili at Talcaguana. Flowers pale blue.

Bristly-stipuled Violet. Shrub 1 foot.

146 V. tracheliifo'lia (Ging. ex Spreng. syst. append. p. 97.) shrubby, smooth; leaves on short footstalks, ovate-cordate, acuminated, sharply-toothed; stipulas lanceolate, quite entire. ♄. G. Native of Sandwich Islands, particularly in O Wahu. Flowers small.

Throat-wort-leaved Violet. Fl. Shrub 1 foot.

147 V. sca'ndens (H. B. et Kunth, nov. spec. amer. 5. p. 371. t. 493.) shrubby, climbing, glabrous; branches rather angular, striated; leaves cordate-ovate, crenated, glabrous; stipulas oblong, dentately-ciliated; peduncles length of leaves; sepals acuminated; lower petal obovate-oblong; spur saccate, short; 2 lower stamens with terminal, elongated membranes; nectariferous appendages, oblong, obtuse, shorter than the cells; stigma bluntish. ♄. S. Native of Peru near Loxa, at the height of 3180 feet. Petals violaceous, smooth.

Climbing Violet. Shrub climbing.

148 V. argu'ta (H. B. et Kunth, nov. spec. amer. 5. p. 373.) shrubby, twining; branches terete, hairy; leaves profoundly cordate, sharply serrated, upper surface puberulous, under surface hoary; footstalks villous; stipulas lanceolate, setaceously-jagged; peduncles shorter than the leaves; sepals acute; lower petal obovate, mucronate; spur broad, very blunt, scarcely one half shorter than the lamina; two of the stamens with longer obtuse reflexed membranes; nectariferous appendages, ovate, truncate, a little shorter than the anthers; seeds covered with glandular dots, brown. ♄. G. Native of Peru in cold woods between Gonzana and Loxa at the height of 3180 feet. Flowers flesh-coloured, smooth.

Sharp-serrated-leaved Violet. Shrub twining.

149 V. stipula'ris (Swartz, fl. ind. occid. 3. p. 1956.) glabrous; stems reptant; leaves ovate-lanceolate, tapering to both ends, with blunt, pressed, serratures; stipulas oblong, acuminated, furnished with long ciliæ; spur very short; two of the stamens with longer awl-shaped, recurved membranes. ♄. S. Native in the islands of Guadaloupe and St. Christopher. V. persicariæfòlia, Poir. dict. 8. p. 628. Flowers blue or white.

Stipular Violet. Shrub trailing.

150 V. graci'llima (St. Hil. in mem. mus. 11. p. 449. t. 22. f. a.) caulescent, very smooth; stem filiform; leaves small, broadly-cordate, obsoletely and remotely toothed; stipulas lanceolate-awl-shaped, hardly toothed; peduncles longer than the leaves; sepals acuminated; petals beardless. ♃. S. Native of Brazil in moist pastures. Flowers violaceous; spur short, saccate. Anthers ending in a membrane at the apex, anterior two appendiculate on the back, and with terminal hooked processes, the rest with erect terminal processes. Style awl-shaped.

Very-slender Violet. Fl. Nov. Pl. ½ to ¾ foot.

151 V. subdimidia'ta (St. Hil. in mem. mus. 11. p. 450.) caulescent, very smooth; leaves ovate-cordate, acute, unequal-sided, toothed; stipulas oblong-lanceolate, ciliately jagged; peduncles shorter than the leaves; sepals ovate-oblong; petals beardless, acuminated; style awl-shaped, curved. ♃. S. Native of Brazil in the province of Minas Geraes, near the town called Villa Rica, at the height of about 3700 feet above the level of the sea. Flowers pale violet. Spur short, saccate. Anthers almost as in *V. gracillima.*

Subdimidiate Violet. Fl. Jan. Pl. ½ to 1 foot.

152 V. confe'rta (St. Hil. in mem. mus. 11. p. 453.) caulescent, very smooth; leaves crowded, ovate-lanceolate, acute, finely-toothed; stipulas broadly linear, very blunt, ciliately-jagged; peduncles equal in length to the leaves; sepals lanceolate, linear, acute; style awl-shaped, in form referable to the letter S. ♃. S. Native of Brazil in the southern part of the province of St. Paul in humid pastures and shady woods near the town of Castro. Root creeping. Flowers white.

Crowded-leaved Violet. Fl. Feb. Pl. ¼ to ½ foot.

153 cerasifo'lia (St. Hil. mem. mus. 11. p. 451.) caulescent, very smooth; leaves approximate, lanceolate, acute, toothed; stipulas oblong-lanceolate, acute, auricled at the base, ciliary-jagged; peduncles usually shorter than the leaves; sepals acuminated; style awl-shaped, incurved. ♃. S. Native of Brazil in very shady places of woods on the mountains called Serra-da Caraca not far from the town called Cahetè in the province of Minas Geraes. Root creeping, slender, usually emitting runners from the base. Flowers violaceous.

Var. β, intermèdia (St. Hil. l. c. p. 453.) leaves somewhat ovate-lanceolate, rather distant, somewhat unequal-sided. ♃. S. Flowers violaceous.

Cherry-leaved Violet. Fl. Jan. Pl. ¼ to 1 foot.

154 V. Dombeya'na (D. C. mss. and prod. 1. p. 305.) glabrous; stems reptant; leaves oval, cuneately narrowed at the base, serrated, with the serratures exserted and remote; stipulas lanceolate-linear, setaceously-toothed; spur very short. ♄. S. Native of South America. V. rèpens, Domb. herb. Perhaps a variety of *V. stipulàris,* Swartz.? Flowers blue.

Dombey's Violet. Shrub creeping.

155 V. pilòsa (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 645.) stigma proboscis-like; style clavate; stamens oblong, connected; capsules ovate-globose; 4 superior petals hairy at the base; leaves cordate, tapering into the petiole a little at the base, crenulate, pilose; stipulas oblong, setaceously-toothed, ciliated, erect. Stem stoloniferous. ♃. S. Native of Java.

Pilose Violet. Pl. creeping.

156 V. tri'fida (Spreng. pug. 1. p. 22.) stem decumbent; leaves somewhat trifid, tapering to the base, with the segments lanceolate, very entire; calyxes hardly appendiculated behind; spur much larger than the calyx. ♃. F.? Native of? Flowers white.

Trifid-leaved Violet. Plant decumbent.

† *Species not sufficiently known.*

157 V. gibbo'sa (Rafin. dec. pl. nov. amer. sept. in litt. 1819.) caulescent, glabrous; leaves on long footstalks, cordate-deltoid, crenated, obtuse, under surface pale; stipulas ovate-lanceolate, obtuse, entire; petals glabrous; spur gibbous, very short. ♃. H. Native on the Alleghany Mountains in North America. Flowers yellow.

Gibbous-spurred Violet. Fl. May, Jul. Clt.? Pl. ½ foot.

158 V. serpyllifòlia (H. B. ex Willd. herb. in Rœm. et Schult. syst. 5. p. 391.) stems procumbent; leaves linear-spatulate, quite entire. ♃. S. Native of South America. Unknown to Kunth.

Wild-Thyme-leaved Violet. Pl. procumbent.

159 V. teucriifòlia (H. et B. ex Willd. herb. in Rœm. et Schult. syst. 5. p. 391.) leaves alternate, ovate, serrated; stem shrubby, procumbent; peduncles longer than the leaves. ♄. S. Native of South America. Unknown to Kunth.

Teucrium-leaved Violet. Shrub procumbent.

160 V. sca'bra (Brown, in flora 1820. p. 469.) almost stemless; leaves cordate, acuminated, scabrous; sepals acute; root creeping. ♃? H. Native about Salzburgh.

Scabrous Violet. Pl. ¼ foot.

161 V. crassiu'scula (Bory, ann. gen. 1820. vol. 3. p. 16.) stems decumbent, without bracteas? leaves alternate, stalked, ovate, oblong, quite entire, thickish; flowers naked, on long peduncles. Native on Sierra Nevada in Spain.

Thickish-leaved Violet. Pl. decumbent.

162 V. Selki'rkii (Pursh. mss. ex Goldie. edinb. phil. journ. 1822. p. 319.) leaves cordate, crenate-serrated, rather pilose; petals beardless; spur long, thick, very blunt. ♃. H. Native on mountains near Montreal in North America. Flowers blue.

Selkirk's Violet. Fl. May, July. Clt. 1822. Pl. ¼ foot.

163 V. spatula'ta (Willd. reliq. ex Rœm. et Schult. syst. 5. p. 353.) leaves lanceolate-spatulate, fascicled, almost entire, pubescent. ♃. H. Native of the province of Guilan on the Caspian sea.

Spatulate-leaved Violet. Pl. ¼ foot.

164 V. Alleghane'nsis (Rœm. et Schult. syst. 5. p. 560.) hairy; leaves ovate and oblong-cordate rather entire; footstalks broad, membranaceous; 2 lateral petals bearded; spur very short, saccate. ♃. H. Native of North America on the Alleghany Mountains. Perhaps a variety of *V. ovàta?* Flowers blue.

Alleghany Violet. Fl. April, June. Clt. 1824. Pl. ¼ foot.

165 V. Labrado'rica (Schrank. denk. I. bot. Gesell. regensb. II. p. 12.) stem erect, branched; leaves orbicularly-cordate, acuminated; stipulas lanceolate. ♃. H. Native of Labrador.

Labrador Violet. Plant ½ foot.

166 V. elonga'ta (Poir. dict. 8. p. 644.) glabrous; leaves elliptical, quite entire, stalked; flowers solitary on long peduncles; stem weak; capsules very smooth; seeds rufous, globose. ♃? H. Native of North America.

Elongated-peduncled Violet. Pl. ¼ foot.

167 V. prunellæfo'lia (H. B. et Kunth, nov. gen. amer. 5. p. 370.) very smooth; leaves ovate-oblong, acute, rounded at the base, obsoletely cordate, crenate; stipulas ciliated; calyxes acute; petals retuse, smooth; spur somewhat saccate, short, rounded; style clavate above, thickened; stigma lateral, truncate. ♃. G. Native of South America about Santa Fe de Bogota, at the height of 4110 feet. Flowers violaceous. Perhaps allied to *V. hírta*. Style club-shaped; stigma truncate.

Prunella-leaved Violet. Pl. ¼ foot.

168 V. umbracti'cola (H. B. et Kunth, nov. spec. amer. 5. p. 370.) caulescent, procumbent; leaves ovate, bluntish; running into the footstalk at the base, denticulated, upper surface glabrous, under surface as well as footstalks and peduncles beset with a few hairs; stipulas dentately-ciliated; calyxes linear, acute; lower petal rounded, with a saccate, short spur, rounded at the base, with the rest of the petals obovately-spatulate; dorsal appendages of stamens oblong, obtuse, compressed, one-half shorter than the cells; ovary ovate, smooth; ovulæ 22, disposed in 2 rows. Style cultriform? stigma obtuse. ♃. G. Native of Mexico in woods near Real del Monte, at the height of 4278 feet. Flowers violaceous. Petals smooth, about the size of those of *Viola palústris*.

Shaded-hill Violet. Pl. procumbent.

169 V. chamædrifo'lia (Ruiz, et Pav. in herb. Lamb. and D. C. prod. 1. p. 306.) stems? leaves ovate, toothed; 2 lateral petals bearded. Native in Peru. Perhaps *V. teucriifòlia*. Rœm. et Schult. syst. 5. p. 391.? or perhaps a variety of *V. rubélla*, Cav.

Germander-leaved Violet. Pl. 1 foot.

170 V. Kamtscha'tica (Ging. in Schlecht. Linneæ. 1. p. 406.) stigma triangular, marginated; leaves cordate; stipulas lanceolate; sepals ovate, acuminated; spur cylindrical, rounded at the top, longer than the sepals. ♃. H. Native of Kamtschatka. Petals purple. Very like *V. hírta*.

Kamtschatka Violet. Pl. ½ foot.

Cult. Almost every species of *Violet* deserves to be cultivated in gardens, the greater part for the beauty of their flowers, and others for their scent, such as the varieties of *Viola odoràta*. The hardy perennial species are well adapted for ornamenting rock-work or the front of flower-borders, but the smaller species should be grown in small pots in a mixture of loam, peat, and plenty of sand. The American species do best in vegetable mould or peat; those species which are natives of woods are well adapted for growing under trees, and those natives of bogs or marshes should be planted in moist situations. They are all readily increased by seeds or parting the plants at the root. The annual species may be sown in the open borders or on rock-work. The greenhouse and stove species should be grown in a mixture of loam and peat, the herbaceous kinds of them should be increased by dividing at the root or by seeds, and the shrubby kinds should be propagated by cuttings, which will root freely if planted under a hand-glass, those of the stove species in heat. The species marked frame should be always preserved in pots, that they may be protected during winter by a frame. The *Neapolitan violet*, a variety of *V. odoràta* forces well, and where there is a stove or warm pit may be had in flower throughout the winter and early part of spring.

V. ERPE'TION (from ερπητος, *erpetos*, creeping, and ιον, *ion*, the Greek for violet, in allusion to the creeping rooting stems). D. C. in herb. Lamb. Sweet, fl. gard. t. 170.

Lin. syst. *Pentándria, Monogýnia*. Character in almost every respect the same as *Viola*, but the lower petal is not drawn out into a spur at the base, and the anthers are destitute of dorsal appendages. The sepals are scarcely produced at the base. Filaments united at the apex; lobes of anthers

distinct, diverging at the base. Stigma inconspicuous. Small tufted plants, with running rooting stems, and roundish or kidney-shaped leaves, 1-flowered peduncles, and beautiful blue flowers mixed with white. The roots of all are perpendicular.

1 E. RENIFO'RME (Sweet, fl. gard. 170.) stem creeping, rooting; leaves crowded, kidney-shaped, repandly-toothed, punctate; stipulas linear-awl-shaped, acuminated; sepals lanceolate, hardly drawn out into auricles; petals reflexed; the two lateral ones are furnished with a beard on the upper side. ♃. F. Native of New Holland about Port Jackson. Erpétion cymbalària, D. C. in herb. Lamb. Vìola renifórmis, R. Br. ined. Vìola hederàcea, Hook. exot. bot. 225. Flowers blue mixed with white.

Kidney-shaped-leaved Erpetion. Fl. May, Oct. Clt. 1823. Pl. creeping.

2 E. HEDERA'CEUM (Lab. spec. nov. holl. 1. p. 66. t. 91. under *Vìola*). stem short, stoloniferous; leaves crowded into fascicles, roundish, somewhat cuneated at the base, crenated, punctate; stipulas awl-shaped, ending in a bristly acumen; sepals hardly drawn out at the base into auricles. ♃. F. Native of Van Diemen's Land. Flowers blue and whitish. This is a much smaller plant than the last. The two lateral petals are arched, with a tuft of hairs on the upper side. Root perpendicular, simple. Peduncles about twice the length of the leaves.

Ivy-like Erpetion. Pl. creeping.

3 E. PETIOLA'RE; stems stoloniferous; leaves crowded in fascicles, kidney-shaped-truncate at the apex, repandly-toothed; stipulas lanceolate, ending in bristle-like acumen; sepals hardly drawn out at the base into auricles; peduncles and petioles very long, even from 6 to 9 inches. ♃. H. Native of New Holland and Van Diemen's Land. Vìola grácilis, R. Br. ined. V. hederàcea γ, petiolàris, D. C. prod. 1. p. 305. Petals smooth.

Slender Erpetion. Pl. creeping.

4 E. SPATHULA'TUM; stoloniferous; leaves on long footstalks, obovate-roundish, toothed, smooth; peduncle slender; flower nodding; spur very short. ♃. H. Native of New Holland. Vìola spatulàta, Sieb. V. Sieberiàna, Spreng. syst. app. p. 96. Perhaps a species of *Vìola*.

Spatulate-leaved Erpetion. Pl. creeping.

Cult. These are elegant little plants, and deserve to be cultivated in every garden. They will suit well for rock-work, or to be grown in pots and placed among other alpine plants; they are all easily increased by separating the runners. All the species require protection in severe weather.

VI. SO'LEA (in honour of William Sole, an acute English botanist, author of Menthæ Brittanicæ, 1 vol. fol. Bath, 1798.) Ging. mss. et D. C. prod. 1. p. 306.—Sòlea, spec. Spreng. pug. rar. 1. p. 22.

Lin. syst. *Pentándria, Monogýnia.* Sepals hardly equal, keeled? not drawn out behind into auricles as in *Vìola*, but running into the pedicel at the base (Nutt.), reflexed after flowering. Petals rather unequal; lower one a little larger than the rest and a little gibbous at the base, the rest almost equal, convolute in æstivation? Stamens approximate, 2 anterior ones bearing each on the outside at the base a nectarial gland? filaments rather unguiculate at the base, with the claws scarcely equalling the ovary in height, bearing the anthers a little higher up. Stigma hooked. Herb pilose. Stems twiggy. Leaves alternate. Peduncles 1-flowered, short, axillary in pairs, but often solitary from abortion, each furnished with 2 little bracteas.

1 S. CO'NCOLOR (Ging. mss. et D. C. prod. 1. p. 306.) ♃. H. Native of Pennsylvania on limestone rocks. Vìola cóncolor, Forster in Lin. trans. 6. p. 309. t. 28. Perhaps the same as *Sòlea stricta* of Spreng. l. c.? Flowers small, green.

Self-coloured-flowered Solea. Fl. June, July. Clt. 1788. Pl. 1 to 2 feet.

Cult. This curious plant may be grown in the open border or on rock-work. A limestone or chalky soil will suit it best. It may be either propagated by dividing the plant at the root, or by seeds. It will require protection in severe weather.

VII. POMBA'LIA (in honour of Sebastian Joseph de Carvalho Marquis de Pombal, a famous Portuguese statesman). Vand. fasc. 7. t. 1. D. C. prod. 1. p. 306.

Lin. syst. *Pentándria, Monogýnia.* Sepals large, running into the pedicel at the base, with the margins echinated with callose prickles. Petals unequal, 4 upper ones short, scarcely exceeding the calyx in length, the lower one 2 or 3 times longer than the rest, somewhat gibbous at the base, stipitately-unguiculate, with a broad limb with an involute margin. Filaments unguiculated at the base, with linear claws equalling the ovary, oblong, dilated at the top, bearing the anthers very high up, 2 of the filaments bearing each a nectarial gland on the back at the base. Lobes of anthers blunt at the top. Style straight; stigma funnel-shaped. Capsule as in *Vìola*, usually villous. Cotyledons generally orbicular, length of the terete radicle. Annual herbs, generally very villous. Root thickish, hard. Leaves alternate. Peduncles axillary, solitary, not jointed, bibracteolate. Flowers large, drooping.

1 P. I'TUBU (Ging. mss. et D. C. prod. 1. p. 307.) ⊙. ♂. S. Vìola I'tubu, Aubl. guian. 2. p. 808. t. 318. bad. Ionídium I'tubu, H. B. et Kunth, nov. gen. amer. 5. t. 496. I. Ipecacuánha et calceolària, Vent. *Itoubou* is the name of the plant in Guiana.

Var. α; stems very hairy; flowers white; seeds whitish; capsules villous. Native of Guiana and Brazil. Sims, bot. mag. 2453. V. Ipecacuánha et calceolària, Lin.

Var. β; stems very hairy; flowers blue. Native in Cayenne. Vìola I'tubu, var. flòre cærùleo, Aublet. l. c.

Var. γ; stems smoothish; flowers white; ovary villous; seeds black. Native in Brazil. Pombàlia Ipecacuánha, Vand. fasc. 7. t. 1. bad. Calceòlar. Lœfl. itin. p. 184. no. 2.? Perhaps *V. Ipecacuánha* of Lin. mant. 484.

Var. δ; indécora (St. Hil. mem. mus. 11. p. 481.) corolla shorter than the calyx, smooth; filaments 3, sterile. Native of Brazil. Ionídium indécorum, St. Hil.

The roots of these plants are emetic, and probably the white ipecacuan of the shops; beside these the name of ipecacuan is given to various species of *Cynánchum, Asclépias, Euphórbia, Dorstènia, Psychótria emética*, but the best is the root of the *Callicócca Ipecacuánha*, which is called in the shops the Brown Ipecacuan. With regard to their comparative strengths, De Candolle says that vomiting is produced by 22 grains of *Cynánchium Ipecacuánha*, 24 of *Psychótria emética*, 60 or 72 of *Ionídium calceolàrium*, and 1 to 3 drachms of *Pombàlia I'tubu*. The root of this plant fills the place of the true *Ipecacuan* of the shops. M. Fernambouc regards it as the best remedy that can be employed in dysentery. Some of the inhabitants of Rio-Grande-do-Norte assured M. Aug. St. Hilaire that they can radically cure the gout with a decoction of the roots. The roots are white within and greyish or reddish without; they are sold by the inhabitants of Brazil for the true *Ipecacuan, Callicócca Ipecacuánha*. The Brazilian name of the plant is *Poaya da praia* or *Poaya branca*. *Poaya* appears to be a name used by the Brazilians for all emetic roots.

Itoubou or White Ipecacuanha. Fl. July. Clt. 1822. Pl. 1 ft.

Cult. Although these plants form small shrubs in their native country, they cannot be considered any more than stove annuals in this country, therefore the only mode of preserving them is by seeds, which should be sown in a hot-bed in the spring, where they should remain, or they may be removed into the stove in May. A mixture of peat and sand suits them best.

VIII. PI'GEA (meaning unknown). D. C. mss. and prod. 1. p. 307.

Lin. syst. *Pentándria, Monogýnia.* Sepals unequal, running into the pedicel at the base. Petals unequal, lower one 4 or 5 times larger than the rest, gibbous at the base, and unguiculate, with a dilated obovate flat limb, which is convolute in æstivation, the rest a little longer than the calyx. Filaments dilated from the base, bearing the anthers low down; lobes of anthers usually drawn out into a bristle at the apex. Capsules generally trigonal, 3-valved; seeds usually angular. Herbs or subshrubs. Leaves generally alternate. Flowers erectish. Peduncles bibracteolate, not jointed, solitary, often racemosely-crowded at the top of the branches.

1 P. filifo'rmis (D. C. mss. and prod. 1. p. 307.) stem erect, undivided; leaves alternate, linear, quite entire; lower petal obovate, entire; sepals lanceolate, acute. ♃. ⊙. G. Native in New Holland about Port Jackson. Flowers small, blue?

Filiform Pigea. Pl. ¾ foot.

2 P.? Banksia'na (Ging. mss. and D. C. prod. 1. p. 307.) stem erect, puberulous; leaves alternate, oblong-linear, quite entire, with revolute margins, upper surface roughish, as well as the awl-shaped stipulas; lower petal much longer than the calyx; seeds elliptical, white, striated? ♄. G. Native of New South Wales. Vìola angustifòlia, Herb. Banks. Flowers small, blue? Perhaps the same as the preceding.

Banksian Pigea. Shrub 1 foot.

3 P.? calyci'na (D. C. mss. and prod. 1. p. 307.) stems branched; leaves linear, quite entire; lower petal lanceolate, acute; sepals ovate, acuminated. ⊙? G. Native in New Holland on the western coast. Flower small, blue?

Large-calyxed Pigea. Pl. ¾ foot.

4 P.? monope'tala (Ging. mss. and D. C. prod, 1. p. 307.) stems branched; leaves linear, quite entire; lower petal spatulate, emarginate, the rest hardly evident; sepals ovate. Ionídium monopétalum, Rœm. et Schult. syst. 5. p. 400.

One-petalled Pigea. Pl. ¾ foot.

Cult. The species may be grown in a mixture of loam and peat, and no doubt cuttings, if planted under a hand-glass in sand, will root readily, or they may be increased by seeds.†

IX. IONI'DIUM (*ιον, ion*, a violet, and *ειδος, eidos*, similar; resemblance). D. C. prod. 1. p. 307. Ionídii, spec. Vent. malm. p. 27. Sòlea, spec. Spreng.

Lin. syst. *Pentándria, Monogýnia.* Sepals small, unequal, running into the peduncle at the base, but not appendiculate, with membranous margins. Petals unequal, lower one 2 or 3 times longer than the rest, carinately-concave and a little gibbous at the base, unguiculate, gradually dilating into the limb, with the margin usually involute in æstivation. Stamens approximate; filaments scarcely oblong-dilated from the base, bearing the anthers low down; the 2 anterior ones are usually furnished each with a nectarial gland at the base. Capsule as in *Vìola*, but not elastic, falling off after maturity by the jointed part of the peduncle, 1-6, rarely 9-seeded. Cotyledons usually reniform; radicle short. Herbs or subshrubs. Leaves sometimes alternate, sometimes opposite, or the lower ones opposite and the upper ones alternate. Peduncles solitary, 1-flowered, furnished with 2 little bracteas above the middle and jointed. Flowers erectish. The roots of all the species are more or less emetic, The roots of several are used in Brazil as emetics under the name of *Poaya* or *Ipecacuanha*.

§ 1. *Lip stipitate, twice or thrice longer than the calyx.*

1 I.? ano'malum (H. B. et Kunth, nov. gen. amer. 5. p. 381.) t. 500.) puberulous; stem branched; rameal leaves alternate, lanceolate-oblong, acuminate, serrated, upper surface glabrous, under surface hoary; stipulas broad, ovate, acute; sepals ovate-acute, silky-pubescent; lip lanceolate, 4 or 5 times longer than the calyx, the rest of the petals ovate, acute. ♄. S. Native in woods near Turbaco in New Granada. Vìola prunifòlia. Willd. rel. in Rœm. et Schult. syst. 5. p. 391. Flowers white, rising before the leaves. Anthers linear-oblong; 2 of which are furnished with hooked, descending appendages, which are villous at the apex, and these are drawn in within the jointed concave spur.

Anomalous Ionidium. Tree 20 feet.

2 I. racemo'sum (Nees et Mart. act. bon. 12. p. 49.) herbaceous; stem erect; leaves lanceolate, serrated; racemes axillary, furcately divided, leafy at the base and naked at the top: flowers very minute. ♃. S. Native of Brazil. Stem smooth at the base. Leaves rather pubescent. Flowers white. Sepals ciliated.

Racemose Ionidium. Pl. 1 foot.

3 I. parietariæfo'lium (D. C. mss. and prod. 1. p. 308.) stem branched, pubescent; leaves alternate, elliptical, or ovate-lanceolate, acuminated, toothed, somewhat pubescent, two-coloured; stipulas awl-shaped, ciliated; sepals acuminated, ciliated; limb of lower petal somewhat rhomboid. ⊙? S. Native of South America. Flowers white or blue.

Var. α, Houstòni (D. C. prod. 1. p. 308.) leaves sharply serrated; stem hairy. Native about Vera Cruz and in Peru. Vìola frutéscens, Ruiz et Pav. ined.

Var. β, Bertèrii (D. C. prod. 1. c.) leaves rather serrated; stem pubescent. Native in St. Martha. Vìola melanospérma, Bertero ined. Seeds lenticular, ovate, dark, shining. Cotyledons reniform.

Péllitory-leaved Ionidium. Fl. July. Pl. 1 foot.

4 I. leptorhi'zum (D. C. mss. and prod. 1. p. 308.) stem simple or sparingly branched, smoothish; leaves alternate, glabrous, ovate, acute, toothed, tapering into the footstalk; stipulas linear-awl-shaped; sepals very acute. ⊙.? S. Native of Malabar and Tranquebar in sand.—Rheed. mal. 9. p. 119. t. 61.—Pluk. alm. t. 120. f. 8. Hardly differing from the preceding species. Two of the petals are rose-purple, the third blue.

Slender-rooted Ionidium. Fl. July. Pl. ¾ foot.

5 I. Cape'nse (Rœm. et Schult. syst. 5. p. 393.) stem suffruticose, erect; leaves alternate, obovate, obsoletely-toothed, pubescent; stipulas awl-shaped, ciliated; sepals acute, ciliated. ♄. G. Native of the Cape of Good Hope. Vìola Capénsis, Thunb. prod. 40. Vìola Massòni, herb. Banks. Flowers white.

Var. β, Owariénse (D. C. prod. 1. p. 308.) upper leaves lanceolate, somewhat crowded, under surface smoothish; sepals pubescent; lip very gibbous at the base. Native of Guinea in the kingdom of Waree. Flowers pale-blue.

Var. γ? Burmánni (D. C. prod. 1. c.) upper leaves oblong-lanceolate, smoothish beneath; lip obovate, gibbous at the base, pubescent on the outside. Native of the East Indies. Differing from *I. heterophýllum*, in the sepals being ciliated, not smooth. Flowers pale-blue.

Cape Ionidium. Fl. May, July. Clt. 1824. Shrub ½ to 1 ft.

6 I. heterophy'llum (Vent. malm. no. 27. in adn.) stem suffruticose, branched at the base; lower leaves obovate, upper ones linear-lanceolate, obsoletely toothed, pubescent; stipulas awl-shaped, rigid; sepals acuminated, glabrous. ♄. G. Native of China and Ceylon. Polýgala frutéscens, Burm. fl. zeyl. 195. t. 85? Flowers pale-blue.

Variable-leaved Ionidium. Shrub ½ to 1 foot.

7 I. buxifòlium (Vent. malm. p. 27. in adn.) stem herbaceous, diffuse; leaves alternate, obovate, entire, with revolute margins; stipulas awl-shaped, rigid; sepals acuminated, gla-

brous; lip gibbous at the base, roundish-truncate at the apex. ♃. S. Native of the island of Madagascar. Viola buxifòlia, Poir. dict. 8. p. 646.

Box-leaved Ionidium. Pl. ½ foot.

8 I. ENNEASPE'RMUM (Vent. malm. p. 27.) stem suffruticose, much branched at the base; leaves alternate, lanceolate, smoothish; stipulas awl-shaped, rigid; sepals acuminated, glabrous; lip —? seeds shining. ♄. S. Native of the East Indies.

Var. α, *Malabáricum* (D. C. prod. 1. p. 309.) stems decumbent; leaves sparingly serrated. ♄. S. Native of Malabar. —Rheed. mal. 9. p. 117. t. 60. Flowers rose-coloured, with deeper veins.

Var. β, *Zeylánicum* (D. C. prod. 1. p. 309.) stems ascending; leaves almost entire. ♄. S. Native of Ceylon. Viola enneaspérma, Lin. spec. 1327. fl. zeyl. no. 317. Flowers rose-coloured.

Nine-seeded Ionidium. Shrub ½ to ¾ foot.

9 I. LINEARIFÒLIUM (Vahl. ecl. amer. 2. p. 18.) stem erect; cauline leaves alternate, oblong, tapering at both ends; stipulas awl-shaped, rigid. ⊙? S. Native of the Caribbee Islands. Viola linearifòlia, Poir. dict. 8. p. 648? Perhaps a variety of I. stríctum. Flowers blue?

Linear-leaved Ionidium. Fl. July. Pl. ½ foot.

10 I. STRI'CTUM (Vent. malm. no. 27. in adn.) stems erect, branched at the base, puberulous; lower leaves opposite, oblong or lanceolate, tapering at the base, blunted at the apex; stipulas awl-shaped, rigid; sepals acuminated, glabrous; lip roundish; capsules roundish, trigonal; seeds ovate-roundish, blackish? ♃. S. Native of St. Domingo and New Spain. Viola strícta, Poir. dict. 8. p. 648. Flowers white?

Var. β; branches erect; leaves elongated, lower ones obtuse, tapering a great way at the base, smoothish. ♃. S. Native of Guadaloupe.

Straight Ionidium. Fl. May, July. Clt. 1820. Pl. ½ foot.

11 I. ANGUSTIFO'LIUM (H. B. et Kunth. nov. gen. amer. 5. p. 377.) stem woody, elongated, weak, glabrous, upper part branched; leaves opposite, linear-lanceolate, narrowed at the top, remotely serrulated, glabrous; stipulas minute; peduncles glabrous, racemosely-crowded on the branches, fructiferous ones 4 or 5 times shorter than the leaves; sepals lanceolate, acuminated; capsules roundish-ovate, trigonal, 3-4-seeded. ♄. S. Native in humid places near Carichana in woods about the Orinoco. Flowers blue?

Narrow-leaved Ionidium. Shrub 1-2 feet.

12 I. COMMU'NE (St. Hil. in mem. mus. 11. p. 469.) stem herbaceous or often suffruticose, pubescent; leaves alternate, intermediate ones lanceolate, acuminated, toothed, but entire at the base, hardly puberulous; stipulas small, linear, very entire; stamens glabrous; filaments 3 times shorter than the lobes of the anthers; sepals linear-lanceolate, acuminated; lip large, ovate-bluntish, downy on the outside. ♃. ♄.? S. Native of Brazil in old woods and coppices. Petals blue?

Common Ionidium. Fl. Jan. April. Pl. 1 to 4 feet.

13 I. SETI'GERUM (St. Hil. in mem. mus. 11. p. 470. t. 23. f. c.) stem suffruticose, pubescent; leaves alternate, oblong-lanceolate, acuminated, very acute, toothed, puberulous; stipulas and bracteas of the peduncles ciliately many-parted; sepals pinnatifidly ciliated; lip orbicular, pubescent. ♄. S. Native of Brazil in cultivated places, as well as in woods that have been cut down in the provinces of Rio Janiero and Minas Geraes. Petals green at the base, but violet, blue, or variegated with white and blue at the apex.

Bristle-bearing Ionidium. Fl. year. Shrub 1 foot.

14 I. SYLVA'TICUM (St. Hil. in mem. mus. 11. p. 472.) stem shrubby, pubescent; leaves alternate, intermediate ones ovate, acuminated, toothed, but very entire at the base, puberulous; stipulas small, linear, very entire; sepals linear-lanceolate, acuminated, acute, very entire; lobes of anthers almost equal in length to the filaments; lip somewhat rhomboid, pubescent on the outside. ♄. S. Native of Brazil in woods near the farm called Cana-braba, about 14 leagues from the town called Villa-do-principe. Petals very pale blue.

Wood Ionidium. Fl. April. Shrub 1 foot.

15 I. GUARANI'TICUM (St. Hil. in mem. mus. 11. p. 474.) stem suffruticose, glabrous; leaves lanceolate, acuminated, glabrous; stipulas small, linear, membranous, glabrous; sepals oblong-lanceolate, acuminated, acute, very entire; lip of flower orbicular, crenate. ♄. S. Native of Brazil in woods on the banks of the river Ibicui in the province called Messoes. Petals white.

Guaranitic Ionidium. Fl. Feb. Shrub 1 to 2 feet.

16 I. BI'COLOR (St. Hil. in mem. mus. 11. p. 475.) plant villous; stem suffruticose, almost simple; leaves lanceolate, acute, unequally toothed, cuneated at the base and very entire; stipulas linear, quite entire; racemes terminal, and often axillary; pedicels bractless; sepals entire, and very unequal; lip transversely elliptical, truncate at the apex, pubescent on the under surface ♄. S. Native of Brazil in pastures in the province of the Mission, chiefly near the village of St. Nicolas. Petals blue, with a yellow spot on the base of the lower one.

Two-coloured-lipped Ionidium. Fl. Feb. Shrub 1 to 1½ foot.

17 I. A'LBUM (St. Hil. in mem. mus. 11. p. 477.) stem shrubby, diffuse, pubescent; leaves alternate, lanceolate, acute at both ends, finely serrated, ciliated; stipulas scarious; peduncles bractless; sepals lanceolate-oblong, acuminated, quite entire, hairy, ciliated; lip somewhat rhomboid, very blunt, with rounded sides, hairy on the under surface. ♄. S. Native of Brazil, in old woods near the Farm called St. Miguel da Jiquitinhonha, at the northern extremity of the province of Minas Geraes. Petals white.

White-flowered Ionidium. Fl. June. Shrub ½ foot.

18 I. SCARIÒSUM (St. Hil. in mem. mus. 11. p. 478.) stem suffruticose, with hairy branches; leaves alternate, lanceolate, acuminated, and very acute, serrated, but very entire at the base, villous; stipulas linear-lanceolate, scarious; sepals oblong-linear, obtuse, pinnatifid, but entire at the apex, hispid; lip rather orbicular, obtuse, villous on the under surface. ♄. S. Native of Brazil in the province of Minas Geraes, near Itajuru de St. Miguel de Mato Dentro. Petals violaceous at the apex.

Scariose-stipuled Ionidium. Fl. Jan. Shrub 1 foot.

19 I. VILLOSI'SSIMUM (St. Hil. in mem. mus. 11. p. 480.) stem suffruticose, very villous; leaves alternate, lanceolate, acute at both ends, serrated, villous; stipulas quite entire, scarious; sepals pinnatifid, very hairy; lip large, semi-orbicular, cuspidate, obliquely-truncate at the base. ♄. S. Native of Brazil in the province of Minas Geraes. Petals cream-coloured?

Very-villous Ionidium. Shrub 1 foot.

20 I. POA'YA (St. Hil. in mem. mus. 11. p. 482.) plant very hairy; stem suffruticose, usually simple; leaves alternate, almost sessile, ovate, acutish, somewhat cordate at the base, obsoletely-toothed; stipulas linear, scarious, quite entire, hardly manifest; lip large, broad, obcordate; filaments bearded on the outside at the apex; processes of anthers membranous, small. ♄. S. Native of Brazil, plentiful in the fields on the western extremity of the province of Minas Geraes, chiefly near the town called Paracatu and the villages called St. Luzia de Goyaz and Meiaponte. Petals white or blue. Root emetic. This plant is called in Brazil *Poaya do Campo*.

Poaya Ionidium. Fl. April, Aug. Shrub 1 foot.

21 I. LANA'TUM (St. Hil. in mem. mus. 11. p. 482. t. 23. f. a.) plant woolly; stem simple; leaves alternate, intermediate ones elliptical, obtuse, with short points, quite entire; stipulas

linear-awl-shaped, quite entire, scariose; lip large, broad, obcordate; filaments longer than the lobes of the anthers. ♃. S. Native of Brazil in grassy fields near the village called Contendas, in the desert of the river St. Francisco. Petals pale-blue.

Var. β, dentàtum (St. Hil. l. c. p. 484.) lower leaves obsoletely-toothed.

Woolly Ionidium. Fl. Sept. Pl. ½ to ¾ foot.

22 I. NA'NUM (St. Hil. in mem. mus. 11. p. 484. t. 23. f. b.) stem dwarf; leaves alternate, upper ones sometimes opposite, acutish, toothed, but quite entire at the base, pubescent or pilose; footstalks hairy; stipulas small, linear, acute; sepals lanceolate, acuminated, quite entire, hairy; lip of flower large, transversely-elliptical, truncate and toothed at the apex. ♄. S. Native of Brazil in dry pastures, near the Fort called Belem, in the province Rio Grande do Sul. Petals white, but yellow at their base.

Dwarf Ionidium. Fl. Jan. Shrub 2 or 3 inches.

23 I. BIGIBBÒSUM (St. Hil. in mem. mus. 11. p. 418. t. 23. f. d.) stem shrubby; leaves opposite, oblong-lanceolate, acuminated, obsoletely toothed, glabrous, with the middle nerve pubescent; flowers all axillary; sepals finely ciliated; lip of flower ovate-oblong, obtuse, bigibbose at the base of the claw. ♄. S. Native of Brazil in old woods near the town of St. Carlos, in the province of St. Paul. Petals greenish.

Bigibbous-lipped Ionidium. Fl. Oct. Shrub 4 to 6 feet.

24 I. OPPOSITIFÒLIUM (Rœm. et Schult. syst. 5. p. 395. St. Hil. in mem. mus. 11. p. 487.) stem suffruticose, branched; leaves opposite, almost sessile, lanceolate-linear, remotely serrated, but very entire at the apex, with scabrous margins; stipulas awl-shaped; flowers in racemes; calyx glabrous; lip of flower transversely-elliptical, with rounded sides. ♄. S. Native of Brazil in the sand on the banks of the river Jiquitinhonha, on the confines of the provinces of Bahia and Minas Geraes. Vìola oppositifòlia, Lin. spec. 1327. Petals violaceous.

Opposite-leaved Ionidium. Fl. July. Pl. ½ to 1 foot.

§ 2. *Lip almost sessile, hardly twice the length of the calyx.*

25 I. ATROPURPU'REUM (St. Hil. in mem. mus. 11. p. 490.) stem suffruticose; lower leaves ovate, upper ones lanceolate, all acuminated and acute, obsoletely serrated, glabrous; stipulas caducous; flowers all racemose, small; sepals finely ciliated; lip of flower orbicular, scarcely larger than the lateral petals. ♄. S. Native of Brazil on the margins of woods on the mountain called Serra-da-Estrada-Nova, a little distance from Rio Janeiro; also in cultivated places, and in the cut down woods called Capueiras, near a farm called Uba. Lip of flower dark-purple.

Dark-purple-lipped Ionidium. Fl. Nov. Feb. Shrub 1 to 2 ft.

26 I. THESIIFÒLIUM (D. C. mss. et prod. 1. p. 309.) stem erect, simple, glabrous; leaves alternate, narrow, very long, glabrous, quite entire; stipulas and sepals awl-shaped; petals scarcely longer than the calyx. ♃. S. Native of Senegal and other parts of Guinea. Vìola thesiifòlia, Poir. dict. 8. p. 649. Flowers very small, pale-blue.

Thesium-leaved Ionidium. Fl. June, July. Clt. 1823. Pl. ½ ft.

27 I. LINIFÒLIUM (D. C. mss. et prod. 1. p. 309.) stem erect, puberulous; leaves alternate, linear, narrow, smooth; stipulas awl-shaped. ⊙? S. Native of Madagascar. Vìola linifòlia, Poir. dict. 8. p. 647. Flowers pale-blue.

Flax-leaved Ionidium. Fl. June, July. Pl. ½ foot.

28 I. POLYGALÆFÒLIUM (Vent. malm. t. 27.) stems branched, diffuse, procumbent; branches puberulous; leaves opposite, lanceolate, rather entire; stipulas lanceolate, one-half shorter than the leaves; sepals ovate-oblong, acute, pubescent; lip spatulate, rounded at the apex, exceeding the calyx; nectarial scales fleshy; capsules roundish, trigonal, 1-5-seeded; seeds somewhat globose, shining, black, with the sides flattened; cotyledons reniform. ♄. S. Native of New Spain, and near Mexico. H. B. et Kunth. nov. gen. amer. 5. p. 376. t. 496. Sòlea verticillàta, Spreng. in Schrad. journ. bot. 1800. vol. 2. p. 190. t. 6. Vìola verticillàta, Orteg. dec. 4. p. 50. Flowers greenish-yellow or white.

Milkwort-leaved Ionidium. Fl. April, Aug. Clt. 1795. Shrub 1 foot.

29 I. URTICÆFÒLIUM (Mart. mat. med. bras. ex Spreng. syst. append. p. 98.) branches covered with clammy pubescence; leaves almost sessile, somewhat cordate, ovate, acute, serrated, smooth; peduncles few-flowered; sepals entire; lower petals square. ♃. S. Native of Brazil. Sòlea urticæfòlia, Spreng. l. c. Flowers white or bluish. Root emetic.

Nettle-leaved Ionidium. Pl. 1 foot.

30 I. GRA'CILE (Moc. et Sesse, fl. mex. ined. icon. and D. C. prod. 1. p. 309.) stems erectish, almost simple; leaves alternate, oblong, entire; stipulas ovate-lanceolate, one-half shorter than the leaves; petals scarcely longer than the calyx, lower one hardly larger than the rest; seeds ovate, black. ♃. S. Native of Mexico. Perhaps a variety of *I. polygalæfòlium*.

Slender Ionidium. Pl. ½ foot.

31 I. VISCI'DULUM (H. B. et Kunth, nov. gen. amer. 5. p. 377.) stem woody, erect, branched, clammy; leaves opposite, lanceolate, glabrous, remotely serrulate; stipulas awl-shaped, minute; sepals ovate-lanceolate, glabrous; lip with a long claw, very broad, ovate, acute, dilated and concave at the base; the lateral petals length of the claw of the superior petal; 2 anterior stamens, each furnished at the base with a gland; terminal membranes acute. ♄. S. Native in humid sandy places near Angustura on the banks of the Orinoco. Flowers sweet-scented, white; but with the lip spotted with yellow at the base.

Viscid-branched Ionidium. Shrub ½ to 1 foot.

32 I. RIPA'RIUM (H. B. et Kunth, nov. gen. amer. 5. p. 378.) stem herbaceous, erect, somewhat branched, pubescent; lower leaves opposite, lanceolate, crenate-serrated; glabrous, somewhat ciliated; stipulas awl-shaped, minute; sepals lanceolate, acuminated or awl-shaped, ciliated; lip unguiculate, ovate-roundish, saccate and concave at the base; lateral petals one-half shorter than the rest, all ciliated towards the base; filaments almost wanting, 2 anterior ones furnished each with a scale-formed gland; terminal membranes acute; capsules ovate-globose, somewhat compressed, shining, brown. ⊙. S. Native of the kingdom of New Granada near Angostura de Carare, on the banks of the river Magdalena, at the height of 360 feet. I. attenuàtum, Willd. herb. ex Rœm. et Schult. syst. 5. p. 402. Flowers blue.

River-side Ionidium. Fl. June, July. Pl. ½ to 1 foot.

33 I. VERBENA'CEUM (H. B. et Kunth, nov. gen. amer. 5. p. 379. t. 497.) stem herbaceous, erect, somewhat branched, pubescent; leaves alternate, ovate-elliptical, acute, running into the footstalk at the base, crenate-serrated, hairy on both surfaces; stipulas linear-awl-shaped, puberulous, somewhat longer than the footstalks of the leaves; sepals lanceolate, acuminated, ciliated; lip with a long claw, roundish-elliptic, furnished with 2 gibbosities at the base, twice or thrice longer than the calyx; lateral petals a little longer than the calyx; filaments short, 2 inferior, gibbous at the base, in consequence of each being furnished with a gland; terminal membranes emarginate. ⊙. S. Gathered in the gardens of Mexico. Flowers pale-blue.

Vervain-like Ionidium. Fl. May, July. Clt. 1823. Pl. ½ ft.

34 I. CIRCÆOI'DES (H. B. et Kunth, nov. gen. amer. 5. p. 379. t. 498.) stem herbaceous, erect, simple, puberulous; leaves opposite, ovate, acuminated, serrate, glabrous, rounded at the base; stipulas glabrous, linear, falcate, almost equalling the footstalks in length; sepals ovate-lanceolate, acuminated, glabrous; lip

with a long claw, roundish-ovate, obtuse, 5 times longer than the calyx; lateral petals 3 times shorter than the lower one, oblong, falcate, narrowed in the middle, hence they appear as if furnished with an obtuse lobule on each side below; filaments short, 2 inferior ones furnished each with a gland at the base; terminal membranes emarginate; capsules glabrous, roundish-ovate, trigonal, 3 times longer than the calyx, 6-seeded, with oblong valves; immature seeds globosely-ovate, flattish, carunculate. ⊙. S. Native near Guayaquil in shady places on the shore of the Pacific ocean. Willd. herb. ex Rœm. et Schult. syst. 5. p. 401. Flowers violaceous.

Circæa-like Ionidium. Fl. June, July. Pl. 1 foot.

35 I. glutino'sum (Vent. malm. no. 27. in adn.) stems erectish, pubescent, clammy; leaves ovate-lanceolate, tapering a great way into the footstalk, sharply-toothed; stipulas awl-shaped, shorter than the footstalks of the leaves; lip obcordate. ♃. G. Native of Buenos Ayres. Viola glutinòsa, Poir. dict. 8. p. 647. Calyx, when dry, greenish, not violaceous, as in the following, to which it is very much akin.

Clammy Ionidium. Fl. Pl. ½ foot.

36 I. parvifloʻrum (Vent. malm. p. 27. in adn.) shrubby, branched, diffuse; branches elongated, puberulous; leaves alternate, ovate, serrated, tapering a little way into the footstalk; stipulas lanceolate, awl-shaped, scarcely the length of the footstalks of the leaves; peduncles glabrous, rising above the leaves; sepals ovate-lanceolate, acute; lip 3 times longer than the calyx, ovate, 2-lobed, with the lobes roundish and spreading; nectarial scales somewhat clavate; capsules roundish, trigonal, 3 times longer than the calyx, 3-5-seeded. ♄. S. Native in the warmer regions of South America near Santa-Fe-de-Bogota. H. B. et Kunth. nov. gen. amer. 5. p. 375. Viola parviflòra, Lin. fil. suppl. 396. Flowers purplish. The roots are yellow, and are used instead of Ipecacuanha in the southern parts of the province of St. Paul in Brazil as well as in Peru.

Var. β? branches very long. Viola filifórmis, Ruiz, et Pav. ined. Native of Peru.

Small-flowered Ionidium. Fl. June, July. Shrub procumbent.

37 I. microphyʻllum (H. B. et Kunth, nov. gen. amer. 5. p. 374. t. 495.) shrubby, branched, diffuse; branches pubescent; leaves opposite, elliptical-oblong, acute, serrated, rather pilose, ciliated; peduncles 3 times longer than the leaves, marked with a puberulous line; stipulas lanceolate, acuminated, ciliated, 3 times longer than the footstalks of the leaves; sepals ovate-oblong, acute; lip somewhat fiddle-shaped; double the length of the calyx; nectarial scales somewhat ovate, capsules roundish-elliptical, trigonal, 3-6-seeded. ♄. S. Native among stones near Lactacunga in Quito, at the height of 4440 feet. Viola microcéphala, Bonpl. ined. Viola microphýlla, Willd. herb. Viola parviflòra, Rœm. et Schult. syst. 5. p. 391. Flowers purplish.

Small-leaved Ionidium. Shrub procumbent.

† *Species not sufficiently known.*

38 I.? Claytonioiʻdes (Rœm. et Schult. syst. 5. p. 402.) stem furnished with one perfoliate leaf. Native —?

Claytonic-like Ionidium. Pl. ½ foot.

39 I.? ereʻctum (Ging. mss. and D. C. prod. 1. p. 311.) stem straight, filiform, roughish; leaves linear, mucronate, remotely denticulated, straight; stipulas lanceolate, ciliated, adpressed; flowers solitary, axillary, nodding. Native of the East Indies. Viola erécta, Roth. nov. spec. 165. Flowers very small.

Erect Ionidium. Pl. ½ foot.

40 I.? suffrutico'sum (Ging. mss. and D. C. prod. 1. p. 311.) stems procumbent, roughish; leaves elliptic-lanceolate, serrated, somewhat pubescent; stipulas lanceolate, pilose, at length spreading, form of prickles; flowers axillary, equal behind, nodding. ♄.? S. Native of the East Indies. Viola suffruticòsa, Roth. nov. spec. 165.

Suffruticose Ionidium. Shrub procumbent.

41 I.? frute'scens (Ging. mss. and D. C. prod. 1. p. 311.) stems ascending, roughish, shrubby at the base; leaves oblong-lanceolate, mucronate, glabrous, somewhat ciliated, serrated; stipulas setaceous, erect, pilose; flowers axillary, solitary, equal behind, nodding. ♄.? S. Native of the East Indies. Viola frutéscens, Roth. nov. spec. 167.

Frutescent Ionidium. Shrub ½ foot.

42 I.? brevicau le (Mart. in litt. and D. C. prod. 1. p. 311.) stem short, ascending; leaves crowded, almost sessile, alternate, ovate-lanceolate, acute, serrated, pubescent. Native of Brazil.

Short-stemmed Ionidium. Pl. ¼ foot.

43 I. linea'tum (Ging. mss. and D. C. prod. 1. p. 311.) branches procumbent; leaves opposite, ovate, lined, stalked, under surface pubescent; stipulas awl-shaped. ♄.? S. Native of Cuba. Viola lineàta, Orteg. dec. 4. p. 49. Lower petal or lip violaceous, with a white claw; lateral ones violaceous, upper one white.

Var. β? lower leaves obovate, smoothish. Native of Cuba. Viola lineàta, herb. hort. monsp.

Lined-leaved Ionidium. Shrub procumbent.

44 I.? calceola'rium (Ging. mss. and D. C. prod. 1. p. 311.) stem branched, pilose; leaves opposite, elliptic-lanceolate, tapering into the footstalk, somewhat stem-clasping; stipulas awl-shaped; sepals awnedly-acuminated, glabrous. ⊙. S. Native of Mexico. Calceolària, Moc. et Sesse, fl. mex. ined. not of Poir. Perhaps the Viola calcària labello obovato retuso of Lœfl. itin. p. 183. no. 1.

Slipper-flowered Ionidium. Pl. 1 foot.

45 I.? longifo'lium (Moc. et Sesse, fl. mex. icon. ined. and D. C. prod. 1. p. 311. but not of Rœm. et Schult.) stems simplish; leaves opposite, lanceolate-linear, rarely serrated, very acute; stipulas lanceolate, somewhat longer than the footstalks; peduncles 3 times longer than the leaves. ♃. S. Native of Mexico.

Long-leaved Ionidium. Pl. 1 foot.

Cult. These plants grow best in a mixture of loam, sand, and peat, and young cuttings of the stove and green-house perennials and shrubs will root freely if planted in sand under a bell-glass. The annual species may be sown in pots and plunged in a gentle hot-bed, and when the plants have attained two or three inches in height, they should be planted separately into small pots, and shifted from time to time as they grow, and about the end of June they may be removed into the green-house, where they will ripen their seed: or they may be planted out in the open border about the end of May, in front of a south wall.

X. HYBA'NTHUS (from *υβος, hybos,* a tuber, and *ανθος, anthos;* in allusion to the form of the spur.) Jacq. amer. 77. H. B. et Kunth, nov. gen. amer. 5. p. 385. D. C. prod. 1. p. 311.

Lin. syst. *Pentándria, Monogýnia.* Sepals unequal, running into the pedicel at the base, but not appendiculated. Petals unequal; lower one saccate at the base, longer than the rest, channelled in the middle and dilated at the apex into a 2-lobed limb, the rest shorter and 3-nerved. Stamens oblong, connate between themselves into a disk at the base; anthers inserted low down, two lower ones with contiguous obliterated cells, and furnished each with a nectarial shell-formed gland at the base; these glands are drawn in within the swelling of the lower petal. Capsules obovate, few-seeded. Inelegant, usually spiny shrubs, with the appearance of *Rándia.* Leaves scattered, those on the branches alternate, and somewhat fasciculate on the stems. Peduncles on the sides, or lateral, solitary, or many crowded together, bifid at the apex. Flowers pedicellate,

whitish, with the pedicels bracteate at the base and jointed above the base. St. Aug. St. Hilaire considers *Pombàlia* and *Hybánthus* to be identical with *Ionídium*.

1 H. Havane'nsis (H. B. et Kunth, l. c. p. 385. t. 494.) stem erect, spiny, branched; leaves oblong, remotely serrated; flowers whitish; lower petal 2-lobed at the apex; peduncles bifid, somewhat racemose. ♄. S. Native near Havanah in the island of Cuba.

Var. α, *Jacquiniànus* (D. C. prod. p. 311.) leaves emarginate at the apex, tapering at the base; sepals ovate, 3 lower ones gibbous at the base; flowers so small as scarcely to be examined with the naked eye; petals, 4 of which are ovate and obtuse, the fifth one is oblong, attenuate in the middle and bifid at the apex, a little longer than the rest; style awl-shaped. ♄. S. Native in wooded mountains. Ionídium Jacquiniànum, Rœm. et Schult. syst. 5. p. 397.

Var. β, *Humboldtiànus* (D. C. prod. 1. p. 312.) leaves entire at the apex, scarcely stalked; stipulas ovate, obtuse; flowers in racemose fascicles, larger than those of var. α; sepals oblong, obtuse, smooth; lower petal saccate and concave at the base, 3 times longer than the calyx, with a dilated 2-lobed limb, lateral ones oblong, obtuse, obsoletely 3-lobed, double the length of the calyx, upper ones obtuse, hardly shorter than the lateral ones; anthers somewhat cordate; ovary roundish-ovate, glabrous, 9-seeded; style jointed and somewhat hooked at the apex.

Havanah Hybanthus. Shrub 2 to 7 feet.

2 H.? Mexica'nus (Ging. mss. and D. C. prod. 1. p. 312.) stem prickly; leaves oblong; lower petal acuminated at the apex; peduncles 1-flowered, in fascicles. ♄. S. Native of Mexico. Moc. et Sesse, fl. mex. icon. ined. Flowers whitish?

Mexican Hybanthus. Shrub 1 foot.

Cult. These shrubs may be grown in a mixture of loam, sand, and peat; and young cuttings will root freely under a bell-glass if planted in sand, and placed in a moderate heat.

XI. ANCHIE'TEA (in honour of P. Anchietea, a very celebrated Brazilian Jesuit, who wrote on the plants of the province of St. Paul in Brazil.) St. Hil. in mem. mus. 11. p. 464. pl. usu. bras. t. 18.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx deeply 5-parted, unequal. Petals 5, very unequal, two upper ones smallest, two intermediate ones longer, lowest one largest, and unguiculate, with a spur at the base. Anthers almost sessile, alternating with the petals, two lowest ones on very short filaments, each drawn out into a filiform appendage, which is bent back into the spur. Ovary superior. Stigma simple. Capsule large, bladdery, inflated, obtuse, 1-celled, 3-valved, many-seeded. Valves membranaceous, bearing the seeds on the middle. Seeds in 2 rows, large, very flat, emarginate at the umbilicus, and girded by a broad membrane.—Shrubs with alternate, stalked, stipulate leaves. Stipulas twin, lateral, caducous. Flowers axillary, solitary, or in fascicles.

1 A. saluta'ris (St. Hil. l. c. p. 465.) leaves ovate, acute, crenated; flowers in axillary fascicles; upper petal longer than the calyx; labellum ovate; spur incurved. ♄. S. Native of Brazil, in the province of St. Paul. The roots of this shrub are used by many persons in the neighbourhood of Rio Janeiro, as a cathartic. It is used with success in eruptions of the skin. Flowers whitish.

Salutary Anchietea. Shrub 6 feet.

2 A. pyrifòlia; leaves ovate, acute, crenated; flowers in axillary fascicles; upper petal longer than the calyx; labellum obovate; spur incurved. ♄. S. Native of Brazil about Rio Janeiro. Noiséttia pyrifòlia, Mart. fl. bras. 1. p. 24. t. 16. Flowers whitish, veined with red at the base; lower petal obovate.

Pear-leaved Anchietea. Fl. July, Aug. Clt. 1826. Shrub cl.

Cult. For cultivation and propagation see *Hybánthus*.

Tribe II.

ALSODI'NEÆ (R. Br. congo. p. 21. D. C. prod. 1. p. 312.) Petals equal between themselves. Stamens usually joined together at their base, or adnate to the inner side of an urceolus, which is situated between the petals and the stamens. According to Aug. St. Hilaire (see mem. mus. 11. p. 493.) *Alsòdea*, *Ceranthèra*, and *Rinòria* are not generically distinct.

XII. GONOHO'RIA (*Gonohorie* is the name of *Gonohòria flavéscens* in Guiana.) D. C. mss. and prod. 1. p. 312. Gonohòria, Passoúra and Riàna, Aubl. guian. 1. p. 237 and 239. t. 95 and 94. and app. p. 21. t. 380.

Lin. syst. *Pentándria*, *Monogýnia*. Sepals imbricate. Petals convolute in æstivation. Stamens free, approximate; filaments on short stipes, dilated at the apex into a strap, furnished each on the outside with an appendiculate erect scale, and bearing the anthers a little higher up; lobes of anther bristly at the apex. Style flexuous, awl-shaped; stigma obtuse. Ovary villous. Capsule 3-valved, with the valves few-seeded. Seeds according to Aublet globose. Shrubs with opposite or alternate leaves. Flowers in axillary or terminal racemes. Pedicels very short, erect, 1-flowered, furnished with a bractea at the base of each, and 2 bracteoles in the middle. Flowers small, white. Stipulas deciduous.

1 G. Ria'na (D. C. mss. and prod. 1. p. 312.) leaves ovate, serrated, acuminated at the apex; scales of stamens acuminated; racemes spike-formed. ♄. S. Native in the woods of Guiana about Arauren. Riàna Guianénsis, Aubl. guian. 1. p. 237. t. 94. Flowers white. *Riana* is probably the name of the tree in Guiana.

Riana Gonohoria. Shrub 10 feet.

2 G. ulmifòlia (H. B. et Kunth, nov. gen. amer. 5. p. 387. t. 491.) leaves twin or tern, but somewhat opposite at the top of the branchlets, oblong, acuminated, toothed, smooth, upper surface shining, with the nerves and veins puberulous; racemes terminal, solitary, branched, 2 or 3 times shorter than the leaves. ♄. S. Native of New Granada on the banks of the river Magdalena. Sepals lanceolate, ciliated. Petals 2 or 3 times longer than the calyx, oblong, obtuse, veined, with the veins somewhat parallel, flat, and whitish. Terminal membranes of stamens rounded at the apex. Scales wanting on the lower stamens? Ovary triquetrous, pilose, 3-seeded. Capsules obovate, turbinate, triquetrous, rather pilose or smooth and brown at the apex. Seeds somewhat globose, with the sides hardly compressed, smooth, glabrous, marked by a longitudinal furrow from the hilum to the opposite faveola. Flower whitish?

Elm-leaved Gonohoria. Shrub 10 feet.

3 G. Passou'ra (D. C. mss. and prod. 1. p. 312.) leaves ovate, almost entire, with a short acumen at the apex; sepals lanceolate, acute; scales of stamens acute. ♄. S. Native in the woods of Guiana. Gonohòria flavéscens, Aubl. guian. 1. p. 239. t. 93. Passoúra, Aubl. guian. suppl. p. 21. t. 380. *Passoura* is the name of the tree in Guiana. Flowers yellow.

Passoura Gonohoria. Shrub 6 feet.

4 G. Lobolo'ba (St. Hil. in mem. mus. 11. p. 494.) leaves alternate and opposite, crowded at the tops of the branches, oblong-lanceolate, narrow, acute, obsoletely-serrated; racemes simple; pedicels puberulous; scales hardly manifest at the base of the stamens; seeds fixed to the base of the placentas. ♄. S. Native of Brazil near Rio Janeiro. Alsòdea physíphora, Mart.

fl. bras. 1. p. 29. t. 20. Physíphora lævigàta, Sol. mss. The green leaves are very mucilaginous, and have an herbaceous taste, the negroes in many of the cantons in the environs of Rio Janeiro eat them with their food. M. Aug. St. Hilaire is of opinion that the leaves would acquire a more agreeable taste if the shrub was planted in good soil under the shade of trees, in order to blanch them. *Lobolòba* is the Brazilian name of the shrub.

Lobolobo Gonohoria. Fl. Sept. Nov. Shrub 6 feet.

5 G. castaneæfòlia (St. Hil. l. c. p. 495.) leaves alternate and opposite, crowded at the top of the branches, oblong; lanceolate sharply serrated, mucronate, with the lateral nerves parallel, rather prominent; racemes compound, rather loose, pubescent; urceolus cup-shaped? girding the ovary. ♄. S. Native of Brazil in hedges not far from Rio Janeiro.

Chesnut-leaved Gonohoria. Fl. Aug. Shrub 6 feet.

6 G. racemo'sa; leaves opposite, oblong, acuminated, quite entire, smooth on both surfaces; racemes opposite, elongated; pedicels cymose; filaments lanceolate, acute, serrulated; cells of anthers horned. ♄. S. Native of Brazil. Alsòdea racemòsa, Mart. fl. bras. 1. p. 29. t. 20. Flowers small, white.

Racemose-flowered Gonohoria. Fl. Nov. Dec. Shrub 6 feet.

7 G. cu'spa (H. B. et Kunth, 7. p. 242. under *Gonòria.*) leaves elliptical-oblong, obtuse, quite entire, smooth, shining above, upper ones opposite; peduncles simple, bracteate. ♄. S. Native of New Granada. Alsòdea Cúspa, Spreng. syst. append. p. 99. Flowers white, small. *Cuspa* is the name of the tree in New Granada, where its bark is celebrated for its frebrifugal qualities both in powder and in decoction.

Cuspa Gonohoria. Tree 20 feet.

8 G. Megapota'mica; leaves elliptical, oblong, quite entire, reticulately veined, rather pubescent beneath; peduncles cymiferous, axillary, bifid; filaments bearded on the back. ♄. S. Native of Brazil at Rio Grande. Alsòdea, Spreng. syst. app. p. 99.

Rio Grande Gonohoria. Shrub 6 feet.

Cult. The species of the genus *Gonohòria* will grow well in a mixture of loam and sand, and young cuttings will root freely under a bell-glass if planted in sand. None of the species have yet been introduced to the gardens.

XIII. RINO'REA (*Rinori* is the name of *R. Guianénsis* in Guiana.) Aubl. guian. 1. p. 235. t. 93. D. C. prod. 1. p. 312.

Lin. syst. *Pentándria, Monogýnia.* Character the same as *Gonohòria*, but with the filaments dilated from the base and joined into an urceolus, girding the ovary, and bearing the anthers lower down, approximate. Middle-sized trees. Leaves alternate, stipulate; stipulas deciduous. Flowers in racemes; racemes axillary or terminal, loosely panicled. Pedicels drooping, 1-flowered, bearing a bractea at the base of each, with two smaller ones toward the middle, and jointed. Flowers small, white. Ovary ovate, 3-lobed, 1-celled, 3-seeded. According to St. Hilaire this genus does not differ from *Gonohòria.*

FIG. 65.

1 R. Guiane'nsis (Aubl. guian. 1. p. 235. t. 93.) flowers in compound racemes; leaves deeply-serrated. ♄. S. Native of Guiana and Brazil. Gonohòria Rinòria, St. Hil. in mem. mus. 11. p. 495. Alsòdea paniculàta, Mart. fl. bras. p. 30. t. 21.

Guiana Rinorea. Tree 14 feet.

2 R.? integrifòlia (Ging. mss. and D. C. prod. 1. p. 313.) peduncles solitary or in pairs, 1-flowered; leaves entire. ♄. S. Native of Brazil. Gonohòria alternifòlia, Spreng. new entd. 2. p. 151. Flowers whitish.

Entire-leaved Rinorea. Tree 15 feet.

Cult. The species of this genus should be cultivated in the same manner as *Gonohòria*, which see.

XIV. ALSO'DEA (from αλσωδης, *alsodes*, leafy; plants thickly beset with leaves.) Pet. Th. hist. veg. afr. 2. p. 55. t. 17 and 18. nov. gen. madag. p. 55. D. C. prod. 1. p. 313.

Lin. syst. *Pentándria, Monogýnia.* Sepals acute, imbricate, 3 exterior and 2 interior. Petals alternate, longer than the sepals, twisted in æstivation. Stamens alternating with the petals; filaments loosened from or adnate to the urceolus which girds the ovary, hence dilated into ligulæ, not unguiculated, bearing the anthers at the base of those ligulæ, exceeding the ovary in length; lobes of anther usually drawn out at the apex into bristly appendages. Urceolus simple on the outside, or girded or furnished with various appendages. Ovary simple. Style club-shaped. Capsule covered with the permanent calyx and corolla, obversely turbinate, bluntly 3-sided. Seeds one or two in each valve. Cotyledons orbicular.—Shrubs or trees from Madagascar. Leaves usually alternate, feather-nerved; stipulas small, deciduous. Flowers small, whitish, racemose; racemes axillary and terminal. Pedicels bracteate, jointed.

§ 1. *Urceolus simple.*

1 A. pauciflòra (Pet. Th. l. c. p. 57. f. 17.) urceolus of stamens simple; leaves wedge-shaped on short footstalks; flowers few, somewhat corymbose; pedicels reflexed. ♄. S. Native of Madagascar in shady places.

Few-flowered Alsodea. Shrub 4 feet.

2 A. arbo'rea (Pet. Th. l. c. p. 57.) urceolus of stamens simple; leaves on long footstalks, deflexed; flowers panicled. ♄. S. Native of Madagascar.

Tree Alsodea. Clt. 1823. Tree 20 feet.

§ 2. *Urceolus girded.*

3 A. angustifo'lia (Pet. Th. l. c. p. 57. t. 17. f. 1.) urceolus of stamens girded; leaves oblong-lanceolate, toothed; racemes spiked. ♄. S. Native of Madagascar.

Narrow-leaved Alsodea. Shrub 6 feet.

4 A. latifo'lia (Pet. Th. l. c. p. 57. t. 18. f. 2.) urceolus of stamens girded; leaves ovate, obtusely-acuminated; racemes glabrous, dense. ♄. S. Native of Madagascar.

Broad-leaved Alsodea. Clt. 1823. Shrub 6 feet.

5 A. pube'scens (Pet. Th. l. c. p. 57. t. 18. f. 3.) urceolus of stamens girded; leaves ovate, cuneated at the base, serrated; racemes loose, pubescent. ♄. S. Native of Madagascar.

Pubescent-racemed Alsodea. Shrub 6 feet?

Cult. The species of this genus will thrive best in a mixture of loam and sand, and young cuttings will strike root under a bell-glass if planted in a pot of sand, placed in heat.

XV. CERANTHE'RA (κερας, *keras*, a horn, and ανθηρα, *anthera*, an anther; in allusion to the lobes of the anthers being terminated by a bristle.) Beauv. fl. ow. 2. p. 11. t. 65. D. C. prod. 1. p. 313.—Passàlia, Banks herb. ex Brown, congo, p. 21. Alsòdea species, Spreng.

Lin. syst. *Pentándria, Monogýnia.* Sepals acute. Petals lanceolate, twice the length of the sepals. Urceolus toothed, joined with the petals at the base, situated between the petals and stamens. Filaments unguiculate at the base; hence dilated into petal-like scales at the apex, bearing the anthers high up at the base of the scales; lobes of anthers bristly; claws of filaments adnate to the urceolus, but free at the top. Ovary ovate. Capsules unknown.—Shrubs. Leaves alternate,

broad. Flowers in panicled racemes; pedicels bracteate. Flowers small, greenish-yellow.

Obs. From the figures of Beauvais, fl. ow. l. c. the structure of the stamens appears to be the same as those of *Gonohòria*, but differs in the stamens being fixed to the inner parietes of the urceolus, not free as in *Gonohòria*. It differs from *Alsòdea* as *Rinòria* does from *Gonohòria*, in the filaments being unguiculate, not dilated from the base, and bearing the anthers high up, not low down.

1 C. denta'ta (Beauv. fl. ow. et ben. 2. p. 11. t. 65.) leaves ovate-lanceolate, toothed; petals lanceolate-ovate. ♄. S. Native of Buonopozo in the kingdom of Waree, and in many other parts of Guinea, Sierra Leone, Cape Coast, and the Island of St. Thomas, Isles de Los, &c. Flowers small, yellowish-white.

Toothed-leaved Ceranthera. Fl. March, April. Clt. 1824. Shrub 6 feet.

2 C. subintegrifo'lia (Beauv. l. c. t. 66.) leaves lanceolate-oblong, rarely with sinuated margins; petals ovate. ♄. S. Native about the town of Waree and many other parts of Guinea. Flowers white.

Subentire-leaved Ceranthera. Fl. Ju. Jul. Clt. 1824. Sh. 6 ft.

Cult. These shrubs will thrive best in a mixture of loam and sand, and young cuttings will root if planted in sand under a bell-glass, plunged in heat.

XVI. PENTA'LOBA (from πεντε, *pente*, five, and λοβος, *lobos*, a lobe; in allusion to the 5-lobed berry.) Lour. coch. p. 154. D. C. prod. 1. p. 314.

Lin. syst. *Pentándria*, *Monogýnia*. Sepals 5, lanceolate, erect, pilose. Petals 5, lanceolate, somewhat reflexed at the apex, conniving into a little bell at the base. Nectary 5-toothed, erect; filaments 5, filiform, flattish, standing upon the incisures of the nectary, almost equal in length to the corolla. Ovary pilose. Style short, pilose; stigma simple. Berry roundish, 5-lobed, 1-celled, 5-seeded; seeds ovate. A middle-sized tree with alternate leaves, and pale, sessile, crowded flowers. Perhaps a congener of *Alsòdea?*

1 P. se'ssilis (Lour. fl. coch. p. 154.). ♄. G. Native on mountains in Cochin-China. Flowers whitish.

Sessile-flowered Pentaloba. Tree 20 feet?

Cult. This tree should be grown in a mixture of loam and peat. Young cuttings will root under a bell-glass, if planted in sand.

XVII. SPATULA'RIA (from *spatula*, a spatula; form of petals). St. Hil. in mem. mus. 11. p. 491. t. 24.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx small, 5-parted, rather unequal (f. 66. *c.*), deciduous. Petals 5, elliptical, inserted at the base of the calyx (f. 66. *b.*), with long claws, spatulate, rather unequal, deciduous, with the claws conniving into a tube (f. 66. *b.*). Stamens 5 (f. 66. *a.*), inserted in the base of calyx and alternating with the petals, deciduous; filaments flat; anthers drawn out at the apex into a membranous point (f. 66. *a.*) affixed by their base, opening lengthwise from the front to the sides. Style 1, tapering at the base (f. 66. *e.*), and denticulated at the apex. Stigma hardly manifest (f. 66. *f.*). Ovary free, 1-celled, many-seeded (f. 66. *d.*); ovulæ numerous, fixed to 3 parietal placentas. Shrub. Leaves alternate and opposite, simple, toothed. Stipulas caducous. Peduncles 1-4, terminal, bracteate at the base, 1-3-flowered; pedicels erect, jointed, and when there are three together they constitute a little umbel.

FIG. 66.

1 S. longifo'lia (St. Hil. l. c. p. 492. t. 24.) ♄. S. Native of Brazil near Rio Janeiro in old woods on a mountain called Corcovada, but very rare. Petals white or pale violet.

Long-leaved Spatularia. Fl. Oct. Shrub 6 feet.

Cult. For propagation and cultivation see *Ceranthèra*.

XVIII. HYMENANTHE'RA (from υμην, *hymen*, a membrane, and ανθηρα, *anthera*, an anther; alluding to the anthers being terminated by a membrane, or probably from the scales on the back). Banks herb. ex R. Br. cong. p. 23.

Lin. syst. *Pentándria*, *Monogýnia*. Sepals 5, imbricate. Petals 5, alternate, ovate, acuminated, at last reflexed, longer than the calyx, obliquely imbricated in æstivation (R. Brown). Structure of stamens approaching to *Vìola*, but closed together at the base into a monodelphous disk; with a scale opposite each on the back. Style very short. Stigmas 2, acute. Capsules somewhat baccate (when dry rough and reticulately veined) thin, ovate (1-celled, 1-seeded?) 2-celled; cells 1-seeded (R. Brown) covered by the permanent calyx, petals, and stamens. Seeds conforming to the capsule and filling the same, hanging from the nerviform placenta (as in *Vìola*). Structure of seed between the *Violarièæ* and *Polygàleæ*, ex R. Brown. Shrubs branched. Leaves coriaceous, sometimes solitary and alternate, sometimes in fascicles. Flowers small, axillary. Peduncles solitary, 1-flowered, furnished with 2 bracteas at the base of each.

1 H. angustifo'lia (R. Br. in herb. Banks and D. C. prod. 1. p. 315.) leaves linear, quite entire. ♄. G. Native of Van Diemen's Land at Port Dalrymple. Flowers yellow.

Narrow-leaved Hymenanthera. Shrub 6 feet.

2 H. denta'ta (R. Br. in herb. Banks and D. C. prod. 1. p. 315.) leaves oblong, denticulated. ♄. G. Native of New Holland near Port Jackson. Flowers yellow.

Toothed-leaved Hymenanthera. Fl. April, May. Clt. 1824. Shrub 6 feet.

Cult. These shrubs will thrive best in a mixture of loam and peat, and young cuttings will root readily under a bell-glass, if planted in sand.

XIX. PIPA'REA (from *Pipari*, the name of the tree in Guiana) Aubl. guian. 2. suppl. p. 31. t. 386.

Lin. syst. *Pentándria*, or *Polyándria*, *Monogýnia*. Sepals equal, permanent, at length reflexed at the apex. Petals equal? Filaments 10-15? awl-shaped, permanent, erect, shorter than the calyx, smooth, with the same number of appendages, these alternate with the stamens and are oblong and very hairy, all connected together and girding the ovary. Capsule ovate, triquetrous, 1-celled, 3-valved. Style filiform; stigma 3-parted (Gært. fil.) Capsule 3-valved, 1-celled, opening laterally from the top, covered densely on the inside with velvety brown down; valves bearing the seeds in the middle, one only in each valve, they are globose and velvety (2 of which are generally abortive). Shrubs or trees. Leaves alternate, scarcely stalked, feather-nerved, furnished with 2 caducous stipulas. Pedicels very short, 1-flowered, axillary, solitary, or numerous, jointed?

Perhaps this genus is truly pentandrous, if so it belongs to *Violarièæ*, but if polyandrous it ought perhaps to be placed in *Tiliàceæ*.

1 P. denta'ta (Aubl. guian. 2. p. 31. t. 386.) flowers solitary or twin; leaves elliptical or acuminated, brownish-velvety be-

neath; capsules acuminated, smoothish. ♄. S. Native of Cayenne in woods. Alsòdea Pipàrea, Spreng. syst. 1. p. 807.

Toothed-leaved Piparea. Shrub 5 feet.

2 P. MULTIFLO'RA (Gært. fil. carp. 3. p. 231. t. 224. f. 1.) flowers numerous; leaves oblong, acuminated, smooth beneath; capsule rather obtuse, velvety. ♄. S. Native of Cayenne.

Many-flowered Piparea. Shrub 5 feet.

Cult. For propagation and cultivation see *Ceranthèra*, p. 342.

ORDER XXII. DROSERA'CEÆ (plants agreeing with *Drosera* in many important characters). D. C. Theor. 214. prod. 1. p. 317. Drosèreæ, Sal. parad. no. 95.

Calyx of 5 permanent equal sepals (f. 68. *c.*) imbricate in the bud. Petals 5, hypogynous, distinct (f. 67. *b.* f. 68. *a.*) or constituting a gomopetalous corolla, as in *Romanzòvia*, alternating with the sepals, usually marcescent. Stamens free, permanent, sometimes equal in number to the petals (f. 67.), when this is the case they alternate with them, sometimes double, triple, or quadruple that number (f. 68.). Anthers 2-celled, birimose. Ovary 1, sessile (f. 67. *e.* f. 68. *c.*). Styles solitary (f. 68.) 3 (f. 67. *b.*) 5, sometimes joined at the base, sometimes distinct, divided at the apex (f. 67. *b.*), rarely simple. Capsule 1-3-celled, 3 (f. 67. *g.*) 5 (f. 68. *c.*) valved; valves bent inwards more or less at the edges, and opening from the top, sometimes with a seminiferous nerve in the middle of each valve, sometimes only bearing the seeds at the base of the valves. Seeds disposed in two rows along the middle nerve, or crowded at the bottom of the capsule; they are ovate, shining, naked, or wrapped in a thin follicular arillus. Albumen cartilaginous or fleshy. Embryo straight, slender, with thickish cotyledons, and an obtuse radicle which is turned towards the hilum. This order contains but a small group of plants, inhabitants of bogs, marshes, or inundated grounds; they are remarkable for the abundance of glandular hairs with which all parts of the herbs are usually clothed; sometimes, though rarely, the plants are extremely smooth, as in *Parnássia*. They are all perennial evergreen herbs, only 2 of which are in any way frutescent. The leaves are alternate, the young ones are always rolled up in a circinnate manner, so remarkable in ferns. The petioles are usually furnished with stipular hairs at the base. The young peduncles are usually rolled up in a circinnate manner. The flowers are blue, purple, yellow, white, or tinged with red. The medicinal properties of the plants appear to be trifling; the leaves of all have the power of curdling milk. The order differs from *Violarièæ* in the styles being seldom solitary, in the leaves being rolled up in a circinnate manner, before expansion not involute. It differs from *Polygàleæ* in the flowers being regular, not irregular, in the capsules being many-seeded, not 1-2-seeded, as well as in the leaves being stipulate, not exstipulate It differs from all the neighbouring orders in the remarkable habit of plants of which *Drósera*, *Dionæ'a*, and *Parnássia* give a very good idea. It is almost impossible to introduce seeds in a living state.

Synopsis of the genera.

1 DRO'SERA. Sepals and petals 5 (f. 67. *c.*) without appendages. Stamens 5. Styles 3 (f. 67. *b.*) 5, 2 or many-parted. Bog plants, ornamented with red irritable glandular hairs.

2 ALDROVA'NDA. Sepals and petals 5, without appendages. Stamens 5. Styles 5, short, filiform. Stigmas obtuse. A floating water plant, with whorled leaves, having a bladdery complicated limb.

3 ROMANZO'WIA. Sepals 5, connected at the base. Petals 5, joined into a 5-cleft deciduous corolla. Stamens 5, inserted at the bottom of the tube. A plant with kidney-shaped toothed leaves.

4 BY'BLIS. Sepals and petals 5, without appendages. Stamens 5. Style 1, filiform. Stigma 2-lobed. A bog plant with linear leaves ornamented with glandular hairs.

5 RORI'DULA. Sepals and petals 5, without appendages. Stamens 5. Style 1. Stigma 3-lobed. A small bog shrub, with linear leaves, ciliated with glandular hairs.

6 DROSOPHY'LLUM. Sepals and petals 5, with the claws approximate. Stamens 10. Styles 5, filiform. A small shrub with linear leaves, beset with stipitate glands.

7 DIONÆ'A. Sepals and petals 5 (f. 68. *a.*). Stamens 10-20. Style 1 (f. 68.). Stigma orbicular (f. 68.). A smooth bog plant, with 2-lobed irritable leaves, which are ciliated on the margins.

8 PARNA'SSIA. Sepals and petals 5. Scales or abortive stamens 5, these end in glandular bristles. Stigmas 4, sessile. Smooth bog herbs with roundish leaves.

I. DRO'SERA (from δροσερος, *droseros*, dewy; because the plants appear as if covered with dew, in consequence of being beset with glandular hairs). Lin. gen. 391. Lam. ill. t. 220. D. C. prod. 1. p. 317.

LIN. SYST. *Pentándria*, *Tri-Pentagýnia*. Sepals and petals 5 (f. 67. *c*), not appendiculated. Stamens 5. Styles 3 f. 67. *b.*) 6-8, 2 or many-parted. Herbs inhabiting boggy sphagnose places. Leaves ornamented with reddish irritable glandular hairs, discharging from their end a drop of viscid acrid fluid. These hairs have been thought irritable, so as to contract when touched, imprisoning insects somewhat in the manner of *Dionæ'a Muscípula*.

SECT. I. RORE'LLA (from *ros roris*, dew, see Genus). D. C. prod. 1. p. 317. Ros-sòlis, Tourn. inst. t. 127. Styles simple, or 2-3-parted, with the lobes entire and somewhat capitate at the apex.

§ 1. *Acaúles. Stemless. Leaves radical, usually rosulate. Scapes naked.*

1 D. ACAU'LIS (Thunb. prod. 57.) leaves oblong, obtuse, narrowed at the base; scape very short, 1-flowered. ♃. G. Native of the Cape of Good Hope. Flowers white. ?

Stemless Sun-dew. Fl. Jul. Aug. Clt. 1821. Pl. $\frac{1}{8}$ foot.

2 D. UNIFLO'RA (Willd. enum. 340.) leaves roundish, on short footstalks; scape short, 1-flowered. ♃. F. Native of the Straits of Magellan. Flowers white or red.

One-flowered Sun-dew. Fl. Jul. Aug. Pl. $\frac{1}{8}$ foot.

3 D. PYGMÆ'A (D. C. prod. 1. p. 317.) leaves roundish, peltate, on long footstalks; stipulas scarious; scape 1-flowered. ⊙. G. Native of New Holland on an island in the entrance to Jervis's Bay. D. pusílla, R. Br. ined. but not of Humboldt.

Pygmy Sun-dew. Pl. 1 inch.

4 D. PAUCIFLO'RA (Banks, herb. and D. C. prod. 1. p. 317.) leaves obovate-oblong, tapering at the base; scape beset with glandular hairs, 1-2-flowered; petals thrice as large as the

calyx. ♃. G. Native of the Cape of Good Hope. Flowers white or red.

Few-flowered Sun-dew. Fl. July, August. Clt. 1821. Pl. ¼ foot.

5 D. PUSI'LLA (H. B. et Kunth, nov. gen. amer. 5. p. 390. t. 490. f. 1.) leaves spatulate, glandular, with an obovate limb, upper surface as well as margins beset with hairs, scapes 2-3-flowered, and are glabrous as well as the calyx; seeds somewhat globose. ♃. S. Native in humid sandy places on the banks of the river Orinoco. D. biflòra, Willd. in Rœm. et Schult. syst. 6. p. 763. Flowers red? Stipulas palmately-5-parted.

Small Sun-dew. Fl. July, Aug. Pl. ⅛ foot.

6 D. TENE'LLA (H. B. et Kunth, l. c. p. 391. t. 490. f. 2. Willd. in Rœm. et Schult. syst. 6. p. 763.) leaves spatulate, with an obovate-roundish limb, upper surface as well as margins beset with glandular hairs; scapes capillary, elongated, 2-3-flowered, and are glabrous as well as the calyx; seeds oblong. ♃. S. Native of New Andalusia in alpine situations. Like *D. capillàris*. Flowers purple?

Pliant Sun-dew. Fl. July, Aug. Pl. ¼ foot.

7 D. UMBELLA'TA (Lour. fl. coch. ed. Willd. 1. p. 232.) leaves ovate, on long footstalks; scape naked at the apex, umbellately 5-flowered. ♃. G. Native of China. Flowers white.

Umbellate-flowered Sun-dew. Pl. ¼ foot.

8 D. BREVIFO'LIA (Pursh, fl. amer. sept. 1. p. 211.) leaves wedge-shaped, on very short footstalks; stipulas scarious, 3-5-cleft; scape 1-4-flowered. ⊙. H. Native in sandy swamps from Carolina to Georgia. Flowers rose-coloured.

Short-leaved Sun-dew. Fl. June. Pl. 1 inch.

9 D. PALEA'CEA (D. C. prod. 1. p. 318.) leaves oblong, stalked; stipulas scarious, acutely cut at the top; scape erect, glabrous, twice as long as the leaves; flowers in racemes at the top of the scape. ⊙. G. Native of New Holland at King George's Sound. Flowers red?

Chaffy Sun-dew. Pl. ⅛ foot.

10 D. TOMENTO'SA (St. Hil. in mem. mus. 11. p. 343.) leaves elliptical-oblong, very blunt, on very short footstalks, with the margin and upper surface beset with glandular hairs, under surface villous; stipulas ciliated to the middle; scapes erect, tomentose, but covered with glandular down at the top; calyxes densely clothed with glandular hairs. ♃. S. Native of Brazil in marshes on the mountains near Itambe in the province of Minas Geraes, at about the height of 2015 feet above the level of the sea. Hairs on the leaves white, but those on the scapes are brown. Flowers purple, all leaning to one side.

Var. β, glabràta (St. Hil. l. c. p. 344.) scapes more or less glabrous. ♃. S. Native of Brazil near the village called Milhoverde in that part of the province of Minas Geraes vulgarly called Distritodos-Diamantes, at about the height of 3700 feet above the level of the sea.

Tomentose Sun-dew. Pl. ¼ to ½ foot.

11 D. HIRTE'LLA (St. Hil. in mem. mus. 11. p. 344.) leaves spatulate, covered with glandular hairs on both surfaces; footstalks one half shorter than the limb of the leaf; stipulas 3-parted, ciliated; scape ascending at the base and covered with soft hairs, but with down towards the top; calyxes clothed with glandular hairs. ♃. S. Native of Brazil in dried up marshes near the town of Formigas in the province of Minas Geraes, and on the mountains called Serra-dos-Pyreneos in the province of Goyaz. Flowers purple, leaning to one side.

Var. β, lutéscens (St. Hil. l. c. p. 345.) leaves smaller, obovate, usually naked on the under surface; hairs on the scape manifestly stiffer and yellowish.

Hairy Sun-dew. Fl. Ju. Jul. Pl. ¼ to ½ foot.

12 D. TRINE'RVIA (Spreng. anleit. 1. p. 298.) leaves spatulate, wedge-shaped, sessile, 3-nerved; scapes few-flowered, and are as well as the calyxes pubescent. ⊙. ♃. G. Native of the Cape of Good Hope. Flowers red?

Three-nerved Sun-dew. Pl. ¼ foot.

13 D. CUNEIFO'LIA (Thunb. prod. 57.) leaves obovately-wedge-shaped, sessile, reticulately veined; scape few-flowered, and is as well as calyxes pubescent. ♃. G. Native of the Cape of Good Hope. Burch. trav. 1. p. 57. cat. no. 599. Flowers red and white.

Wedge-leaved Sun-dew. Fl. July, Aug. Pl. ¼ foot.

14 D. BURMA'NNI (Vahl. symb. 3. p. 50.) leaves spatulately wedge-shaped, sessile, reticulately-veined; scape erect, few-flowered, and is as well as calyxes glabrous. ⊙. ♃. S. Native of Ceylon, Coromandel, and perhaps China. Burm. zeyl. t. 94. f. 2. Flowers white.

Burmann's Sun-dew. Fl. July, Aug. Pl. ½ foot.

15 D. SESSILIFLÒRA (St. Hil. in mem. mus. ii. p. 341. t. 19. f. a.) leaves sessile, cuneated, very blunt at the apex, covered to the middle with glandular hairs, base and under surface naked; stipulas ciliated; scape flat, glabrous; calyxes clothed with glandular pubescence; style 5-parted; stigmas 5-7-parted. Native of Brazil in marshes near Tapeira and Riachao in the desert called Certaô-do-Rio-S-Francisco in the province of Minas Geraes. Flowers purple, leaning to one side.

Sessile-leaved Sun-dew. Fl. July, Aug. Pl. ½ foot.

16 D. MARI'TIMA (St. Hil. in mem. mus. ii. p. 346. t. 19. f. b.) leaves spatulate, almost exstipulate; with a wedge-shaped roundish border, upper surface clothed with glandular hairs; margins ciliately jagged; footstalks equal in length to the leaves; scape short, filiform, terete at the base, but flattened at the apex, clothed with glandular down as well as the calyx. ♃. S. Native of Brazil in the sea-sand near Ararangua at the termination of the province of St. Catharine and Rio-Grande-de-St.-Pedro-do-Sul, also on a mountain called Pao-de-Assucar on the sea-shore in the province of Cisplatine. Flowers purple, leaning to one side.

Sea-side Sun-dew. Fl. Ju. Oct. Pl. 2 inches.

17 D. SPATHULA'TA (Lab. nov. holl. t. 106. f. 1.) leaves oblong-spatulate, tapering somewhat into the footstalk; scape glandular at the top as well as calyxes; flowers almost sessile, disposed in short racemes. ⊙. ♃. G. Native of Van Diemen's Land and about Port Jackson. Flowers reddish?

Spatulate-leaved Sun-dew. Fl. July, August. Pl. ¼ foot.

18 D. PETIOLA'RIS (R. Br. ined. and D. C. syst. 1. p. 318.) leaves orbicular, peltate, on long footstalks; footstalks, calyx, and scape thickly beset with hairs, which are not glandular. ♃. G. Native in New Holland near Endeavour River. Flowers red?

Stalked-leaved Sun-dew. Fl. June, Aug. Pl. ½ foot.

19 D. CAPILLA'RIS (Poir. dict. 6. p. 299.) leaves obovately-spatulate, on short footstalks; scape erect, and is as well as calyxes glabrous. ⊙. H. Native of Carolina and about Philadelphia in sandy or gravelly swamps filled with Sphagnum. D. rotundifòlia, Mich. fl. bor. amer. 1. p. 186. Pursh, fl. amer. sept. 1. p. 210. Perhaps sufficiently distinct from the European *D. rotundifòlia*. Flowers white.

Capillary Sun-dew. Fl. July, Aug. Clt.? Pl. ½ foot.

20 D. MONTA'NA (St. Hil. in mem. mus. 2. p. 342.) leaves short, oblong, very blunt, tapering into a very short footstalk at the base, upper surface and margins covered with glandular hairs, under surface pilose; stipulas linear, jagged to the middle; scapes flat, 3-5-flowered, covered with glandular down as well as the calyxes and pedicels. ♃. S. Native of Brazil on the mountains called Serra-do-Papagayo on the southern part of the province of Minas-Geraes. Flowers red, leaning to one side.

Mountain Sun-dew. Fl. March. Pl. ¼ to ½ foot.

21 D. PARVIFO'LIA (St. Hil. in mem. mus. 11. p. 345.) leaves small, somewhat spatulate or obovate, very blunt, upper surface

and margins clothed with glandular hairs, under surface glabrous; petioles villous; scapes ascending at the base, 2-3-flowered; segments of calyx linear, acute, covered with glandular down. ♃. S. Native of Brazil in argillaceous bogs near the city of Joao-del-Rey in the province of Minas Geraes. Flowers rose-coloured, secund.

Small-leaved Sun-dew. Fl. ? Pl. $\frac{1}{4}$ foot.

22 D. ROTUNDIFO'LIA (Lin. spec. 402.) leaves orbicular, footstalks hairy, longer than the limb; scapes erect, 4-5-times higher than the leaves; seeds arillate. ♃. H. Native in many parts of Europe, plentiful in Britain in mossy turfy bogs, generally among sphagnum. The whole disk of the leaf, but especially its margin, is beset with red inflexed hairs, discharging from their ends a drop of viscid acrid fluid. These hairs have been thought irritable, so as to contract when touched, imprisoning insects, somewhat in the manner of the American *Dionæ'a muscípula*. Flowers white. Drev. et Hayne, pl. eur. 3. p. 40. t. 74. D. longifòlia, Smith, engl. bot. t. 867. Fl. dan. 1028.

Var. β, distàchya (D. C. prod. 1. p. 318.) scape bifid, 2-spiked at apex. ♃. H. Native of Europe and North America.

Round-leaved or Common Sun-dew. Fl. Jul. Aug. Brit. Pl. $\frac{1}{4}$ ft.

23 D. INTERME'DIA (Drev. et Hayne, pl. eur. 3. p. 43. t. 75. b.) leaves obovate on longer glabrous footstalks; scapes ascending, a little higher than the leaves; seeds exarillate. ♃. H. Native in many parts of Europe, plentiful in Britain along with *D. rotundifòlia* in mossy turfy bogs, generally among sphagnum. D. longifòlia, Lin. spec 403. D. rotundifòlia, Smith, engl. bot. 868. Disk and edge of leaves beset with glandular hairs as in *D. rotundifòlia*. Flowers white, often reddish. Styles 6-8.

Var. β, corymbòsa (D. C. prod. 1. p. 318.) scape bifid, branches diverging; flowers in cymose corymbs. ♃. H. Native about the Hague.

Var. γ, Americàna (D. C. l. c.) scape simple; leaves oblong-obovate. ♃. H. Native in swamps filled with sphagnum from Canada to Carolina. Pl. $\frac{3}{4}$ to 1 foot.

Intermediate Sun-dew. Fl. July, Aug. Britain. Pl. $\frac{1}{4}$ to $\frac{3}{4}$ ft.

24 D. COMMU'NIS (St. Hil. pl. usu. bras. no. 15. in mem. mus. 11. p. 349.) leaves spatulate with an obovate border, very blunt, upper surface as well as margins clothed with glandular hairs, under surface rather naked; stipulas capillaceously-many-parted; scapes rather ascending; calyxes 4-parted, covered with glandular down. ♃. S. Native of Brazil. Flowers purple. This plant is considered good pasture for sheep in Brazil.

Common Sun-dew. Pl. $\frac{1}{2}$ foot.

25 D. A'NGLICA (Huds. angl. 135.) leaves oblong, obtuse, narrowed at the base on glabrous footstalks rather longer than the leaves; scapes erect, almost twice the length of the leaves; seed arillate; styles 8; capsules with 4 valves. ♃. H. Native of middle and northern Europe in bogs, in several parts of Britain. Three miles from Carlisle towards Scotland; in Lancashire and Bedfordshire. Abundant on bogs near Smallburgh House of Industry, Norfolk. In several parts of Scotland. Gathered on St. Faith's bogs, Norfolk in 1781. Smith, engl. bot. t. 869. Pet. h. brit. t. 63. f. 12. Flowers white, but often reddish.

Var. β, subuniflòra (D. C. prod. 1. p. 318.) scape 1-2-flowered. ♃. H. Native on Mount St. Gothard.

English Sun-dew. Fl. July, Aug. Britain. Pl. $\frac{1}{2}$ foot.

26 D. LINEA'RIS (Gold. in edin. phil. journ. 1822. p. 325.) leaves linear, obtuse, on very long naked footstalks; scapes radical; flowers few; calyx glabrous. ♃. F. Native in Upper Canada in bogs about Lake Simcoe. Flowers purple?

Linear-leaved Sun-dew. Fl. June, July. Clt. 1822. Pl. 1 ft.

27 D. GRAMINIFO'LIA (St. Hil. in mem. mus. 11. p. 351. t. 19. f. c.) leaves sessile, linear, long, erect, upper surface and margins clothed with glandular hairs, under surface villous; stipulas ovate, ciliated at the apex; scapes triangular, villous, simple. ♃. S. Native of Brazil on the tops of the mountains called Serra-da-Caraca in the province of Minas Geraes; at the height of 6000 feet above the level of the sea. Flowers purple, leaning to one side.

Grass-leaved Sun-dew. Fl. Feb. Pl. $\frac{1}{2}$ foot.

28 D. SPIRA'LIS (St. Hil. in mem. mus. 11. p. 352.) leaves linear, sessile, long, at last spirally twisted; stipulas lanceolate, hardly ciliated at the apex: scape flattened, bifid, clothed with glandular down. ♃. S. Native of Brazil on the mountains called Serra-de-Curumatahy at the rivulet called Corgo-Novo in that part of the province of Minas Geraes called Distritodos-Diamantes, at the height of about 3700 feet above the level of the sea. Flowers purple, leaning to one side.

Spiral-leaved Sun-dew. Fl. July. Pl. $\frac{3}{4}$ foot.

29 D. FILIFO'RMIS (Raf. in Desf. journ. 1808. 1. p. 227.) leaves filiform, very long; footstalks woolly at the base, much shorter than the leaves; scapes erect, hardly equal in length to the leaves. ♃. F. Native of North America in pine barrens of New Jersey near Tuckerton. Pursh, fl. amer. sept. 211. D. tenuifòlia, Willd. enum. p. 340. An elegant plant with large purple flowers. Stipulas complicately dissected.

Filiform-leaved Sun-dew. Fl. Ju. Aug. Clt. 1811. Pl. 1 ft.

30 D. VILLO'SA (St. Hil. in mem. mus. 11. p. 349.) leaves linear-lanceolate, tapering into the footstalk with the margins and upper surface clothed with glandular hairs, under surface villous; footstalks villous; stipulas 2-parted, ciliately jagged; scapes erect, 4-times longer than the leaves; seeds oblong, striated, transversely reticulated. ♃. S. Native of Brazil on gravelly humid parts of the mountains called Serra-Negra in the province of Minas Geraes. Flowers purple, leaning to one side.

Villous Sun-dew. Fl. Jan. Feb. Pl. 1 foot.

31 D. ASCE'NDENS (St. Hil. in mem. mus. 11. p. 350.) leaves linear, rather tapering towards the base, under surface villous, upper surface and margins clothed with glandular hairs, even beyond the middle; scapes ascending; pedicels all bractless; calyxes covered with glandular down. ♃. S. Native of Brazil in gravelly humid parts of the mountains called Serra-de-Curumatahy, on the northern part of the province of Minas Geraes, at the height of about 3700 feet above the level of the sea. Flowers purple, leaning to one side.

Ascending Sun-dew. Fl. Sept. Pl. $\frac{1}{2}$ to 1 foot.

32 D. CAPE'NSIS (Lin. spec. 403.) leaves subradical, oblong-linear, obtuse, tapering at the base; footstalks glabrous, shorter than the limbs of the leaves; scape rather ascending, somewhat hairy, longer than the leaves. ♃. S. Native of the Cape of Good Hope.—Burm. afr. t. 75. f. 1. Flowers purple.

Cape Sun-dew. Fl. June, July. Clt.? Pl. $\frac{1}{2}$ foot.

§ 2. *Caulescéntes. Caulescent; leaves on the stem.*

33 D. RAMENTA'CEA (Burch, cat. no. 7692 and D. C. prod. 1. p. 318.) stem erect, covered with the old deflexed leaves; leaves on the top of the stem, obovate, somewhat rosulate, on ciliated footstalks which are longer than the limbs of the leaves; stipulas cut. ♄. ♃? S. Native of the Cape of Good Hope. Flowers probably red.

Ramentaceous Sun-dew. Pl. 1 foot.

34 D. HI'LARIS (Schlecht. ex Spreng. syst. app. p. 126.) caulescent; leaves rosulately crowded at the apex, spatulate-lanceolate, obtuse, beset with glandular pili, with the under surface and petioles villous; stipulas wanting; racemes secund, bracteate. ♃. S. Native of the Cape of Good Hope. Flowers probably red.

Cheerful Sun-dew. Pl. $\frac{1}{2}$ foot.

35 D. MADAGASCARIE'NSIS (D. C. prod. 1. p. 318.) stem ascending; leaves scattered, obovate, on glabrous footstalks, which are longer than the limbs of the leaves; stipulas ciliately-

jagged; flower-bearing peduncles 6-times longer than the leaves. ♃. S. Native of Madagascar. Flower purple?

Madagascar Sun-dew. Fl. July. Pl. ½ foot.

36 D. FOLIO'SA (Ell. sketch. 1. p. 376.) caulescent; leaves oval, crowded, wedge-shaped at the base; footstalks glabrous, elongated; stipulas awl-shaped. ♃. F. Native in South Carolina. Flowers white.

Leafy Sun-dew. Fl. July, Aug. Pl. ¼ foot.

37 D. CISTIFLO'RA (Lin. amœn. 6. p. 85.) stem erect, simple; leaves oblong-linear, sessile; flowers few, on pedicels. ♃. S. Native of the Cape of Good Hope.—Burm. afr. t. 75. f. 2. Flowers large, purple; stamens and pistils black; anthers yellow. There are variations of this plant according to Thunberg with white or red flowers spotted at the base.

Var. β, violàcea (D. C. prod. 1. p. 319.) leaves narrower; stem 2-flowered; flowers violaceous. D. violàcea, Willd. enum. 1. p. 340.

Rock-rose-flowered Sun-dew. Fl. Ju. July. Pl. ½ to 1 foot.

38 D. I'NDICA (Lin. spec. 403.) stem branched; leaves linear, surrounded by glandular hairs, on glabrous footstalks, which are scarcely narrower than the leaves; pedicels and calyxes puberulous. ♃? S. Native of Ceylon and Malabar.—Burm. Zeyl. t. 94. f. 1.—Rheed. mal. 10. t. 20. Flowers reddish.

This plant is called by the Ceylonese *Kandulaessa*, from *kandula*, a tear; because of the leaves being surrounded by glandular hairs, appearing like drops of water or tears.

Indian Sun-dew. Pl. ¼ foot.

SECT. II. ERGA'LEUM (from *εργον, ergon*, work, and *γαλα, gala*, milk? perhaps in allusion to the plants curdling milk, but this is the case with all the species). D. C. prod. 1. p. 319. Styles capillaceously-multifid (f. 67. *b.*), like a hair pencil.

§ 1. *Caulescéntes. Cauline leaves peltate.*

39 D. LUNA'TA (Buch. ined. D. C. prod. 1. p. 319.) stem erect, glabrous; radical leaves roundish-reniform; cauline ones scattered, stalked, moon-shaped, peltate; racemes lateral, few-flowered; sepals ovate, acute, beset with glandular hairs on the margins. ⊙. G. Native of Upper Nipaul at Suembu. Drósera peltàta, D. Don, prod. fl. nep. p. 212. Stem flexuous, slender. Flowers beautiful yellow.

Lunated-leaved Sun-dew. Fl. July, Aug. Pl. ½ foot.

40 D. PELTA'TA (Smith, in Rees' cycl. no. 5.) stem erect, glabrous; leaves scattered, stalked, peltate, somewhat triangular; racemes terminal; calyxes ciliated, with glandular hairs. ♃. S. Native of New Holland in marshy ground near Port Jackson. Smith, exot. bot. t. 41. Lab. nov. holl. t. 106. f. 2. Flowers large, red. Radical leaves moon-shaped (f. 67.).

FIG. 67.

Peltate-leaved Sun-dew. Fl. Aug. Sept. Pl. ½ foot.

41 D. BA'NKSII (R. Br. ined. and D. C. prod. 1. p. 319.) stem erectish, glabrous, hairy at the apex between the flowers; leaves scattered, stalked, peltate, orbicular; calyxes hairy. ⊙. S. Native of New Holland near Endeavour river. Flowers rose-coloured?

Banks's Sun-dew. Fl. July, Aug. Pl. ½ foot.

42 D. MENZI'ESII (R. Br. ined. and D. C. prod. 1. p. 319.) stem erectish, flexuous, glabrous, with branchlets rising from the axillæ; younger leaves somewhat fascicled, stalked, peltate, orbicular; racemes 2-flowered, glabrous, calyxes ciliated. ⊙. S. Native of New Holland. Flowers rose-coloured?

Menzies's Sun-dew. Fl. Jul. Sept. Pl. ½ foot.

§ 2. *Acaúlis. Stemless; leaves divided, all radical.*

43 D. BINA'TA (Lab. nov. holl. 1. t. 105.) leaves on long footstalks, deeply parted into 2 linear lobes. ♃. S. Native of Van Diemen's Land. Flowers white or reddish. Raceme dichotomous.

Binate-leaved Sun-dew. Fl. June, Sept. Clt. 1823. Pl. ½ ft.

44 D. PEDA'TA (Pers. ench. 1. p. 357.) leaves on long footstalks, pedately or twice forked; lobes linear. ♃. S. Native of New Holland. D. dichótoma, Smith, in Rees' cycl. no. 6. Flowers large, white.

Pedate-leaved Sun-dew. Pl. ½ to 1 foot.

Cult. Drósera is a singular and beautiful genus of plants, with their leaves ornamented with red glandular hairs, discharging from their ends a drop of viscid acrid juice. These hairs have been thought irritable, so as to contract when touched, imprisoning insects, somewhat in the manner of the *Dionæ'a muscípula* or *Venus's fly-trap*. They all grow in their places of natural growth on mossy turfy bogs; those species, natives of Europe and America, grow among sphagnum on a peat, gravelly, or sandy soil, particularly the American species on the latter soil. They thrive best in cultivation in small pots, which should be filled three parts full of peat earth and some sphagnum planted on it, the plants should be then planted in the moss, and the pots should be placed in pans of water, or in boxes in the same manner, and even then the hardy species should be placed in the greenhouse, and those species from New Holland and the Cape of Good Hope, as well as those natives within the tropics, should be placed in the stove. They are all increased by seeds, which should be allowed to sow themselves, but as the seeds will not vegetate after a voyage, plants of the foreign species must be introduced in pots or boxes, in the same manner as recommended for growing them.

II. ALDROVA'NDA (in honour of Ulysses Aldrovandus, an old botanist; author of *Dendrologia Naturalis libri duo*, in 1 vol. fol. Bonnoniæ, 1667, once prefect of the botanic garden, Boulogne). Monti, act. bon. 2. p. 3. p. 404. t. 12. Lin. gen. 390. Lam. ill. t. 220. D. C. prod. 1. p. 319.

LIN. SYST. *Pentándria, Pentagýnia.* Sepals and petals 5, not appendiculate. Stamens 5. Styles 5, filiform, short. Stigmas blunt. Capsules globose, 5-valved, 1-celled, 10-seeded. A water plant with whorled leaves, bearing bladders at the tip.

1 A. VESICULO'SA (Lin. spec. 402.). ♃. H. W. (All.) ⊙. H. W. (Savi.) Native of the south of Europe floating in stagnant water. Stems slender, herbaceous, almost simple. Leaves small, 6-9 in a whorl, approximate, narrow, wedge-shaped, bearing 5 or 6 threads, each terminated by a bladder. Flowers small, solitary, axillary, dirty-white. Anthers yellow. Petals hardly longer than the calyx. Peduncle 1-flowered, longer than the flower. Fruit globose, the size of a pea. This plant bears its bladders almost in the same manner as *Utriculària*, but in tufts.

Bladdery Aldrovanda. Fl. Ju. Aug. Clt. 1823. Pl. floating.

Cult. This plant should be grown in a marshy situation, or in water in a peat soil; if planted in pots half filled with some species of sphagnum, and set in pans of water, it will thrive well, but when grown in water it should never be above 4 or 8 inches under its surface.

III.? ROMANZO'WIA (in honour of Count Romanzoff, director of the Russian Admiralty, at whose expense the voyage of Kotzebue round the world was undertaken). Cham. in hor. phys. berl. 71. t. 14. D. C. prod. 1. p 319.

LIN. SYST. *Pentándria, Digýnia.* Sepals 5, united at the

base. Petals 5, united into a 5-cleft deciduous corolla. Stamens 5, inserted in the bottom of the tube of the corolla. Capsules 2-valved, 2-celled, many-seeded. Perhaps this genus more properly belongs to *Saxifràgeæ*.

1 R. Unalaschie'nsis (Cham. l. c.). 4. F. B. Native of moist valleys in the island of Unalaschka. Herb with the habit of *Saxífraga* or *Adóxa*. Leaves stalked, roundish, reniform, deeply toothed. Flowers whitish, without bracteas, in terminal, few-flowered racemes.

Unilaschka Romanzowia. Pl. $\frac{1}{4}$ foot.

Cult. This plant will thrive best in a peat soil in a moist situation; if planted in pots they should stand in pans of water. It may be increased by dividing at the root or by seed.†

IV. BY'BLIS (Byblis in mythology, the daughter of Miletus, who was changed into a fountain; in allusion to the habitation of the plant in bogs). Sal. parad. t. 95. D. C. prod. 1. p. 319.

Lin. syst. *Pentándria, Monogýnia*. Sepals and petals 5, not appendiculate. Stamens 5. Anthers bursting by 2 pores at the apex. Style 1, filiform. Stigma 2-lobed. Capsule 2-valved, 2-celled, many-seeded.

1 B. liniflo'ra (Salisb. l. c.). 4. S. B. Native of New Holland on bogs. A little simple herb with linear leaves beset with glandular hairs as in *Drósera*. Flowers blue.

Flax-flowered Byblis. Fl. May, July. Clt. 1803. Pl. $\frac{1}{2}$ ft.

Cult. This plant should be treated in the same manner as that recommended for the genus *Drósera*. It should be kept in the stove. It can only be increased by seeds, which should be allowed to sow themselves. Plants should be introduced, as seeds will not vegetate after a voyage.†

V. RORI'DULA (a diminutive of *ros roris*, dew; because of the leaves being beset with glandular hairs, which appear like dew). Lin. syst. veg. 244. D. C. prod. 1. p. 320.

Lin. syst. *Pentándria, Monogýnia*. Sepals and petals 5, not appendiculated. Stamens 5; anthers bursting by 2 pores at the apex, and each drawn out at the base into a callous appendage. Style 1. Stigma 3-lobed. Capsules 3-celled, 3-valved. Seeds generally solitary in each cell.

1 R. denta'ta (Lin. l. c.). ♄. G. Native of the Cape of Good Hope. Lam. ill. t. 141. Leaves linear, crowded, fringed, with the margins beset with glandular hairs. Bracteas leafy. Flowers white or blueish, in terminal racemes.

Var. β, muscicàpa (Gært. fr. 1. t. 62.) growing along with var. *α*. Petals narrower, white.

Toothed-leaved Roridula. Shrub 1 to 3 feet.

Cult. Cultivation and treatment the same as for the greenhouse species of *Drósera*.

VI. DROSOPHY'LLUM (from *δροσος, drosos*, dew, *φυλλον, phyllon*, a leaf; in allusion to the leaves being beset with stipitate glands, appearing like dew). Link. in Schrad. journ. 1806. 1. p. 53. D. C. prod. 1. p. 320.

Lin. syst. *Decándria, Pentagýnia*. Sepals and petals 5, approximate, unguiculate. Stamens 10. Styles 5, filiform. Capsules 5-valved, 1-celled, with the valves bent inwards to the middle, so as almost to make the capsule 5-celled.

1 D. Lusita'nicum (Link. l. c.). 4. ♄. F. Native on sandy hills in Portugal; stem shrubby; leaves linear, entire, beset with stipitate glands; panicle corymbose; flowers large, sulphur-coloured. St. Hil. mem. mus. 2. t. 4. f. 13. Drósera Lusitánica, Lin. spec. 403. Spérgula droseroìdes, Brot. fl. lus. 2. p. 215.—Mor. hist. 3. p. 620. f. 15. t. 4. f. 4.—Pluk. alm. t. 117. f. 2.

Portugal Drosophyllum. Fl. Ju. Aug. Subshrub $\frac{1}{2}$ foot.

Cult. This singular plant is called in Portugal *Herva Pinheira orvalhada*. It has not as yet been introduced, therefore the mode of treatment it may require in our gardens is unknown. But from the nature of the soil in which it naturally grows, sand, if ever it be introduced we would recommend its being grown in pots filled with sand, so that it might be sheltered during winter. The plant may be probably increased by cuttings or seed.

VII. DIONÆ'A (one of the names of Venus). Ellis, nov. act. ups. 1. p. 98. t. 8. Lin. mant. 151. D. C. prod. 1. p. 320.

Lin. syst. *Decándria* or *Polyándria, Monogýnia*. Sepals and petals 5. Stamens 10-20; anthers bursting laterally. Style 1. Stigma fringed. Capsules 5-valved, 1-celled. Seeds numerous, half buried in the cellular substance at the base of the capsule.

FIG. 68.

1 D. muscí'pula (Lin. mant. 238.). 4. S. B. Native of North America in swamps of North Carolina around Wilmington. Vent. malm. t. 23. Ker. bot. reg. t. 785. Sims, bot. mag. 785. Delaum. herb. amat. 349. Herb smooth. Leaves radical, on long footstalks, which are dilated at the top into a 2-lobed irritable limb, which is beset with one row of long hairs on the margin, which fold together when touched in the manner of the teeth of a trap. Flowers white, in terminal corymbs. This is a singular plant in respect of its leaves, which are of an anomalous form, and have a singular motion by which they catch insects, whence the specific name *muscípula*, a fly-trap. The root is scaly, almost like a bulb, and not prolific in fibres. The leaves have the petiole winged as in the orange; the extreme part or proper leaf is the part that operates as a trap. As soon as the insect enters, the lobes of the leaf fold together, and remain so as long as the insect continues to struggle, but as soon as it ceases and is quiet the leaf opens and permits it to escape. A straw or pin introduced between the lobes of the leaf will have the same effect. Mr. Ellis thinks it probable that a sweet liquor discharged by the red glands on the inner surface tempts insects to their destruction. "On the side of each lobe of the leaf stand about three erect, highly irritable bristles, which, when touched, cause the two lobes to fold together like a rat-trap, imprisoning insects; no doubt that their bodies may administer an air wholesome to the plant, which theory and recent observations on *Sarracènia*, *Drósera*, and *Nepénthes* confirm." Smith, introd. bot.

Venus's *Fly-trap*. Fl. July, Aug. Clt. 1768. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

Cult. This plant thrives best in small pots in peat earth, and some dwarf species of moss placed underneath in the pot, the pots should then be placed in a pan of water and set in a cool place near the glass in the stove. Seeds are sometimes produced, by which they may be increased as well as by dividing the plants at the root. Mr. Shepherd of Liverpool finds that the leaves will root, if placed on damp moss, and emit young plants from their edges.

VIII. PARNA'SSIA (from Mount Parnassus, the abode of grace and beauty, where, on account of the elegance of their form, these plants are feigned to have first sprung up). Tourn. inst. t. 127. Lin. gen. 384. D. C. prod. 1. p. 320

Lin. syst. *Pentándria, Tetragýnia*. Sepals 5. Petals 5. Scales 5 (perhaps abortive stamens) opposite the claws of the petals, ending in tufts of bristles which are glandular at the apex. Stamens 5; anthers behind. Stigmas 4, sessile. Capsules 4-valved, 1-celled; valves with a narrow dissepiment in

the middle of each. Seeds arillate. Herbs very smooth. Leaves ovate-cordate, cauline ones usually clasping the stem, or sessile. Flowers of all white, striped with green. The tuft of glands are yellow.

1 P. PALU'STRIS (Lin. spec. 391.) appendages furnished with 9-13 glandular bristles; petals almost sessile, somewhat emarginate; radical leaves cordate, cauline ones clasping the stem. Native throughout Europe in marshes and bogs, plentiful in Britain in mountainous countries. Smith, engl. bot. t. 82. Mill. illustr. t. 15. Curt. fl. lond. t. 1. Fl. dan. t. 584. Flowers elegant, white, marked with greenish pellucid veins. Glands of appendages or scales yellow, as well as in all the rest of the species.

Marsh or Common Grass of Parnassus. Fl. Septemb. Oct. Britain. Pl. ½ foot.

2 P. PARVIFLO'RA (D. C. prod. 1. p. 320.) appendages furnished with 5-7 glandular bristles; petals sessile; radical leaves ovate, cauline ones sessile. ♃. H. Native of North America in Pennsylvania and Virginia in bog meadows. Perhaps P. palústris, Pursh. fl. amer. sept. 1. p. 208, and also perhaps P. ténuis, Wahl. fl. lapp. no. 137. Flowers white, with netted veins of green or pale purple.

Small-flowered Grass of Parnassus. Fl. July, Aug. Clt. 1820. Pl. ½ foot.

3 P. OVA'TA (Ledeb. act. petr. 1815. p. 514.) appendages furnished with 3 glandular bristles; radical leaves ovate, cauline ones somewhat cordate, clasping the stem. ♃. H. Native in bogs in eastern Siberia. Flowers white.

Var. β, Belvìsii (D. C. prod. 1. p. 320.) radical leaves 5-7-nerved, cauline ones ovate. ♃. H. Native of North America. P. ovàta, Beauv. ined.

Ovate-leaved Grass of Parnassus. Fl. Jul. Aug. Pl. ½ to 1 ft.

4 P. CAROLINIA'NA (Michx. fl. bor. amer. 1. p. 184.) appendages furnished with 3 glandular bristles; petals almost sessile; radical leaves somewhat orbicular, cauline ones ovate, sessile. ♃. H. Native of North America in swamps and mosses from New York to Virginia, and from Carolina to Canada. Sims, bot. mag. t. 1459. Flowers white, netted, with veins of green or pale purple, the flowers have a greenish tint.

Carolina Grass of Parnassus. Fl. Jul. Aug. Clt. 1802. Pl. ½ ft.

5 P. ASARIFO'LIA (Vent. malm. t. 39.) appendages furnished with 3 glandular bristles; petals unguiculate; radical leaves kidney-shaped, cauline ones somewhat cordate, orbicular. ♃. H. Native of North America on high mountains in Virginia and Carolina. Flowers white, and are as well as leaves larger than those of the preceding species.

Asarabacca-leaved Grass of Parnassus. Fl. July, Aug. Clt. 1812. Pl. ½ foot.

6 P. GRANDIFO'LIA (D. C. prod. 1. p. 320.) appendages furnished with 3 glandular bristles; petals oblong, sessile; radical leaves ovate, somewhat cordate, 7-nerved, cauline ones somewhat cordate, orbicular. ♃. H. Native of North America at Cherokee. Flowers white. Leaves larger than in any other species.

Great-leaved Grass of Parnassus. Fl. Jul. Aug. Pl. ¾ ft.

7 P. FIMBRIA'TA (Banks, in Kœn. ann. 1. p. 391.) appendages palmate, glandless; petals obovate, unguiculated, fringed at the base; radical leaves kidney-shaped, cucullate at the base, many-nerved, cauline ones cordate. ♃. H. Native on the western coast of North America. Flowers white. The leaves of this species are remarkably hollowed out at the base, close to the lateral ribs, which are connected with one another by a common base, like the divisions of a pedate leaf, and have consequently a very elegant appearance. Hook. bot. misc. part. 1. t. 23.

Fringed-petalled Grass of Parnassus. Fl. Jul. Aug. Pl. ½ ft.

8 P. KOTZEBU'EI (Cham. ex Spreng. syst. 1. p. 951.) radical as well as cauline leaves ovate, tapering to both ends, nerved; petals linear-oblong; appendages furnished with numerous glandular bristles? ♃. F. Native of the north-west coast of America, round the Arctic Circle, plentiful in Escholtz Bay. Flowers white.

Kotzebue's Grass of Parnassus. Fl. Jul. Aug. Pl. ¼ to ½ ft.

Cult. The species of this beautiful genus thrive best in a peat soil in a moist situation. They may be also grown in pots, which should be placed in pans of water. They may be all increased by dividing the plants at the roots or by seed, which ripen in plenty. Plants must be introduced, as seeds do not vegetate after a voyage.

ORDER XXIII. POLYGA'LEÆ (plants agreeing with *Polýgala* in many important characters). Juss. ann. mus. 14. p. 386. mem. mus. 1. p. 385. D. C. prod. 1. p. 321.

Calyx of 5 sepals, which are imbricate in æstivation, the two inner ones usually petal-formed (f. 70. *a.*), the three outer ones smaller, of these last two are connected. Petals 3-5, hypogynous, more or less connected with the staminiferous tube, which is usually cleft in front (f. 70. *b.*), rarely distinct. Filaments united with the petals (f. 70. *b.*), monadelphous; these are divided at the top into 2 equal bundles, containing 4 anthers each. Anthers 8, 1-celled (f. 71. *d.*) inserted by the base, opening by a pore at the top. Ovary 1, free, 2-celled (f. 69. *b.*), rarely 1, (f. 70. *a.*) 3-celled. Style 1, incurved (f. 70. *e.*). Stigma funnel-shaped or 2-lobed (f. 70. *e.*). Pericarp capsular (f. 71. *f.* f. 69. *b.*), or drupaceous (f. 70. *d.*), 2-celled (f. 69. *b.*), or only 1-celled from abortion (f. 70. *a.*); valves bearing a dissepiment in the middle. Seeds solitary in the cells, pendulous (f. 70. *d.*), usually with an arillate caruncle at the base (f. 71. *f.*), sometimes pilose or with a tuft of hairs (f. 69. *c.*). Embryo straight, flat. Albumen thin but rarely wanting, with the endopleura sometimes tumid. Herbs or subshrubs, sometimes abounding in cream-coloured juice, but more especially in the roots. Leaves entire, for the most part alternate, articulated above the stem. Flowers disposed in racemes. The affinities of this truly natural order are extremely doubtful. The habit of the flowers is referable to *Leguminòsæ* and *Fumariàceæ*. The situation, disposition, and number of the stamens nearly agree with *Fumariàceæ*. But if the sepals are admitted as 5, and the petals 5, and 3 of which are supposed to be connected into a keel, *Polygàleæ* is more nearly related to *Leguminòsæ* than to any other Order.

Most of the plants of this order are interesting, and deserving of the attention of gardeners, some for their neatness, some for their beauty, and some for their use in medicine. They are natives of most countries, and are either low herbaceous plants, or shrubs from a dwarf spiny habit, to a tall graceful drooping appearance. The Order is remarkable for the union of the stamens into a single body, and in the anthers opening by a pore at the top, as well as in their irregular flowers; one of the petals is usually keel-shaped, and beautifully crested or bearded. The leaves have a bitter astringent taste, which is much more abundant in the roots, combined with an acrid flavour. These properties are particularly sensible in *P. Sénega*, which is reputed a sudorific, diuretic, sialagogue, cathartic, or mild emetic,

according to the manner in which it is administered. The *Yelhoi* of South America, the root of a species of *Monnìna*, has the same properties as *P. sénega*, and is particularly used as a remedy in dysentery. The well known *Rattany* or *Rattanhia* root of Chili is the produce of *Kramèria triándra*, and possesses powerful tonic and astringent qualities. According to the analysis of a French chymist, it contains gallic acid, but neither tannin nor resin. The seeds of all retain their vegetative power a considerable time, therefore, in most cases, they may be introduced in a living state.

Synopsis of the Genera.

1 Poly'gala. Sepals 5, permanent, 2 inner ones wing-formed. Petals 3-5, united with the staminiferous tube; the lower petal keel-formed. Capsule compressed. Seeds pubescent, with a caruncle at the hilum.

2 Salomo'nia. Sepals 5, nearly equal. Tube of corolla cleft longitudinally, with a 3-cleft limb. Keel cucullate. Stamens monadelphous; anthers 4. Capsules compressed, 2-lobed, usually serrate-ciliated. Small Asiatic herbs.

3 Comespe'rma. Sepals 5, deciduous, 2 inner ones wing-formed. Petals 3-5, united at the base, middle one 3-lobed and bearded (f. 69. *a.*). Stamens 8, monadelphous at the base. Capsule spatulate (f. 69. *b.*), 2-celled. Seeds with a tuft of long hairs at the hilum (f. 69. *c.*), and a linear caruncle at the top.

4 Badie'ra. Sepals 5, nearly equal, deciduous. Petals 3, connected at the base, beardless. Stamens 8, monadelphous. Capsule compressed, obcordate, 2-celled. Seeds furnished with a large oily arillus.

5 Soula'mea. Sepals 5, 2 inner ones large, concave. Petal 1. Stamens 2-6. Capsule indehiscent, compressed, orbicular, emarginate, 2-celled. Seeds without albumen.

6 Mura'ltia. Sepals 5, glumaceous, nearly equal. Petals 3, united, middle one bifid; lobes obtuse. Capsule crowned by 4 horns or tubercles, 2-valved, 2-celled.

7 Mun'dia. Sepals 5, permanent, glumaceous, 2 inner ones wing-formed. Petals 3, hardly united at the base, the middle one cucullate, crested or beardless. Stamens 7-8, monadelphous at the base, with the tube cleft in front. Drupe 2-celled, or from abortion only 1-celled, 1-seeded. Albumen fleshy.

8 Monni'na. Flowers resupinate. Sepals 5 (f. 70. *a.*), deciduous, 2 inner ones wing-formed, 3 outer ovate, 2 of these are usually united. Petals 3-5, connate at the base (f. 70. *b.*), middle one concave, 3-toothed. Stamens 8 (f. 70. *b.*), rather pilose, united into a tube at the base, which is cleft on one side. Drupe or capsule 2-celled, 2-seeded, or 1-celled, 1-seeded (f. 70. *c.*), girded by a membranous wing or without (f. 70. *d.*). Seed hanging from the top of the cell (f. 70. *d.*). Albumen sparing.

9 Ja'ckia. Sepals 5, equal, deciduous. Petals 5, middle one keel-formed. Stamens 8, diadelphous. Drupe ovate, containing a 1-seeded nucleus. Albumen none.

10 Bredeme'yera. Sepals 5, 2 inner ones petal-like. Petals 3, middle one keel-formed. Stamens 8, monadelphous. Drupe ovate, containing a 2-celled nut.

11 Securida'ca. Sepals 5, 2 inner ones petal-like. Petals 5, united at the base, lower one 3-lobed, upper two connivent. Stamens 8, united into a tube, which is cleft in front. Capsule compressed, indehiscent, 1-celled, 1-seeded, ending in a leafy ligulate wing at the apex. Seed hanging from the top of the cell. Albumen wanting.

12 Carpolo'bia. Sepals 5, 2 lateral ones wing-shaped. Petals 5, lower one keel-shaped. Stamens 6, monadelphous. Berry fleshy, containing a silky 1-seeded legume.

13 Krame'ria. Sepals 4, rarely 5, silky outside. Petals 4-5, 2 of which are orbicular (f. 71. *b.*), the third constantly of 2 or 3 united petals, all unguiculate. Stamens 3-4, free from the base. Anthers bursting by 2 pores. Fruit 1-celled, 1-seeded, globose (f. 71. *f.*), indehiscent, echinated (f. 70. *e.*).

I. POLY'GALA (from $\pi o \lambda \upsilon$, *poly*, much, and $\gamma \alpha \lambda \alpha$, *gala*, milk; alluding to the reputed effects of the plant on cattle that feed upon it.) Tourn. inst. t. 79. Lin. gen. no. D. C. prod. 1. p. 321.

Lin. syst. *Monodélphia*, *Octándria*. Sepals 5, permanent, 2 inner ones wing-formed, 3 outer ones small. Petals 3-5, united with the tube of the stamens, lower petal keel-formed (perhaps from 2 petals being constantly joined.) Stamens 8, with the filaments connate into a tube at the base, which is cleft in front. Anthers opening by a pore at the apex. Capsules compressed, elliptical, obovate or obcordate. Seeds pubescent, caruncculate at the hilum, with the caruncle rarely inappendiculate. Elegant shrubs or herbs. Flowers disposed in terminal or axillary racemes.

Sect. I. Psycha'nthus (from $\psi \upsilon \chi \eta$, *psyche*, a butterfly, and $\alpha \nu \theta o \varsigma$, *anthos*, a flower; form of flowers.) Raf. specch. 1. p. 116. D. C. prod. 1. p. 321. Keel amply crested. Capsules smooth, marginate. Bracteas 3, usually permanent at the base of the pedicels. This section consists of elegant shrubs from the Cape of Good Hope, and one from Arabia. The flowers of all are purple, usually with a pale crest and keel.

* *Leaves opposite. Perhaps all the species in this division are varieties of one.*

1 P. oppositifo'lia (Lin. mant. 259.) leaves opposite, cordate, ovate, acute. ♄. G. Native on mountains at the Cape of Good Hope. Very like the following species. Ker. bot. reg. 636. Flowers purplish. Keel yellowish-green.

Opposite-leaved Milkwort. Fl. year. Clt. 1790. Sh. 3 to 4 ft.

2 P. cordifo'lia (Thunb. prod. 120.) leaves opposite, cordate, acuminated; anthers bearded at the base; branchlets terete, glabrous; racemes terminal, subcorymbose. ♄. G. Native of the Cape of Good Hope. P. fruticòsa, Berg. cap. 188. Flowers red or purplish. Keel yellowish-green.

Cordate-leaved Milkwort. Fl. March, Aug. Clt. 1791. Shrub 3 feet.

3 P. latifòlia (Ker. bot. reg. 645.) leaves opposite, almost sessile, cordate-ovate, acuminate, 3-5-nerved, villous beneath, as well as the branches; corymbs terminal; anthers bearded at the base. ♄. G. P. cordifòlia, Sims, bot. mag. 2438. but not of Thunb. Flowers purplish. Keel yellowish-green.

Broad-leaved Milkwort. Fl. May, Oct. Clt. 1820. Shrub 3 feet.

4 P. tetra'gona (Burch. cat. no. 4639.) leaves opposite-cordate, acuminated; branches tetragonal, glabrous. ♄. G. Native of the Cape of Good Hope. Flowers large, purplish, in terminal racemes. P. cordifòlia, var. màjor, Lindl. bot. reg. t. 1146.

Square-branchletted Milkwort. Fl. year. Clt. 1820. Shrub 2 to 4 feet.

5 P. NUMMULA'RIA (Burch. cat. no. 3709.) leaves opposite, orbicularly kidney-shaped, cordate at the base, mucronated at the top; branchlets rather terete, glabrous. ♄. G. Native of the Cape of Good Hope. Flowers purplish in terminal corymbose racemes.

Moneywort-leaved Milkwort. Fl. year. Clt. 1812. Shrub 3 feet.

6 P. BORBONIÆFO'LIA (Burch. cat. no. 6861.) leaves opposite, cordate, acuminated; branchlets terete, hispid. ♄. G. Native of the Cape of Good Hope. P. oppositifòlia, Sims, in bot. mag. not of D. C. Flowers purplish, in terminal corymbose racemes.

Borbonia-leaved Milkwort. Fl. year. Clt. 1790. Sh. 3 ft.

* * *Leaves alternate.*

7 P. CLUYTIOI'DES (Burch. cat. no. 3326.) leaves elliptical, somewhat mucronated at the apex; branchlets very smooth; petals 2-lobed; lobes acute, very long. ♄. G. Native of the Cape of Good Hope. Flowers purplish, in terminal racemes.

Cluytia-leaved Milkwort. Fl. May, Aug. Shrub 3 feet.

8 P. GRANDIFLÒRA (Lodd. bot. cab. 1227.) leaves oblong, mucronate; branchlets pubescent; bracteas equal, permanent. ♄. G. Native of the Cape of Good Hope. Flowers large, purple, in terminal racemose corymbs, with a pale keel and crest.

Great-flowered Milkwort. Fl. May, Aug. Clt. 1820. Sh. 3 ft.

9 P. MYRTIFÒLIA (Lin. amœn. 2. p. 138.) leaves obovate or oblong, somewhat mucronated; branchlets clothed with appressed down; bracteas equal, permanent; pedicels shorter than the flowers. ♄.G. Native of the Cape of Good Hope. Flowers purplish, in terminal corymbose racemes, with a pale crest and keel.

Var. α, vèra (D.C. prod. 1. p. 322.) leaves obovate-oblong, flat. ♄. G.—Burm. afr. t. 73. f. 1.—Ker, bot. reg. t. 669.

Var. β, angustifòlia (D. C. prod. 1. p. 322.) leaves oblong. ♄. G.—Perhaps *P. tenuifòlia*, Link. enum. 2. p. 220.

Var. γ, rosmarinifòlia (D. C. prod. 1. p. 322.) leaves oblong-linear, with revolute margins.

Myrtle-leaved Milkwort. Fl. May, Aug. Clt. 1707. Shrub 3 feet.

10 P. LIGULA'RIS (Ker, bot. reg. t. 637.) leaves ligulate-linear, rather obtuse, crowded, spreading, glabrous; branches villous; bracteas permanent, equal, and are as well as the rachis villous; racemes short, crowded. ♄. G. Native of the Cape of Good Hope. Flowers purplish, in racemose terminal corymbs.

Tongue-leaved Milkwort. Fl. May, Aug. Clt. 1820. Shrub 2 to 3 feet.

11 P. INTERME'DIA (D. C. prod. 1. p. 322.) leaves oblong-linear, mucronated, with revolute margins; branchlets glabrous; bracteas permanent, equal; pedicels rather longer than the flowers; wings of flowers somewhat pointed. ♄. G. Native of the Cape of Good Hope. Flowers purplish.

Intermediate Milkwort. Fl. May, Oct. Clt.? Sh. 2 to 3 ft.

12 P. BRACTEOLA'TA (Lin. amœn. 2. p. 137. var. β.) leaves linear-lanceolate, flat; branches glabrous; bracteas permanent, lower one longest; pedicels rather longer than the flowers; wings of flowers pointed. ♄. G. Native of the Cape of Good Hope. Curt. bot. mag. 345. Flowers purple, with a white crest and green keel, in loose terminal racemes.

Var. α, stricta (D. C. prod. 1. p. 322.) leaves erect, and branches glabrous.

Var. β, pátula (D. C. l. c.) leaves spreading and branches glabrous.

Var. γ, hispida (D. C. l. c.) leaves erect and branches hispid.

Large-bracted Milkwort. Fl. May, Oct. Clt. 1713. Shrub 1 to 3 feet.

13 P. UMBELLA'TA (Thunb. prod. 120.) leaves linear-lanceolate, flat; branches hispid; bracteas permanent; flowers few. ⊙.? Thunb. ♄. G. Native of the Cape of Good Hope. Flowers purplish, with a white crest. P. bracteolàta δ umbellàta, D. C. prod. 1. p. 332.—Burm. afr. t. 73. f. 5.

Umbellate-flowered Milkwort. Fl. May, Oct. Shrub 1 to 2 ft.

14 P. TINCTO'RIA (Vahl. symb. 1. p. 50.) leaves obovate, and are as well as the branches velvety-villous; calyxes pubescent. ♄. F. Native on the mountains of Arabia Felix. P. bracteolàta, Forsk. descr. 213. Flowers purplish, in terminal racemes. There is a blue dye resembling Indigo obtained from this plant.

Dyer's Milkwort. Shrub 2 feet.

15 P. PUBIFLO'RA (Burch. cat. no. 6205.) leaves lanceolate, acuminated, ciliated; branchlets hairy; calyxes pubescent. ♄. G. Native of the Cape of Good Hope. Flowers purplish.

Downy-flowered Milkwort. Fl. May, Oct. Shrub 3 feet.

16 P. BURMA'NNI (D. C. prod. 1. p. 322.) leaves linear, bluntish; branchlets velvety-pubescent; racemes supra-axillary; pedicels shorter than the flowers; bracteas deciduous. ♄. G. Native of the Cape of Good Hope. P. bracteolàta δ, Lin.—Burm. afr. t. 73. f. 4. Burch. cat. no. 6437. Flowers purple.

Burmann's Milkwort. Fl. May, Oct. Clt. 1800? Sh. 3 ft.

17 P. AFFI'NIS (D. C. prod. 1. p. 322.) leaves linear obtuse; younger ones somewhat villous; branchlets pubescent; racemes opposite the leaves; bracteas small, permanent. ♄. G. Native of the Cape of Good Hope. Flowers purplish.

Neighbouring Milkwort. Fl. May, Oct. Shrub 3 feet.

18 P. MICROLO'PHA (Burch. cat. no. 3416.) leaves linear, mucronated, and are as well as the branches glabrous: racemes few-flowered; pedicels very short; wings of flowers obovate. ♄. G. Native of the Cape of Good Hope. Flowers purplish, with a small crest.

Small-crested-flowered Milkwort. Fl. May, Oct.? Sh. 3 ft.

19 P. SI'MPLEX (Burch. cat. no. 1933.) leaves oblong-wedge-shaped, obtuse, somewhat mucronated, and are as well as simple stem glabrous; bracteas deciduous; pedicels spreading; wings of flower oval. ♄. G. Native of the Cape of Good Hope. Flowers purple in racemes, one-half smaller than those of *P. speciòsa*, which it very much resembles.

Simple-stemmed Milkwort. Fl. May, Oct. Clt. 1816. Shrub 3 to 4 feet.

20 P. SPECIO'SA (Sims, bot. mag. t. 1780.) lower leaves oblong-cuneated, obtuse, mucronated, upper ones linear, and are as well as the twiggy branches glabrous; bracteas deciduous; pedicels spreading; wings of flower roundish. ♄. G. Native of the Cape of Good Hope. Ker, bot. reg. t. 150. Delaun. herb. amat. t. 193. Sims, bot. mag. t. 621. Flowers purplish in loose racemes.

Shewy Milkwort. Fl. May, Oct. Clt. 1814. Shrub 6 feet.

21 P. PEDUNCULA'RIS (Burch. cat. no. 5163.) leaves linear, with revolute margins, upper surface scabrous; peduncles rather stiff, spreading, bearing few flowers at the top, and are as well as branchlets angular. ♄. G. Native of the Cape of Good Hope. Flowers purple, almost like those of *P. myrtifòlia*.

Peduncled Milkwort. Fl. May, Oct. Shrub 3 feet.

22 P. TERETIFO'LIA (Thunb. prod. 120.) leaves linear, with revolute margins, rather terete, furrowed on the under surface, glabrous; branchlets clothed with white velvety down; racemes short, few-flowered. ♄. G. Native of the Cape of Good Hope. P. empetrifòlia, Houtt. hist. nat. 11. D. V. t. 28. f. 1. Andr. bot. rep. t. 370. Flowers purplish.

Terete-leaved Milkwort. Fl. May, Sept. Clt. 1791. Sh. 3 ft.

23 P. PINIFÒLIA (Lam. ill. t. 598. f. 2.) leaves linear, with revolute margins, somewhat terete, furrowed on the under surface, spreading, stalked, and are as well as the branches gla-

brous. ♄. G. Native of the Cape of Good Hope. Perhaps sufficiently distinct from *P. teretifòlia*. Leaves twice the length. Flowers purple, in short racemes.

Pine-leaved Milkwort. Fl. May, Oct. Clt. 1823. Shrub 3 ft.

24 P. REFRA'CTA (Burch. cat. no. 4891.) leaves linear, acuminated, spreading, and are glabrous as well as the branches; peduncles lateral, few-flowered, and are refracted as well as the pedicels; bracteas deciduous; wings of flower oval. ♄. G. Native of the Cape of Good Hope. Flowers purplish.

Refracted-pedicelled Milkwort. Fl. May, Aug. Shrub 3 ft.

25 P. MA'CRA (D. C. prod. 1. p. 323.) leaves small, somewhat linear, acute, erect, and are glabrous as well as the branches; racemes few-flowered; pedicels shorter than the flowers; wings of flower oval. ♄. G. Native of the Cape of Good Hope in arid places at Breda river. Flowers purple.

Lean Milkwort. Fl. May, Aug. Shrub 3 feet.

26 P. ATTENUA'TA (Lodd, bot. cab. 1000.) leaves narrow, tapering to both ends, acute, and are smooth as well as the twigs; racemes elongated; bracteas deciduous; pedicels longer than the flowers; wings obtuse. ♄. G. Native of the Cape of Good Hope. Flowers purple.

Tapering-leaved Milkwort. Fl. May, Oct. Clt. 1823. Sh. 2 ft.

27 P. GENISTOI'DES (Poir. dict. 5. p. 402.) leaves linear, acute, few, distant, and are glabrous as well as the twiggy branches; racemes elongated; bracteas deciduous; pedicels at length spreading, shorter than the flowers; wings of flower oval, obtuse. ♄. G. Native of the Cape of Good Hope. Flowers purplish.

Var. β, *ephedroìdes* (D. C. prod. 1. p. 323.) Burch. cat. no. 1793. itin. 1. p. 485.) branches scarcely leafy; racemes loose.

Var. γ, *spartioìdes* (Burch. cat. no. 4449.) branches and younger leaves hardly pubescent; wings of flower roundish.

Broom-like Milkwort. Fl. May, Oct. Clt. 1823. Shrub 3 ft.

28 P. GARCI'NI (D. C. prod. 1. p. 323.) leaves linear, almost awl-shaped, rather distant, and are glabrous as well as the twiggy branches; racemes elongated; pedicels hardly twice the length of the bracteas; wings of flower oval, obtuse. ♄. G. Native of the Cape of Good Hope. P. bracteolàta γ, Lin. amœn. 2. p. 137.—Burm. afr. t. 73. f. 3. Burch. trav. 1. p. 19. 37. Flowers purplish.

Garcin's Milkwort. Fl. May, Oct. Shrub 3 feet.

29 P. ERICIFÒLIA (D. C. prod. 1. p. 323.) leaves linear, erect, crowded, acute, glabrous, upper ones ciliated; pedicels somewhat umbellate, longer than the flowers; wings of flower oval, mucronated. ♄. G. Native of the Cape of Good Hope. Burch. cat. no. 5514. Flowers purplish.

Heath-leaved Milkwort. Fl. May, Oct. Shrub 3 feet.

30 P. PU'NGENS (Burch. cat. no. 1598. trav. 1. p. 304.) leaves linear, acutish, narrow, few; branchlets divaricating, glaucous, rigid, spinescent at the top; racemes 2-4-flowered. ♄. G. Native of the Cape of Good Hope. Flowers with a purple crest and white wings, veined with green. Capsules obcordate.

Pungent-branched Milkwort. Fl. May, Sept. Shrub 1½ ft.

31 P. RI'GENS (Burch. cat. no. 1821. trav. 1. p. 465.) leaves linear-oblong, channelled, obtuse, furnished at the top with a somewhat recurved point, and are pubescent as well as the younger branches; racemes few-flowered; wings of flower a little ciliated. ♄. G. Native of the Cape of Good Hope. Flowers purplish?

Stiff Milkwort. Fl. May, Sep.? Shrub 1 foot.

32 P. LEPTOPHY'LLA (Burch. cat. no. 2380. trav. 1. p. 400.) leaves linear, erect, acutish, and are as well as younger branches rather pubescent; racemes loose; bracteas small, deciduous; wings of flower elliptical. ♄. G. Native of the Cape of Good Hope. Flowers purplish?

Slender-leaved Milkwort. Fl. May, Aug. Shrub 2 feet.

33 P. HI'SPIDA (Burch. cat. no. 4473.) lower leaves elliptical, upper ones somewhat linear, and are as well as branchlets covered with soft bristles; racemes elongated, pubescent; bracteas deciduous, lower one equal in length to the pedicel; wings of flower elliptical. ♄. G. Native of the Cape of Good Hope. Flowers purplish?

Hispid-leaved Milkwort. Fl. May, Sep. Shrub 1½ foot.

34 P. ASBESTI'NA (Burch. cat. no. 2030. trav. 1. p. 543.) leaves obovate, tapering to the base, uppermost ones lanceolate, mucronated, rather glaucous, and are as well as the branchlets somewhat pubescent; peduncles generally 1-flowered, lateral; wings of flower lanceolate, green. ♄. G. Native of the Cape of Good Hope beyond the Orange river. Flowers white. Capsules oval, cleft in two lobes at the top. Perhaps belonging to a separate section.

Asbestus or Cloth Milkwort. Fl. May, Aug. Sh. 1 to 2 ft.

35 P. POLYPHY'LLA (D. C. prod. 1. p. 324.) leaves oblong, acute at both ends, crowded, rough on the back and margins; branchlets somewhat puberulous; pedicels axillary, 1-flowered. ♄. G. Native of the Cape of Good Hope. Plant with the habit of *Múndia*. Flowers probably purplish.

Many-leaved Milkwort. Fl. May, Sep. Shrub 2 feet.

† *Species belonging to the present section, but whether the leaves are opposite or alternate is not mentioned.*

36 P. CE'RNUA (Thunb. prod. 1. p. 120.) flowers crested, racemose; leaves lanceolate, glabrous. Native of the Cape of Good Hope. Flowers probably purple.

Drooping-flowered Milkwort. Shrub.

37 P. VIRGA'TA (Thunb. prod. 1. p. 120.) flowers crested, racemose; leaves obovate-oblong. Native of the Cape of Good Hope. Perhaps P. speciòsa of Sims. Flowers purple?

Twiggy Milkwort. Shrub.

38 P. AMŒ'NA (Thunb. prod. 120.) flowers crested, lateral; leaves obovate-oblong, glabrous.—Native of the Cape of Good Hope. Flowers probably white. P. asbestìna of Burchell?

Pleasant Milkwort. Shrub.

39 P. TOMENTO'SA (Thunb. prod. p. 120.) flowers crested in whorls; leaves cordate, downy on the under surface.—Native of the Cape of Good Hope. Flowers purple?

Tomentose-leaved Milkwort. Shrub.

SECT. II. POLY'GALON (see genus for derivation.) D. C. prod. 1. p. 324. Keel of flower crested. Capsules smooth. Bracteas three, situated at the base of the pedicels, deciduous. Elegant herbs and subshrubs. Native of Europe and the temperate parts of Asia.

40 P. TENUIFO'LIA (Willd. spec. 3. p. 879.) leaves linear, mucronated, and are as well as erect stem glabrous; racemes elongated, loose, almost bractless; wings of flower oval-oblong, acute. ♃. H. Native on the mountains of Siberia. Flowers flesh-coloured and blue.

Thin-leaved Milkwort. Pl. 1 foot.

41 P. SIBI'RICA (Lin. spec. 987.) leaves lanceolate, lower ones ovate, glabrous, younger ones somewhat puberulous; racemes loose, few-flowered; bracteas soon falling off; wings of calyx elliptical, mucronated. ♃. H. Native on mountains in Siberia.—Gmel. sib. 4. p. 64. t. 32. f. 1. Flowers intense blue.

Siberian Milkwort. Fl. May, July? Pl. ¼ foot.

42 P. JAPO'NICA (Houtt. syst. 8. t. 62. f. 1.) leaves glabrous, lower ones roundish, upper ones ovate, acute; stem erect; racemes lateral, somewhat corymbose; calyx spreading; wings of calyx oblong. ♃. G. Native of Japan. P. vulgàris, Thunb. jap. 277. Flowers blue.

Japan Milkwort. Pl. ½ foot.

43 P. densiflo'ra (Blum. bijdr. fl. ind. ned. ex Schlecht. Linnæa 1. p. 466.) leaves linear-lanceolate, mucronate, with ciliated revolute margins, lower ones obovate; racemes supra-axillary, short, dense; wings of calyx falcate, longer than the orbicular capsule. ♄. S. Native of Java. Flowers red?

Dense-flowered Milkwort. Shrub 1 foot?

44 P. saxa'tilis (Desf. atl. 2. p. 128. t. 175.) leaves oblong-lanceolate, mucronated; stems shrubby at the base, decumbent; racemes extra-axillary, few-flowered; wings of calyx elliptical. ♄. F. Native of Mauritania, Spain, and south of France, on rocks. Flowers blue or purple.

Stone Milkwort. Fl. May, June. Pl. ½ foot.

45 P. Oxycoccoi'des (Desf. atl. t. 174.) leaves elliptical, thickish; stem shrubby, decumbent; racemes lateral, short, few-flowered; wings of calyx ovate. ♄. F. Native of the north of Africa in the fissures of rocks. Flowers blue or purple?

Cranberry-like Milkwort. Fl. May, July. Shrub decumbent ¼ to ½ foot long.

46 P. supi'na (Schreb. dec. t. 10.) leaves obovate, somewhat retuse; stem shrubby, trailing; racemes subterminal, 7-9-flowered; wings of calyx oval, somewhat 3-nerved, longer than the corolla. ♄. F. Native of Armenia and Tauria in gravelly places. P. andrachnoïdes, Willd.—Buxb. cent. t. 70. f. 2. Flowers either blue or purple.

Trailing Milkwort. Shrub trailing.

47 P. adsce'ndens (Clark. in Spreng. new entd. 3. p. 165.) leaves oblong, tapering at the base, lower ones obovate, somewhat villous; stem shrubby at the base, ascending; racemes few-flowered; wings of calyx oblong, obtuse, one-half shorter than the corolla; ovary sessile. ♄. F. Native in the island of Cos. Flowers blue?

Ascending-stemmed Milkwort. Shrub ½ foot.

48 P. venulo'sa (Sibth. et Smith, prod. fl. græc. 2. p. 52.) leaves elliptical-lanceolate; stem ascending; racemes subterminal; wings of calyx oblong, 3-nerved, transversely veined, one-half shorter than the corolla. ♃. F. Native in the islands of the Archipelago. Flowers blush-coloured, with a white crest; the petals nearly twice as long as the wings.

Veiny-winged Milkwort. Pl. ½ foot.

49 P. strami'nea (Presl. ex Spreng. syst. append. p. 265.) stem erect, a little branched; leaves lanceolate-linear, acuminate; bracteas deciduous; wings ovate-elliptical, 3-nerved, twice the length of the corolla. ♃. F. Native of Sicily. Flowers straw-coloured.

Straw-coloured-flowered Milkwort. Pl. ½ foot.

50 P. elonga'ta (Presl. ex Spreng. syst. append. p. 265.) stem ascending; leaves serrulated, lower ones obovate, upper ones oblong; wings of calyx elliptical, shorter than the corolla. ♃. H. Native of Sicily.

Elongated Milkwort. Pl. ½ foot.

51 P. multicau'lis (Tauch. in flor. 1821. p. 563.) flowers crested; racemes lax, few-flowered; wings of calyx elliptical, acute, shorter than the corolla, deeply 3-nerved, with veiny margins; stems filiform, much branched, trailing; leaves linear-lanceolate, acute. ♃. H. Native of Switzerland. Flowers blue.

Many-stemmed Milkwort. Pl. ¼ foot.

52 P. ro'sea (Desf. atl. 2. p. 128. t. 176.) lower leaves oblong, obtuse, upper ones lanceolate; stem erect, shrubby at the base; wings of calyx oval, many-nerved, a little shorter than the corolla; ovary on a very short stipe. ♄. F. Native of the north of Africa near Tlemsen. Flowers rose-coloured, large.

Rose-coloured-flowered Milkwort. Shrub 1 foot.

53 P. ma'jor (Jacq. austr. t. 413.) leaves linear-lanceolate, acute; stems erect; wings of calyx ovate, many-nerved, a little longer than the corolla; ovary on a long stipe. ♃. H. Native of Italy, Austria, Greece, and the Levant, in mountainous meadows. Flowers rose-purple, double the size of those of *P. vulgàris*.—Buxb. cent. 8. p. 40. t. 70. f. 1.

Larger-perennial Milkwort. Fl. July, Aug. Clt. 1739. Pl. 1 foot.

54 P. Thuringi'aca (Spreng. syst. 3. p. 166.) stem ascending, lower leaves spatulate; wings obovate, shorter than the corolla, but equal in length to the capsule. ♃. H. Native of Thuringia and Italy. P. buxifòlia, Reichb. Flowers blue or purple.

Thuringian Milkwort. Fl. June, July. Pl. ¼ foot.

55 P. oxy'ptera (Reichb. ex Spreng. syst. 3. p. 166.) stem ascending; leaves lanceolate; wings acute, shorter than the corolla, and equal in length to the broad capsule. ♃. H. Native of Germany and Denmark. P. vulgàris, Fl. dan. t. 516. Flowers blue and purple.

Sharp-winged Milkwort. Fl. June, July. Pl. ¼ to ½ foot.

56 P. flave'scens (D. C. cat. hort. monsp. 134.) leaves linear, rather lanceolate, acute; stems ascending; wings of calyx elliptical, acute at both ends, longer than the corolla and capsule. ♃. H. Native on the Appenines.—Seb. pl. rom. fasc. 1. t. 1. Flowers yellowish.

Yellowish-flowered Milkwort. Pl. ½ foot.

57 P. vulga'ris (Lin. spec. 986.) leaves linear-lanceolate, bluntish; stems ascending; wings of calyx elliptical, bluntish, a little longer than the capsule, but somewhat equal in length or shorter than the corolla; ovary almost sessile. ♃. H. Native on gravelly heathy pastures and woods throughout Europe, plentiful in Britain. Flowers either blue, red, purple, white, or yellowish.

Var. a, vèra (D. C. prod. 1. p. 325.) stems erectish, lower leaves obovate, obtuse, upper ones linear, acute. Smith, engl. bot. t. 76. Vaill. par. 160, 161. t. 32. f. 1.

Var. β, pubéscens (D. C. l. c.) stems decumbent, and are as well as leaves pubescent. Rohd. journ. bot. 2. p. 359.

Var. δ, Verviàna (Lej. fl. spa. 2. p. 92.) stems ascending; leaves lanceolate-linear; flowers white.

Var. ε, acutifòlia (D. C. l. c.) stems erect; leaves linear; flowers middle-sized, blue.

Var. ζ, angustifòlia (D. C. prod. 1. p. 325.) stems erect; leaves linear; flowers middle-sized, rose-coloured. P. Monspelìaca, Vill. dauph. 3. p. 388?

Var. κ, grandiflòra (D. C. prod. 1. p. 325.) stems erect; leaves linear; flowers large, rose-coloured. P. Monspelìaca, All. pedm. no. 1087.

The *Polýgala vulgàris*, like the rest of the European species, is bitter, and when given in infusion promotes expectoration, and is good for a catarrhous cough. Duhamel used it in pleuritic cases with effect. Linnæus found the plant to possess the same properties as *P. Sénega*, but in an inferior degree. The powdered root may be given in doses of half a drachm. Foreigners celebrate it as a grateful and nutritious food for cattle. According to the Swedish experiments, kine, sheep, and goats eat it, but swine refuse it.

Common Milkwort. Fl. June, July. Britain. Pl. ¼ to ½ ft.

58 P. como'sa (Schkuhr, handb. t. 194.) stem erect; lower leaves scattered, obovate, the rest linear; bracteas longer than the flower; wings elliptical, longer than the capsule and corolla. ♄. H. Native of Germany. P. vulgàris var. γ, elàta, D. C. prod. 1. p. 325. Flowers purple or blue.

Tufted Milkwort. Fl. May, July. Pl. ¾ foot.

59 P. Austri'aca (Crantz. aust. t. 2. f. 4.) stem ascending; lower leaves obovate, oblong; wings 3-nerved, elliptical, equal in length to the corolla, shorter than the capsule. ♃. H. Native of Germany, south of France, and Volhynia. Wings of flower greenish after flowering. P. decípiens, Bess. cont. 2. p.

73. V. amàra, fl. Lith. P. uliginòsa, Rchb. Flowers blue, or purple, or white. Plant very bitter.

Austrian Milkwort. Fl. June, July. Clt. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

60 P. alpe'stris (Reichb. ex Spreng. syst. 3. p. 166.) stem ascending, lower leaves obovate-oblong; wings obtuse, longer than the corolla, but equal in length with the broad capsule. ♃. H. Native of Switzerland, France, Austria, and Volhynia, on the Alps. P. amàra, Jacq. austr. t. 412. P. Vaillánti, Bess. cont. 2. p. 73.—Vaill. par. t. 32. f. 3. Perhaps *P. hýbrida*, no. 62. Flowers blue.

Alp Milkwort. Fl. June, July. Clt. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

61 P. ama`ra (Lin. spec. 987.) radical leaves obovate, very blunt, cauline ones linear; stems erectish; wings of calyx elliptical, equalling the corolla in length; capsules almost orbicular. ♃. H. Native of mountainous pastures of Europe, particularly Germany, Switzerland, France, and Austria. Flowers blue.

Var. β? cæspitòsa (D. C. prod. 1. p. 325.) flowers blue; stems tufted, procumbent; leaves linear, upper ones approximating the flowers. P. rèpens, Merat.—Sims, bot. mag. 2437.

Var. γ, alpìna (Poir. dict. 5. p. 488.) flowers few, blue; stems tufted, procumbent, very short; lower leaves obovate.

Var. ε, obtusifòlia (D. C. prod. 1. p. 325.) flowers blue; stems tufted, procumbent, lower leaves obovate, very blunt.

Probably the same qualities as are ascribed to *P. Sénega* may reside in this, and it might be used as a succedaneum for it. Gesner asserts, that an infusion of it is a safe cathartic. A tincture of 4 ounces of it, in a pint of Canary wine is extremely bitter, and of a brownish colour. It is employed in the pleurisy, in malignant and milk fevers, and in phthisis pulmonalis. A drachm of the root in powder is given as a dose; or an ounce of it is boiled in a pint and a half of water to a pint, and drank with milk. The stimulating and resolving principles are stronger in *P. Sénega*, but this seems to abound more in balsamic resin. It is more efficacious than *P. vulgàris*, but that may be owing in a great measure to its mountainous or subalpine situation. (Mart. Mill.)

Bitter Milkwort. Fl. June, July. Clt. 1775. Pl. $\frac{1}{4}$ foot.

62 P. hy'brida (D. C. prod. 1. p. 325.) stem glabrous, erectish, simple, lower leaves oblong, the rest linear; wings of calyx oblong, longer than the corolla. ♃. F. Native of the Ural deserts in Siberia. This plant is intermediate between the two preceding species. Flowers blue.

Hybrid Milkwort. Fl. June, July. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

63 P. Podo'lica (D. C. prod. 1. p. 325.) stem erectish, glabrous, simple; leaves linear, acute; bracteas awl-shaped, twice the length of the flower; wings of calyx oblong, 1-nerved, equal in length to the corolla (white, with a green line on the middle). ♃. H. Native of southern Podolia. Flowers blue?

Podolian Milkwort. Fl. June, July. Pl. $\frac{1}{2}$ foot.

64 P. Monspeli`aca (Lin. spec. 987.) stem erect, glabrous, almost simple; leaves linear, acuminated; wings of calyx oblong, 3-nerved, acute at both ends. ⊙. H. Native on sterile places about the Mediterranean and the south of France. D. C. icon. rar. 1. p. 3. t. 9. Flowers pale rose-coloured or greenish, very small.

Montpelier Milkwort. Fl. June, July. Clt. 1823. Pl. $\frac{1}{2}$ ft.

65 P. exi`lis (D. C. cat. hort. monsp. 133.) stem erect, glabrous, much branched; leaves linear, thickish; wings of calyx oval, obtuse, 1-nerved, length of capsule; raceme loose. ⊙. H. Native in the south of France and Spain. P. lineàris, Lag. P. nòva, Boiss. fl. eur. 1. p. 474. f. 1. Flowers rose-coloured or blue.

Slender Milkwort. Fl. July. Pl. $\frac{1}{2}$ foot.

66 P. gluma`cea (Smith, prod. fl. græc. 2. p. 52. fl. græc. t. 670.) stem somewhat erect; leaves lanceolate-linear, acuminated; wings of calyx elliptical-lanceolate, twice as long as the corolla, 3-nerved, obsoletely veined. ♃. F. Native in the island of Cyprus, and at Gibraltar. Flowers white, small.

Chaffy Milkwort. Fl. June, July. Pl. $\frac{1}{2}$ foot.

67 P. di'scolor (Hamilt. in herb. Lamb. D. Don, prod. fl. nep. 199.) spike many-flowered; wings spatulate; stem erect, simple; lower leaves obovate or elliptical, reddish beneath, upper ones linear-lanceolate, mucronate. ⊙. H. Native of Upper Nipaul. P. leptostàchya, D. C. in herb. Lamb, P. leptàlea and P. oligophýlla, D. C. prod. 1. p. 325. Flowers small, pendulous.

Two-coloured-leaved Milkwort. Pl. $\frac{1}{4}$ foot.

† *Species not sufficiently known, but evidently belonging to section Polýgalon.*

68 P. elonga`ta (Klein. in Willd. spec. 3. p. 879.) flowers crested; racemes axillary, elongated; stem branching from the base; leaves linear, obtuse, mucronated, with rather ciliated margins. ⊙. S. Native of the East Indies near Hydrabad.

Elongated-racemed Milkwort. Pl. $\frac{1}{2}$ foot.

69 P. longifo`lia (Poir. dict. 5. p. 501.) flowers crested; racemes spike-formed; wing of flower oblong; stem almost simple; leaves very long, grassy, upper ones filiform. ⊙. S. Native of Java.

Long-leaved Milkwort. Fl. July, Aug. Pl. $\frac{1}{2}$ foot.

70 P. Tranqueba'rica (Mart. ex Gœt. anz. 1817. p. 159.) flowers crested; racemes few-flowered, lateral; leaves linear, mucronated; stems herbaceous, branched. ⊙. S. Native on the shores of Tranquebar and Coromandel.

Tranquebar Milkwort. Pl. $\frac{1}{2}$ foot.

71 P. Ma'rtii (D. C. prod. 1. p. 332.) flowers crested; racemes lateral; leaves lanceolate-linear, bluntish; stems procumbent, herbaceous. ⊙? S. Native of the East Indies. P. pubéscens, Mart. ex Gœt. anz. 1817. p. 159. but not of Nutt.

Martius's Milkwort. Pl. $\frac{1}{4}$ foot.

72 P. va`rians (Mart. l. c.) flowers crested; racemes axillary; lower leaves obcordate or ovate, upper ones lanceolate; stem herbaceous, branched, procumbent; peduncles hairy. ⊙? S. Native of Bengal.

Varying Milkwort. Pl. $\frac{1}{4}$ foot.

73 P. umbro`sa (Mart. l. c.) flowers crested; racemes axillary; leaves oblong, acutish, tapering to the base. ⊙? S. Native of Bengal.

Shaded Milkwort. Pl. $\frac{1}{2}$ foot.

74 P. macrophy'lla (D. C. prod. 1. p. 332.) flowers crested; wings cordate-orbicular; racemes axillary; leaves obovate, emarginated. ♄. S. Native of Madagascar.—Vouhe Flac. mad. p. 136. no. 94. icon.

Large-leaved Milkwort. Shrub 1 foot?

75 P. rarifo`lia (D. C. prod. 1. p. 332.) flowers crested; wings of flower obovate, longer than the elliptical capsule; leaves linear, acute; stem suffruticose, erect, furrowed, twiggy. ♃. ♄. S. Native of Sierra Leone in low grassy places. Flowers blue. Perhaps belonging to a proper section. This plant has the habit of a species of *Genésta*.

Rare-leaved Milkwort. Fl. Feb. May. Shrub 1 to $1\frac{1}{2}$ foot.

Sect. III. Blephari'dium (from *βλεφαρις, blepharis*, an eyelash, and *ειδος, eidos*, similar, in allusion to the ciliary margins of the capsule.) D. C. prod. 1. p. 326. Keel of corolla crested. Capsules emarginate at the apex, with ciliated margins. Racemes short, lateral. Bracteas 3, small, situated at the base of each pedicel. Small much branched herbs, natives of India, Egypt, and Guinea. Flowers pale-red and greenish.

76 P. telephioi`des (Willd. spec. 3. p. 876.) flowers crested; racemes axillary, twice as long as the leaves; stem simple, erect; leaves oblong, obtuse, tapering to the base. ⊙. S. Native of the East Indies. Flowers green. Capsule ciliated.

Orpine-like Milkwort. Pl. ½ foot.

77 P. erio'ptera (D. C. prod. 1. p. 326.) stems ascending, branched, pubescent-velvety at the apex; leaves linear, acutish, glabrous; racemes 4-5-flowered; wings of calyx elliptical, pubescent, longer than the oblong velvety capsule. ♃. S. Native of Senegal and Egypt. P. paniculàta, Forsk. fl. arab. no. 429? Flowers pale-red?

Woolly-winged Milkwort. Pl. 1 foot.

78 P. obtusa'ta (D. C. prod. 1. p. 326.) stems diffuse, twiggy, glabrous; leaves linear, very obtuse; racemes 2-6-flowered; wings of calyx oblong, obtuse, glabrous, somewhat ciliated, longer than the capsule, which is rather pubescent. ♃. G. Native of Arabia and Egypt.

Obtuse-winged Milkwort. Pl. 1 foot.

79 P. linarifo'lia (Willd. spec. 3. p. 877.) stem erect, twiggy, branched, pubescent; leaves linear, straight; racemes 6-8-flowered; wings of calyx oval-oblong, acute; capsules obcordate, ciliated. ♃? ♄? S. Native of the islands of Mindanao and Samboagang. Flowers reflexed.

Toad-Flax-leaved Milkwort. Pl. 1½ foot.

80 P. procu'mbens (Roth. nov. spec. p. 329.) stem procumbent, pilose; leaves oblong-oval, obtuse, somewhat mucronated, ciliated, glabrous; racemes axillary, short, few-flowered; wings of calyx acuminated; capsules emarginate, edged with hairs. ♄? S. Native of the East Indies. Flowers purple.

Var. β, angustifòlia (Roth. l. c.) leaves longer and narrower than in variety α.

Procumbent Milkwort. Pl. procumbent.

81 P. glomera'ta (Lour. fl. coch. 426.) stem somewhat erect, branched, pubescent; leaves obovate-oblong; racemes dense, 7-8-flowered; wings of calyx oval, acuminated; corolla generally 3-petalled; capsules orbicular. ♃. ♄. G. Native of China near Canton. Flowers white.

Glomerated-flowered Milkwort. Pl. ½ foot.

82 P. glaucoi'des (Lin. spec. 991.) stems diffuse, somewhat pubescent; leaves oval-oblong, on short stalks, glabrous, glaucous; racemes 7-8-flowered; wings of calyx oval, acute; capsules obovate, emarginate, somewhat ciliated. ♃. S. Native of Ceylon. Flowers white.

Glaux-like Milkwort. Pl. 2 inches.

83 P. arena'ria (Willd. spec. 3. p. 880.) stem procumbent; leaves oblong, stalked; racemes ovate-globose, on short peduncles; wings of calyx obovate, downy; capsules oval, emarginate, ciliated. ⊙. S. Native of Guinea. Flowers reflexed.

Sand Milkwort. Pl. procumbent ½ foot.

84 P. serpyllifo'lia (Poir. dict. 5. p. 499.) stems branched from the base, pubescent, lateral ones procumbent; leaves oblong, obtuse, on very short footstalks; racemes 4-5-flowered; wings of calyx oval, acute; capsules ovate, immarginate, ciliated. ♃? S. Native of the East Indies. Flowers rose-coloured.

Wild-thyme-leaved Milkwort. Pl. procumbent.

85 P. arve'nsis (Willd. spec. 3. p. 876.) stem branched from the base, procumbent; leaves obovate, mucronated; racemes 7-8-flowered; bracteas permanent, almost the length of the pedicels; wings of calyx oblong, scarcely longer than the ovate, emarginated, ciliated capsule. ⊙. S. Native of the East Indies. Flowers small, green.

Corn-field Milkwort. Pl. procumbent.

86 P. Vahlia'na (D. C. prod. 1. p. 326.) stem erect, pubescent; leaves obovate, mucronated, rather villous, upper ones oblong; racemes 3-5-flowered; wings of flower elliptical, scarcely longer than the capsule, which is ovate, emarginated, and ciliated. ⊙. S. Native of the East Indies. P. tomentòsa, Vahl. but not of Thunb. Flowers greenish.

Vahl's Milkwort. Pl. ½ foot.

87 P. brachysta'chya (D. C. prod. 1. p. 327.) stem diffuse, rather downy; leaves linear, glabrous; racemes 3-5-flowered; wings of calyx oval, acuminated, somewhat falcate, a little longer than the emarginate ciliated capsule.—Native of the East Indies. Flowers greenish?

Short-spiked Milkwort. Pl. ½ foot.

88 P. leptorhi'za (D. C. prod. 1. p. 326.) stem branched from the base, diffuse, somewhat downy; leaves linear, pubescent; racemes 7-8-flowered; wings of calyx elliptical, obtuse, a little longer than the oval, emarginated, ciliated capsule. ⊙. S. Native of? Flowers greenish?

Slender-rooted Milkwort. Pl. ½ foot.

89 P. persicariæfo'lia (D. C. prod. 1. p. 326.) stem erect, forked at the top and rather hairy; leaves lanceolate, bluntish, pilose; racemes 10-15-flowered, rising from the fork of the stem; wings of calyx obovate, longer than the obcordate ciliated capsule. ⊙. G. Native of Nipaul. P. Buchanàni, D. Don, prod. p. 199. Flowers drooping, red. Capsule naked with a membranous margin. (D. Don.) Seeds very villous.

Persicaria-leaved Milkwort. Pl. ½ foot.

90 P. crotalarioi'des (Hamilt. ined. and D. C. prod. 1. p. 327.) stem branched from the base, somewhat shrubby, decumbent, pilose; leaves obovate, wedge-shaped; racemes short, 8-10-flowered, opposite the leaves; wings of calyx orbicular, equal in length to the capsule, which is rather orbicular and ciliated; lobes of the lateral petals oblong, 1-toothed at the base. ♃? G. Native of Nipaul. Bracteas permanent, acute. Flowers red or greenish.

Crotalaria-like Milkwort. Pl. ½ foot.

91 P. Java'na (D. C. prod. 1. p. 327.) stem branched from the base, suffruticose, diffuse; leaves obovately-cuneated, stalked; racemes 7-8-flowered, length of leaves; wings of flower ovate-roundish, villous, a little longer than the capsule, which is rather orbicular and pubescent. ♄. S. Native of Java. Perhaps belonging to this section.

Java Milkwort. Shrub ½ foot.

Sect. IV. Clincli'nia (from *Clinclin*, the Peruvian name of *P. thesioìdes*.) D. C. prod. 1. p. 327. Keel of flower crested. Wings oblong. Capsules glabrous, marginated and emarginated at the apex, as well as somewhat toothed on both sides at the top. American herbs or subshrubs, but one from Nipaul.

92 P. thesioi'des (Willd. spec. 3. p. 877.) stems many, erect; leaves oblong-linear, crowded; racemes 8-12-flowered; capsules somewhat 2-horned at the apex. ♃. S. Native of Chili and Peru. Clínclin, Feuill. obs. 2. t. 13. Flowers blue.

Thesium-like Milkwort. Pl. ½ foot.

93 P. gnidioi'des (Willd. spec. 3. p. 878.) stems diffuse, branched; leaves linear, bluntish; racemes 6-10-flowered; capsules somewhat emarginate. ♃. S. Native in Chili and Peru. Flowers greenish.

Gnidia-like Milkwort. Pl. ½ foot.

94 P. capillifo'lia (Desf. herb. and D. C. prod. 1. p. 327.) stems erect, hardly branched; racemes slender; leaves capillary; wings of calyx obovate; capsules bifid. ⊙. G. Native of? Perhaps belonging to this section? Flowers red?

Hair-leaved Milkwort. Pl. ¼ foot.

95 P. arilla'ta (Hamilt. mss. D. Don. prod. 1. p. 200.) leaves elliptical, oblong, acuminated, underneath as well as the branches pubescent; racemes opposite the leaves; wings of calyx obovate-oblong; stigma bidendate; capsule rather baccate, with a winged margin. ♄. F. Native of Nipaul at Narainhetty. Habit of *Monnìna polystàchya*. Flowers large, shewy, red, nodding. Capsule subbaccate, compressed, ribbed with a winged margin, 2-celled. Seeds large, covered with an arillus.

Arillate-seeded Milkwort. Fl. Aug. Shrub 1 foot.

Sect. V. Timu'tua (from *Timoutou*, the name of a place in

Cayenne). D. C. prod. 1. p. 327. Keel of flower crested (crest sometimes very minute). Capsules glabrous, oval-oblong, hardly emarginate. Racemes sometimes elongated, sometimes crowded, forming a dense spike. Flowers small, lower ones soon falling off. Leaves alternate or in whorls. American herbs or small shrubs. The character given by M. Anguste St. Hilaire to this section is as follows: Style 4-lobed; lobes nearly equal, or very unequal, upper lobe bearded or appendiculate, lower one gland-formed. Caruncle of seed very minute or with 2 small appendages.

96 P. trichospe'rma (Lin. mant. 259.) racemes ovate, spike-formed; leaves alternate, oblong-linear, erect; stems erect, twiggy. ♃. S. Native in New Granada. Jacq. obs. 3. t. 67. Flowers small, white.

Hairy-seeded Milkwort. Pl. ½ foot.

97 P. aspa'latha (Lin. mant. 99.) racemes dense, roundish, capitate; leaves numerous, alternate, linear-setaceous, mucronate, spreading, full of pellucid dots; stems suffruticose, erect, twiggy, simple, or branched. ♄. S. Native in Brazil in marshy places in the province of St. Paul. Flowers purple, rarely white; wings elliptical, rather longer than the keel. Seeds pubescent.

Aspalathus-like Milkwort. Fl. Feb. Sh. ¼ foot.

98 P. stelle'ra (D. C. prod. 1. p. 327.) racemes somewhat capitate, spike-formed; wings lanceolate, acuminated, longer than the keel; leaves smooth, scattered, few, lower ones opposite, elliptical, obtuse, the rest linear, all full of pellucid dots; stems erect, branched, twiggy; seeds conical, silky, unappendiculate. ⊙. S. Native in Brazil, Portorico, and St. Domingo. Flowers dark-purple.

Starry Milkwort. Fl. Jan. Feb. Pl. ½ to 1 foot.

99 P. hygro'phila (H. B. et Kunth, nov. gen. amer. 5. p. 395. t. 508.) racemes dense, spike-formed, oblong; wings elliptical, longer than the keel; leaves scattered, linear, acute, rather falcate, smooth, lower ones four in a whorl; stem erect, twiggy, almost simple; seeds small, elliptical, pilose. ⊙. S. Native in humid places near Esmeralda on the Orinoco and in Brazil. P. Berteriàna, D. C. prod. 1. p. 328. Flowers whitish, and marked with purple.

Water-loving Milkwort. Fl. May, June. Pl. ½ foot.

100 P. filifo'rmis (St. Hil. fl. bras. 2. p. 7.) stem long, filiform, simple, almost leafless; upper leaves scale-formed, hardly conspicuous; racemes spike-formed, very narrow, lax; wings elliptical, obtuse, shorter than the keel. ⊙. S. Native of Brazil in the province of Minas Geraes on a mountain called Serra da Caraca. Flowers purple, Stigma 4-lobed.

Filiform Milkwort. Fl. April. Pl. 1½ foot.

101 P. equisetoi'des (St. Hil. fl. bras. 2. p. 7.) stem herbaceous, leafless; branches dichotomous; branchlets leafy; leaves very narrow, linear, acute; racemes spike-formed, rather conical; wings elliptical, obtuse, longer than the keel; seeds elongated, cylindrical, beaked, somewhat pubescent. ⊙. S. Native of Brazil in the western part of the province of Minas Geraes. Flowers probably purple. Stigmas 4-lobed. This species has the habit of *P. setàcea*, Mich.

Horse-tail-like Milkwort. Pl. ¾ foot.

102 P. incarna'ta (Lin. spec. 986, exclusive of Pluk. icon.) racemes spike-formed, oblong, without glands; leaves scattered, few, awl-shaped; stem erect, scarcely branched. ⊙. H. Native in low, sandy fields near rivulets from New Jersey to Carolina. A delicate little plant with bright flesh-coloured flowers.

Flesh-coloured-flowered Milkwort. Fl. Ju. July. Clt. 1812. Pl. ½ to 1 foot.

103 P. longicau'lis (H. B. et Kunth, nov. gen. amer. 5. p. 396.) racemes spike-formed, roundish; corolla glandular; leaves scattered, remote, linear, covered with glandular dots; stem elongated, somewhat branched. ⊙. S. Native in New Andalusia and New Granada. Plant smooth. Wings of flower rose-coloured. Seeds conical, covered with retrograde silky hairs.

Long-stemmed Milkwort. Fl. June, July. Pl. 1½ foot.

104 P. adeno'phora (D. C. prod. 1. p. 327.) racemes oblong, spike-formed; wings of calyx as well as capsules glandular; leaves scattered, few, awl-shaped; stem erect, somewhat branched. ⊙. S. Native in dry pastures of Guiana. P. incarnàta, Aubl. guian. 2. p. 739. exclusive of the synonymes. Flowers flesh-coloured.

Gland-bearing Milkwort. Fl. Ju. Jul. Pl. ½ to 1 foot.

105 P. bi'color (H. B. et Kunth, nov. gen. amer. 5. p. 394. t. 507.) racemes dense, cylindrical, spike-formed; 3 shorter sepals bearing 2 thick parallel nerves; leaves full of shining dots; lower ones 3 or 5 in a whorl, upper ones scattered, linear-lanceolate. ⊙. S. Native of Mexico near Santa-Rosa. Plant smooth, simple. Flowers about the size of those of *P. Austrìaca*, whitish, lower ones reddish-copper-coloured.

Two-coloured-flowered Milkwort. Fl. May, July. Pl. ½ foot.

106 P. Timou'tou (Aubl. guian. 2. t. 225.) racemes spike-formed, cylindrical, imbricated; flowers at length reflexed; wings ovate-lanceolate, obtuse, longer than the keel; leaves sessile, oblong, somewhat mucronated, lowest ones obovate, 4 in a whorl, upper ones oblong, acute, alternate; stem erect, branched, 4-angled, winged; seeds pilose. ⊙. S. Native of Cayenne and Brazil in wet places. P. lupulìna, Willd. spec. 3. p. 880. P. uliginòsa, Pers. ench. 2. p. 272. Flowers whitish-green. P. cuspidàta, D. C. prod. 1. p. 328. *Timoutou* is the name of the place in Cayenne, where this plant was first collected by Aublet.

Timoutou Milkwort. Pl. ½ to 1 foot.

107 P. di'stans (St. Hil. fl. bras. 2. p. 24. t. 84.) stem herbaceous, almost simple, erect; leaves 5 or 7 in a whorl, lanceolate, very acute, full of pellucid dots; whorls few and very remote; racemes spike-formed, very narrow and rather loose; wings obovate, about equal in length with the keel; seeds oblong, pubescent. ⊙. S. Native of Brazil in the province of Minas Geraes in the desert called Certao. Flowers purple?

Distant-leaved Milkwort. Pl. ½ to ¾ foot.

108 P. molluginifo'lia (St. Hil. fl. bras. 2. p. 25.) stem dichotomous, quadrangular; leaves 4 in a whorl, linear or oblong-linear, mucronulate, full of glandular dots, smooth; racemes spike-formed; wings elliptical, equal in length with the keel; seeds oblong, pubescent. ⊙. S. Native of Brasil in the provinces of St. Paul and Cis Platine, &c. Flowers purple.

Mollugo-leaved Milkwort. Fl. Oct. Jan. Pl. ½ to 1 foot.

109 P. varia'bilis (H. B. et Kunth, nov. gen. 5. p. 397. t. 509.) racemes spike-formed, rather loose; leaves scattered, remote, narrow, linear, glabrous, full of pellucid dots; stems ascending, fastigiately branched at the top. ⊙. S. Native of South America. Seeds conical, covered with retrograde hairs.

Var. α; flowers rose-coloured. On the banks of the river Orinoco.

Var. β; flowers white. Near Maypures.

Var. γ; stem simple. Near Esmeralda.

Variable-flowered Milkwort. Pl. ½ to ¾ foot.

110 P. crucia'ta (Lin. amœn. 2. p. 138.) racemes spike-formed, ovate, imbricated; wings of younger flowers with long points; leaves linear, 4 in a whorl; stem erect, branched, angular. ⊙. H. Native in wet places on the edges of bogs and rivulets from Canada to Carolina. Flowers red, mixed with green. Plant dwarf and spreading.

Cross-leaved Milkwort. Fl. July, Sept. Clt. 1739. Pl. ¾ ft.

111 P. brevifo'lia (Nutt. gen. amer. 2. p. 89.) racemes spike-formed, partly capitate; wings of flower cordate-ovate, acute; leaves oblong-linear, full of resinous dots, 4 in a whorl;

stem erect, branched, winged. ⊙. H. Native on the margins of sandy swamps of New Jersey, and on the banks of the Ohio. Flowers bright red.

Short-leaved Milkwort. Fl. July. Clt. 1824. Pl. ½ foot.

112 P. fastigia'ta (Nutt. gen. amer. p. 89.) racemes spike-formed, somewhat capitate; wings of calyx spreading, acute; leaves alternate, linear, acute; stem slender, fastigiately branched. ⊙. H. Native of New Jersey, Flowers red.

Fastigiate-branched Milkwort. Fl. Ju. Sep. Clt. 1824. Pl. ½ ft.

113 P. lu'tea (Lin. spec. 990.) racemes spike-formed, dense, ovate; wings of calyx mucronated; leaves oblong-lanceolate, acute, radical ones somewhat stalked and spatulate; stems simple, elongated; keel with a small, minute crest. ⊙. H. Native in wet woods and bogs from New Jersey to Florida. A fine species, with flowers of a golden yellow.

Yellow-flowered Milkwort. Fl. Jul. Aug. Clt. 1739. Pl. ¾ ft.

114 P. na'na (D. C. prod. 1. p. 328.) racemes spike-formed, dense, cylindrical; wings of calyx ovate, with a narrow point; leaves oblong-spatulate, stalked; stems simple, scarcely longer than the leaves. ⊙. H. Native in pine forests of Carolina and Georgia. P. viridéscens, Nutt. gen. 2. p. 88. not of others. P. lùtea β, Mich. Flowers green, with a tinge of yellow. P. lùtea β, nàna, Pursh, fl. amer. sept. 2. p. 465.

Dwarf Milkwort. Fl. July, Aug. Clt. 1815. Pl. ¼ foot.

115 P. viride'scens (Pursh, fl. amer. sept. 2. p. 465.) stem erect, very simple; leaves linear-lanceolate, bluntish; spike capitate, terminal. ⊙. H. Native of North America from Pennsylvania to Carolina. Flowers greenish-white with some red. In general habit the plant is like *P. incarnàta*. Perhaps the keel is without a crest. Perhaps the same as the preceding.

Greenish-flowered Milkwort. Fl. July, Aug. Pl. ½ foot.

116 P. angula'ta (D. C. prod. 1. p. 328.) racemes spike-formed, short, 8-10-flowered; wings of calyx oblong; leaves oval, with a narrow point; stems branched, ascending, angularly-winged, shrubby. ♄. S. Native of Brazil. Flowers purple?

Angular-branched Milkwort. Pl. ½ foot.

117 P. lancifòlia (St. Hil. fl. bras. 2. p. 42.) stem suffruticose, puberulous; leaves ovate, lanceolate, acuminated and very acute; racemes spike-formed; wings obovate, very blunt; seeds clavate, scarcely tomentose. ♄. S. Native of Brazil on the margins of woods in the province of Minas Geraes. Flowers greenish-white.

Lance-leaved Milkwort. Fl. Oct. March. Shrub 1 foot.

118 P. pulche'lla (St. Hil. fl. bras. 2. p. 30.) herbaceous; stem short, rather tufted, filiform, rather pubescent; leaves small, linear, tapering to both ends, very acute; racemes spike-formed, shortish, rather loose; wings obovate, with long claws rather longer than the keel; seeds cylindrical, hardly pilose. ⊙. S. Native of Brazil. Flowers whitish.

Pretty Milkwort. Fl. Sept. Oct. Pl. ¼ foot.

119 P. purpu'rea (Nutt. gen. 2. p. 88.) racemes spike-formed, ovate, imbricated; wings of calyx ovate, cordate, twice as long as the capsule; leaves alternate, oblong-linear; stems erect, fastigiately branched. ⊙. H. Native of North America. P. sanguínea, Mich. fl. bor. amer. 2. p. 52. and Pursh. Flowers purplish with the keel almost beardless. Bart. fl. amer. t. 47.

Purple-flowered Milkwort. Fl. July, Aug. Clt. 1739. Pl. ½ to ¾ foot.

120 P. sangui'nea (Lin. spec. 991.) racemes spike-formed, oblong; wings obovate, length of capsule; leaves alternate, narrow-linear; stem erect, fastigiately branched. ⊙. H. Native in woods on the sides of hills from New England to Carolina. P. viridéscens, Poir. dict. 5. p. 502.—Pluk. mant. t. 438. f. 5. Flowers rose-coloured, with the keel almost beardless.

Bloody Milkwort. Fl. July, Aug. Clt. 1739. Pl. ¼ to ½ ft.

121 P. seta'cea (Mich. fl. bor. amer. 2. p. 52.) racemes spike-formed, dense, oblong; leaves scale-like, almost wanting; stem erect, setaceous, almost simple. ⊙. H. Native of Carolina and Georgia. Flowers small, almost sessile.

Bristly-stemmed Milkwort. Fl. July, Aug. Pl. ½ foot.

122 P. gra'cilis (H. B. et Kunth, nov. gen. amer. 5. p. 401.) racemes spike-formed, slender, loose; leaves scattered, linear; stem erect, elongated, scarcely branched. ⊙. S. Native in humid places near the Maypures on the Orinoco. Flowers purple. Seeds obliquely oblong, covered with retrograde hairs.

Slender-spiked Milkwort. Fl. May. Pl. 1 foot.

123 P. paludòsa (St. Hil. fl. bras. 2. p. 8.) herbaceous, smooth; stem erect, branched, or simple; leaves narrow, linear, acute: racemes spike-formed; wings oblong, unguiculate, rather longer than the keel; seeds hairy, subglobose, or subcylindrical. ⊙. S. Native of Brazil in the sand in several places. Flowers yellow. Stigma 4-lobed.

Var. β, *myùrus* (St. Hil. l. c.) stems and branches much shorter; racemes longer, narrower; flowers very minute, at first yellowish-green, then purplish; seeds ovate-globose. ⊙. S. Native in the province of St. Paul. P. ténuis, D. C. prod. 1. p. 329.

Var. γ, *amethýstina* (St. Hil. l. c.) stem filiform, almost simple; racemes a little longer and rather narrower; flowers amethyst; seeds ovate-globose. ⊙. S. In Minas Geraes.

Var. δ, *ambígua* (St. Hil. l. c.) stem almost simple; racemes elongated, more crowded; flowers larger; capsule oblong; seeds ovate-globose.

Var. ε, *longispicàta* (St. Hil. l. c.) stem and branches shorter; leaves much longer, flattish; racemes longer and narrower; flowers hardly larger, amethyst blue; wings large elliptical; capsule oblong; seeds rather cylindrical, rather truncately-obtuse at the apex. ⊙. S. In St. Catherine in sandy places.

Var. ζ, *appendiculàta* (St. Hil. l. c.) stem filiform, almost simple, nearly leafless; racemes lax; capsule oblong; seeds cylindrical, truncately obtuse at the apex, unappendiculate or appendiculate. ⊙. S. In marshes near Gaxueirinha.

Var. θ, *gigantèa* (St. Hil. l. c.) stem tall, branched, almost leafless; flowers approximate, longer, pale-purplish; capsule oblong; seeds cylindrical, truncately obtuse at the apex, with short appendages. ⊙. S. In Minas Geraes.

Marsh Milkwort. Pl. ½ to 1 foot.

124 P. subti'lis (H. B. et Kunth, nov. gen. amer. 5. p. 393. t. 506.) racemes capitellate, dense; flowers glandular on the back; wings oblong, acute, longer than the keel; leaves form of scales, remote, linear-awl-shaped; stem erect, filiform, branched at the top. ⊙. S. Native in humid sandy places on the borders of the river Orinoco and in Brazil. Flowers small, white. Style 4-lobed. Seeds globose, smoothish, unappendiculate.

Delicate Milkwort. Fl. July, Sept. Pl. ½ foot.

125 P. atropurpu'rea (St. Hil. fl. bras. 2. p. 10.) stem herbaceous, rather twiggy, nearly leafless, sparingly and dichotomously branched; leaves scale-formed, hardly conspicuous, rather terete, acute; racemes spike-formed, rather pyramidal; wings almost equal in length to the keel, orbicular; seeds obovate-globose, rather hairy, with short appendages. ⊙. S. Native of Brazil in the province of Minas Geraes. Flowers dark purple. Style 4-lobed.

Dark-purple Milkwort. Fl. May. Pl. 1 to 1½ feet.

126 P. herbìola (St. Hil. fl. bras. 2. p. 12.) stem herbaceous, filiform, nearly leafless, sparingly branched; leaves small, very narrow-linear, acute; racemes capitate, dense; wings oblong-elliptic, obtuse, longer than the keel; seeds conically-oblong, rather pubescent, inappendiculate. ⊙. S. Native of Brazil in humid pastures of Serra da Canastra in the province of Minas Geraes. Flowers purple.

Small-herb Milkwort. Fl. March, June. Pl. ½ foot.

127 P. ju'ncea (St. Hil. fl. bras. 2. p. 13.) stem erect, angular, nearly leafless; leaves scale-formed, hardly conspicuous, rather ovate, acute; racemes capitate; wings elliptical, longer than the keel; seeds oblong, hairy. ⊙. S. Native of Brazil in the province of Minas Geraes on Serra da Canastra. Flowers pale-purple.

Rushy Milkwort. Fl. March. Pl. ¾ foot.

128 P. glochida'ta (H. B. et Kunth, nov. gen. amer. 5. p. 400.) racemes loose, slender, spike-formed; leaves narrow-linear, opposite, or in whorls, those on the branches scattered; stem erect, paniculately-branched. ⊙. S. Native in humid places near the rivers Orinoco and Magdalena. Herb glabrous. Flowers pale flesh-coloured. Seeds oblong, covered with hooked hairs.

Hooked-haired-seeded Milkwort. Fl. May, Aug. Pl. ½ ft.

129 P. ambi'gua (Nutt. gen. amer. 2. p. 89.) racemes spike-formed, acute, on long peduncles; wings of flower round, equalling the capsule in length; leaves linear, lower ones in whorls, the rest scattered; stem erect, twiggy, branched. ⊙. H. Native of New Jersey and Virginia. Flowers large, purplish.

Ambiguous Milkwort. Fl. July, Aug. Clt. 1824. Pl. ½ to 1 ft.

130 P. verticilla'ta (Lin. amœn. 2. p. 159.) racemes spike-formed, acute, peduncled; wings of calyx roundish; leaves linear, in whorls; stem erect, branched. ⊙. H. Native on the sides of dry hills and in pine-forests from New York to Carolina. Flowers very small, white, or sometimes pale red, but usually greenish. Pluk. mant. t. 438. f. 4.

Whorl-leaved Milkwort. Fl. Ju. July. Clt. 1739. Pl. ½ ft.

131 P. galioìdes (Poir. dict. 5. p. 503.) racemes spike-formed, very slender, loose, peduncled; wings roundish-obovate, somewhat emarginate, about equal in length with the keel; leaves linear-lanceolate, or linear-mucronate, 4 or 5 in a whorl, full of pellucid dots; stem erect, slender, sparingly branched, quadrangular. ⊙. S. Native of Cayenne and the Caribbee Islands as well as Brazil. Flowers purple.

Lady's Bedstraw-like Milkwort. Fl. Feb. March. Pl. ½ ft.

132 P. spergulæfòlia (St. Hil. fl. bras. 2. p. 28.) stems herbaceous, slender, beset with glandular pubescence; branches filiform; leaves small, very narrow-linear, acute, tapering to the base, 4 in a whorl, upper ones alternate; racemes spike-formed, loose, crowded into a kind of corymb; wings oblong-elliptical, rather longer than the keel; seeds elliptical, villous; hairs glandular. ⊙. S. Native of Brazil in the province of St. Paul. Flowers white.

Spurry-leaved Milkwort. Fl. Dec. Pl. ½ foot.

133 P. crucianelloìdes (D. C. prod. 1. p. 329.) racemes spike-formed, loose, on peduncles; wings of calyx oblong; leaves rhomb-ovate, wedge-shaped at the base, in whorls, uppermost ones alternate; stem erect, angular. ⊙. S. Native of St. Domingo. Flowers white or pale rose-coloured?

Crosswort-like Milkwort. Pl. ½ foot.

134 P. asperuloìdes (H. B. et Kunth, nov. gen. amer. 5. p. 403.) racemes spike-formed, slender, rather loose; flowers glandular on the back; leaves oblong, full of pellucid dots, glabrous, opposite, or 3 or 6 in a whorl; stems diffuse, tufted. ♃. S. Native of South America. Seeds oblong, covered with retrograde silky down. Flowers rose-coloured.

Woodruff-like Milkwort. Pl. 1 foot.

135 P. cypari'ssias (St. Hil. fl. bras. 2. p. 15.) herbaceous; stems usually umbellately branched; leaves numerous, rather terete, linear, very narrow, mucronate; racemes capitate, very obtuse; wings obovate, very blunt, equal in length to the keel; seeds globose, rather pilose. ⊙. S. Native of Brazil near Rio Janeiro by the sea-side and by the sides of lakes, where it is called *Alegrim da Praya*. Flowers purplish?

Cypress-like Milkwort. Fl. April, Aug. Pl. 1 foot.

136 P. polyce'phala (St. Hil. fl. bras. 2. p. 16.) herbaceous; stems usually umbellately crowded; leaves very numerous, approximate, needle-shaped, acute, rather terete; racemes capitate; wings oblong-elliptical, rather narrow, very acute, longer than the keel; seeds elliptical, punctate, smooth. ⊙. S. Native of Brazil in sand on the banks of the river Plate and many other places. Flowers whitish.

Many-headed Milkwort. Fl. Sep. Dec. Pl. ¼ to ¾ foot.

137 P. corisoìdes (St. Hil. fl. bras. 2. p. 17. t. 83.) stem herbaceous, procumbent; branches simple, angular, compressed and complanate; leaves fleshy, very numerous, deflexed, linear, obtuse, mucronate; racemes capitate, sessile; wings ovate-elliptical, obtuse, mucronulate, longer than the keel. ⊙. S. Native of Brazil by the sea-side in the province of Cis Platine. Flowers coloured with violet and white.

Coris-like Milkwort. Fl. Oct. Pl. ½ foot.

138 P. stri'cta (St. Hil. fl. bras. 2. p. 18.) stem short, strict; leaves imbricate, fleshy, linear, mucronulated, full of pellucid dots; racemes capitate, very obtuse; wings oblong-elliptical, very acute, longer than the keel; seeds rather cylindrical, hairy-villous. ⊙? S. Native of Brazil in the province of Minas Geraes. Flowers white, tinged with purple.

Straight Milkwort. Fl. April, Aug. Pl. ½ foot.

139 P. ri'gida (St. Hil. fl. bras. 2. p. 18.) stems suffruticose, somewhat dichotomous, straight, puberulous; leaves very numerous, imbricate, stiff, linear-lanceolate, mucronate, full of pellucid dots; racemes capitate, dense; wings elliptical, mucronate, longer than the keel. ⊙. S. Native of Brazil in the province of Goyaz at the base of the mountain called Serra das Caldas.

Stiff Milkwort. Fl. Aug. Pl. 1 foot.

140 P. coria'cea (St. Hil. fl. bras. 2. p. 19.) stems suffruticose, angular at the apex, erect; leaves sessile, coriaceous, imbricated, lanceolate, very acute, clammy and much nerved, and full of pellucid dots; racemes capitate, small; wings oblong, narrow, acuminated, longer than the keel; seeds oblong-clavate, very villous. ♄. S. Native of Brazil in the southern part of the province of Goyaz. Flowers greenish-white.

Coriaceous-leaved Milkwort. Fl. Aug. Shrub ½ foot.

141 P. poa'ya (Mart. mat. med. bras. fasc. 1. p. 13.) stem suffruticose, 5-angled; leaves coriaceous, 5-nerved; racemes spike-formed; wings oblong-elliptical, or obovate, obtuse, rather longer than the keel; seeds clavate, very villous. ♄. S. Native of Brazil in the provinces of Minas Geraes and Goyaz. *Poaya* is the name of the plant in Brazil, where the roots are used by the inhabitants for Ipecacuan. All emetic plants are called *Poaya* in Brazil. St. Hil. pl. usu. bras. no. 71.

Poaya Milkwort. Fl. April, Aug. Pl. 1 foot.

142 P. adenophy'lla (St. Hil. fl. bras. 2. p. 20.) stem suffruticose, erect, 5-angled, smooth; leaves sessile, obovate, obtuse, mucronate, full of pellucid tubercles; racemes spike-formed, elongated; wings oblong-elliptical, obtuse, scarcely shorter than the keel; seeds oblong-clavate, villous. ♄. S. Native of Brazil. Flowers greenish-white. This plant smells like *Anthoxánthum*.

Var. β, *parvifòlia* (St. Hil. l. c.) leaves much smaller, and very numerous, and somewhat imbricate, lanceolate, acute, mucronate. In the province of St. Paul.

Gland-leaved Milkwort. Fl. Dec. March. Shrub ½ foot.

143 P. Raddia'na (St. Hil. fl. bras. 2. p. 26.) stem herbaceous, erect, puberulous; leaves 4 in a whorl, rather terete, linear, acute, erectish; racemes spike-formed, loose; wings obovate, longer than the keel; seeds clavate, inappendiculate, beset with glandular hairs. ⊙. S. Native of Brazil in the province of Minas Geraes. Flowers elegant.

Var. β, subaphýlla (St. Hil. l. c.) stem much longer, slenderer, nearly leafless; branches slenderer; whorls of leaves much more distant, lower ones deciduous, upper ones very minute; upper part of the rachis quite naked, therefore the spikes of flowers appear to stand on long peduncles.

Raddi's Milkwort. Fl. Aug. Sep. Pl. ½ to ¾ foot.

144 P. paniculàta (Lin. amœn. 5. p. 402.) racemes somewhat spike-formed, loose, elongated; wings of calyx elliptical, tapering into the claws, about equal in length to the keel; leaves scattered, linear, tapering to both ends, mucronulate at the apex; stem erect, much branched at the top; branches puberulous. ⊙. S. Native throughout South America in dry places. Ker. bot. reg. t. 761. Flowers rose-coloured or pale purple.

Var. β, Brasiliàna (D. C. prod. 1. p. 329.) flowers smaller; leaves broader. Native of Brazil. Seeds cylindrical, pubescent.

Var. γ, Africàna (D. C. l. c.) leaves linear-awl-shaped. Native of Sierra Leone.

This beautiful little plant has much the smell and taste of *P. Sénega*, but is not so strong or disagreeable. It is a mild attenuant and sudorific, and may be administered in infusions or decoctions.

Panicled-flowered Milkwort. Fl. Jul. Aug. Clt. 1823. Pl. ½ ft.

145 P. scopària (H. B. et Kunth, nov. gen. amer. 5. p. 399.) racemes spike-formed, rather loose; leaves scattered, linear; stem erect, somewhat fastigiately-branched; root vermicular, twisted. ♃. S. Native near Mexico. Herb smooth. Flowers white. Seeds oblong, cylindrical, covered with retrograde silky hairs.

Broom Milkwort. Pl. ½ to 1 foot.

146 P. corymbòsa (Mich. fl. bor. amer. 2. p. 54.) racemes many, disposed in a terminal corymb; wings of calyx oblong, cuspidate; radical leaves obovate, cauline ones linear, uppermost ones awl-shaped. ♃. F. Native in bogs among sphagnum from Carolina to Florida. P. cymòsa, Walt. carol. 179. Flowers citron-yellow.

Corymbose Milkwort. Fl. June, Aug. Pl. 1 foot.

147 P. graminifòlia (Poir. dict. 5. p. 500.) racemes many, disposed into a terminal corymb; wings of calyx oblong, acute; radical leaves linear-spatulate, cauline ones linear-awl-shaped. ♃. F. Native of grassy places from Carolina to Florida. Perhaps *P. attenuàta*, Nutt. gen. amer. 2. p. 90. Flowers citron-yellow. A tall plant.

Grass-leaved Milkwort. Fl. July. Clt. 1824. Pl. 3 feet.

148 P. Balduìni (Nutt. gen. amer. 2. p. 90.) racemes numerous, corymbose, peduncled; wings of calyx lanceolate, cuspidate; radical leaves spatulate, cauline ones alternate, lanceolate; stem erect, angular, a little branched at the top. ♃. F. Native of Florida near St. Mary's. Flowers greenish-white.

Baldwin's Milkwort. Pl. ¾ foot.

149 P. Neæ'i (D. C. prod, 1. p. 329.) racemes many, short, crowded into a corymb: wings of calyx oblong, acute; leaves awl-shaped; stems many, rising from the root, at top a little branched. ⊙. G. Native of Peru and Chili. Flowers white.

Nee's Milkwort. Pl. ½ foot.

150 P. Muhlenbe'rgii; stem erect, pubescent; branches twiggy; leaves lanceolate, linear, ciliated; racemes elongated; bracteas deciduous; flowers distinct. ⊙. H. Native of Georgia. P. pubéscens, Muhl. not of Nutt.

Muhlenberg's Milkwort. Pl. ½ foot.

151 P. linoìdes (Poir. dict. 5. p. 449.) racemes somewhat spike-formed, elongated, acute; wings elliptical, obtuse, hardly longer than the capsule; leaves small, linear, acuminated, crowded, rather falcate; stems tufted, branched at the top; seeds oblong-clavate, rather pilose. ♃. S. Native of Brazil about Monte-Video and Buenos-Ayres. Habit of *Resèda glaúca*. Flowers white or green, usually coloured with purple.

Flax-like Milkwort. Fl. Nov. Pl. ½ to ¾ foot.

152 P. resedoìdes (St. Hil. fl. bras. 2. p. 31.) stem herbaceous, tufted, simple, puberulous, full of resinous dots; leaves numerous, narrow, linear, falcately curved, very acute; racemes spike-formed, rather loose; wings obovate, very blunt, rather longer than the keel; seeds subcylindrical, rather pilose. ⊙. S. Native of Brazil in the provinces of Rio Grande do Sul and Cis Platine. Flowers white, often mixed with blue and purple.

Mignonette-like Milkwort. Fl. Oct. Nov. Pl. ½ foot.

153 P. dunalia'na (St. Hil. fl. bras. 2. p. 32. t. 85.) stems very slender; leaves small, appressed, ovate-lanceolate, very much acuminated, mucronulate, cordate at the base; racemes spike-formed, slender; wings ovate-rhomboid, hardly longer than the keel; seeds rather cylindrical, incurved, smooth. ♄. S. Native of Brazil near a town called Rio Pardo. Flowers purplish, disposed in racemes resembling *Erìca vulgàris*.

Var. β, álba (St. Hil. l. c.) leaves less cordate at the base, less puberulous; flowers white or pale purple. ♄. S. In Minas Geraes.

Dunal's Milkwort. Fl. Feb. Sept. Sh. 1 foot.

154 P. a'lba (Nutt. gen. 2. p. 87.) racemes spike-formed, peduncled; wings of calyx roundish, length of corolla; leaves alternate, linear, with revolute margins; stem simple, elongated. ♃. F. Native of Upper Louisiana. P. Sénega, var. álba, Pursh. Flowers white. This plant possesses the same qualities as *P. Sénega*. no. 168. p. 359.

White-flowered Milkwort. Fl. June, July. Pl. ½ to 1 foot.

155 P. rube'lla (Pursh, fl. amer. sept. 2. p. 464.) pubescent; racemes rather loose, somewhat spiked, elongated; wings of calyx oval, very blunt; leaves lanceolate-linear, mucronated; stem erect, furrowed, a little branched at the top. ♃. H. Native in woods and on dry shady hills from Pennsylvania to Georgia. P. polýgama, Walt. Flowers pale red. This species approaches near to *P. vulgàris*.

Like some of the European species this plant is a powerful bitter, imparting its properties both to water and alcohol. In the United States of America it is administered in small doses, as a useful tonic and stimulant to the digestive organs. In large doses it operates as a cathartic and excites diaphoreses. Dr. Bigelow says its powers appear to resemble the *P. vulgàris* and *P. amàra* of Europe, which are considered tonic and expectorant.

Red-flowered Milkwort. Fl. June, July. Pl. ½ foot.

156 P. Duartea'na (St. Hil. fl. bras. 2. p. 34.) stem herbaceous, puberulous; leaves linear, acute, on short petioles, smooth; racemes spike-formed, narrow, loose; wings elliptical or obovate, bluntish, about equal in length with the keel; seeds clavate, rather pilose. ⊙. S. Native of Brazil in the province of Minas Geraes. Flowers greenish-white.

Duarte's Milkwort. Fl. Dec. Feb. Pl. 1 to 1½ foot.

157 P. Roubie'nna (St. Hil. fl. bras. 2. p. 35.) stem suffruticose, tufted, or a little branched; leaves obtuse, mucronulate, lower ones obovate; racemes spike-formed, truncate at the apex, loose; wings elliptical, very blunt, somewhat emarginate, equal in length to the keel; seeds rather cylindrical, incurved, villous, ♄. S. Native of Brazil in the province of Minas Geraes.

Roubieu's Milkwort. Fl. Mar. Shrub ½ to 1 foot.

158 P. Moquinia'na (St. Hil. fl. bras. 2. p. 36. t. 86.) stems suffruticose, prostrate, somewhat quadrangular, puberulous, leaves numerous, distich, lanceolate, mucronulate, puberulous, obsoletely-dotted; racemes capitate, obtuse, dense, on long peduncles; wings lanceolate, acute, longer than the keel; seeds cylindrical, pubescent. ♄. S. Native of Brazil in the province of St. Paul. The heads of flowers resemble those of *Jasiòne* or *Globulària*.

Moquin-Tandon's Milkwort. Fl. Mar. Sh. ½ foot.

159 P. obova'ta (St. Hil. fl. bras. 2. p. 37.) stem suffruti-

cose, crowded, puberulous; leaves usually obovate, mucronate, full of small pellucid dots; racemes capitate, dense; wings oblong-elliptical, rather narrow, acute, longer than the keel; seeds oblong-cylindrical, villous. ♄. S. Native of Brazil in the province of Rio Grande do Sul, among rocks. Flowers white.

Obovate-leaved Milkwort. Fl. Oct. Feb. Shrub ½ foot.

160 P. Cneo'rum (St. Hil. fl. bras. 2. p. 38.) stems suffruticose, ascending; leaves very numerous, narrow-linear, tapering to the base, mucronulate at the top, full of minute pellucid dots; racemes capitate, dense; wings ovate-lanceolate, mucronulate, about equal in length to the keel; seeds cylindrical, pubescent. ♄. S. Native of Brazil in the province of Minas Geraes.

Cneorum-like Milkwort. Fl. March. Shrub ½ foot.

161 P. bryoìdes (St. Hil. fl. bras. 2. p. 39.) stem suffruticose, crowded, dichotomous at the apex, puberulous, clammy; leaves small, very numerous, narrow, linear, acute, falcate, rather fleshy, full of pellucid dots; wings lanceolate, narrow, acute, rather glandular, hardly longer than the keel; seeds clavate-cylindrical, villous. ♄. S. Native of Brazil in the province of Minas Geraes in sandy places. Habit of *Erìca*. Flowers white, tinged with red.

Var. β, pygmæ'a (St. Hil. l. c.) stem 2 inches; leaves broader, less fleshy, lower ones rather obovate. Near Barbacena.

Bryum-like Milkwort. Fl. Sep. Dec. Shrub ½ foot.

162 P. pseudoeri'ca (St. Hil. fl. bras. 2. p. 40. t. 87.) stem suffruticose, dichotomous; branchlets pubescent; leaves very numerous, spreading, narrow linear, acute, full of pellucid dots; racemes small, terminal and lateral, spike-formed; wings elliptical, obtuse, glandular in the middle, rather longer than the keel; seeds oblong, a little incurved, villous. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers yellow, tinged with purple.

False-heath Milkwort. Fl. Sept. Shrub ½ foot.

163 P. densifòlia (St. Hil. fl. bras. 2. p. 41.) stem subherbaceous, erect, rather twiggy; branches umbellate, usually di-trichotomous; leaves very numerous, imbricated, linear, acute, full of pellucid dots; racemes spike-formed, rather pyramidal; wings elliptical, obtuse, mucronate, longer than the keel; seeds oblong, villous. ⊙. ♃. S. Native of Brazil on hills in the eastern part of the province of Cis Platine. Flowers yellowish.

Var. β, grandiflòra (St. Hil. l. c.) stems thicker; leaves longer, broader; flowers larger, greenish-white. In Minas Geraes.

Var. γ, mìnor (St. Hil. l. c.) stem much smaller, quadrangular, twiggy; leaves stiffer and broader; spikes much shorter. In Minas Geraes.

Dense-leaved Milkwort. Fl. Nov. Jan. Pl. 1 to 2 feet.

† *Species not sufficiently known, but evidently belonging to section Timoutou.*

164 P. sulca'ta (Willd. spec. 3. p. 878.) flowers crested; racemes terminal on peduncles; stems erect, furrowed, branched at the top; leaves linear, pressed to the stem. ⊙. S. Native of Brazil at Monte Video. Very like *P. paniculàta*. Flowers violaceous.

Furrowed-stemmed Milkwort. Fl. July, Aug. Pl. 1 foot.

165 P. tene'lla (Willd. spec. 3. p. 878.) flowers crested; racemes terminal, on very long peduncles; stem erect, branched at the top; leaves linear-ovate, mucronate. ⊙. S. Native of Panama. Like *P. paniculàta*. Flowers small, flesh-coloured.

Pliant Milkwort. Fl. July, Aug. Pl. 1½ foot.

166 P. Brazilie'nsis (Lin. mant. 99.) flowers crested, somewhat spiked; stems prostrate, very simple; leaves lanceolate. Native in Brazil. Flowers white.

Brazilian Milkwort. Pl. prostrate.

167 P. Guinee'nsis (Willd. spec. 3. p. 882.) flowers crested, nodding; racemes axillary, secund; leaves filiform; stem branched, herbaceous. Native of Guinea.

Guinea Milkwort. Fl. April, June. Pl. ½ foot.

Sect. VI. Se'nega (by mistake supposed to have first come from Senegal.) D. C. prod. 1. p. 330. Keel of flower beardless. Three outer sepals of calyx nearly equal. Leaves alternate. American herbs. The character given by M. Auguste St. Hilaire to this section is as follows. Style simple or 2-lobed; superior lobe longest. Caruncle of seed helmet-formed, usually with one appendage.

168 P. Se'nega (Lin. spec. 990.) stems many, rather erect, simple, terete; leaves ovate-lanceolate, upper ones acuminated; racemes somewhat spike-formed; wings of calyx orbicular; capsules elliptical, emarginate. ♃. F. Native of North America on the sides of hills and in dry woods from Carolina to Georgia. Woodv. med. bot. 3. t. 93. Sims, bot. mag. t. 1051. Flowers small, red. This is the famous *Senega* or *Snake-root*, formerly so celebrated for the bite of rattle-snakes, but other more efficacious remedies have supplanted it, as *Prenánthes* and *Liàtris*.

This plant has a branched woody contorted root, about half an inch thick, and covered with an ash-coloured bark, whence it is supposed to resemble the tail of the rattle-snake. It is inodorous; the taste is at first sweetish and nauseous, but after being chewed for less than a minute, becomes pungent and hot, producing a singular sensation in the fauces. Medically it is considered stimulating, expectorant, and diuretic, and in large doses emetic and cathartic; it increases absorption and the force of circulation, and consequently augments the natural excretions, and frequently occasions a copious ptyalism. It was introduced to the notice of physicians by Dr. Tennant, who having discovered that it was an antidote employed internally as well as applied externally to the wounds by the Senegaro Indians against the bite of the rattle-snake, and reasoning from the effects of the poison, and of the remedy in removing these, was induced to try it in pneumonic affections, and found it to afford very marked relief by promoting expectoration even in far advanced stages of inflammation, but it is apt to disorder the stomach and induce diarrhœa. On account of its stimulating and diaphoritic properties, however, it can be employed in these complaints only after the resolution of the inflammation by bleeding and evacuations. It proves more directly useful in humoral asthma, chronic catarrh, chronic rheumatism, and some kinds of dropsy. (Thoms. lond. dispens. p. 450.) In consequence of its well-ascertained power of exciting salivation, it has been introduced as a remedy in croup by Dr. Archer of Maryland; he gives two tea-spoonsful of a strong decoction of the root twice in an hour, according to the urgency of the symptoms, until it acts as an emetic or cathartic. Dr. Brandreth of Liverpool derived great benefit in some cases of lethargy from an extract of *seneka* combined with carbonate of ammonia.

A peculiar principle has lately been discovered in the root of this plant by Gehlen, to which he has given the name of senegin. It is a brown substance, and excites violent sneezing like tobacco. The powder of the root is given in doses from 20 to 30 grains. The decoction is made from one ounce of the root to two pints of water, boiled down to one pint and strained; this is given in doses of three ounces three or four times a-day.

Senega, Seneka, or Snake-root Milkwort. Fl. July, Aug. Clt. 1739. Pl. ¾ foot.

169 P. poly'gama (Walt. fl. carol. 179.) stems many, simple, erect and procumbent; leaves oblong, acute or linear-lanceo-

late; lower racemes apetalous. ♃. F. Native in the pine-barrens of Carolina. Calyx greenish-white, with pale yellow petals (Pursh.) Flowers red (Nutt.). Racemes axillary and terminal.

Polygamous Milkwort. Fl. July, Aug. Pl. ½ foot.

170 P. monti'cola (H. B. et Kunth, nov. gen. amer. 5. p. 405.) stems almost simple, hairy-pubescent, as well as the lanceolate, acute, remote leaves; racemes terminal, loose; wings of calyx elliptical, unguiculate at the base; capsules emarginate. ♃. G. Native on the arid mountain of Tumiriquiri in New Andalusia. Flowers rose-coloured.

Mountain Milkwort. Pl. 1 foot.

171 P. angustifo'lia (H. B. et Kunth, l. c. p. 405. t. 511.) stem branched, puberulous at the top; leaves remote, linear-lanceolate, acute, with revolute margins, glabrous, but puberulous on the nerve and veins on the under surface; racemes spike-formed, rather lax. ♃. S. Native on the banks of the river Orinoco near Carichana. Upper flowers white, the rest purple.

Narrow-leaved Milkwort. Pl. 1½ foot.

172 P. mo'llis (H. B. et Kunth, l. c.) stems villous, simple or branched; leaves lanceolate-oblong, soft, hoary; racemes spike-formed, rather lax. ♃. S. Native in sandy places near Carichana, on the river Orinoco. Seeds covered with retrograde hairs. Wings of calyx orbicularly-obovate. Flowers rose-coloured.

Soft Milkwort. Pl. ½ foot.

173 P. Nutka'na (Moc. et Sesse, icon. ined. and D. C. prod. 1. p. 330.) stems shrubby at the base, ascending; leaves oval, acuminated at both ends, stalked; racemes lax, 4-5-flowered; wings of calyx orbicular; capsules emarginate. Native on the north-west coast of North America, near Nutka. Flowers red?

Nutka Milkwort. Pl. ½ foot.

174 P. hebeca'rpa (D. C. prod. 1. p. 330.) stems simple; leaves ovate, reticulately veined; racemes 10-12-flowered; wings of calyx oval-oblong; capsule oval, pubescent. ♃. ♄. S. Native of St. Domingo. Perhaps P. ovàta, Poir. dict. 5. p. 498?

Downy-fruited Milkwort. Pl. ½ foot.

175 P. pedicella'ris (St. Hil. fl. bras. 2. p. 47.) stem suffruticose, horizontal; branches pubescent; leaves lanceolate, acuminated, smoothish; racemes capitate, loose; flowers on long pedicels; wings oblong-ovate, obtuse, rather pubescent. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers purplish-violet.

Pedicelled-flowered Milkwort. Fl. Feb. Shrub procumbent.

176 P. violoìdes (St. Hil. fl. bras. 2. p. 48.) stem suffruticose, slender, sparingly branched; leaves ovate or roundish, finely ciliated; racemes few-flowered, loose; wings elliptical, obtuse, finely ciliated; seeds oblong, very villous. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers white, tinged with violet.

Violet-like Milkwort. Fl. April. Shrub ½ foot.

177 V. la'xa (Mart. ex Spreng. syst. 3. p. 170.) branches twiggy; leaves lanceolate, acuminated, pubescent beneath; racemes lateral and terminal, few-flowered; wings obovate, equal in length to the corolla. ♄. S. Native of Brazil. Flowers purple.

Lax Milkwort. Shrub ½ to 1 foot.

178 P. viola'cea (Vahl. symb. 2. p. 79.) stem suffruticose, erect; branches herbaceous, pubescent; leaves ovate or lanceolate, acuminated, pubescent, full of pellucid dots; racemes spike-formed; flowers secund; wings elliptico-orbicular, very obtuse, equalling the oval smooth capsule; seeds cylindrical, silky, villous, unappendiculate. ♃. S. Native of Cayenne and Brazil. Flowers greenish, tinged with violet.

Violaceous-flowered Milkwort. Fl. March, April. Pl. ¼ ft.

179 P. cine'rea (Willd. spec. 3. p. 880.) stem erect, branched, hairy; leaves lanceolate, acuminated, somewhat tomentose; racemes 8-10-flowered; keel and margins of flowers fringed; capsules oblong, glabrous. ⊙. S. Native of Guiana and Cayenne. P. violàcea, Aubl. guian. t. 294. Flowers violaceous.

Cinerous Milkwort. Pl. ½ foot.

180 P. America'na (Mill. dict. no. 7.) stems erect, branched, younger ones pubescent; leaves oblong, mucronate, velvety-pubescent; racemes many-flowered; wings of calyx obovate; capsules orbicular, velvety. ♃. G. Native of South America near Vera Cruz. Flowers bluish-purple.

American Milkwort. Fl. June, July. Clt.? Pl. ½ foot.

181 P. pube'scens (Nutt. gen. amer. 2. p. 87.) stem erect, pubescent, twiggy, branched; leaves ovate-lanceolate, ciliated; keel of flower glandular at the top. ♃. F. Native of Georgia about Savannah. Flowers rose-coloured, cristate. This is one of the largest and finest species indigenous to North America.

Pubescent-branched Milkwort. Pl. 3 feet.

182 P. Torre'yi; stem branched, smooth, angular, erect; leaves linear, crowded, acutish; racemes somewhat spike-formed, slender, loose; keel beardless. ♃.? H. Native of North America on the Rocky Mountains. Polýgala, nov. spec. Torrey in ann. lyc. new york, 2. p. 164.

Torrey's Milkwort. Pl. 1 foot.

183 P. Caracasa'na (H. B. et Kunth, nov. gen. amer. 5. p. 407.) stems procumbent and erect; branches as well as elliptical acute leaves hairy-pubescent; racemes spike-formed, terminal, few-flowered; capsules elliptical, emarginate, pubescent. ♄. S. Native of dry places near Caraccas. Flowers blue.

Caraccas Milkwort. Shrub 1 foot.

184 P. monninoìdes (H. B. et Kunth, l. c. p. 408.) branches villously-pubescent; leaves ovate-oblong, somewhat acuminated, hairy-pubescent; racemes somewhat terminal. ♄. S. Native in the mountains of New Granada. Flowers white, tinged with purple.

Monnina-like Milkwort. Shrub 1 to 2 feet.

185 P. ligustroìdes (St. Hil. fl. bras. 2. p. 49.) stem shrubby; branches hardly puberulous; leaves lanceolate, acuminate, smooth; racemes short; wings obovate, obtuse; seeds ovate, furrowed both on the back and front, very villous. ♄. S. Native of Brazil in woods in the province of Minas Geraes. Flowers yellow, tinged with red and orange.

Privet-like Milkwort. Fl. Jan. March. Shrub 1 to 5 feet.

186 P. oleæfòlia (St. Hil. fl. bras. 2. p. 49.) stem shrubby; branches striated, tomentose; leaves coriaceous, oblong-lanceolate, acuminated, very acute, puberulous above, pubescent beneath; racemes short; wings ovate, very obtuse. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers crowded, yellow.

Olive-leaved Milkwort. Fl. Sept. Shrub 2 feet.

187 P. laure'ola (St. Hil. fl. bras. 2. p. 50. t. 89.) stem suffruticose, sparingly branched, pubescent; leaves lanceolate, oblong, acuminated; racemes few-flowered; wings oblong-triangular, obtuse; seeds oblong, 4-angled, hairy. ♄. S. Native of Brazil in woods near Rio Janeiro. Flowers greenish-yellow.

Laurel-like Milkwort. Shrub 1 to 3 feet.

188 P. cestrifòlia (St. Hil. fl. bras. 2. p. 51.) stem shrubby; branches erect, puberulous; leaves large, obovate-oblong, acuminated, soft; racemes extra-axillary, short, broadish; wings irregularly ovate, obtuse, shorter than the keel. ♄. S. Native of Brazil near Rio Janeiro. Flowers yellowish?

Cestrum-leaved Milkwort. Shrub 2 to 4 feet.

189 P. grandifòlia (St. Hil. fl. bras. 2. p. 52.) stem suffruticose, simple, scarcely puberulous at the apex; leaves large, lanceolate, with a short acumen, smooth; racemes supra-axillary, incurved, few-flowered; wings oblong, elliptical, acuminated,

longer than the keel. ♄. S. Native of Brazil near the town of Benevente. Flowers white, tinged with purple.

Great-leaved Milkwort. Fl. Oct. Shrub 2 to 3 feet.

190 P. rivinæfòlia (H. B. et Kunth, l. c. p. 409. t. 512.) stems herbaceous, rather simple, pubescent; leaves ovate, much acuminated, puberulous on both surfaces, ciliated; racemes spike-formed, terminal, many-flowered. 4. S. Native of Mexico near Ario. Flowers violet. Capsules elliptically-orbicular, emarginated, glabrous, ciliated.

Rivina-leaved Milkwort. Pl. ½ to 2 feet.

191 P. ovalifòlia (D. C. prod. 1. p. 331.) stems round, somewhat velvety; leaves oval, on short footstalks; racemes 7-8-flowered; wings of calyx obovate; capsules oval, pubescent. ♄. S. Native of New Spain. Flowers white, tinged with purple?

Oval-leaved Milkwort. Pl. 1 foot.

192 P. hebe'clada (D. C. prod. 1. p. 331.) stems shrubby, a little branched, erect, rather villous; leaves linear, obtuse or acute, pubescent; racemes elongated, loose; wings of flower obovate, very obtuse; capsules oblong, glabrous. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers pale-violet. Perhaps the same as the following.

Hairy-branched Milkwort. Shrub 1 to 2 feet.

193 P. brizoìdes (St. Hil. fl. bras. 2. p. 44. t. 88.) stem herbaceous, erect, simple, pubescent, rather naked below; leaves linear, acute, upper ones longest, approximate; racemes extra-axillary, rather narrow, few-flowered; flowers pendulous; wings wedge-shaped, obliquely truncate, equal in length with the keel; seeds oblong, very villous. ⊙. S. Native of Brazil in the province of Rio Janeiro. Flowers greenish, tinged with purple.

Briza-like Milkwort. Fl. Sept. Pl. ¾ foot.

194 P. Pohlia'na (St. Hil. fl. bras. 2. p. 45.) stem suffruticose, hairy; leaves oblong-ovate, rather acute, pilose, ciliated; racemes loose, few-flowered; wings cuneated, obliquely truncate, longer than the keel; seeds oblong, very villous. ♄. S. Native of Brazil in mountain pastures in the province of Minas Geraes. Flowers purple.

Pohl's Milkwort. Fl. March. Shrub ½ foot.

195 P. hirsu'ta (St. Hil. fl. bras. 2. p. 45.) stem suffruticose, hairy; leaves lanceolate-ovate, acuminated, ciliated; racemes loose, few-flowered; flowers pendulous; wings orbicularly-wedge-shaped, very obtuse, longer than the keel; seeds oblong, very villous. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers pale-purple.

Hairy Milkwort. Fl. Sept. Shrub ½ foot.

196 P. buxifòlia (H. B. et Kunth, l. c. p. 407.) stems branched, diffuse; branches hairy-pubescent; leaves oblong-elliptical, rounded at the top and somewhat emarginated, with revolute margins; racemes few-flowered, terminal as well as lateral. ♄. S. Native of Mexico near Santa Rosa. Flowers white.

Box-leaved Milkwort. Fl. Sept. Shrub 1 foot.

197 P. glandulòsa (H. B. et Kunth, l. c. p. 404. t. 510.) stems much branched, procumbent, covered with glandular dots; leaves obovately-wedge-shaped, mucronated, without nerves, somewhat puberulous, covered with pellucid dots; flowers on pedicels, generally solitary, extra-axillary or opposite the leaves. ♄. S. Native of New Spain. Seeds covered with retrograde pubescence. Viola punctàta, Willd. ex Schlecht. in Rœm. et Schult. syst. 5. p. 391. Flowers white.

Glandular-dotted-stemmed Milkwort. Shrub procumbent.

198 P. triphy'lla (Hamilt. mss. in D. Don, prod. fl. nep. p. 200.) wings of calyx obovate; lateral lobes of petal falcate, truncate and bidentate at the top; leaves ovate, acute, glabrous, finely serrulated, stalked; stem trichotomous at the apex; branches 3-leaved. ⊙. H. Native of Nipaul at Narainhetty. Flowers small, yellow, not crested.

Three-leaved Milkwort. Fl. July. Pl. ¼ foot.

Sect. VII. Chamæbu'xus (from χαμαι, *chamai*, on the ground, and βυζω, *buxo*, the box-tree, that is to say dwarf box-tree; resemblance in *P. chamæbúxus*.) Dill. nov. gen. t. 9. D. C. prod. 1. p. 331. Lower sepal of calyx concave-hollow, embracing a gland on the inside at the base. Keel slightly crested or callous at the tip. Flowers few, large. Herbs or subshrubs.

199 P. paucifòlia (Willd. spec. 3. p. 880.) stems very simple, erect, naked below; leaves ovate; flowers in threes, terminal; keel of flower crested. 4. H. Native in sphagnous bogs and swamps; principally on the mountains from Pennsylvania to Virginia. P. purpùrea, Ait. hort. kew. ed. 2. vol. 4. p. 244. but not of Nutt. Triclispérma grandiflòra, Raf. specch. 1. p. 117. Flowers larger than in any other American species, of a fine purplish colour.

Few-leaved Milkwort. Fl. May, Aug. Clt. 1812. Pl. ¼ ft.

200 P. uniflòra (Michx. fl. bor. amer. 2. p. 58.) stem ascending, almost simple; leaves oval, acute; flowers solitary, pedicelled, scattered; keel of flower beardless. 4. H. Native on the banks of Lake Ontario on the confines of Canada. Flowers nodding, perhaps pale purple.

One-flowered Milkwort. Pl. ¼ foot.

201 P. chamæbu'xus (Lin. spec. 989.) stems suffruticose, branched, procumbent; leaves oblong-lanceolate, mucronated; racemes 1-2-flowered; keel of flower crested. ♄. H. Native of mountain woods in many parts of Europe, particularly Germany, Austria, and Switzerland. Jacq. fl. aust. t. 233. Sims, bot. mag. t. 316. Flowers yellowish, tipped with purple.

Dwarf-box or Box-leaved Milkwort. Fl. May, July. Clt. 1658. Procumbent shrub ¼ to ½ foot.

202 P. venulòsa (Juss. in Poir. dict. 5. p. 493.) stem shrubby; leaves stalked, obovate, acuminated, large; flowers racemose; keel of flower crested. ♄. S. Native of Java.

Veiny-flowered Milkwort. Shrub.

203 P. oxyphy'lla (D. C. prod. 1. p. 331.) stem shrubby; leaves oblong, very much pointed; flowers in short racemes; keel of flower beardless; wings orbicular. ♄. S. Native of Brazil.

Sharp-leaved Milkwort. Shrub 1 foot.

204 P. specta'bilis (D. C. prod. 1. p. 331.) stem shrubby; leaves oval-oblong, acuminated, tapering to the base, upper ones generally opposite; flowers disposed in long racemes; keel of flower beardless; wings orbicular. ♄. S. Native of Para in South America.

Remarkable Milkwort. Shrub 1 foot.

205 P. Chine'nsis (Lin. spec. 989.) stem suffruticose, prostrate; leaves oval, obtuse; flowers in short racemes; keel of flower beardless; wings obovate. ♄. G. Native of China. Flowers probably purple.

China Milkwort. Shrub decumbent.

Sect. VIII. Brachy'tropis (from βραχις, *brachys*, short, τροπις, *tropis*, a keel; in allusion to the keel being much shorter than the wings). D. C. prod. 1. p. 332. Keel of corolla beardless, much shorter than the wings of the calyx. Perhaps a proper genus allied to *Comespérma*.

206 P. microphy'lla (Lin. spec. 989.) stems shrubby, twiggy; leaves very minute, elliptical; racemes axillary, sessile, 8-10-flowered. ♄. F. Native of Portugal in bushy places. Flowers blue? P. juniperìna, Cav. annal. cienc. nat. 1801. 4. p. 53.?

Small-leaved Milkwort. Fl. June, July. Shrub 1½ foot.

† *Doubtful species. The most of them will probably belong to Section* VI. Se'nega. *Keel of flower beardless.*

207 P. triflòra (Lin. fl. zeyl. 269.) flowers beardless;

peduncles generally 3-flowered, shorter than the leaves; stem herbaceous, erect; leaves linear, alternate. ⊙. S. Native of Ceylon. Flowers white.

Three-flowered Milkwort. Pl. ½ foot.

208 P. prostra'ta (Willd. spec. 3. p. 896.) flowers beardless; peduncles many-flowered; stems diffuse, herbaceous; leaves lanceolate, obtuse. ⊙. S. Native of the East Indies. Like *P. glaucoìdes*. Flowers white.

Prostrate Milkwort. Pl. prostrate.

209 P. multiflòra (Poir. dict. 5. p. 497.) flowers beardless; racemes long, terminal? stems herbaceous, branched, twiggy; leaves linear, few. ♄.? S. Native of Sierra Leone. Flowers blue?

Many-flowered Milkwort. Pl. ½ foot.

210 P. thunbe'rgii (D. C. prod. 1. p. 333.) flowers beardless, racemose; leaves ovate, unarmed. ♄. G. Native of the Cape of Good Hope. P. microphýlla, Thunb. prod. 121. but not of Lin. Flowers purple.

Thunberg's Milkwort. Shrub 1 foot.

211 P. mucrona'ta (Willd. spec. 3. p. 888.) flowers beardless; racemes terminal? stem shrubby with hairy branches; leaves lanceolate, mucronated, downy on the under surface. ♄. S. Native of South America. Flowers purple.

Mucronate-leaved Milkwort. Shrub ½ foot.

212 P. myrtilloìdes (Willd. spec. 3. p. 889.) flowers beardless; racemes opposite the leaves; stem shrubby with procumbent branches; leaves roundish-ovate, reticulately veined. ♄. S. Native of South America. Flowers white.

Myrtle-like Milkwort. Shrub 1 foot.

213 P. Mexica'na (Moc. et Sesse. fl. mex. icon. ined. and D. C. prod. 1. p. 333.) flowers beardless, at length drooping; racemes terminal? somewhat spiked; stems simple, erectish; leaves linear, acute. ♄. G. Native in Mexico. Flowers purple?

Mexican Milkwort. Shrub 1 foot.

214 P. linariæfòlia (Poir. dict. 5. p. 495.) flowers almost beardless? racemes terminal? dense, ovate; stem herbaceous, round; leaves linear, upper ones disposed in whorls.

Flax-weed-leaved Milkwort.

215 P. unguicula'ta (Poir. dict. 5. p. 494.) flowers beardless, crowded, axillary; petals 2, unguiculate; calyx 4-sepalled; stem shrubby; leaves ovate, mucronate. ♄. S. Native of? Perhaps a proper genus.

Unguiculate-petalled Milkwort. Shrub.

216 P. ramosi'ssima (Cav. annal. cienc. nat. 1801. 4. p. 53.) stem herbaceous, much branched; leaves linear; spikes terminal; flowers minute. ♄.? G. Native in the island of Teneriffe.

Much-branched Milkwort. Pl. ½ foot.

217 P.? the'zans (Lin. mant. 260. exclusive Burm. syn. 2.) flowers beardless, solitary; peduncles 1-flowered, axillary; leaves alternate, linear-lanceolate. ♄. S. Native of Java and Japan. Icon. Burm. fl. zeyl. p. 195. t. 85. is truly a species of *Ionídium*. P. thèa, Burm. fl. ind. p. 154. is a species of *Leptospérmum*, as is seen by the specimens collected by Burman, now in the herbarium of M. Benj. Delessert. P. triphýlla and P. pinnàta of Burm. prod. f. cap. p. 20. are leguminous plants.

Tea-like Milkwort. Shrub.

Cult. All the species of *Polýgala* are very shewy, therefore they deserve to be cultivated in every garden. Those belonging to the section *Psychánthus* are all natives of the Cape of Good Hope, these will thrive well in two thirds peat and one-third turfy loam, with a good quantity of sand mixed with it; and to have the cuttings proper for putting in, the shoots should be topped, they will then push out numerous young ones, which should be taken off close to the old branch, when about three inches long, and in a growing state, these plant in pots of sand, and place bell-glasses over them; the pots must then be put into a close frame or the propagation-house, and the glasses must be taken off and wiped occasionally. The perennial species belonging to other sections thrive best in a sandy peat soil; they should be always kept in small pots, and may be either increased by seed or dividing the plants. The shrubby kinds in the same way as recommended for those belonging to *Psychánthus*. The annual species should be sown about the end of March in pots; they also prefer a sandy peat soil and heat. Most of them would grow in the open border in warm situations. *P. chamæbúxus* will grow in the open border.

II. SALOMO'NIA (in honour of Solomon, King of the Hebrews, son of David, one of the first botanists, died 975). Lour. coch. ed. Willd. p. 18. D. C. prod. 1. p. 333.

Lin. syst. *Monadélphia, Tetrándria.* Calyx quinquefid; segments equal. Keel cucullate. Petal 3-lobed, with the lateral lobes falcate, intermediate one cucullately saccate, inclosing the genitals, not crested. Filaments connate into a membranous sheath including the style. Anthers 4, 1-celled, conglutinate around the stigma. Style tapering to the base, dilated and compressed at the apex; stigma small, obtuse, pruinose. Capsules 2-lobed, 2-celled, compressed, usually ciliary-serrated; cells 1-seeded. Small Asiatic herbs with alternate broadish leaves and slender spike of minute rose-coloured flowers, each flower furnished with a cuspidate bractea.

1 S. Cantone'nsis (Lour. l. c.) herb glabrous, erect, branched; leaves cordate, acute, on very short footstalks; wings equal in length to the keel; capsules truncate, with crestedly-toothed margins. ⊙. H. Native of China about Canton. S. petiolàta, D. Don. fl. nep. p. 200. Salmònea Cantonénsis, Vahl. enum. 1. p. 8.

Canton Salomonia. Fl. July. Pl. ¼ foot.

2 S. ede'ntula (D. C. prod. 1. p. 334.) herb glabrous, erect, branched; leaves broad-ovate, mucronate, on very short footstalks; capsules with toothless margins. ⊙. H. Native of Nipaul. Perhaps the same as the last.

Toothless-capsuled Salomonia. Fl. June, July. Pl. ¼ foot.

3 S. oblongifòlia (D. C. prod. 1. p. 334.) herb glabrous, erect, very simple; leaves oval or elliptical, mucronulate, sessile; wings shorter than the keel; capsules truncate, with crestedly-toothed margins, in a double series. ⊙. H. Native of Nipaul. S. sessilifòlia, D. Don, fl. nep. p. 201. Flowers purple.

Oblong-leaved Salomonia. Fl. June, July. Pl. ¼ foot.

4 S.? cilia'ta (D. C. prod. 1. p. 334.) stem erect, branched, hairy, as well as the peduncles; leaves lanceolate, obtuse; capsules ciliary-toothed. ⊙. H. Native of the East Indies. Polýgala ciliàta, Lin. spec. 991.

Ciliated-capsuled Salomonia. Pl. ½ foot.

Cult. These plants will require to be sown in pots in the month of March, in a mixture of sand, loam and peat, then placed in a moderate hot-bed, and in the month of May they may be planted out in the borders in a sheltered situation.

III. COMESPE'RMA (from κομε, *kome*, the hair of the head, and σπερμα, *sperma*, a seed; in allusion to the tuft of hairs at the end of the seeds, f. 69. *c.*). Labill. spec. nov. holl. 2. p. 21. D. C. prod. 1. p. 334.

Lin. syst. *Monadélphia, Octándria.* Calyx 5-sepalled, deciduous; two inner sepals of the form of wings, three outer ones small. Petals 3-5, united with the tube of the stamens, the lower one keel-formed, 3-lobed (f. 69. *a.*), middle lobe beardless, entire, or emarginate, 2 lateral petals scale-formed (f. 69. *a.*) 2 superior ones alternating with the superior sepals of the calyx. Stamens 8, united into a tube, which is cleft in front, free at the apex. Anthers bursting by a terminal pore. Fruit baccate or capsular, 2-celled, spatulate (f. 69. *b.*), tapering towards the base. Seeds with a long tuft of hair at their base (f. 69. *c.*). Erect

or scandent shrubs, rarely herbs. Bracteas 2 or 3 at the base of the flowers. Flowers small, disposed in compound panicles or simple racemes.

1 C. RETU'SA (Labill. l. c. t. 160.) shrub glabrous, erect; leaves oblong, obtuse; racemes contracted; middle lobe of corolla entire. ♄. G. Native of Van Diemen's Land. Flowers purple.

Retuse-leaved Comesperma. Fl. May, Aug. Sh. 1 to 2 ft.

2 C. SECU'NDA (Banks' herb. and D. C. prod. 1. p. 334.) shrub pubescent, erect; leaves ovate, mucronate; racemes secund. ♄. G. Native of New Holland near Endeavour river. Flowers purple.

Side-flowering Comesperma. Shrub 1 to 2 feet.

3 C. CORIDIFÒLIA (Cuning. in Fields' trav. p. 337.) this species is nearly allied to *C. conférta* of Lab. but it is not described in the above work. ♄. G. Native of New Holland on the Blue Mountains. Flowers purple.

Coris-leaved Comesperma. Shrub 1 to 2 feet.

4 C. CONFE'RTA (Labill. specim. nov. holl. 2. t. 161.) shrub erect, glabrous; leaves linear, crowded, erect, with revolute margins; racemes contracted; middle lobe of corolla emarginated. ♄. G. Native of Van Diemen's Land. Leaves 7-8 lines long. Flowers purple. (f. 69.)

FIG. 69.

Crowded-leaved Comesperma. Sh. 1 foot.

5 C. ERICÌNA (D. C. prod. 1. p. 334.) shrub glabrous, erect; leaves linear, with somewhat revolute margins, obliquely erect; racemes rather lax; middle lobe of corolla entire. ♄. G. Native on the eastern coast of New Holland. Leaves 3 or 4 lines long. Flowers purple.

Heath-like Comesperma. Fl. May, Aug. Clt. 1822. Shrub 2 feet.

6 C. FLA'VA (D. C. prod. 1. p. 334.) shrub glabrous, erect; leaves linear, flat, erect; racemes contracted; middle lobe of corolla entire. ♄. G. Native on the eastern coast of New Holland. Flowers yellow.

Yellow-flowered Comesperma. Shrub 1 to 2 feet.

7 C. CALYME'GA (Labill. specim. nov. holl. 2. t. 162.) herb glabrous, erect; leaves lanceolate; wings or two inner sepals scarcely exceeding in length the rest of the sepals; middle lobe of lower petal entire. ♃. G. Native of Van Diemen's Land. C. isocàlyx, Spreng. syst. 3. p. 172. Flowers purple.

Large-calyxed Comesperma. Pl. 1 foot.

8 C. NUDIU'SCULA (D. C. prod. 1. p. 334.) shrub glabrous, erect, twiggy; leaves linear, rather setaceous, acute, upper ones very small; racemes rather lax; wings hardly exceeding in length the rest of the sepals. ♄. G. Native of New Holland at King George's Sound. Flowers purple.

Nakedish Comesperma. Shrub 1½ foot.

9 C. VIRGA'TA (Labill. specim. nov. holl. 2. t. 159.) shrub glabrous, erect, twiggy; leaves lanceolate-linear, bluntly acuminated; racemes elongated; middle lobe of corolla emarginate. ♄. G. Native of New Holland. Flowers purple.

Twiggy Comesperma. Shrub 3 feet.

10 C. VOLU'BILIS (Labill. l. c. t. 163.) herb glabrous, twining; leaves very few, lanceolate; racemes contracted; middle lobe of corolla toothed. ♃. ◡. G. Native of Van Diemen's Land. Flowers purple.

Twining-stemmed Comesperma. Pl. twining.

11 C. KUNTHIA'NA (St. Hil. fl. bras. 2. p. 54. t. 90.) stem shrubby; branches spreading, tomentose; leaves lanceolate or roundish, acute or very obtuse, and as if they were emarginate, sometimes mucronulated, pubescent on both surfaces; panicle somewhat pyramidal, dense, leafy at the base; wings orbicular, ciliated. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers whitish.

Kunth's Comesperma. Fl. April. Shrub 3 to 4 feet.

12 C. FLORIBU'NDA (St. Hil. fl. bras. 2. p. 55. t. 91.) stem shrubby, scandent; branches thick, angular at the top; leaves oblong, obtuse at the base, acuminate at the apex, smooth above and puberulous below; panicle composed of bundles of flowers, rather leafy; wings obovate, hardly emarginate, puberulous in the middle. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers whitish or yellowish.

Bundle-flowered Comesperma. Fl. March. Shrub 3 to 7 ft.

13 C. LAURIFÒLIA (St. Hil. fl. bras. 2. p. 56.) stem shrubby, erect; branches angular at the apex, tomentose; leaves elliptical, lanceolate, with a short acumen, smooth above, and tomentosely-pubescent below; panicle very loose; wings ovate-orbicular, ciliated at the base. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers greenish-white.

Laurel-leaved Comesperma. Fl. Feb. Shrub 5 feet.

Cult. The species of the genus *Comespérma* thrive best in a mixture of sandy-loam and peat; and young cuttings will root freely if planted in sand under a bell-glass, those of the stove species in heat. They are all worthy of cultivation.

IV. BADIE'RA (M. Badier, a French botanist, and friend of De Candolle's.) D. C. prod. 1. p. 334.—Penæ'a, Plum. gen. p. 22. t. 25. but not of Lin.

Lin. syst. *Monadélphia, Octándria.* Calyx 5-sepalled, deciduous; sepals almost equal in size and length. Three lower petals somewhat joined at the base; middle one of these concave, beardless. Stamens 8, monadelphous. Capsules compressed, obcordate, 2-celled, with furrowed margins. Seeds glabrous, with a large oily arillus, filling the cell from above. American shrubs.

1 B. DIVERSIFÒLIA (D. C. prod. 1. p. 334.) racemes short, axillary; leaves oval, oblong, acuminated at both ends. ♄. S. Native of Jamaica in woods. Polýgala diversifòlia, Lin. amœn. 2. p. 140.—Browne, jam. t. 5. f. 3 and 4.—Sloan. jam. 141. hist. 2. p. 32. t. 170. f. 2. Flowers greenish-white.

This shrub is called in Jamaica *Bastard Lignum-Vitæ*, because it tastes not unlike the gum of that wood, and is sometimes used for the same purposes.

Variable-leaved Badiera. Shrub 8 feet.

2 B. DOMINGE'NSIS (D. C. prod. 1. p. 335.) racemes axillary, very long, pubescent; leaves oblong-lanceolate, obtuse. ♄. S. Native of the mountains in St. Domingo. Polýgala Domingénsis, Jacq. amer. ed. min. 252. B. Berteriàna, Spreng. syst. 3. p. 172. Flowers greenish-yellow.

St. Domingo Badiera. Shrub 3 to 6 feet.

3 B. PENÆ'A (D. C. prod. 1. p. 135.) flowers solitary, axillary, on peduncles; leaves obovate, obtuse. ♄. S. Native of South America. Polýgala Penæ'a, Lin. amœn. 2. p. 140. Plum. ed. Burm. t. 214. f. 1. Flowers probably yellowish.

Pena's Badiera. Shrub 3 to 8 feet.

4 B. ACUMINA'TA (D. C. prod. 1. p. 335.) racemes lateral, opposite the leaves; leaves oblong, acuminated, shorter than the racemes. ♄. S. Native of New Spain. Polýgala acuminàta, Willd. spec. 2. p. 887. Very like *B. diversifòlia*, according to Willdenow. Flowers greenish-yellow.

Acuminated-leaved Badiera. Shrub 3 to 6 feet.

5 B. DIVARICA'TA (D. C. prod. 1. p. 335.) racemes axillary, panicled, velvety; leaves oval-oblong, glabrous; wings obovate. ♄. S. Native of Para in Brazil. Perhaps belonging to this genus.

Divaricated-branched Badiera. Shrub 3 to 8 feet.

Cult. The species of *Badièra* will do well in a mixture of loam, peat, and sand; and young cuttings will root if planted in a pot of sand, with a bell-glass placed over them, in heat.

V. SOULA'MIA (*Soulamou* is the name of the tree in the Moluccas.) Lam. dict. 1. p. 449. D. C. prod. 1. p. 335.

Lin. syst. *Monadélphia, Hexándria.* Calyx of 5 sepals, 3 outer ones very small, 2 inner ones larger, concave. Petal 1, concave. Stamens 6? Capsules (samara) not opening, compressed, suberose, orbicular, emarginate, 2-celled. Seeds without albumen. According to Lam. the character is as follows: Calyx small, trifid. Petals 3. Stigma sessile. Samara 2-celled, obcordate; cells 1-seeded. A shrub with crowded ovate leaves, tapering to the base, quite entire, and veiny. Racemes short, axillary.

1 S. ama'ra (Lam. l. c.) ♄. S. Native of the Moluccas and Java on rocky places by the sea-side. Rex amaròris, Rumph. amb. 2. p. 129. t. 40. Leaves large, oval-oblong, entire. Flowers white, racemose. The whole plant is very bitter, and is used as a strengthening medicine in its native country, and as a counterpoison. It is called *Caju Soulamou* in the island of Ternatea.

Bitter Soulamia. Fl. Dec. Shrub 10 feet.

Cult. As this shrub has not yet been introduced to the gardens the mode of cultivating it is unknown, but we would recommend its being grown in a mixture of loam and sand, and young cuttings will no doubt root if planted in a pot of sand, placed under a hand-glass, in heat.

VI. MURA'LTIA (in honour of John Von Muralt, a Swiss botanist.) Neck. elem. no. 1382. D. C. prod. 1. p. 335. Heistèria, Berg. cap. 185. but not of Lin.

Lin. syst. *Monadélphia, Hexándria.* Calyx glumaceous, of 5 sepals. Sepals almost equal. Petals 3, connected, middle one bifid, with obtuse lobes. Ovary crowned with 4 horns or tubercles. Capsules 2-valved, 2-celled, crowned with 4 horns or 4 tubercles. Shrubs, natives of the Cape of Good Hope, with a rigid spiny habit. Flowers small, axillary, sessile, usually purple or red.

* *Leaves mucronately-pungent at their apex.*

1 P. Heiste'ria (D. C. prod. 1. p. 335.) leaves triquetrous, stiff, spiny at the apex, in bundles; branchlets puberulous; flowers axillary, sessile. ♄. G. Native of the Cape of Good Hope. Heistèria púngens, Berg. cap. 185. Polýgala, Heistèria, Lin. spec. 989. Curt. bot. mag. t. 340. Horns longer than the capsule. Flowers small, purple.

Var. β. pilòsa, (D. C. l. c.) leaves flattish, hairy, and ciliated.

Heister's Muraltia. Fl. Jan. Clt. 1787. Shrub 2 to 3 feet.

2 M. confe'rta (D. C. prod. 1. p. 335.) leaves oblong-lanceolate, in crowded bundles, rather spiny at the top, with scabrous margins; branchlets hairy; flowers axillary, sessile. ♄. G. Native of the Cape of Good Hope. Perhaps Polýgala thymifòlia, Thunb. prod. 121. Flowers purple. Horns longer than the capsule.

Crowded-leaved Muraltia. Fl. April, Sept. Sh. 2 to 3 feet.

3 M. brevifòlia (D. C. prod. 1. p. 335.) leaves elliptical-oblong, scattered, with a recurved spiny point at the apex, younger ones and branchlets pubescent; flowers axillary, sessile. ♄. G. Native of the Cape of Good Hope. Capsules pubescent. Flowers purple.

Short-leaved Muraltia. Shrub 2 feet.

4 M. serpyllifòlia (D. C. prod. 1. p. 335.) leaves ovate, spiny at the top, with somewhat revolute margins; nerve on the under surface hairy; branches hairy; flowers axillary, sessile. ♄. G. Native of the Cape of Good Hope. Flowers purple. Horns shorter than the capsule.

Wild-Thyme-leaved Muraltia. Shrub 2 feet.

5 M. alopecuroìdes (D. C. prod. 1. p. 335.) floral leaves ovate, with a spiny point at the apex, crowded, glabrous, ciliated, lower leaves almost linear; branches rather hairy; flowers axillary, sessile. ♄. G. Native of the Cape of Good Hope. Polýgala alopecuroìdes, Lin. mant. 260. Sims, bot. mag. t. 1006. Flowers purple. Horns length of capsule.

Fox-tail-like Muraltia. Fl. May, Aug. Clt. 1800. Pl. 2 to 4 feet.

6 M. trine'rvia (D. C. prod. 1. p. 335.) leaves ovate, cordate, 3-nerved, glabrous, with a pungent point; branches angular, glabrous; flowers axillary on pedicels. ♄. G. Native of the Cape of Good Hope. Flowers purple. Capsule 2-horned.

Three-nerved-leaved Muraltia. Shrub 2 to 3 feet.

7 M. squarròsa (D. C. prod. 1. p. 335.) leaves lanceolate, spiny at the top, stiff, in bundles, upper ones spreading, lower ones reflexed; branchlets villous; flowers axillary, sessile. ♄. G. Native of the Cape of Good Hope. Polýgala squarròsa, Thunb. prod. 121. Muráltia, no. 3493, Burch. cat. is only a variety of this plant. Flowers purplish.

Squarrose Muraltia. Fl. May, Aug. Clt. 1820. Shrub 3 ft.

8 M. stipula'cea (Burch. trav. 1. p. 19 and 29.) leaves linear, convex on the under surface, mucronate, glabrous, in bundles, distant; branchlets somewhat pubescent; flowers axillary, sessile. ♄. G. Native of the Cape of Good Hope. Polýgala stipulàcea, Lin. mant. 260. exclusive of the synonyme of Sieb. Andr. bot. rep. t. 263. Sims, bot. mag. 1715. Flowers red mixed with white.

Stipular Muraltia. Fl. Ap. Sept. Clt. 1801. Shrub 2 to 3 ft.

9 M. juniperifòlia (D. C. prod. 1. p. 336.) leaves triquetrous, awl-shaped, mucronate, straight, and are as well as branches glabrous; flowers axillary, on very short pedicels; capsules crowned by 4 tubercles. ♄. G. Native of the Cape of Good Hope. Polýgala juniperifòlia, Poir. 5. p. 496. Flowers purplish.

Juniper-leaved Muraltia. Fl. April, Sept. Clt. 1810. Sh. 2 ft.

10 M. ericæfòlia (D. C. prod. 1. p. 336.) leaves trigonal, awl-shaped, mucronate, straight, in bundles, glabrous; branchlets somewhat pubescent; flowers axillary, sessile; capsules crowned by 4 horns. ♄. G. Native of the Cape of Good Hope. Perhaps Polýgala míxta, Thunb. prod. 121? but not of Lin. Flowers red mixed with white.

Heath-leaved Muraltia. Fl. May, Sept. Shrub 2 to 3 feet.

11 M. sprengelioìdes (Burch. cat. no. 4957.) leaves somewhat trigonal, mucronate, pungent, scattered, at length spreading, and are as well as branches glabrous; flowers axillary, on very short pedicels. ♄. G. Native of the Cape of Good Hope. Flowers purple.

Sprengelia-like Muraltia. Shrub 2 to 3 feet.

12 M. satureioìdes (Burch. cat. no. 5617.) leaves somewhat trigonal, mucronate, pungent, in bundles, with somewhat puberulous margins; branches pubescent; flowers axillary, sessile. ♄. G. Native of the Cape of Good Hope. Leaves hardly 2 lines in length. Flowers purple. Capsules 4, rarely 3-horned.

Savory-like Muraltia. Shrub 1½ foot.

13 M. tenuifòlia (D. C. prod. 1. p. 336.) leaves awl-shaped, recurved at the apex, mucronate, spreading, in bundles, very fine; branches pubescent; flowers axillary, almost sessile. ♄. G. Native of the Cape of Good Hope. Polýgala tenuifòlia, Poir. dict. 5. p. 497. but not of Willd. Flowers purple. Capsules crowned by 4 diverging horns.

Fine-leaved Muraltia. Shrub 2 feet.

14 M. aspa'latha (D. C. prod. 1. p. 336.) upper leaves

linear, somewhat trigonal, acuminated, pungent, hairy; lower leaves awl-shaped, glabrous; branches hairy; flowers axillary, sessile; capsules pubescent, 4-horned. ♄. G. Native of the Cape of Good Hope. Flowers purple?

Aspalathus-like Muraltia. Shrub 2 feet.

15 M. DIFFU'SA (Burch. cat. no. 916 and 354.) leaves linear, acuminated, pungent, scattered, distant; branches very slender, diffuse; flowers axillary, sessile. ♄. G. Native of the Cape of Good Hope. Polýgala micrántha, Willd. spec. 2. p. 892. Andr. bot. rep. 324. Flowers purple.

Diffuse-branched Muraltia. Fl. year. Clt. 1800. Sh. 2 ft.

16 M. VIRGA'TA (Burch. cat. no. 7074. and 7104.) leaves linear-awl-shaped, pungent, scattered, straight, and are as well as very slender branches glabrous; flowers axillary, sessile; sepals oblong, very much pointed. ♄. G. Native of the Cape of Good Hope. Polýgala micrántha, Thunb. prod. cap. 121.? Flowers small, purple. Stems many, rising from the root.

Twiggy-branched Muraltia. Fl. year. Clt. 1812. Sh. 2 ft.

17 M. LINOPHY'LLA (Burch. cat. no. 510.) leaves linear, almost awl-shaped, somewhat pungent, scattered, and are as well as branches finely puberulous or smooth; flowers axillary, sessile; sepals ovate-oblong, mucronate. ♄. G. Flowers purple. Very like the preceding plant, but differing in the shape of the sepals. Perhaps Polýgala filifórmis, Thunb. prod. 121.

Flax-leaved Muraltia. Fl. May, July. Clt. 1819. Shrub 2 ft.

18 M. MACRO'CERAS (D. C. prod. 1. p. 336.) leaves linear, awl-shaped, mucronate, straight, in crowded bundles, and are as well as the very slender branches glabrous; flowers axillary, sessile; horns longer than the capsule. ♄. G. Native of the Cape of Good Hope. Burch. cat. no. 3984. Flowers purple.

Long-horned-capsuled Muraltia. Fl. May, Aug. Clt. 1812. Shrub 2 feet.

19 M. MI'XTA (Lin. fil. suppl. 316.) leaves linear-awl-shaped, mucronulate, straight, in crowded bundles, and are as well as very slender branches glabrous; flowers axillary, sessile; horns shorter than the capsule. ♄. G. Native of the Cape of Good Hope. Polýgala míxta, Andr. bot. rep. t. 455. Sims, bot. mag. 1714. Flowers purple, mixed with white.

Mixed-flowered Muraltia. Fl. year. Clt. 1791. Shrub 2 ft.

20 M. CILIA'RIS (D. C. prod. 1. p. 336.) leaves linear, awl-shaped, mucronate, spreading, in bundles, and are as well as branches hispidly-ciliated; flowers axillary, sessile; capsules almost unarmed. ♄. G. Native of the Cape of Good Hope. Burch. cat. no. 5566. Flowers purplish?

Var. β, laxiúscula (D. C. l. c.) leaves shorter and more distant. ♄. G. Perhaps a proper species.

Ciliated-leaved Muraltia. Fl. May, July. Clt. 1824. Shrub 2 feet.

§ 2. *Leaves bluntish at the apex.*

21 M. PUBE'SCENS (D. C. prod. 1. p. 336.) leaves linear, spreading, in bundles, and are as well as branchlets velvety-pubescent; flowers axillary, solitary. ♄. G. Native of the Cape of Good Hope. A very distinct species. Flowers purple.

Pubescent Muraltia. Shrub 2 feet.

22 M. HU'MILIS (D. C. prod. 1. p. 337.) leaves lanceolate-linear, erect, scattered; stem dwarf, much branched; flowers axillary, sessile, solitary. ♄. G. Native of the Cape of Good Hope. Polýgala hùmilis, Lodd. bot. cab. 420. Flowers purple.

Dwarf Muraltia. Fl. May, July. Clt. 1818. Shrub 1 foot.

23 M. DEPRE'SSA (Burch. cat. no. 6264.) leaves somewhat trigonal, callous, glabrous, in rosulate-bundles; younger branches pubescent; flowers axillary, sessile. ♄. G. Native of the Cape of Good Hope. Perhaps the same as the preceding. A low, much branched shrub. Flowers purple.

Depressed Muraltia. Shrub ½ foot.

24 M. BREVICO'RNU (D. C. prod. 1. p. 337.) leaves linear, obtuse, glabrous, tuberculated on the outside at the base, scattered; branches twiggy, glabrous, flowers axillary, sessile; capsules crowned with very short horns. ♄. G. A very distinct species. Flowers purple.

Short-horned-capsuled Muraltia. Shrub 1 foot.

25 M. OBOVA'TA (D. C. prod. 1. p. 337.) leaves obovate, obtuse, somewhat fascicled, and are as well as branches glabrous; flowers axillary, sessile. ♄. G. Native of the Cape of Good Hope. Flowers purple. Habit of *Múndia*, but without prickles.

Obovate-leaved Muraltia. Shrub 2 feet.

† *Species not sufficiently known, and perhaps many of them are identical with some of those described above.*

26 M. PHYLICOÌDES (D. C. prod. 337.) leaves linear-lanceolate, mucronate, with revolute margins, under surface as well as branches pubescent. ♄. G. Native of the Cape of Good Hope. Polýgala phylicoìdes, Thunb. prod. 121. Flowers purple.

Phylica-like Muraltia. Shrub 2 feet.

27 M. THYMIFÒLIA (D. C. l. c.) leaves oblong-lanceolate, keeled, mucronate, denticulated, and are as well as divaricating branches glabrous. ♄. G. Native of the Cape of Good Hope. Polýgala thymifòlia, Thunb. prod. 121. Flowers purple.

Thyme-leaved Muraltia. Shrub 2 feet.

28 M. PILÒSA (D. C. prod. 1. p. 337.) leaves lanceolate, mucronate, stiff, hairy; branchlets velvety. ♄. G. Native of the Cape of Good Hope. Polýgala pilòsa, Thunb. prod. 121. Flowers purple.

Hairy-leaved Muraltia. Shrub 2 feet.

29 M. FILIFO'RMIS (D. C. prod. 1. p. 337.) leaves trigonal, mucronate, solitary. ♄. G. Native of the Cape of Good Hope. Polýgala filifórmis, Thunb. Flowers purple.

Filiform-branched Muraltia. Fl. May, Dec. Clt. 1812. Shrub 1½ foot.

30 M. PAUCIFLÒRA (D. C. prod. 1. p. 337.) leaves linear, mucronated; flowers axillary, pedunculated. ♄. G. Polýgala pauciflòra, Thunb. prod. 121. Flowers purple.

Few-flowered Muraltia. Shrub 2 feet.

31 M. BURMA'NNI (D. C. l. c.) leaves ovate-linear, straight, pressed to the stem. ♄. G. Native of the Cape of Good Hope. Polýgala ericoìdes, Burm. fl. cap. prod. p. 20. Flowers probably purple.

Burmann's Muraltia. Shrub 2 feet.

32 M. POIRE'TTII (D. C. prod. 337.) leaves awl-shaped, and are as well as twiggy branches glabrous; flowers axillary, sessile, crowded. ♄. G. Native of the Cape of Good Hope. Polýgala ericoìdes, Poir. dict. 5. p. 497. Perhaps the same as *M. virgàta*. Flowers purple.

Poiret's Muraltia. Shrub 2 feet.

33 M. DUMÒSA (D. C. prod. 1. p. 337.) leaves somewhat linear, reflexed at the apex; flowers sessile, solitary. ♄. G. Native of the Cape of Good Hope. Polýgala dumòsa, Poir. dict. 4. p. 495. Flowers purple.

Bushy Muraltia. Shrub 2 feet.

34 M.? LA'XA (D. C. prod. 1. p. 337.) leaves lanceolate, solitary; flowers racemose. ♄. G. Native of the Cape of Good Hope. Polýgala láxa, Thunb. prod. 121. Flowers probably purple.

Lax Muraltia. Shrub 2 feet.

35 M.? FASCICULA'TA (D. C. l. c.) leaves very slender, somewhat ciliated; branches fascicular; flowers sessile, solitary, and in pairs. ♄. G. Native of the Cape of Good Hope. Polýgala fasciculàta, Thunb. Poir. dict. 5. p. 502. Perhaps the same as *M. ciliàris*. Flowers purple?

Fasciculated-leaved Muraltia. Shrub 1½ foot.

36 M. STRIA'TA (D. C. prod. 1. p. 337.) leaves almost terete,

unarmed. ♄. G. Native of the Cape of Good Hope. Polýgala striàta, Thunb. prod. 121. Flowers probably purple.

Striated Muraltia. Shrub 2 feet.

37 M.? PARVIFLÒRA (D.C. prod. 1. p. 337.) leaves setaceous, smoothish, minute, stipulate? branches slender; flowers axillary, solitary, sessile. ♄. G. Native of the Cape of Good Hope. ⊙? G. Polýgala parviflòra, Poir. dict. 5. p. 504.

Small-flowered Muraltia. Shrub 1 foot.

Cult. Murâltia is a beautiful genus of pretty furze-like shrubs, which deserve to be cultivated in every green-house; they all succeed well in a sandy peat soil; and cuttings taken from the young branches, and planted in sand, with a bell-glass placed over them, will root readily.

VII. MU'NDIA (from *mundus*, neat; appearance of plants). Kunth, nov. gen. amer. 5. p. 392. in adn. D. C. prod. 1. p. 337.

LIN. SYST. *Monadélphia, Hepto-Octándria.* Calyx of 5 sepals, glumaceous, permanent, 2 inner sepals wing-formed, 3 outer ones small. Petals 3 or 5, scarcely united at the base, but united with the tube of the stamens at the base, middle petal cucullate, beardless. Stamens 7-8, rather villous, monadelphous at the base with the tube cleft in front. Anthers opening by a pore at the top. Disk urceolate, girding the base of the ovary. Drupe 2-celled, and sometimes from abortion only 1-celled, 1-seeded. Seeds smooth. Albumen fleshy. Much branched, furze-like shrubs; branches spinose at the apex. Leaves leathery, quite entire. Flowers axillary, pedicellate, guarded by 3 unequal bracteas. A genus with a calyx almost like that in *Murâltia*, but with a fruit like that of *Monnìna*.

1 M. SPINÒSA (D. C. prod. 1. p. 338.) branches smooth, spinescent at the apex, angular; leaves scattered, spatulate, obtuse, rather mucronate; flowers sessile; keel 1-lobed. ♄. G. Native of the Cape of Good Hope. Polýgala spinòsa, Lin. amœn. 2. p. 141. U'lex Capénsis, Lin. spec. 1046. ex Burm. herb. Flowers small, white with a red keel. Berry eatable.

Var. α, latifòlia (D. C. l. c.) leaves obovate or oval; branches short, spinose at the top.

Var. β, angustifòlia (D. C. l. c.) leaves oblong or lanceolate; branches twiggy. Polýgala vimínea, Houtt. in herb. Deless.

Spinose Mundia. Fl. Jan. May. Clt. 1780. Shrub 2 feet.

2 M. BRAZILIE'NSIS (St. Hil. fl. bras. 2. p. 58. t. 92.) branches spreading, puberulous; leaves lanceolate, acute at the base, obtuse at the top, usually emarginate, thin; flowers not crested; wings rhomboid, tapering into the claw, bluntish, equal in length with the 3-lobed keel. ♄. S. Native of Brazil. A spinose shrub with blue flowers, which at length become yellowish.

Brazilian Mundia. Fl. Oct. Shrub 2 to 3 feet.

Cult. Neat furze-like shrubs, which deserve to be preserved in every collection of greenhouse plants. A sandy peat soil suits them best, and young cuttings planted in sand and a bell-glass placed over them will root. *M. spinòsa* often produces fruit in England, by which it may be increased in abundance.

VIII. MONNI'NA (Monnino, Count de Flora Blanca, a Spanish promoter of botany.) Ruiz et Pav. fl. per. syst. 1. p. 169. Kunth, nov. gen. amer. 5. p. 409. D. C. prod. 1. p. 338. Hebeándra, Bonpl. ges. berl. 1808. p. 40.

LIN. SYST. *Monadélphia, Octándria.* Flowers resupinate. Calyx of 5 deciduous sepals (f. 70. *a.*); 2 inner sepals wing-formed, 3 outer ones ovate, and 2 of these are often united. Petals 3-5, connate at the base (f. 70. *b.*), with the middle one concave and often 3-toothed. Stamens 8; filaments hairy, rather diadelphous, or united into a tube which is cleft in front; anthers bursting by an oblique chink at the apex. Fruit drupaceous or capsular, cordate or obovate (f. 70. *d.*), 2-celled, 2-seeded, or from abortion 1-celled, 1-seeded (f. 70. *c.*), indehiscent, at least in all the Brazilian species, sometimes girded by a membranous margin. Seeds smooth or pilose, hanging almost from the top of the cell (f. 70. *d.*). Albumen none or sparing. Shrubs or herbs, natives of South America. Leaves of all rather large, usually with revolute margins. Flowers usually with a white or yellowish corolla, and blue calycine wings, disposed in compound or simple, terminal or lateral racemes; pedicels guarded by 3 bracteas. The greater part of the species are not well known.

SECT. I. HEBEA'NDRA (εβε, *hebe*, hairy, and ανερ ανδρος, a man; in allusion to the stamens being hairy). D. C. prod. 1. p. 338. Drupes without a winged margin.

* *Racemes compound.*

1 M. POLYSTA'CHYA (Ruiz et Pav. l. c.) shrubby; leaves ovate, acutish; panicles and branchlets villous. ♄. G. Native of the Andes of Peru in thickets, especially at Pillao, where it is called Yalhoi. Flowers yellowish. The whole plant, more especially the root, is very bitter and saponaceous, hence very useful in medicine. It is said to have the same properties as *Polýgala Sénega*, and is particularly used in dysentery. Ruiz, diss. madr. 1805. icon.

Many-spiked Monnina. Fl. May. Shrub 3 or 5 feet.

2 M. LIGUSTRIFÒLIA (Kunth, nov. gen. amer. 5. p. 417.) leaves oblong-lanceolate, acute, tapering to the base, reticulately veined, membranous; branchlets and panicles pubescent; racemes in threes. ♄. S. Native of Quito in warm places near Ayavaca. Flowers yellowish but with blue wings.

Privet-leaved Monnina. Fl. May. Shrub 2 to 6 feet.

3 M. LATIFÒLIA (Bonpl. ges. berl. 1808. p. 40. under the name of Hebeándra) herbaceous; leaves obovate-oblong, acuminated, under surface pubescent; branches furrowed; racemes panicled. ♃. S. Native of New Granada on Mount Quindiu.

Broad-leaved Monnina. Pl. 1 foot.

4 M. PARVIFLÒRA (H. B. et Kunth, nov. gen. amer. 5. p. 419.) leaves ovate-oblong, tapering to the base, lessened toward the apex, under surface pubescent, reticulately veined, membranaceous; branches terete, soft, hairy; racemes panicled, somewhat corymbose. ♄. G. Native of New Granada on Mount Quindiu. Hebeándra parviflòra, Bonpl. ges. berl. 1808. p. 40. Flowers white, but with blue wings.

Small-flowered Monnina. Fl. Sept. Shrub 3 to 4 feet.

5 M. FASTIGIA'TA (Bonpl. ges. berl. 1808. p. 40. under Hebeándra) leaves oblong, acuminated at both ends, under surface soft, pubescent; racemes compound. ♄. G. Native of New Granada on Mount Quindiu. Perhaps sufficiently distinct from *M. parviflòra.*

Fastigiate-branched Monnina. Shrub 2 to 4 feet.

6 M. PUBE'SCENS (H. B. et Kunth. nov. gen. amer. 6. p. 418. t. 505.) leaves oblong, acute, somewhat mucronate, tapering towards the base, reticulately-veined, membranaceous, upper surface puberulous, under surface as well as branchlets hairy-pubescent; racemes solitary and in threes. ♄. S. Native of Caraccas. Hebeándra pubéscens, Bonpl. ges. berl. 1808. p. 40. Flowers with blue wings.

Pubescent Monnina. Fl. Feb. Shrub 3 feet.

7 M. PILÒSA (H. B. et Kunth, nov. gen. amer. 5. p. 419.) leaves oblong, acuminated, reticulately veined, membranous, upper surface puberulous, under surface hairy, but especially the nerves and veins; racemes many, disposed in a corymb-like bundle. ♄. S. Native of Quito near Ayavaca. Flowers blue.

Hairy-veined Monnina. Fl. Aug. Shrub 6 feet.

8 M. Æ'STUANS (D. C. prod. 1. p. 338.) shrubby; leaves lanceolate, stalked, and are as well as branches somewhat pubescent; racemes branched, puberulous. ♄. S. Native of New Granada. Polýgala æ'stuans, Lin. suppl. 315. Flowers blue.

Scorching Monnina. Shrub 6 feet.

9 M. CESTRIFÒLIA (H. B. et Kunth, nov. gen. amer. 5. p. 413. t. 502.) leaves oblong-lanceolate, acute, veiny, leathery, tapering to the base, with revolute margins, and are as well as branchlets glabrous; racemes many, disposed in crowded corymbs. ♄. S. Native of South America near the city of Quito. Hebeándra cestrifòlia, Bonpl. l. c.? Flowers with blue wings.

Cestrum-leaved Monnina. Shrub 3 feet.

10 M. PHYTOLACCÆFÒLIA (H. B. et Kunth, nov. gen. amer. 5. p. 413. t. 503.) leaves elliptical-oblong, acute at both ends, reticulately-veined, thickish, glabrous; branchlets rather hairy; racemes generally in threes. ♄. S. Hebeándra padifòlia, Bonpl. l. c. Flowers with blue wings and yellow petals.

Var. α; branchlets rather hairy; leaves elliptical-oblong, acute at both ends. Native of New Granada near Mariquita.

Var. β; branchlets villous; leaves oblong, narrowed and acute at both ends. Native of Caraccas on Mount Avila. Hebeándra padifòlia, Bonpl. l. c.

Phytolacca-leaved Monnina. Fl. Ju. Dec. Shrub 2 to 4 feet.

11 M. OBSCU'RA; leaves leprous, oblong-lanceolate, with revolute margins, tapering to both ends; racemes simple or rather compound, lateral and terminal, loose; stem much branched. ♄. S. Native of Mexico. Like *M. salicifòlia.*

Obscure Monnina. Shrub 2 feet.

12 M. DE'PPEI; pubescent; leaves ovate or roundish, bluntish; racemes corymbose, lateral and terminal, forming a panicle. ♄. S. Native of Mexico. Flowers blue.

Deppe's Monnina. Shrub 1½ foot.

* * *Racemes simple and solitary.*

13 M. XALAPE'NSIS (H. B. et Kunth, nov. gen. amer. p. 414.) leaves oblong, acuminated, tapering to the base, reticulately-veined, membranous, smoothish; racemes solitary or in pairs. ♄. G. Native of Mexico near Xalapa. Hebeándra euonymoìdes, Bonpl. l. c. Flowers with blue wings.

Xalapa Monnina. Fl. March. Shrub 2 to 6 feet.

14 M. NEMORÒSA (H. B. et Kunth, nov. gen. amer. p. 410. t. 504.) leaves elliptical-oblong, acute, mucronate, tapering, and revolute at the base, obsoletely denticulated, rather veiny, thickish, glabrous, younger ones as well as branchlets pubescent; racemes bifid or simple. ♄. S. Native of the province of Quito in thickets. Hebeándra mucronàta, Bonpl. l. c. Flowers with a yellow corolla and blue wings.

Grove Monnina. Shrub 2 to 6 feet.

15 M. MYRTILLOI'DES (Bonpl. ges. berl. 1808. p. 40. under the name of *Hebeándra*) leaves elliptical, acute at both ends, rather coriaceous, racemes simple. ♄. S. Native of Peru in groves. Wings of flowers blue.

Myrtle-like Monnina. Shrub 2 to 4 feet.

16 M. OBTUSIFÒLIA (H. B. et Kunth, nov. gen. amer. 5. p. 411.) leaves oblong, obtuse, wedge-shaped at the base, obsoletely veined, rather leathery, and are as well as branchlets glabrous; racemes solitary. ♄. S. Native of New Granada near Almaguer. Hebeándra Phylliræoìdes, Bonpl. l. c. Flowers violet and white.

Obtuse-leaved Monnina. Fl. Dec. Shrub 12 feet.

17 M. CRASSIFÒLIA (H. B. et Kunth, nov. gen. amer. 5. p. 411.) leaves linear-oblong, rounded at the apex, obtuse at the base, veinless, fleshy, leathery, glabrous; branchlets pubescent, leafy; racemes solitary. ♄. S. Native on mountains about Quito. Flowers with blue wings.

Thick-leaved Monnina. Shrub 6 feet.

18 M. REVOLU'TA (H. B. et Kunth, nov. gen. amer. 5. p. 412. t. 501.) leaves oblong-lanceolate, acute, at base bluntish, with revolute margins, veinless, leathery, hairy; branchlets pubescent; racemes solitary. ♄. S. Native on the Andes in the province of Pasto. Hebeándra revolùta, Bonpl. l. c. Flowers white, with blue wings (f. 70.).

FIG. 70.

Revolute-leaved Monnina. Fl. Dec. Shrub 2 feet.

19 M. RUPE'STRIS (H. B. et Kunth, nov. gen. amer. 5. p. 415.) leaves oblong, somewhat acuminated, mucronate, narrowed at the base, irregularly and undulatedly denticulated, reticulately veined, membranaceous, smoothish; branchlets hairy; racemes solitary. ♄. S. Native of New Granada on Mount Saraguru. Perhaps Hebeándra celastroìdes and ligustrìna of Bonpl. l. c.? Flowers with blue wings.

Rock Monnina. Shrub 2 feet.

20 M. CONFE'RTA (Ruiz et Pav. fl. per. syst. 1. p. 173.) shrubby; leaves crowded, oblong, with a very small point; racemes short, corymbose, terminal. ♄. S. Native in thickets on the Andes. Flowers bluish. Drupe ovate, glabrous.

Crowded-leaved Monnina. Shrub 1½ foot.

21 M. CARDIOCA'RPA (St. Hil. fl. bras. 2. p. 60. t. 93.) stem suffruticose, hairy; leaves broad-linear, tapering to the base, very obtuse, and as if they were emarginate, denticulated, full of glandular dots; racemes spike-formed, loose, solitary; wings obovate-orbicular, very obtuse; capsule 2-celled, heart-shaped, smooth, wingless. ♄. S. Native of Brazil. Flowers pale blue.

Heart-fruited Monnina. Fl. Feb. Shrub 1 foot.

22 M. SELLÒI (Spreng. syst. 3. p. 175.) erect; stem beset with branched pili; leaves oblong or obovate-lanceolate, tapering to both ends, but much more so at the base, with ciliated revolute margins; young leaves pilose on the nerves beneath; racemes terminal, solitary, elongated; flowers large. ♃. S. Native of Brazil. Perhaps M. tristaniæfòlia, St. Hil.

Sello's Monnina. Shrub 2 to 6 feet.

23 M. LANCIFÒLIA; erect; leaves lanceolate, finely reticulated, with a strong middle nerve; racemes lateral and terminal, crowded near the tops of the branches. ♄. S. Native of Brazil. Plant smooth. Flowers rather large.

Lance-leaved Monnina. Shrub 2 to 4 feet.

24 M. TUBERÒSA; racemes loose, simple, terminal, or lateral; leaves ovate-oblong, acuminated, membranous, smooth; stem suffruticose, climbing; branchlets pubescent. ♄. S. Native of Brazil. Roots tuberous. Flowers blue.

Tuberous-rooted Monnina. Pl. 1 foot.

25 M. CROTALARIOÌDES (D. C. prod. 1. p. 339.) shrubby; leaves elliptical, acuminated at both ends, lower ones ovate; branchlets covered with pressed pubescence; racemes elongated. ♄. S. Native of South America. Berry ovate, black.

Crotalaria-like Monnina. Shrub 2 feet.

26 M. MEXICA'NA; pubescent, suffruticose; leaves oblong-lanceolate, acute; racemes terminal, solitary; stem branched; root hard, woody. ♄. S. Native of Mexico.

Mexican Monnina. Shrub 1 foot.

27 M. CÆRU'LEA; stem suffruticose, erect, pilose; leaves smooth, but rather hairy on the nerves beneath, oblong, acuminated, acute; racemes solitary, slender, elongated. ♄. S. Native of Mexico. Flowers blue.

Blue-flowered Monnina. Shrub 1½ foot.

28 M. LANCEOLA'TA (D. C. prod. 1. p. 339.) suffruticose? leaves lanceolate, acuminated, glabrous; branches divaricating; racemes elongated, pedunculated. ♄.? S. Native of Peru. Polýgala lanceolàta, Poir. dict. 5. p. 498.

Lanceolate-leaved Monnina. Shrub 1½ foot.

29 M. salicifòlia (Ruiz et Pav. fl. per. syst. 1. p. 172.) shrubby; leaves lanceolate, smooth on the upper surface, with a small point; branches hairy; racemes short, almost pyramidal. ♄. S. Native of Peru among decayed rocks. Flowers purple.

Willow-leaved Monnina. Shrub 2 feet.

30 M. pa'llida (Spreng. syst. 3. p. 175.) leaves oblong, tapering to both ends, and are as well as the branches smooth; racemes axillary, simple; fruit smooth. ♄. S. Native of Brazil.

Pale Monnina. Shrub.

31 M. longifòlia (D. C. prod. 1. p. 339.) suffruticose; leaves narrow-lanceolate, very long; branches rather velvety; racemes short, rather lax, pyramidal. ♄. S. Native of Brazil. Polýgala salicifòlia, Poir. dict. 5. p. 498.

Long-leaved Monnina. Shrub 1 to 2 feet.

32 M. bifurca'ta (Moc. et Sesse, fl. mex. icon. ined. and D.C. prod. 1. p. 339.) stem herbaceous, forked at the apex; leaves lanceolate on short footstalks, upper ones somewhat opposite, glabrous; racemes terminal, in pairs. ♃. S. Native of Mexico.

Bifurcate-stemmed Monnina. Pl. 2 feet.

33 M. ciliolòsa (Moc. et Sesse, fl. mex. icon. ined. and D. C. prod. 1. p. 340.) suffruticose, dichotomous; leaves oblong, acute, lessened at the base; leaf-stalks short, ciliated; racemes short. ♄. S. Native in Mexico.

Ciliary-footstalked Monnina. Shrub 1 to 2 feet.

34 M. linearifòlia (Ruiz et Pav. fl. per. syst. 1. p. 173. D. C. prod. 1. p. 340.) suffruticose; leaves linear, almost sessile, glabrous; racemes long, naked at the base. ♃. G. Native of Chili in subalpine places.

Linear-leaved Monnina. Shrub 1 to 2 feet.

35 M. herba'cea (D. C. prod. 1. p. 340.) herbaceous; at top a little branched, glabrous; leaves rhomb-lanceolate; racemes rather elongated; drupe pubescent, wingless. ☉. S. Native of Peru near Lima.

Herbaceous Monnina. Pl. 1 foot.

Sect. II. Peroca'rya (from πτερον, *pteron*, a wing, and καρυον, *karyon*, a nut; fruit girded by a wing). D. C. prod. 1. p. 340. Fruit expanded at the margin into a membranous wing.

36 M. macrosta'chya (Ruiz et Pav. fl. per. syst. 1. p. 173.) herbaceous; leaves lanceolate-rhomboid; racemes very long, lateral, and terminal; drupes glabrous, girded by a narrow, nervous, toothed membrane. Native on the hills of Peru. Flowers with purple wings?

Long-racemed Monnina. Fl. Aug. Sep. Pl. 2 feet.

37 M. peroca'rpa (Ruiz et Pav. fl. per. syst. 1. p. 174.) herbaceous, glabrous; leaves lanceolate, lower ones somewhat ovate; racemes very long; drupes girded by a membrane, which is emarginate at both ends. ♃. S. Native of Peru. Flowers purple. Plant bitter.

Wing-fruited Monnina. Fl. Aug. Sep. Pl. 1 to 2 feet.

38 M. angustifòlia (D. C. prod. 1. p. 340.) herbaceous, glabrous; leaves linear, lower ones somewhat lanceolate; racemes very long; drupes girded by a membrane. ♃. S. Native of Peru about Lima.

Narrow-leaved Monnina. Pl. 1 foot.

39 M. resedoìdes (St. Hil. fl. bras. 2. p. 61. t. 94.) stem subherbaceous, sparingly branched, somewhat dichotomous; leaves oblong-lanceolate, acute, undulately-denticulated, smoothish; racemes spike-formed, loose; wings obovate; capsule 2-celled, heart-shaped, with a narrow wing. ♃. S. Native of Brazil on the banks of the river Uruguay. Flowers violet.

Reseda-like Monnina. Fl. Jan. Pl. 1½ foot.

40 M. cunea'ta (St. Hil. fl. bras. 2. p. 62. t. 95.) stem herbaceous, almost simple, puberulous; leaves wedge-shaped, linear, obtuse or truncately emarginate, mucronulate, quite entire; racemes spike-formed, very narrow, lax; wings obovate, very obtuse; capsule 1-celled, elliptic, smooth, broadly winged. ♃. S. Native of Brazil in the eastern part of the province of Cis Platine. Flowers purple, nodding.

Wedge-leaved Monnina. Fl. Oct. Pl. 2 feet.

41 M. emargina'ta (St. Hil. fl. bras. 2. p. 63.) stem woody at the base, puberulous; leaves wedge-shaped, cordate at the apex, with a recurved mucrone in the recess, quite entire, smoothish; racemes spike-formed, loose; wings somewhat orbicular; capsule 1-celled, elliptic, pubescent, winged. ♄. S. Native of Brazil in the northern part of the province of Rio Grande do Sul. Flowers purple.

Emarginate-leaved Monnina. Fl. June. Pl. 1½ foot.

42 M. stenophy'lla (St. Hil. fl. bras. 2. p. 64.) stem woody; a little striated, sparingly-branched; leaves linear, bluntish, mucronulate, quite entire, smooth; racemes spike-formed; wings orbicular; capsule 1-celled, orbicular, pubescent, winged. ♄. S. Native of Brazil on Mount Serra da Caraca in the province of Minas Geraes. Flowers purple.

Narrow-leaved Monnina. Fl. May. Shrub 2 to 3 feet.

43 M. tristania'na (St. Hil. fl. bras. 2. p. 65.) stem rather woody at the base, rather angular, puberulous, sparingly branched; leaves linear, tapering to the base, obtuse, mucronulate, quite entire; racemes spike-formed, very loose; wings ovate, very blunt; capsule 1-celled, elliptical, winged. ♃. S. Native of Brazil in the province of Minas Geraes. Flowers purplish.

Tristan's Monnina. Fl. Aug. Oct. Pl. 3 to 4 feet.

44 M. Richardia'na (St. Hil. fl. bras. 2. p. 66.) stem suffruticose, simple, angular at the apex, pubescent; leaves elliptical, very blunt, mucronulate, quite entire, smoothish, upper ones oblong-linear or linear, pubescent; racemes spike-formed, loose; wings orbicular; capsule 1-celled, elliptically-orbicular, pubescent, winged. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers purple.

Richard's Monnina. Fl. May, Sept. Pl. 1 to 1½ foot.

Cult. None of the species of this genus are worth cultivating for ornament. They will all thrive well in a mixture of loam and peat, and young cuttings will root readily if planted in a pot of sand with a bell-glass placed over them, in heat.

IX. JA'CKIA (to the memory of Dr. Jack, a meritorious botanist who travelled in Sumatra). Blum. bijdr. ex Schlecht. Linnæa. 1. p. 646.

Lin. syst. *Diadélphia, Octándria.* Calyx of 5 equal, deciduous sepals, which are imbricate in the bud. Petals 5, middle one keel-formed. Stamens 8; filaments diadelphous, tumid at the base. Ovary on a very short pedicel, semi-orbicular; cells 2-4-seeded. Drupe globose, containing a 1-seeded nucleus. Seeds without albumen, but the endopleura is nevertheless tumid. Cotyledons large, thick. Radicle short, superior. Shrubs or trees with stipulas in the axillæ of the leaves, these are spinescent. Leaves coriaceous, entire. Flowers in axillary and terminal racemes.

1 J. vitelli'na (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 647.) leaves elliptical-oblong, obtusely acuminated, flat; racemes compound, twin, terminal, longer than the leaves or axillary, solitary. ♄. S. Native of Java. Monnìna vitellìna, Spreng.

Yellow-barked Jackia. Tree 30 feet.

2 J. exce'lsa (Blum. l. c.) leaves elliptical-oblong, waved; racemes compound, axillary, and terminal, crowded, shorter than the leaves. ♄. S. Native of Java. A large tree. Monnìna excélsa, Spreng. syst. app. p. 265.

Tall Jackia. Tree 60 feet.

3 J. longifòlia (Blum. l. c.) leaves ovate-oblong, acuminated, flat; racemes compound, axillary, and terminal, much shorter than the leaves. ♄. S. Native of Java. Monnìna longifòlia, Spreng. syst. app. p. 265.

Long-leaved Jackia. Tree.

Cult. A mixture of loam, peat, and sand will suit this genus well, and young cuttings will root if planted in a pot of sand, with a hand-glass placed over them, in heat.†

X. BREDEME'YERA (in honour of Bredemeyer, a German botanist). Willd. nov. act. nat. scrut. berl. 3. p. 411. t. 6. D. C. prod. 1. p. 340.

Lin. syst. *Monodélphia, Octándria.* Calyx of 5 sepals, two inner sepals petal-formed. Petals 3, with the middle one keel-formed. Stamens 8, monadelphous at the base. Drupe ovate, with a 2-celled nut. A doubtful genus.

1 B. floribu'nda (Willd. l. c.). ♄. S. Native of Caraccas by the margins of woods. Leaves alternate, oblong-lanceolate, very entire, glabrous, on short footstalks. Bracteas awl-shaped, situated at the base of the pedicels. Flowers small, yellow, disposed in terminal panicles.

Bundle-flowered Bredemeyera. Shrub 5 to 8 feet.

Cult. This shrub will thrive well in a mixture of sand, loam, and peat. Cuttings taken from young branches and planted in the same kind of soil will root freely under a hand-glass, in heat.

XI. SECURIDA'CA (from *securis*, a hatchet; in allusion to the form of the wing at the end of the pod). Lin. gen. no. 852. Lam. ill. t. 599. D. C. prod. 1. p. 340. but not of Tourn.

Lin. syst. *Monadélphia, Octándria.* Calyx 5-sepalled, 2 inner sepals petal-formed, 3 outer ones small. Petals 5, almost joined together and united to the tube of the stamens at their base; the middle one forming a keel which is 3-lobed at the top, the 2 lateral ones are scale-formed, the superior 2 conniving. Stamens 8, united into a tube at the base, which is cleft in front but free at the apex; anthers bursting by a pore at the apex. Capsules ovate, indehiscent, 1-celled, 1-seeded, ending in a hatchet-formed, leafy wing at the apex, and often marginated. Seed naked, hanging from the top of the cell. Albumen sparing. Climbing shrubs. Leaves alternate, ovate, or oblong, entire. Flowers in lateral or terminal racemes. Pedicels furnished with 3 bracteas at the base.

* *Stems twining and climbing.*

1 S. virga'ta (Swartz, fl. ind. occid. 3. p. 1231.) glabrous; stem climbing; branches twiggy; leaves roundish, very blunt; racemes terminal; wing of capsule rounded. ♄. ◡. S. Native of Jamaica, Hispaniola, Porto-Rico, Trinidad, &c. in bushy places.—Plum. ed Burm. t. 248. f. 1. Leaves deciduous, hardly half an inch long. Flowers fragrant, variegated.

Twiggy-branched Securidaca. Clt. 1739. Shrub climbing.

2 S. volu'bilis (Lin. spec. 992.) stem twining; branchlets somewhat pubescent; leaves oval-oblong, acute; racemes lateral; wing of capsule obovate, appendiculated on the back from the base. ♄. ◠. S. Native of South America near Santa Martha and Carthagena as well as in Trinidad. S. scándens, Kunth. Flowers red or purple, fragrant.

Twining Securidaca. Clt. 1739. Fl. March. Shrub twining.

3 S. ovalifo'lia (St. Hil. fl. bras. 2. p. 68.) stem suffruticose, climbing, branched; leaves thin, ovate, or orbicularly-ovate, very blunt and finely nerved, smooth above and pilose beneath; wings of flower obovate, scarcely ciliated at the base; wing of capsule finely ciliated and denticulated. ♄. ◡. S. Native of Brazil near Rio Janeiro. Flowers yellowish-white.

Oval-leaved Securidaca. Fl. Dec. Shrub climbing.

4 S. rivinæfòlia (St. Hil. fl. bras. 2. p. 69.) stem shrubby, climbing; branches tomentose; leaves elliptical, sometimes rather orbicular, with a very short acumen, smoothish above and tomentose beneath; wings of flowers obovately-orbicular, very blunt, hardly ciliated; wing of fruit? ♄. ◡. S. Native of Brazil in the province of Minas Geraes near a village called Curumatahy. Flowers purple.

Rivina-leaved Securidaca. Fl. Sept. Shrub climbing.

5 S. lanceola'ta (St. Hil. fl. bras. 2. p. 69.) stem shrubby, climbing; branches spotted, puberulous at the apex; leaves lanceolate, lower ones obovate or somewhat orbicular, finely nerved, all smooth above and puberulous beneath; racemes rather loose; wings of flower somewhat elliptically orbicular, finely ciliated; wing of fruit crested. ♄. ◡. S. Native of Brazil near Rio Janeiro. Flowers purple.

Lanceolate-leaved Securidaca. Shrub climbing.

6 S. mo'llis (H. B. et Kunth, nov. gen. amer. 5. p. 421.) stem climbing; branchlets pubescent; leaves roundish-ovate, obtuse at both ends, upper surface puberulous, under surface soft, pubescent; racemes terminal. ♄. ◡. S. Native on the banks of the river Amazon. P. coriàcea, Bonpl. Lower petal spatulate. Flowers violaceous.

Soft-leaved Securidaca. Fl. Aug. Shrub twining.

7 S. pube'scens (D. C. prod. 1. p. 341.) stem climbing; leaves oval, ovate, or obovate, under surface as well as branchlets somewhat pubescent; racemes terminal. ♄. ◡. S. Native of Cayenne and Guiana. Perhaps two species are here confused. Flowers purplish.

Var. α, *obovàta* (D. C. l. c.) leaves obovate, obtuse.

Var. β, *ovàta* (D. C. l. c.) leaves ovate, acutish.

Pubescent Securidaca. Shrub climbing.

8 S. hebe'clada (D. C. prod. 1. p. 341.) stem rather climbing; branches and nerves of leaves on the under surface as well as pedicels clothed with velvety hairs; leaves oval, mucronate, shining on the upper surface; racemes terminal, rather leafy. ♄. ◡. S. Native in Brazil. Flowers the size of those of *S. virgàta*, very smooth. Fruit unknown.

Hairy-branched Securidaca. Shrub climbing.

9 S. acumina'ta (St. Hil. fl. bras. 2. p. 70.) stem shrubby, climbing; branches hirsutely-tomentose; leaves ovate, acuminated, smooth above, pilose beneath; racemes rather conical, broadish; wings irregularly orbicular, puberulous in the middle on the back. ♄. ◡. S. Native of Brazil in the province of Minas Geraes. Flowers purple.

Acuminate-leaved Securidaca. Fl. Jan. Shrub climbing.

10 S. tomentòsa (St. Hil. fl. bras. 2. p. 71. t. 96.) branches woody, hirsutely-tomentose; leaves elliptically ovate, somewhat emarginate, obtuse, ciliated, smooth and shining above, but tomentose beneath; racemes capitate, sessile; wings of flower obovate, very blunt; outer sepals ciliated. ♄. ◡. S. Native of Brazil. S. divaricàta, Mart.? Flowers purplish.

Tomentose Securidaca. Shrub climbing.

11 S. divarica'ta (Mart. in act. bonn. vol. 11.) branches twisted; leaves ovate-elliptical, very obtuse, coriaceous, shining above, tomentose beneath; racemes dense, panicled. ♄. ◡ S. Native of Brazil. Flowers purplish.

Divaricate-branched Securidaca. Shrub climbing.

12 S. complica'ta (H. B. et Kunth, nov. gen. amer. 5. p. 423.) stem climbing; leaves ovate-elliptic, obtuse, rounded at the base, covered with complicated hairs on the under surface; branchlets soft, hairy. ♄. ◡. S. Native on the banks of the river Orinoco. S. péndula, Bonpl. Bearing two glands at the base of the leafstalks in place of stipulas. Lower petal linear-oblong, equalling in length the upper one. Flowers purplish.

Complicated-haired Securidaca. Fl. May. Shrub climbing.

** *Stems erect.*

13 S. ere'cta (Lin. spec. 992.) stem erect; leaves oblong, acute at both ends; branchlets and pedicels somewhat pubescent; racemes terminal, simple. ♄. S. Native of Hispaniola

and St. Thomas, among stones. Jacq. amer. p. 197. t. 183. f. 39. Swartz. obs. 294. Flowers purple.

Erect Securidaca. Shrub 12 feet.

14 S. PANICULA'TA (Lam. ill. t. 599. f. 2. Poir. dict. 7. p. 52.) stem erect; leaves oval-oblong, rather acute; branches smoothish; racemes terminal, somewhat compound. ♄. S. Native of Cayenne. Wing of fruit appendiculate on the back from the base. Flowers purple.

Panicled-flowered Securidaca. Shrub 6 feet.

15 S. BRAZILIE'NSIS (Spreng. syst. 3. p. 175.) leaves obovate, obtuse, pubescent beneath as well as the branches; flowers panicled. ♄. S. Native of Brazil. Flowers purplish?

Brazilian Securidaca. Shrub 6 feet.

Cult. The species of *Securidàca* grow well in a mixture of loam, peat, and sand, and if cuttings are planted in a pot of sand, with a bell-glass placed over them, they will root readily.

XII. CARPOLO'BIA (from καρπος, *karpos*, a fruit, and λοβος, *lobos*, a pod; in allusion to the berry containing a silky pod or seed.)

Lin. syst. *Monadélphia, Octándria.* Sepals 5, somewhat bilabiate. Petals 3-5, with a large keel; the rest nearly equal, all unguiculate. Stamens 8, monadelphous? Drupe containing 1 villous, silky seed, or a silky 1-seeded legume. Smooth-branched shrubs, with alternate, entire leaves. Flowers disposed in axillary few-flowered racemes.

1 C. VERSI'COLOR; leaves oval, acuminated, mucronate, entire; peduncles 3-5-flowered. ♄. S. Native of Sierra Leone on the mountains. Flowers cream-coloured, striated.

Party-coloured-flowered Carpolobia. Shrub 4 feet.

2 C. DU'BIA; leaves ovate-oblong, acuminated, cordate at the base, on long footstalks; racemes in panicles, many-flowered; stamens distinct? ♄. S. Native of Sierra Leone. Flowers white.

Doubtful Carpolobia. Shrub 4 feet.

3 C. LU'TEA; leaves ovate, acuminated, mucronate; on short footstalks; peduncles 2-5-flowered. ♄. S. Native of Sierra Leone. Flowers yellow.

Yellow-flowered Carpolobia. Shrub 4 feet.

4 C. A'LBA; leaves ovate-lanceolate, acuminated, on short footstalks; peduncles usually 2-flowered. ♄. S. Native of Sierra Leone. Flowers white, streaked with red.

White-flowered Carpolobia. Shrub 6 feet.

Cult. These shrubs will grow freely in a mixture of loam and sand, and young cuttings will strike root in sand under a hand-glass, in heat.

XIII. KRAME'RIA (in honour of John George Henry and William Henry Kramer, M.D., father and son, German botanists; the former published Tentamen Botanicum in 1728 and 1744, the latter Flora Austriæ in 1756; it must also distinguish John Rudolf Kramer, who wrote a dissertation on *Myrtus* in 1731). Lœfl. itin. 195. Ruiz et Pav. prod. fl. per. t. 3. Juss. mem. mus. 1. p. 390. D. C. prod. 1. p. 341.

Lin. syst. *Monadélphia, Tetra-Hexándria.* Sepals 4 (f. 71. *a.*), rarely 5, irregular, spreading, silky on the outside and coloured on the inside. Petals 4-5, in 2 series, 3 inner ones unguiculate, with the claws united at the base. Stamens 3 or 4, somewhat monadelphous at their base or free; anthers opening by 2 pores at the apex (f. 71. *d.*). Fruit globose, indehiscent, covered with bristly prickles (f. 71. *e. b.*), 1-celled, 1-seeded (f. 71. *e.*), or incompletely 2-celled, 2-seeded. Embryo straight. Albumen none. Diffuse, many-stemmed shrubs. Leaves alternate, entire, simple or trifoliate. Flowers axillary, or on the top of the branchlets, generally solitary or disposed in spike-formed racemes. Pedicels usually furnished with 2 or 3 bracteas.

* *Leaves simple.*

1 K. IXÌNA (Lin. spec. 177.) leaves ovate-lanceolate, with spiny points, villously-pubescent; pedicels axillary, bibracteate, disposed in terminal racemes. ♄. S. Native of Cumana, where it is called *cordilla breva*, also near Angustura on the Orinoco, and St. Domingo. Flowers purple, tetrandrous. Whether there be any thing viscid in this plant which might induce its discoverer to adopt the Greek word ixine does not appear.

Ixina Krameria, Shrub procumbent.

2 K. SECUNDIFLÒRA (Moc. et Sesse, fl. mex. icon. ined. and D. C. prod. 1. p. 341.) leaves linear, acute, villous; pedicels longer than the leaves, furnished with two bracteas, disposed in a secund raceme. 4. S. Native of Mexico. Flowers probably red.

Secund-flowered Krameria. Pl. 1 foot.

3 K. PAUCIFLÒRA (Moc. et Sesse, fl. mex. icon. ined. and D. C. prod. 1. p. 341.) leaves oblong-linear, villous; pedicels few, longer than the leaves, bearing 2 bracteas on the middle of each; lower lobe of calyx gibbous. 4. G. Native of Mexico. Flowers probably red.

Few-flowered Krameria. Pl. 1 foot.

FIG. 71.

4 K. TRIA'NDRA (Ruiz. et Pav. fl. per. 1. t. 93.) leaves oblong, acutish, silky-villous; pedicels rather longer than leaves, furnished with two bracteas, disposed in a short raceme. ♄. G. Native of Peru on declivities of sandy mountains, where the root is called *Rattany*, or *Ratanhia*. It possesses powerful tonic and astringent qualities. According to the analysis of a French chemist it contains gallic acid, but neither tannin nor resin.

This plant is gathered in large quantities, from which a beautiful extract is prepared, which, as well as the root, is imported into Portugal for improving the colour and richness of red wine. From this use in manufacturing of wine, the Portuguese and Spanish merchants have kept its properties so concealed, that in this country the root was unknown till very lately: the deep colour it communicates to port wine renders it an article of great and deserved value to the manufacturer of wine. The sensible properties chiefly reside in the cortical part of the root; the ligneous part is tough and somewhat mucilaginous. On being slightly masticated the root discovers a grateful astringency, and is slightly aromatic and bitter. These qualities are imparted, as well as its colouring matter, to cold and boiling water and to proof spirit. The tincture made with brandy approaches very near to the flavour of port wine. The foreign extract, which is a gum-resin, is a very beautiful transparent article. The extract made from a decoction or infusion of the root is powdery, and not so astringent as the powdered root. Dr. Duncan asserts that the foreign extract of this root cannot be discovered from *kino*, but this melts and swells on exposure to the heat, and thus it does when as dry as *kino*, which becomes charred on exposure to heat. *Rhatany* is a very valuable tonic medicine for indigestion arising from direct debility. The solution of the foreign extract, dissolved in a camphoretic mixture, is a remedy in advanced stages of typhus fever; and it possesses all the good qualities of port wine and is exempt from its pernicious ingredient alcohol. It is an excellent tonic to accompany the use of diuretics, cathartics and absorbent stimulants in cases of dropsy. It may be substituted for *bark* or *kino*.

The compound tincture of *Rhatany* is a pleasant and efficacious stomachic; taken in doses of a tea-spoonful in a little water 3 or 4 times a day it will prove a good remedy in indigestion, heart-burn, cramp of the stomach, nervous irritability, &c.

The simple tincture is made with three ounces of the powdered root to a quart of proof spirit, and is much used by dentists with equal parts of rose-water as a lotion to astringe the gums. Equal parts of powdered Rhatany-root, oris-powder, areca-nut, and charcoal form the best tooth-powder.

Rhatany or *Triandrous* Krameria. Shrub 1 foot.

5 K. GRANDIFLÒRA (St. Hil. fl. bras. 2. p. 73. t. 97.) stem suffruticose, prostrate, almost simple, smooth below and hairy above; leaves lanceolate, very acute, spinulose, lower ones smoothish, upper ones hairy; racemes spike-formed; flowers large, secund. ♄. S. Native of Brazil in the southern part of the province of Goyaz. Flowers red.

Great-flowered Krameria. Fl. June. Shrub prostrate.

6 K. RUSCIFÒLIA (St. Hil. fl. bras. 2. p. 74.) stem suffruticose, prostrate; branches simple, flexuous, pilose below and villous above; leaves lanceolate-ovate, very acute, spinulose, villous; racemes spike-formed, flexuous, flowers secund. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers red.

Butcher's-Broom-leaved Krameria. Shrub prostrate.

7 K. TOMENTÒSA (St. Hil. fl. bras. 2. p. 74.) stem suffruticose, erect, tomentose, branched; leaves ovate, elliptical, spinulose, tomentose; racemes spike-formed, short, few-flowered. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers red.

Tomentose Krameria. Fl. May. Shrub 1 foot.

8 K. ARGE'NTEA (Mart. in act. bonn. vol. 11.) leaves oblong, acutish, rather thick, acute from a deciduous point, upper ones villous; racemes spike-formed, villous. ♄. S. Native of Brazil. Flowers red?

Silvery Krameria. Shrub prostrate.

9 K. LINEA'RIS (Ruiz et Pav. fl. per. 1. t. 94. f. a.) prostrate; leaves linear-awl-shaped, villous; pedicels downy, furnished with two bracteas. ♄. G. Native on argillaceous hills in Peru. K. pentapétala, Ruiz et Pav. syst. fl. per. p. 35. Flowers red.

Linear-leaved Krameria. Shrub prostrate.

10 K. GLA'BRA (Spreng. new. entd. 2. p. 157.) leaves oblong-lanceolate, shining; fruit smoothish. Native in Brazil. Flowers probably red.

Glabrous Krameria. Shrub 1 foot.

11 K.? LANCEOLA'TA (Torrey. in ann. lyc. new york. vol 2. p. 166.) plant hoary-pubescent; leaves lanceolate, acute, villous; pedicels twice the length of the leaves, axillary. ♄. H. Native of North America on the Rocky Mountains.

Lanceolate-leaved Krameria. Shrub.

** *Leaves trifoliate.*

12 K. CISTISOI'DES (Cav. icon. 4. p. 590.) leaves stalked, trifoliate; leaflets oblong, villous; pedicels twice as long as leaf-stalks. ♄. S. Native of New Spain. Flowers violet or red.

Cytisus-like Krameria. Shrub 3 feet.

Cult. The species of *Kramèria* will thrive well in loam mixed with plenty of sand, and young cuttings, if planted in a pot of sand with a bell-glass placed over them, will root readily.

ORDER XXIV. TREMA'NDREÆ (plants agreeing with *Tremándra* in important characters). R. Brown. gen. rem. p. 12. D. C. prod. 1. p. 343.

Calyx of 4 (f. 72. *a.*) or 5, unequal sepals, which are valvate when in the bud, and somewhat united at the base, deciduous. Petals equal in number with the sepals (f. 72. *b.*), and alternating with them; these are involute in the bud, inclosing the stamens, and much larger than the calyx, also deciduous. Stamens hypogynous, distinct, 2 in front of each petal, therefore there are 8 or 10 in each flower; filaments erect; anthers inserted by the base, 2-4-celled, bursting by a pore or tube at the apex. Ovary ovate (f. 72. *c.*), compressed, 2-celled; each cell containing 1-3 ovulæ (f. 72. *d.*). Capsule ovate, compressed, 2-celled, 2-valved (f. 72. *c.*), bearing a dissepiment in the middle of each valve. Seeds pendulous, ovate, with a naked umbilicus, and terminated by a caruncle-like appendage, inserted at the apex of the dissepiment. Embryo cylindrical, straight, placed in the axis of a fleshy albumen, with the radicle pointing towards the umbilicus, not superior.

This is a small order containing elegant, erect, heath-like shrubs, natives of New Holland, usually beset with pili, which are tipped with capitate glands. The leaves are either alternate or in whorls, without stipulas, entire or toothed. The pedicels are axillary, solitary, and 1-flowered. The flowers are usually purple, and may be compared to those of *Bauèra*, as well as the habit of the shrubs. This order is allied to *Polygàleæ*, also to *Droseràceæ*, but differs from the first in the stamens being free as well as in having regular flowers, and from the last in the capsule being 2-celled, and from all in cells of the anthers. Nothing is known of the properties of the plants contained in this order.

Synopsis of the genera.

1 TETRATHE'CA. Sepals 4 (f. 72. *a.*), nearly equal. Petals 4 (f. 72. *b.*). Stamens 8; anthers 4-celled. Seeds usually solitary in the cells.

2 TREMA'NDRA. Sepals 5. Petals 5. Stamens 10; anthers 2-celled.

I. TETRATHE'CA (from τετρα, *tetra*, fourfold, and θηκη, *thece*, a cell; in allusion to the 4 cells of the anthers, for which the plants are remarkable). Smith, nov. holl. 1. t. 2. Labill. nov. holl. specim. 1. p. 95. t. 122, 123. D. C. prod. 1. p. 343.

LIN. SYST. *Octándria, Monogýnia.* Calyx of 4, almost equal sepals (f. 72. *a.*). Petals 4 (f. 72. *b.*). Stamens 8; anthers 4-celled. Seeds generally solitary. Shrubs beset with glandular hairs, with the habit of *Bauèra*.

1 T. JU'NCEA (Smith, nov. holl. 1. t. 2.) leaves alternate, few, lanceolate, and are as well as branches glabrous. ♄. G. Native of New Holland. Stems 2-edged, almost naked. Flowers either white or purple.

Rushy Tetratheca. Fl. July, Aug. Clt. 1803. Shrub 1 ft.

2 T. GLANDULÒSA (Labill. nov. holl. 1. p. 95. t. 123. but not of Smith.) leaves alternate, ovate-oblong, toothed, and are as well as branches covered with glandular hairs; sepals ovate-lanceolate. ♄. G. Native of Van Diemen's Land. Very like *T. pilòsa*, but the flowers are larger. Flowers purple.

Glandular Tetratheca. Fl. Jul. Aug. Clt. 1822. Sh. ½ to 1 ft.

3 T. PILÒSA (Labill. nov. holl. 1. p. 95. t. 122.) leaves scattered or in whorls, oblong-linear, entire, with revolute margins, and are as well as branches covered with glandular hairs; sepals almost orbicular. ♄. G. Native of Van Diemen's Land. T. glandulòsa, Smith, exot. bot. t. 21. Flowers axillary, solitary, purple. Peduncles furnished each with a bractea at the base. Sepals orbicular, acute, ciliated with glandular hairs. Petals obovate.

Hairy Tetratheca. Fl. July, August. Clt. 1822. Shrub ½ to 1 foot.

4 T. denticula'ta (Sieb. ex Spreng. syst. append. p. 147.) leaves opposite, linear, revolute, a little denticulated, and are pilose as well as the branches; sepals lanceolate, acute, glandular. ♄. G. Native of New Holland. Flowers red.

Denticulated-leaved Tetratheca. Shrub 1 foot.

5 T. ericæfòlia (Smith, exot. bot. p. 87. t. 20.) leaves linear, 5-6 in a whorl, with revolute scabrous margins; branches scabrous; sepals ovate, acutish. ♄. G. Native of New Holland. Rudge, in Lin. trans. 8. t. 11. Peduncles and calyxes smooth. Flowers somewhat nodding. Petals obovate, rose-coloured, but sometimes white (f. 72.).

Heath-leaved Tetratheca. Fl. July, Aug. Clt. 1820. Shrub ½ to 1 foot.

6 T. thymifòlia (Smith, exot. bot. t. 22.) leaves 4 in a whorl, lanceolate, acute, ciliated; branches rather hairy; sepals lanceolate, acute, ciliated. ♄. G. Native of New Holland. Peduncles and calyxes scabrous. Sepals more acute than in *T. ericæfòlia*, to which it is nearly allied. Petals purple.

FIG. 72.

Thyme-leaved Tetratheca. Fl. July, Aug. Clt. 1824. Shrub ½ to 1 foot.

7 T. rubioìdes (Cuning. in Fields, geogr. new south wales, p. 336.) leaves 5 or 6 in a whorl, linear, falcate, upper surface scabrous; branches hoary; peduncles solitary, axillary, drooping. ♄. G. Native of New Holland on rocky declivities of the Blue Mountains. Flowers purple. Allied to *T. ericæfòlia*.

Madder-like Tetratheca. Fl. July, Aug. Clt. 1825. Shrub 1 foot.

Cult. The species of this beautiful genus of little shrubs deserve to be cultivated in every green-house, but they are very difficult to preserve, as well as extremely difficult to procure, as seeds seldom vegetate after a voyage from their places of natural growth. They thrive best in a mixture of very sandy loam and peat. Young cuttings will root freely if planted in a pot of sand, with a bell-glass placed over them.

II. TREMA'NDRA (from τρεμω, *tremo*, to tremble, to shake, and ανερ ανδρος, *aner andros*, a male; the anthers being slightly fixed by their base to the points of the filaments, shake from the least motion or breath of air.) R. Brown. ined. and D. C. prod. 1. p. 344.

Lin. syst. *Decándria*, *Monogýnia*. Calyx of 5 sepals. Petals 5. Stamens 10; anthers 2-celled. Shrubs, with the habit of *Heliánthemun*, beset with starry hairs.

1 T. stelli'gera (R. Br. ined. and D. C. prod. 1. p. 344.) erect; leaves ovate, entire, under surface hoary, upper surface beset with rough stellate hairs. ♄. G. Native on the eastern coast of New Holland. Habit of plant like *Hermánnia* or *Heliánthemum alyssoìdes*. Flowers purple?

Star-bearing Tremandra. Shrub 1 to 1½ foot.

2 T. diffu'sa (R. Br. ined. and D. C. prod. 1. p. 344.) diffuse, much branched; leaves ovate, with a few deep teeth, upper surface glabrous, under surface scabrous from a few scattered stellate hairs. ♄. G. Native of New Holland. Flowers purple?

Diffuse-branched Tremandra. Shrub 1 foot.

Cult. The species of this genus require the same treatment as *Tetrathèca*.

Order XXV. PITTOSPO'REÆ (shrubs agreeing with *Pittósporum* in many important characters.) R. Br. gen. rem. ter. austr. p. 10. D. C. prod. 1. p. 345.

Calyx of 5 deciduous sepals, which are sometimes free, and sometimes united together to the middle (f. 73. *a*.) they are imbricate in the bud. Petals 5, hypogynous, with the claws conniving, sometimes united, with spreading lamina (f. 73. *d. c*.) which are imbricate in the bud. Stamens 5 (f. 73. *d*.) hypogynous, distinct, alternating with the petals. Ovary 1, free (f. 73. *c*.) with the cells or placentas 2-5 or many-seeded. Style 1 (f. 73. *f*.), crowned by numerous stigmas (f. 73. *g*.) which are equal in number to the placentas or cells of the ovary. Pericarp capsular or baccate; cells many-seeded, sometimes incomplete. Seeds usually covered with glutinous pulp. Embryo minute, placed near the umbilicus in a fleshy albumen, with a longish radicle and short cotyledons.

This order contains beautiful trees and shrubs, or climbing shrubs as *Billardièra*, with alternate simple feather-nerved leaves, destitute of stipulas, usually entire. Flowers terminal or axillary, sometimes polygamous; they are from white to yellow, usually of a bell-shaped form, with a spreading border. This order is distinguished from the neighbouring tribes in the seeds being enveloped in resinous pulp, and in the imbricate æstivation of the petals and sepals. Nothing is known of the properties of the plants contained in this order.

Synopsis of the Genera.

1 Billardie'ra. Sepals and petals 5, which last have the claws somewhat convolute at the edges, approximate. Berry ellipsoid, terminated by the style. Climbing or twining shrubs.

2 Pitto'sporum. Sepals (f. 73. *a*.) and petals 5 (f. 73. *b*.) which last have their claws conniving into a connate tube (f. 73. *d*.). Capsule 2-3-valved, 1-celled, with a dissepiment in the middle of each valve. Seeds covered with resinous pulp. Erect trees or shrubs.

3 Bursa'ria. Calyx 5-toothed. Petals 5, distinct. Capsule compressed, obcordate, 2-celled, 2-valved. Seeds covered with resin. A spiny, branched shrub.

4 Sena'cia. Calyx 5-toothed. Petals 5, distinct. Capsule or berry 2-valved, half-2-celled. Seeds 4-8, arillate, adnate to the middle or base of the dissepiment. Shrubs with the habit of *Celástrus*.

I. BILLARDIE'RA (in honour of Jean Jacques Julien Labillardiére, a celebrated French botanist, who visited Syria and afterwards New Holland in d'Entrecasteux's expedition, author of Novæ Hollandiæ plantarum specimen, 2 vol. 4to. &c.) Smith, exot. bot. t. 1. D. C. prod. 1. p. 345. but not of Vahl. nor Mœnch.

Lin. syst. *Pentándria*, *Monogýnia*. Calyx of 5 acuminated sepals. Petals 5, with approximate claws, which are somewhat convolute at their edges, forming a bell-shaped flower. Berry elliptical, terminated by the style. Climbing shrubs, natives

of New Holland and Van Diemen's Land, with 1-2-flowered axillary or terminal pedicels, and eatable fruit generally of bluish colour when ripe.

* *Leaves entire.*

1 B. sca'ndens (Smith, nov. holl. t. 1.) branches climbing, younger ones villous; leaves linear-oblong, entire; pedicels 1-flowered, villous, shorter than the flower; berries velvety. ♄. ◡. G. Native on the western coast of New Holland. Adult branches glabrous. Leaves 1½ inch long and 2 lines broad. Flowers cream-coloured. Sims, bot. mag. 801. B. Canariénsis, Wend. hort. her. 3. t. 15.

Climbing Apple-berry. Fl. June, Aug. Clt. 1790. Shrub climbing.

2 B. muta'bilis (Sal. par. lond. t. 48.) branches climbing, younger ones rather villous; leaves lanceolate-linear, entire; peduncles 1-flowered, glabrous, length of flower; berries glabrous. ♄. ◡. G. Native of New Holland. Flowers cream-coloured, at length purplish. Sims, bot. mag. t. 1313.

Changeable-flowered Apple-berry. Fl. June, Sept. Clt. 1795. Shrub climbing.

3 B. fusifo'rmis (Labill. nov. holl. t. 90.) branches hardly climbing, younger ones rather villous; leaves lanceolate, entire; panicles few-flowered; berries spindle-shaped, villous. ♄. ◡. G. Native of Van Diemen's Land. Flowers cream-coloured, changing to bluish. Petals spreading.

Spindle-shaped Apple-berry. Fl. May, Aug. Clt. 1823. Shrub climbing.

4 B. longiflòra (Labill. nov. holl. t. 89.) branches climbing, younger ones scarcely pubescent; leaves lanceolate, entire; pedicels 1-flowered, glabrous, one-half shorter than the flower; berries almost globose, torose, glabrous. ♄. ◡. G. Native of Van Diemen's Land. Sims, bot. mag. t. 1507. Flowers pale-yellow. This is a free growing species and abundant flowerer. It has a very fine appearance when covered with its bluish fruit.

Long-flowered Apple-berry. Fl. May, Aug. Clt. 1810. Shrub climbing.

5 B. angustifòlia (D. C. prod. 1. p. 345.) branches climbing, younger ones pubescent; leaves linear, entire, flat, glabrous; pedicels 1-flowered, and are as well as oblong berries glabrous. ♄. ◡. G. Native of New Holland. Leaves acute. Pedicels glabrous. Flowers cream-coloured. Petals acute.

Narrow-leaved Apple-berry. Fl. May, Sep. Clt. 1820. Shrub climbing.

6 B. rosmarinifòlia (D. C. prod. 1. p. 345.) branches climbing, glabrous; leaves linear, somewhat reticulately-nerved, glabrous, with revolute margins. ♄. ◡. G. Native of New Holland on the eastern coast. Flowers cream-coloured?

Rosemary-leaved Apple-berry. Fl. May, Sep. Sh. climbing.

* * *Leaves variable, some entire, others toothed or cut.*

7 B. parviflòra (D. C. prod. 1. p. 346.) branches climbing, younger ones rather villous; leaves oblong, glabrous, entire, or with a few teeth at the apex; pedicels 1 or 3-flowered, bracteate, rather hispid. ♄. ◡. G. Native on the eastern coast of New Holland. Sepals villous, hispid. Flowers 4 or 5 lines long, bluish when dry. Petals acute.

Small-flowered Apple-berry. Fl. May, Aug. Clt. 1825. Shrub climbing.

8 B. variifòlia (D. C. prod. 1. p. 346.) branches filiform, villous; leaves oblong, rather villous, entire, and somewhat pinnatifidly-toothed; pedicels villous, hardly longer than the calyx. ♄. ◡. G. Native of New Holland at King George's Sound. Sepals villous. Flowers cream-coloured, 4 lines long, disposed in a kind of corymb on the tops of the branches.

Various-leaved Apple-berry. Fl. May, Aug. Shrub climbing.

Cult. The species of *Billardièra* are desirable shrubs for the conservatory. They thrive well in an equal portion of loam and peat. Cuttings planted in a pot of sand, with a bell-glass placed over them will root readily. They may also be raised from seed, which several of the species produce in abundance.

II. PITTO'SPORUM (from πιττη, *pitte*, resin, and σπορος, *sporos*, a seed; in allusion to the seeds being covered with resinous pulp.) Banks in Gært. fr. 1. p. 286. t. 59. D. C. prod. 1. p. 346.

Lin. syst. *Pentándria, Monogýnia.* Calyx of 5 sepals (f. 73. *a.*). Petals 5 (f. 73. *b.*) with the claws conniving into a connate tube (f. 73. *d.*). Capsules smooth or hairy (f. 73. *c.*) 2-5-valved, 1-celled, bearing a dissepiment in the middle of each valve. Seeds covered with a resinous pulp. Shrubs, with entire permanent leaves, with the habit of *Laurel.* Flowers tubular, with a spreading border disposed in terminal cymes or racemes; they are either white or yellowish.

1 P. coria'ceum (Ait. hort. kew. ed. 1. vol. 3. p. 488.) leaves obovate, obtuse, coriaceous, quite smooth; peduncles umbellately branched, many-flowered, and are as well as the calyxes villous. ♄. G. Native of Madeira on the mountains. Andr. bot. rep. t. 151. Lodd. bot. cab. t. 569. Flowers bluish-white.

Leathery-leaved Pittosporum. Fl. May, June. Clt. 1783. Shrub 8 feet.

2 P. viridiflòrum (Sims, bot. mag. t. 1684.) leaves obovate, retuse, cuneated at the base, shining, under surface reticulated; panicle somewhat globose, terminal, glabrous. ♄. G. Native of the Cape of Good Hope. P. Capénse and arbutifòlium of gardeners. P. Sinénse, Desf. cat. 231. Capsules 3-valved. Flowers greenish-yellow, smelling like jasmine.

Green-flowered Pittosporum. Fl. May, June. Clt. 1806. Shrub 6 feet.

3 P. Tobìra (Ait. hort. kew. ed. 2. p. 27.) leaves obovate, obtuse, coriaceous, quite smooth; peduncles 1-flowered, pubescent, disposed in aggregate umbels. ♄. G. Native of Japan. Sims, bot. mag. 1396. Tobìra, Kœmpf. amœn. t. 797. Euónymus Tobìra, Thunb. jap. 99. P. Chinénse, Donn, cant. 48. Capsules usually 3-valved, but sometimes 3 to 5 valved; valves thick, leathery, almost woody. Flowers white. *Tobira* is the name of the shrub in Japan.

Tobira Pittosporum. Fl. March, Aug. Clt. 1804. Sh. 12 ft.

4 P. undula'tum (Andr. bot. rep. t. 393.) leaves oval-lanceolate, undulated, tapering at both ends, and are as well as the footstalks glabrous; peduncles terminal, aggregate, pubescent, branched, many-flowered. ♄. G. Native of New Holland. Vent. hort. cels. t. 76. Delauny, herb. amat. t. 36. Ker. bot. reg. t. 16. Schrad. gen. em. t. 4. Flowers white.

Undulated-leaved Pittosporum. Fl. Feb. June. Clt. 1789. Shrub 10 feet.

5 P. revolu'tum (Ait. hort. kew. ed. 2. vol. 2. p. 27.) leaves elliptical-oblong, bluntish, under surface pubescent, with revolute margins; peduncles terminal, villous, disposed in aggregate umbels. ♄. G. Native of New Holland at Port Jackson. Ker. bot. reg. 186. Lodd. bot. cab. t. 506. Flowers yellow.

Revolute-leaved Pittosporum. Fl. Feb. May. Clt. 1795. Shrub 6 feet.

6 P. tomentòsum (Bonpl. nav. t. 21.) leaves oboval-oblong, acute at both ends, upper surface glabrous, under surface as well as branches pubescently-tomentose, flat; peduncles aggregate, terminal. ♄. G. Native of New Holland. Sweet, fl. austr. t. 33. Flowers yellow.

Tomentose-leaved Pittosporum. Fl. April, June. Clt. 1824. Shrub 4 to 6 feet.

FIG. 73.

7 P. FU'LVUM (Rudge trans. Lin. soc. 10. p. 298.) leaves broad-lanceolate, obtuse; footstalks and nerves of leaves tomentose; branches tomentose; peduncles aggregate; sepals spreading. ♄. G. Native of New Holland. Flowers yellowish. Perhaps sufficiently distinct from *P. tomentòsum* (f. 73.)

Fulvous-leaved Pittosporum. Fl. April, May. Clt. 1820. Shrub 2-4 feet.

8 P. FERRUGI'NEUM (Ait. hort. kew. ed. 2. vol. 2. p. 27.) leaves elliptical, acuminated at both ends, upper surface glabrous, under surface covered with rusty tomentum on the nerves and leafstalks; peduncles terminal, branched, disposed in aggregate umbels. ♄. S. Native of Guinea? Sims, bot. mag. t. 2075. Flowers yellow.

Var. β? filàrium (D. C. prod. 1. p. 347.) bark thready. Rump. amb. 7. p. 13. t. 7. Native of the Molucca islands.

Rusty-leaved Pittosporum. Fl. Feb. May. Clt. 1787. Shrub 6 feet.

9 P. HI'RTUM (Willd. enum. p. 261.) leaves ovate-oblong, under surface pubescent, adult ones glabrous; leafstalks and branches hairy. ♄. G. Native of the Canary Islands. P. hirsùtum, Link. enum. 233. Flowers white?

Hairy-branched Pittosporum. Fl. May, June. Clt. 1822. Shrub 4 feet.

10 P. LAURIFÒLIUM (Willd. sel. in Rœm. and Schult. syst. 5. p. 432.) leaves oblong, obtuse, coriaceous; peduncles 1-flowered, lateral, and aggregate. ♄. G. Native of Teneriffe. Flowers white?

Laurel-leaved Pittosporum. Shrub 6 feet.

11 P.? PHYLLIRÆÒIDES (D. C. prod. 1. p. 347.) leaves oblong, mucronate, coriaceous, flat, very smooth, almost veinless; pedicels lateral, 1-flowered, solitary. ♄. G. Native of New Holland. Capsules ovate, somewhat compressed, 2-valved, rather fleshy, and even on the outside. Flowers yellow.

Phylliræa-like Pittosporum. Shrub 4 feet.

† *Species scarcely known except by name, and probably some of them are identical with some of those described above.*

12 P. TENUIFÒLIUM (Gært. fr. 1. p. 286. t. 59.) capsules 3-valved, rather globose, wrinkled. ♄. G. Native of New Holland.

Thin-leaved Pittosporum. Fl. May, June. Clt. 1820. Shrub 4 feet.

13 P. UMBELLA'TUM (Gært. fr. 1. p. 286.) capsules 3-valved, compressedly-globose, scabrous on the outside from elevated dots. ♄. G. Native of Australia.

Umbellate-flowered Pittosporum. Fl. May, June. Sh. 4 ft.

14 P. EXPE'NSE (Nois. hort. ex Steud. nom. 628.) ♄. G.

Expensive Pittosporum. Fl. April, June. Clt. 1820. Shrub 6 feet.

15 P. TUBERCULA'TUM (Zeyh. ex Steud. nom. 628.) ♄. G.

Tuberculated Pittosporum. Fl. April, June. Shrub.

16 P. ANDERSÒNII (Fisch. in cat. hort. roy. peterb.) ♄. G. Flower yellow. Cultivated in Chelsea botanic garden in 1824.

Anderson's Pittosporum. Fl. April, June. Clt. 1824. Sh. 4 ft.

17 P. MAURITIA'NUM (Lodd. cat. 1825.) ♄. S. Perhaps P. ferrugíneum var. β, filàrium.

Mauritian Pittosporum. Fl. Ap. Ju.? Clt. 1825. Sh. 8 feet.

Cult. All the species of *Pittósporum* are handsome shrubs, with good foliage and pretty flowers, well adapted for conservatories. They thrive best in an equal mixture of loam and peat. Ripened cuttings will root freely if planted in sand under a hand-glass, or one species may be grafted on another. *P. Tobìra*, a native of Japan, is nearly hardy, as well as those species native of the Canary Islands; these may be preserved against a south wall, with the assistance of a mat, in severe weather.

III. BURSA'RIA (from *bursa*, a pouch; the capsules very much resemble those of *Thlaspi bursa-pastoris*, which resemble a female's pocket.) Cav. icon. 4. t. 350. D. C. prod. 1. p. 347.

LIN. SYST. *Pentándria, Monogynia.* Calyx 5-toothed. Petals 5, distinct. Capsules compressed, obcordate, somewhat stipitate, 2-celled, 2-valved (almost as in *Polýgala.*) The seeds according to Cav. are clothed with resin.—An elegant much branched shrub, with oblong-cuneated, entire small leaves, and small white flowers, which are disposed either in lateral or terminal panicles.

1 B. SPINÒSA (Cav. l. c.) ♄. G. Native of New Holland. Branches either spiny or unarmed. Leaves small, wedge-shaped. Itèa spinòsa, Andr. bot. rep. t. 314. Sims, bot. mag. 1767. Cyrílla spinòsa, Spreng. nov. prov. 15.

Spiny-branched Bursaria. Fl. July, Dec. Clt. 1793. Shrub 10 feet.

Cult. This is a very desirable shrub for a green-house or conservatory, being an abundant flowerer, and very shewy when covered all over with its elegant little white blossoms. An equal mixture of sandy loam and peat is the best soil for it; and young cuttings will root freely if planted in sand under a bell-glass. (Swt.)

IV. SENA'CIA (in honour of John Senac, a distinguished French physician, was born in Gascony about the close of the 17th century; he died 1770.) Comm. ined. Du. Pet. Th. obs. pl. isl. d' afr. p. 27. D. C. prod. 1. p. 347.—Senàciæ. sp. Lam. ill. 2. p. 95.

LIN. SYST. *Pentándria, Monogýnia.* Calyx 5-toothed, small. Petals 5, distinct, lanceolate. Stamens 5, hypogynous. Younger capsules berry-formed, at length 2-valved, half 2-celled. Seeds 4-8, adhering to the base and middle of the dissepiments, arillate; with horny albumen. Embryo small, situated at the base of the seed.—Smooth branched shrubs, with feather-nerved entire leaves, and terminal corymbs of white flowers. These shrubs have the habit of *Celástrus*, and are apt to be confused with that genus if not particularly examined. The hypogynous insertion of the stamens is sufficient to distinguish them.

1 S. UNDULA'TA (Lam. ill. no. 2709.) leaves lanceolate, waved; flowers terminal, disposed in umbellate corymbs; fruit 4-sided, on short pedicels. ♄. S. Native of the Mauritius, where it is called by the French *Bois de Joli Cœur* on account of the hardness of its wood. Celástrus undulàtus, Lam. dict. 1. p. 662. Flowers white. Ovary somewhat stipitate. Style short.

Var. β; leaves oval-lanceolate.

Waved-leaved Senacia. Clt. 1785. Shrub 15 feet.

2 S. NIPAULE'NSIS (D. C. prod. 1. p. 347.) leaves lanceolate, flattish; flowers terminal, disposed in umbellate corymbs; fruit sessile, 4-seeded. ♄. G. Native of Nipaul. Celástrus verticillàtus, Roxb. hort. beng. 18. not of Fl. Peru. Leaves not in whorls, but crowded around the corymbs of flowers. Capsules somewhat compressed. Valves after opening mucronate at the apex. Flowers white.

Nipaul Senacia. Clt. 1820. Shrub 12 feet.

3 S. LANCEOLA'TA (Lam. ill. no. 2710.) leaves lanceolate, flattish; flowers disposed in umbellate corymbs; seeds 8, 4 in the bottom and 4 in the middle of the cells. ♄. S. Native of the Mauritius. See Pet. Th. l. c. Flowers white?

Lanceolate-leaved Senacia. Shrub 10 feet.

4 S. ELLÍPTICA (Lam. ill. no. 2711.) leaves elliptical, obtuse; flowers axillary, disposed in something like fascicles. ♄. S. Native of the Antilles. Like *Rhámnus sarcomphàlus*. A very doubtful species. Perhaps referable to *Celástrus* or *Maytènus*. Flowers white.

Elliptical-leaved Senacia. Shrub.

Cult. All the species of *Senàcia* will grow well in a mixture of loam and peat, or any rich light soil; and ripened cuttings planted in a pot of sand under a hand-glass, placed in heat, will root freely.

ORDER XXVI. FRANKENIA'CEÆ (plants agreeing with *Frankènia* in many important particulars.) St. Hil. mem. plac. cent. p. 39. and mem. mus. 12. p. 77. D. C. prod. 1. p. 349.

Calyx of 4-5 erect (f. 74. *b.*) or spreading (f. 77. *a.* f. 76. *a.*) sepals, united at the base into a furrowed tube (f. 74. *a.*), or cleft to the base (f. 76. *a.* f. 77. *a.*), permanent, equal, rarely unequal, lanceolate or linear acute. Petals hypogynous, equal in number to the sepals, and alternating with them, sometimes unguiculate (f. 74. *b.*). Claws length of calyx, with a spreading limb (f. 74. *b.*) in this case the throat is usually crowned with petal-like scales as in *Caryophýlleæ*, sometimes sessile, spreading (f. 76. *b.*), sometimes with a 5-petalled (f. 76. *d.*) or 5-toothed urceolus (f. 77. *d.*) between the petals and the stamens. Stamens hypogynous, sometimes equal in number with the petals (f. 74. *d.*), in this case they are alternate with them; or double that number, when this is the case the alternate ones are opposite the petals, but sometimes multiple that number; filaments filiform (f. 74. *d.*) or very short. Anthers roundish, linear or elliptical, bursting laterally by 2 pores at the apex, seldom at the base. Ovary 1 (f. 74. *g.* f. 77. *e.* f. 76. *e.*), free. Style filiform (f. 74. *e.*), simple (f. 77. *d.*). bifid or trifid (f. 74. *f.*). Capsule ovate-oblong (f. 77. *e.*), somewhat trigonal, 2-3-valved (f. 74. *g.* f. 75. *d.*), 1-celled or incompletely 3-celled from the valves being bent inwards at the edges; valves bearing seminiferous placentas at the margins on both sides (f. 74. *g.*), many-seeded. Seeds small. Embryo straight in the middle of the albumen, with a short radicle pointing towards the umbilicus, and flat leafy cotyledons. This order is composed of elegant little herbs, subshrubs or shrubs, with simple and branching stems, and opposite alternate whorled or crowded, entire, ciliated or toothed leaves, stipulate or exstipulate, when this last is the case the base is produced into stem-clasping membranes, usually furnished with glands; the stipulas when present are usually fringed. The flowers are either white, rose-coloured, or yellow, axillary or terminal, when they are axillary the peduncles are 1-flowered, when they are terminal they are either disposed in corymbs or loose racemes. Pedicels always propped by a leaf or bractea.

This order differs from *Violarièæ* and *Caryophýlleæ* as well as from all the neighbouring orders, in the seeds being fixed to the margins of the valves, to marginal parietal nerves or dissepiments, not to intervalvular placentas, as in *Violarièæ*, nor to central placentas as in *Caryophýlleæ*. The medicinal virtues of the plants contained in this order are very slight. The seeds of all are truly difficult to preserve in a living state for more than a few weeks, therefore very few of the plants of this order are to be met with in gardens, but the whole are very easy to introduce as plants.

Synopsis of the Genera.

SECT. I. FRANKE'NIÆ. Sepals united into a tube (f. 74. *a.*). Petals unguiculate; claws length of calyx. Stamens 6.

1 FRANKE'NIA. Petals and sepals 4-5. Stamens 6. Style 3-cleft (f. 74. *f.*) lobes oblong, stigmatose inside. Flowers usually with a crown of scales in the throat. Capsule 3- (f. 74. *g.*) 4 valved, many-seeded.

2 BEATSO'NIA. Petals and sepals 4-5. Stamens 6. Style bifid; lobes ending in a globular stigma. Capsule 2-valved, few-seeded. Petals appendiculate.

SECT. II. SAUVA'GEÆ. Petals and sepals spreading, not unguiculate, usually furnished with an urceolus or inner corolla, situated between the petals and stamens. Stamens 5-7 or indefinite.

3 LUXEMBU'RGIA. Sepals and petals 5 (f. 75. *e.*), unequal. Anthers 7 or indefinite, almost sessile, united into a secund mass, each bursting by 2 pores at the apex. Style awl-shaped, incurved. Capsule 3-valved (f. 75. *d.*), many-seeded. Seeds winged at the apex.

4 SAUVAGE'SIA. Sepals and petals 5 (f. 76. *a. c.*), with filiform appendages between the 5 petal-like scales or inner corolla (f. 76. *d.*). Stamens 5 between the scales and the petals. Style simple. Capsule incompletely 3-celled, 3-valved.

5 LAVRA'DIA. Petals and sepals 5 (f. 77. *a. b.*), with a monapetalous 5-toothed urceolus or corolla (f. 77. *d.*), including the stamens. Style simple. Capsule incompletely 3-celled, 3-valved, many-seeded.

SECT. I. FRANKE'NIÆ (plants agreeing with *Frankènia*, in having a tubular calyx and unguiculate petals.) Calyx tubular. Petals unguiculate, with the claws the length of the calyx, furnished with an appendage at the top on the inner side of each claw. Style bifid or trifid. Small heath-like herbs or subshrubs. Leaves opposite or in whorls.

I. FRANKE'NIA (in honour of John Frankenius, professor of botany at Upsal, who first enumerated the plants of Sweden in Speculum Botanicon, 1638; died 1661.) Lin. gen. no. 445. D. C. prod. 1. p. 349.

LIN. SYST. *Hexándria, Monogýnia.* Style 3-cleft; lobes oblong, stigmatose within. Capsules 3-4-valved.—Small prostrate heath-like plants, with the flowers usually rising from the forks of the stem, or disposed in terminal corymbs.

1 P. PULVERULE'NTA (Lin. spec. 474.) leaves opposite, in whorls, obovate, retuse, glabrous, under surface powdery, with the petioles ciliated; root slender; flowers axillary and terminal, subsolitary. ⊙. H. Native in sand by the sea-side in various parts of Europe, Siberia, Tauria, and perhaps New Holland; in England on the Sussex coast very rare, between Bognor and Brighthelmston. Smith, engl. bot. 2222. Fl. græc. t. 344. Clus. hist. 2. p. 186. f. 2. Stems prostrate. Flowers axillary, solitary, pale-red.

Powdery Sea-heath. Fl. July, Aug. England. Pl. prostrate.

2 F. NODIFLO'RA (Lam. ill. t. 262. f. 4.) leaves ovate, glabrous, not ciliated on the footstalks; stems prostrate, and are as

well as calyx glabrous. ♄. ♃. G. Native of the Cape of Good Hope. Frankènia, Burch. cat. no. 513. Flowers pale-red in axillary corymbs.

Knot-flowering Sea-heath. Fl. Ju. Aug. Clt. 1818. Pl. prostrate.

3 F. Nóthria (Thunb, prod. 58. fl. cap. ed. Schult. 1. p. 295.) leaves clustered, linear, glabrous, with revolute margins, ciliated at the base; branchlets pubescent; stems prostrate, and are as well as calyxes glabrous. ♄. ♃. G. Native of the Cape of Good Hope. Nóthria rèpens, Berg. cap. 171. t. 1. f. 2. Flowers pale red, terminal, aggregate. Petals toothed.

Nothria Sea-heath. Fl. June, Aug. Clt. 1816. Prostrate creeping plant.

4 F. læ̀vis (Lin. spec. 473.) leaves clustered, linear, glabrous, with revolute margins, ciliated at the base; stems prostrate, rooting, and are as well as calyxes glabrous; flowers terminal, or axillary, solitary. ♄. ♃. H. Native in muddy salt marshes by the sea-side in many parts of Europe and the Canary Islands. In England chiefly on the eastern coast. Smith, engl. bot. t. 205.—Mich. gen. t. 22. f. 1. Flowers rising from the forks of the stem in the same manner as in most of the species, flesh-coloured, but sometimes white with yellow claws.

Smooth Sea-heath. Fl. July, Aug. England. Pl. creeping.

5 F. interme̊dia (D. C. prod. 1. p. 349.) leaves in whorls, linear, with revolute margins, glabrous, ciliated at the base; stems prostrate, velvety; calyxes hispid; flowers aggregate. ♄. ♃. H. Native on the sea-shore in the south of Europe, particularly along the shores of the Mediterranean and Algiers. F. hirsùta, var. Calábrica, Lin. F. hirsùta, D. C. fl. fr. 4. p. 766.—Mich. gen. t. 22. f. 2. Flowers pale red or white.

Intermediate Sea-heath. Fl. Ju. Aug. Clt. 1820. Pl. trailing.

6 F. grandiflòra (Cham. et Schlecht. Linnæa. 1. p. 35.) leaves obovately-cuneated, mucronulate, with revolute margins, rather coriaceous, ciliated at the base. ♄. F. Native of New California in the sand by the sea-side. Stem trailing, woody at the base. Flowers axillary and terminal, solitary, sessile; scales of throat bifid. Stamens 6-7. Capsule lanceolate, obsoletely triquetrous. Petals reddish?

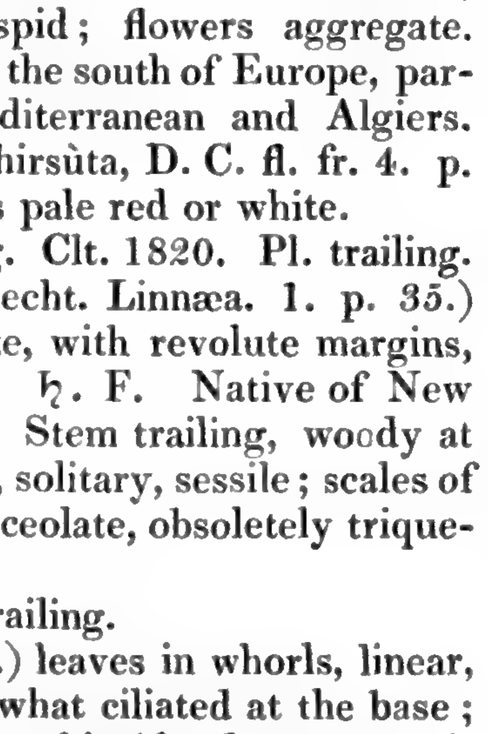
Great-flowered Sea-heath. Shrub trailing.

7 F. híspida (D. C. prod. 1. p. 349.) leaves in whorls, linear, with revolute margins, glabrous, somewhat ciliated at the base; stems diffuse, and are as well as calyxes hispid; flowers terminal, solitary. ♄. ♃. H. Native in salt marshes and on rocks from the island of Cyprus to Siberia. F. hirsùta, var. Crética, Lin. F. hirsùta, Sibth. fl. græc. t. 313. Flowers white.

Hispid Sea-heath. Fl. June, Aug. Clt. 1789. Pl. prostrate.

8 F. corymbòsa (Desf. atl. 3. p. 315. t. 93.) leaves clustered, linear, with revolute margins, glabrous, somewhat ciliated at the base; stems velvety, erect; calyxes glabrous; flowers in terminal corymbs. ♄. F. Native of Barbary near Arzeau by the sea-shore. Flowers rose-coloured (f. 74.).

FIG. 74.



Corymbose-flowered Sea-heath. Fl. June, July. Clt. 1823. Sh. ½ ft.

9 F. ericæfòlia (C. Smith, in Buch. can. p. 30.) leaves in whorls, linear, stalked, with revolute margins, somewhat ciliated at the base, upper surface glabrous, under surface as well as stems and calyxes pruinosely-velvety; flowers aggregate, terminal. ♄. G. Native of the Canary Islands on the sea-shore. Flowers rose-coloured.

Heath-leaved Sea-heath. Fl. June, July. Clt. 1815. Shrub prostrate.

10 F. Kre̊bsii (Cham. in Schlecht. Linnæa. 1. p. 36.) leaves linear, with revolute margins, smooth, rather ciliated at the base; stems flagellæform, and are as well as the calyxes hispid; flowers disposed in branched panicles; petals twice the length of the calyx. ♄. G. Native of the Cape of Good Hope. Like *F. híspida*, but the flowers are double the size. Stems 2 feet long. Leaves in whorls?

Krebs's Sea-heath. Shrub creeping.

11 F. velutì̀na (D. C. prod. 1. p. 350.) leaves linear-oblong, obtuse, not ciliated at the base, soft and velvety on both surfaces, but the stems and calyxes are not so. ♄. F. Native in fields about Mogodor. Flowers red.

Velvety-leaved Sea-heath. Fl. June, July. Shrub ½ foot.

12 F. mo̊llis (Bieb. suppl. 276.) leaves ovate-lanceolate, acute, villous; flower-bearing branches alternate, panicled, villous; flowers on pedicels, disposed in racemose panicles. ♄. H. Native of Tauria? The whole plant is clothed with soft hoary hairs. Flowers red.

Soft Sea-heath. Fl. June. Aug. Clt. 1824. Shrub prostrate.

13 F. thymifòlia (Desf. atl. 1. p. 316.) leaves oblong, obtuse, small, rather stiff, glabrous, cinerous, ciliated at the base; stems erect, younger ones hardly puberulous; calyxes glabrous; flowers axillary, sessile. ♄. F. Native in the sand of the desert of Barbary about Tozzer, also in Spain about Aranjuez. Flowers red.

Thyme-leaved Sea-heath. Fl. June, August. Shrub ½ foot.

14 F. microphẙlla (Cav. icon. 6. t. 597. f. 1.) leaves oval, small, quadrifariously-imbricated, glabrous; stems prostrate, and are as well as calyxes glabrous; flowers solitary, terminal and axillary. ♄. S. Native of South America. Flowers red.

Small-leaved Sea-heath. Shrub prostrate.

15 F. fruticulòsa (D. C. prod. 1. p. 350.) leaves linear, acutish, with revolute margins, glabrous, not ciliated at the base; stems erect, glabrous; calyxes acute, glabrous. ♄. G. Native of New Holland in the island of St. Francisco in the sand by the sea-side. Flowers pink.

Shrubby Sea-heath. Fl. June, July. Shrub 1 foot.

16 F. pauciflòra (D. C. syst. 1. p. 350.) leaves linear, almost filiform, with revolute margins, glabrous, ciliated at the base; stems erectish, canescent, and are as well as acute calyxes, glabrous. ♄. G. Native of New Holland on the western coast. Hook, in bot. mag. 2896. Flowers pink.

Few-flowered Sea-heath. Fl. June, Jul. Clt. 1824. Sh. 1 ft.

17 F. tetrape̊tala (Labill. nov. holl. 1. p. 114.) leaves linear, almost filiform, with revolute margins; flowers solitary, terminal, 4-petalled; lobes of calyx 4, with tomentose margins. ♄. G. Native of New Holland and Van Diemen's Land. Flowers pink?

Four-petalled Sea-heath. Shrub ¾ foot.

18 F. revolůta (Forsk. æg. 75.) leaves in whorls, ovate, with revolute margins; stems dichotomous; capsules 4-valved; flowers terminal, usually solitary. ♄. F. Native in the deserts of Alexandria. Habit of *F. corymbòsa*, but the flowers are scattered and solitary. Calyx 5-sepalled. Flowers rose-coloured.

Revolute-leaved Sea-heath. Shrub ½ foot.

Cult. Frankènia is a genus of beautiful little evergreen shrubs or herbs, ornamented with pretty little flesh-coloured or reddish flowers. The hardy species are well adapted for ornamenting rock-work, or to be grown in small pots and placed among other alpine plants as well as those marked frame; the greenhouse species should be placed on the front shelf of a greenhouse during winter. They all thrive well in a mixture of loam, sand, and peat, but the pots require to be well drained with potsherds. They are readily increased by cuttings, which

should be planted under a hand-glass in sand, by seeds, or by dividing at the roots.

II. BEATSO'NIA (Mr. Beatson, who wrote an account of the island of St. Helena.) Roxb. fl. st. hel. in Beats. trav. p. 300. D. C. prod. 1. p. 350.

LIN. SYST. *Hexándria, Monogýnia.* Style bifid; lobes crowned by globular stigmas. Capsules 2-valved, few-seeded. Perhaps sufficiently distinct from *Frankènia.*

1 B. PORTULACOI'DES (Beats. itin. p. 300.) leaves roundish, fleshy, glabrous; stem shrubby, bushy. ♄. G. Native of St. Helena on rocks by the sea-side on the south side of the island. Frankènia portulacæfòlia, Spreng. syst. 2. p. 134. Flowers red?

Purslane-like Beatsonia. Shrub ½ foot.

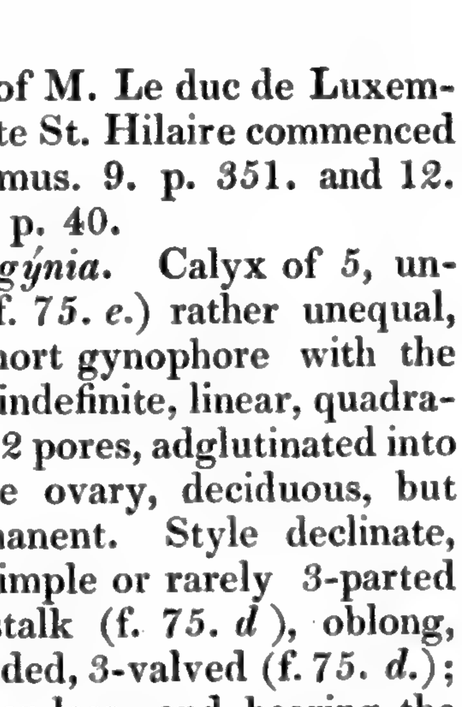
Cult. This plant will thrive well in a mixture of peat and sand, and cuttings will root readily in the same kind of mould under a hand-glass.

SECT. II. SAUVA'GEÆ (plants agreeing with *Sauvagèsia* in having a spreading calyx and corolla). Calyx of 5 equal (f. 76. *a.* f. 77. *a.*) or unequal spreading sepals. Petals 5, equal or unequal, spreading, usually with a 5-leaved (f. 76. *d.*) or tubular, 5-toothed (f. 77. *d.*), urceolus or inner corolla, situated between the petals and stamens in *Sauvagèsia*, and inclosing the stamens in *Lavràdia.* Style simple. Elegant plants with alternate leaves and feathery stipulas.

III. LUXEMBU'RGIA (in honour of M. Le duc de Luxembourg, under whose auspices M. Auguste St. Hilaire commenced his voyage to Brazil). St. Hil. mem. mus. 9. p. 351. and 12. p. 83. Plectanthèra, Mart. fl. bras. 1. p. 40.

LIN. SYST. *Octo-Polyándria, Monogýnia.* Calyx of 5, unequal, deciduous sepals. Petals 5 (f. 75. *e.*) rather unequal, deciduous. Anthers inserted on a short gynophore with the pistil, almost sessile, definite, or usually indefinite, linear, quadragonal, 2-celled, bursting at the apex by 2 pores, adglutinated into a mass on one side, usually clasping the ovary, deciduous, but the rudiments of the filaments are permanent. Style declinate, pyramidately-subulate, crowned by a simple or rarely 3-parted stigma. Ovary sessile or on a short stalk (f. 75. *d*), oblong, triangular. Capsule 1-celled, many-seeded, 3-valved (f. 75. *d.*); valves bent inwards at the edges, more or less, and bearing the seeds on the margins. Seeds numerous, oblong, girded by a membrane which is broadest at the top, with a double covering, both membranous. Umbilicus at the narrowest extremity of the seed. Albumen fleshy. Embryo slender, straight, with the radicle almost touching the umbilicus. Elegant, branched, smooth shrubs, with the habit of some species of *Rhododéndron.* Leaves alternate, toothed, mucronate, oblong, elegantly lined. Stipulas lateral, twin, caducous or permanent, setaceously-ciliated. Flowers beautiful yellow, disposed in terminal racemes or corymbs. Peduncles jointed above the base, furnished with 2 bracteas.

FIG. 75.



1 L. SPECIÒSA (St. Hil. mem. mus. 12. p. 86. t. 3.) leaves almost sessile, oblong, obtuse, tapering to the base; flowers large, disposed in racemes; stamens numerous. ♄. S. Native of Brazil on mountains near Milhoverde at the height of 3700 feet. (f. 75.)

Shewy Luxemburgia. Fl. Oct. Shrub 3 to 4 feet.

2 L. CORYMBÒSA (St. Hil. in mem. mus. 12. p. 87. t. 4.) leaves on short footstalks, oblong, narrow, acutish, cuneated and tapering at the base; flowers large, few, disposed in corymbs; stamens numerous. ♄. S. Native of Brazil on the mountains called Serra da Caraca, at the height of 6000 feet, by the sides of rivulets.

Corymbose-flowered Luxemburgia. Fl. Feb. Sh. 5 to 6 ft.

3 L. POLYA'NDRA (St. Hil. mem. mus. 12. p. 88.) leaves stalked, oblong-elliptical, rather cuneated at the base; flowers middle-sized, disposed in racemes; stamens numerous. ♄. S. Native of Brazil in the province of Minas Novas on mountains. The specific name is very inapplicable, as the two preceding species are polyandrous as well as this plant. This shrub is called *Congoha do Campo* and *Mate do Campo* in Brazil.

Polyandrous Luxemburgia. Shrub 4 to 5 feet.

4 L. OCTA'NDRA (St. Hil. in mem. mus. 9. p. 351. and 12. p. 89.) leaves almost sessile, oblong-elliptical, narrow, somewhat cuneated at the base; flowers small, disposed in racemes; sepals ciliated; stamens definite, 7-12. ♄. S. Native of Brazil with the preceding. Plectanthèra floribúnda, Mart. fl. br. 1. p. 40. t. 26.

Octandrous Luxemburgia. Fl. Feb. Shrub 2 to 6 feet.

Cult. Luxembúrgia is a genus of truly elegant shrubs, with large beautiful yellow flowers, and serrated, shining, stiff leaves, having the habit of some species of *Rhododéndron.* None of the species have been introduced to the gardens of Europe, therefore the mode of cultivating and propagating them in the gardens is unknown; but should any person be fortunate enough to introduce them in a living state, we recommend their being grown in a mixture of loam and sandy peat, giving them plenty of water in the summer season. Young cuttings will no doubt root freely in a pot of sand, with a bell-glass placed over them, in heat.

IV. SAUVAGE'SIA (so called by Linnæus in honour of his distinguished friend and correspondent Francis Boissier de Sauvages, a celebrated physician of Montpelier, and inventor of modern nosology, died in 1767). Lin. gen. no. 112. Jacq. amer. p. 77. D. C. prod. 1. p. 315. St. Hil. in mem. mus. 11. p. 97.

LIN. SYST. *Pentándria, Monogýnia.* Calyx deeply 5-parted (f. 76. *a.*), spreading, permanent, closed when in fruit. Outer petals 5 (f. 76. *b.*), equal, spreading, obovate, deciduous. Inner petals (scales?) 5 (f. 76. *d.*), opposite the outer ones, erect, with incumbent margins, conniving into a tube, permanent, with filiform appendages between the outer and inner corolla (f. 76. *c.*), which are indefinite or definite in number, they are permanent and dilated at the apex. Stamens 5, permanent, alternating with the petals; filaments very short, adhering to the base of the inner petals; anthers fixed by their base, linear, 2-celled, opening laterally at the apex. Style erect, crowned by a blunt hardly manifest stigma. Ovary superior (f. 76. *e.*), 1-celled, many-seeded. Capsule oblong or ovate-oblong, acutely 3-lobed, rarely ovate and bluntish as in *S. tenélla*, more or less profoundly 3-valved, empty above. Seeds disposed in two rows on the margins of the valves, minute and favosely-scrobiculate. Albumen fleshy. Radicle pointing towards the umbilicus, longer than the cotyledons. Elegant, smooth subshrubs, rarely herbs. Leaves simple on short petioles, rarely sessile. Stipulas lateral, twin, ciliated, permanent. Flowers axillary, or disposed in terminal racemes, sometimes bracteate, white, rose, or violet-coloured. Parts of flowers twisted in the bud.

1 S. RACEMÒSA (St. Hil. in mem. mus. 11. p. 98.) stem shrubby, almost simple; leaves elliptical-oblong or elliptical-ovate or ovate, acutish, toothed; stipulas ciliated, curled; racemes terminal, almost simple; segments of calyx acute, shorter than the corolla; filiform appendages numerous. ♄. S. Native of Brazil in humid pastures or marshes in the provinces of St. Paul

and Minas Geraes. S. ovàta, Mart. fl. bras. 1. p. 36. t. 24. f. 2. Calyx reddish or rather violaceous. The five outer petals flesh or rose-coloured. The five inner ones red or dark purple, or variegated with red and purple, girded on the outside with an indefinite number of filiform appendages.

Var. β, nàna (St. Hil. l. c.) stems hardly the length of a finger; leaves much smaller.

Racemose-flowered Sauvagesia. Fl. Dec. May. Sh 1 to 2 ft.

2 S. SPRENGE'LII (St. Hil. l. c. p. 99.) stem shrubby, erect, hardly branched; leaves small, lanceolate, acute, remotely serrated; racemes terminal; segments of calyx unequal, very blunt, shorter than the corolla; filiform appendages numerous. ♄. S. Native of Brazil and Guiana in moist meadows. S. erécta, Spreng. neue. entd. 1. p. 296. exclusive of the synonymes. S. serpyllifòlia, Mart. fl. bras. 1. p. 37. t. 25. Flowers red; the five inner petals girded on the outside by an indefinite number of filiform appendages.

Var. β, gràcilis (St. Hil. l. c. p. 101.) stem more slender and longer; leaves narrower, less crowded; racemes few-flowered; pedicels shorter, and are as well as bracteas generally solitary.

Sprengel's Sauvagesia. Fl. May. Shrub ½ foot.

3 S. LA'XA (Mart. fl. bras. 1. p. 38.) stem herbaceous, loose, elongated, erectish; leaves linear-lanceolate, acute, serrulated; flowers disposed in terminal racemes; sepals acute. ↄ. S. Native of Brazil in humid meadows. S. rubiginòsa, var. β, luxùrians, St. Hil. in mem. mus. 11. p. 102. Flowers pink.

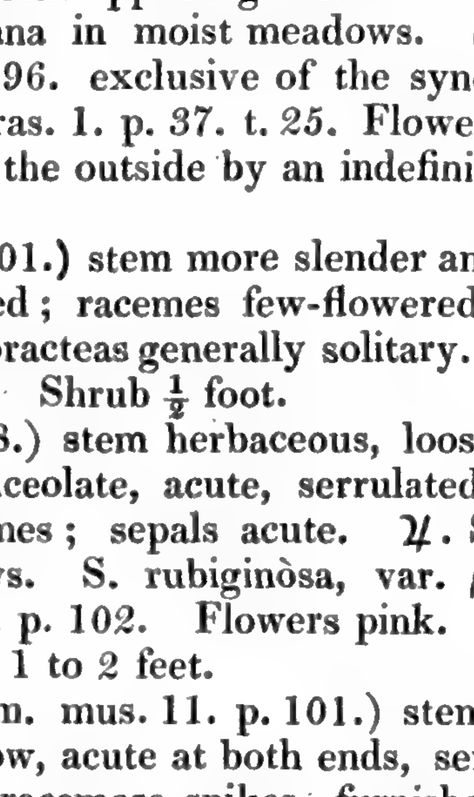
Loose Sauvagesia. Fl. Nov. Pl. 1 to 2 feet.

4 S. RUBIGINÒSA (St. Hil. in mem. mus. 11. p. 101.) stems suffruticose; leaves lanceolate, narrow, acute at both ends, serrated; flowers terminal, disposed in racemose spikes, furnished with bracteas; segments of calyx hardly unequal, oblong, acute, longer than the outer petals; filiform appendages numerous. ♄. S. Native of Guiana and Brazil in dry meadows. An erect or decumbent much-branched shrub. Inner petals girded on the outside by numerous filiform appendages.

Rusty Sauvagesia. Shrub 1 to 2 feet.

5 S. ERE'CTA (Lin. spec. 1. ed. p. 241.) root fibrous; stems suffruticose and usually branched, erect, or ascending; leaves lanceolate, acute at both ends, serrulated; flowers axillary, solitary or twin, sometimes in threes; generally nodding; segments of calyx ovate-oblong, acute, or lanceolate, acuminated, a little longer than the corolla; filiform appendages numerous. ♄. or ↄ. S. Native in humid meadows and on the borders of rivulets and fountains as well as in marshes throughout South America and the West Indies, also in Guinea, Madagascar, and Java. Jacq. amer. p. 77. t. 51. f. 3. St. Hil. mem. mus. 11. pl. 6. t. I. A. S. erécta, Aubl. guian. 1. p. 253. t. 100. f. b. Lam. ill. II. p. 119. t. 140. f. 1 and 2. S. erécta and nùtans, Pers. ench. 1. p. 253. S. erécta, Adìma, and nùtans, Poir. encyclo. VI. p. 669, 670. suppl. 5. p. 72. S. erécta, Adìma, and Peruviàna, Rœm. et Schult. syst. 5. p. 437 and 438. S. Adìma, Spreng. neue. entd. 1. p. 294. S. erécta and geminiflòra, Ging. viol. p. 27. t. II, X. The five outer petals are white, and sometimes flesh-coloured. The five inner ones purple at base and white at the apex, girded on the outside by numerous filiform appendages. This plant is called *Yaoba* by the Caribbs, *Yerba de St. Martin* by the Peruvians. This is a truly polymorphous plant.

FIG. 76.



Var. β, stricta (Mart. fl. bras. 1. p. 38.) root fibrous; stems erect, and are as well as the branches very straight.

Erect Sauvagesia. Fl. May to Oct. Clt. 1823. Pl. ½ to 1 ft.

6 S. ADI'MA (Aubl. guian. 1. p. 251. t. 100. f. a. Mart. fl. bras. 1. p. 37.) root creeping; stem herbaceous, procumbent, branched; branches flexuous; leaves lanceolate, somewhat spatulate, acute, serrulated; peduncles filiform, axillary, solitary; segments of the calyx ovate, setaceously-acuminated. ↄ. S. Native of Brazil on rocks at the river Niger, also in Guiana. M. Aug. St. Hilaire considers *S. erécta* and *S. Adìma* to be identical, but Martius considers them specifically distinct. Perhaps *S. Adìma* of all authors is the same as this plant. Flowers red. *Adima* is the name of the plant in Guiana. The negroes and creoles of Guiana use the leaves of this plant, as well as those of *S. erécta*, instead of *spinach*; they are mucilaginous; the roots are supposed to be emetic.

Adima Sauvagesia. Pl. procumbent.

7 S. TENE'LLA (Lam. ill. 2. p. 119.) stem herbaceous, weak, generally simple; leaves sessile, linear-lanceolate, rarely toothed; stipulas small; flowers axillary or terminal; outer petals a little longer than the calyx; filiform appendages five or fewer. ⊙. S. Native of Guiana in moist places. St. Hil. in mem. mus. II. p. 105. pl. 6. t. 1. f. β. Flowers pale red.

Weak Sauvagesia. Fl. July. Clt. 1820. Pl. ½ foot.

8 S. LINEARIFÒLIA (St. Hil. in mem. mus. 11. p. 106. pl. 6. t. 2. f. a.) stem suffruticose, 4 inches high; leaves linear-acute, rarely serrated; flowers axillary; petals a little shorter than the calyx; filiform appendages 5. ♄. S. Native of Brazil in the sandy part of the province of Minas Geraes called Distritodos-Diamantes, near the place where the diamonds which are vulgarly called Servico do Rio Pardo are found, at the height of about 4000 feet above the level of the sea, but very rare. S. pusílla, Mart. fl. bras. 1. p. 35. t. 24. f. 1. Flowers white or rose-coloured. Sepals ciliated at the apex.

Linear-leaved Sauvagesia. Shrub ¼ to ½ foot.

† *Species not sufficiently known.*

9 S. ERICOI'DES (Ging. mss. et D. C. prod. 1. p. 316.) stem simple; leaves crowded, linear-lanceolate, with very entire, revolute margins; stipulas bristly, awl-shaped; racemes dichotomous; sepals ovate, acuminated, 3-times shorter than the petals. ⊙. ↄ. S. Native of Brazil in moist places. S. péndula, Mart. ex Steven. in litt. Flowers pinkish.

Heath-like Sauvagesia. Fl. June, Aug. Pl. ½ foot.

10 S. ? FRUTICÒSA (Mart. in litt. et D. C. prod. 1. p. 316.) stem much branched, covered with lanceolate, bristly-pectinated permanent stipulas; branches fastigiate; leaves crowded at the top of branchlets, linear, acute, with sharp, serrulated, revolute margins; peduncles axillary, 1-flowered. ♄. S. Native of Brazil on rocks. Flowers pinkish.

Shrubby Sauvagesia. Fl. Feb. Sh. 1 foot.

11 S. SALICIFÒLIA (Ging. mss. and D. C. prod. 1. p. 316.) stems branched, ascending; leaves lanceolate, with revolute, quite entire margins; stipulas awl-shaped, awned, entire; flowers solitary, almost sessile. ♄. S. Native of Brazil. Flowers pink? Perhaps a species of *Lavràdia*.

Willow-leaved Sauvagesia. Shrub ½ foot.

Cult. Sauvagèsia is a genus of elegant little annual or shrubby plants. The annual species should be sown thinly in pots in a mixture of loam and peat in the month of March, and then placed in a moderate hot-bed, where they may remain until they have ripened their seeds, or they may be removed into the stove when the plants are of sufficient size. The shrubby kinds require the heat of a stove, and should be planted in the same kind of soil as recommended for the annual species. They may be either increased by cuttings under a hand-glass in

heat, or by seeds. The whole of the species require to be kept rather moist during the summer months.

V. LAVRA'DIA (in honour of the Marquis of Lavradio, a distinguished patron of botany ; once Viceroy of Brazil). Vellosa et Vand. in Rœm. script. lus. et bras. p. 88. t. 6. f. 6. D. C. prod. 1. p. 314. St. Hil. in mem. mus. 11. p. 107.

LIN. SYST. *Pentándria, Monogýnia.* Calyx profoundly 5-parted (f. 77. *a.*), spreading, permanent, closed when in fruit. Outer petals 5 (f. 77. *b.*), equal, spreading, ovate, or ovate-lanceolate, deciduous. Inner corolla monopetalous (urceolus ?), ovate-conical, narrowed at the apex (f. 77. *c.*) and toothed, permanent, without any filiform appendages between the outer and inner corolla. Stamens 5, alternating with the petals of the outer corolla, but inclosed within the inner corolla ; permanent filaments very short, adhering to the base of the inner corolla; anthers fixed by their base, elliptical, 2-celled, opening lengthwise at the sides. Style erect (f. 77. *d.*) permanent, crowned by a scarcely manifest stigma. Ovary (f. 77. *e.*) 1-celled at the top and 3-celled at the base, many-seeded. Capsule ovate, 3-lobed, acute, 3-valved, and empty at the top, but with the valves bent inwards at the base, even to the centre of the capsule, therefore the capsule is 3-celled at the base, dissepiments lunulately truncate, and bearing the seeds at the top. Seeds, albumen, and embryo as in *Sauvagèsia.* Elegant, smooth, subshrubs. Leaves simple, on very short footstalks. Stipulas lateral, twin, ciliated, permanent. Flowers axillary or terminal, disposed in racemes, rarely in panicles, but in both cases they are bracteate ; they are either white or red. Parts of flowers twisted in the bud.

1 L. ERICOÌDES (St. Hil. in mem. mus. 11. p. 108. pl. 7. f. a.) leaves crowded, small, linear, quite entire, with revolute margins ; flowers axillary. ♄. S. Native of Brazil on the top of a mountain called Caraca in the province of Minas Geraes, at the height of about 5700 feet above the level of the sea, but very rare. The five outer petals are rose-coloured, and the urceolus is purple.

Heath-like Lavradia. Fl. Feb. Shrub $\frac{1}{4}$ to $\frac{1}{2}$ foot.

2 L. ELEGANTI'SSIMA (St. Hil. in mem. mus. 11. p. 109. pl. 8.) stem a little branched ; leaves minute, much crowded, in bundles, elliptically-ovate, very blunt, quite entire, veinless ; racemes short, terminal. ♄. S. Native of Brazil in sandy places on the mountains called Serra de Curumatahy in the province of Minas Geraes, near Tejuco, at the height of about 4000 feet above the level of the sea, but very rare. An elegant little shrub, with pale purple flowers.

Most elegant Lavradia. Shrub 1 to 2 feet.

3 L. VELLÒZII (St. Hil. in mem. mus. 11. p. 110.) stem a little branched ; leaves lanceolate, acute at both ends, serrated ; racemes compound, generally few-flowered. ♄. S. Native of Brazil in humid places of woods, and in arid places of mountains, but very rare, in the province of Minas Geraes near fountains at the height of about 3700 feet above the level of the sea. Lavràdia, Vel. mss. Vand. fl. lus. et bras. p. 15. f. 6. Vand. in Rœm. script. p. 88. t. 4. f. 6. L. Velloziàna, Steud. nom. Flowers purple.

Velloz's Lavradia. Shrub 1 to 2 feet.

4 L. GLANDULO'SA (St. Hil. in mem. mus. 11. p. 112. pl. 9.) stem a little branched ; leaves much crowded, obovate, very blunt, with dry gland-like serratures, mucronate ; racemes furnished with very short branches ; bracteas and calyxes with glandular serratures. ♄. S. Native of Brazil, plentiful on the mountains in the province of Minas Geraes among stones, especially at the places called Itambe, Ponte Alta, and Candonga, at the height of about 2000 feet above the level of the sea. Flowers rose-coloured. Leaves broad, terminated by a long point (f. 77.).

Glandular-calyxed Lavradia. Fl. Feb. Mar. Sh. 1 to 2 ft.

5 L. CAPILLA'RIS (St. Hil. in mem. mus. 11. p. 113. pl. 10.) stem much branched ; leaves approximate, numerous, lanceolate, acute at both ends, with glandular serratures, veiny ; panicle terminal, divaricating, capillary, generally few-flowered. ♄. S. Native of Brazil in sandy places on mountains near the places called Itambe and Tapanhoa-canga, in the province of Minas Geraes, at about the height of 2000 feet above the level of the sea. Flowers red.

FIG. 77.

Var. β, glandulòso-pubéscens (St. Hil. l. c. p. 114.) branches clothed with glandular pubescence ; leaves smaller ; stipulas almost simple.

Capillary-panicled Lavradia. Fl. Nov. to April. Sh. 1 to 2 ft.

6 L. ALPE'STRIS (Mart. fl. bras. 1. p. 32. t. 22.) leaves approximate, linear, quadrifariously disposed, spreading horizontally, quite entire ; stipulas almost entire, setaceous ; bracteas and sepals naked ; flowers panicled. ♄. S. Native of Brazil in the province of Minas Geraes in stony shady places. Corolla purplish or rose-coloured.

Rock Lavradia. Fl. April, May. Sh. 3 to 4 feet.

7 L. MONTA'NA (Mart. fl. bras. 1. p. 33. t. 23.) leaves alternate, almost sessile, obovate, marginate, denticulated, obtuse, smooth, ending in a mucrone ; stipulas pinnatifid, bracteas and calyxes ciliated with glands. ♄. S. Native of Brazil in the province of Minas Geraes. L. Vandéllii, Rœm. et Schult, script. lus. min. p. 88. t. 16. f. b. L. glandulòsa, var. *β* rubélla, St. Hil. in mem. mus. 11. p. 113. Flowers deep rose-coloured, in crowded racemose panicles.

Mountain Lavradia. Clt. 1826. Shrub 2 to 3 feet.

Cult. These elegant shrubs will thrive well in a mixture of loam, sand, and peat, and cuttings will root readily in sand under a hand-glass, in heat.

Cohort III. *Ovary solitary. Placentas central.*

ORDER XXVII. CARYOPHY'LLEÆ. Juss. gen. 299. D. C. prod. 1. p. 351. Caryophýlleæ and Arenàriæ, Lam.

Calyx of 4 (f. 79. *a.*) but usually of 5 sepals (f. 81. *b.*), continuous with the pedicel, never free, sometimes united together into a tube, which is 4-5-toothed, constantly imbricate in æstivation, usually permanent. Petals equal in number to the teeth or sepals of the calyx, and alternating with them, inserted in a more or less elevated torus, unguiculate, with an entire (f. 80. *d.* f. 81. *b.*) or bifid (f. 79. *d.*) spreading limb, usually furnished with petal-like scales at the throat (f. 78. *d.* f. 79. *c.*). These scales are seldom absent. Stamens equal in number with the petals, or double that number (f. 79. *e.* f. 81. *b.*), inserted in the torus, those that are alternate with the petals are much earlier than the others and free, those that are opposite the petals are sometimes adnate to their base, sometimes these last are abortive ; filaments awl-shaped (f. 80. *c.*), sometimes monadelphous at the base ; anthers 2-celled (f. 81. *e.*), birimose, usually inserted by their base. Ovary inserted on the top of the torus, simple, ovate, or oblong (f. 81. *f.*), 2-5-valved, crowned by an equal number of stigmas (f. 81. *g.*), these are filiform or clavate, distinct from the base, stigmatose and papillose inside. Capsule 2-5-valved,

united at the base and opening at the top (f. 78. *a.*), and toothed; teeth equal in number to the valves of the capsule, sometimes entire, sometimes bifid, usually 1-celled, but sometimes 2-5-celled from the partitions jutting out from the valves to the central placenta, sometimes incomplete, sometimes continuous to the axis. Placenta always central, it is free and rather conical in the 1-celled capsule, and sometimes, though seldom, continuous with the base of the styles; in the many-celled capsules it is connected with the dissepiments. Seeds indefinite, rarely definite, disposed along the central placenta, 2 rows in a series, with as many series as there are styles, and alternating with them. Albumen mealy, usually central. Embryo sometimes perepheric, more or less incurved, rarely straight, central, with the radicle pointing towards the hilum. This order is composed of herbs or subshrubs with knotted stems, opposite, entire leaves, which are usually connate at the base. The flowers are terminal, solitary, or disposed in racemes, panicles, or corymbs, they are either white, yellow, or red, or the shades between these colours. They are inhabitants of mountains and pastures of all parts of Europe, Siberia, the North of Africa and North America; few are to be met with within the tropics. Most of the genera are ornamental and well adapted for ornamenting rock-work and flower-borders; but in *Diánthus* the pride of the order consists. This genus is almost unrivalled for the brilliancy and fragrance of its flowers, and for the neatness of its leaves. Some are trifling weeds, as *Spérgula*, *Alsìne*, and *Cerástium*. The medical virtues of this order are but slight. *Saponària officinàlis* and one or two others have been praised for possessing antisyphilitic properties; the root of *Silène Virginiàna* is reputed anthelmintic, and the *Arenària peploìdes*, being fermented, is used by the Icelanders as food. This order differs from all the foregoing in the placentas being central, not intervalvular, nor marginal, and from *Lineæ* in the cells being many-seeded, not 1-2-seeded as in that order, except from abortion, as well as in the valves of the capsule being connected, not separating from the base. From *Malvàceæ* it differs in the capsule not being of numerous distinct carpels surrounding the axis. The seeds of all retain their vegetative power for a length of time, therefore they are easily introduced in a living state from any part of the world.

Synopsis of the genera.

Tribe I.

Sile'neæ. *Sepals united into a cylindrical tube, which is 4-5-toothed at the apex.*

1 Gypsóphila. Calyx campanulate, angular, somewhat 5-lobed, with membranous margins. Petals 5, not unguiculate. Stamens 10. Styles 2. Capsule 1-celled.

2 Ba'nffya. Calyx tubular, profoundly 5-parted. Petals 5, undivided. Stamens 10, 5 of which are fertile. Styles 2. Capsule 1-celled, few-seeded.

3 Dia'nthus. Calyx tubular, 5-toothed, furnished with 2-6 imbricate, opposite scales at the base. Petals 5 (f. 78. *b.*) with long claws. Stamens 10. Styles 2. Capsule 1-celled (f. 78.). Seeds compressed.

4 Sapona'ria. Calyx tubular, 5-toothed, naked at the base. Petals 5, unguiculate. Stamens 10. Style 2. Capsule 1-celled.

5 Cucu'balus. Calyx campanulate, 5-toothed, naked. Petals 5, unguiculate, with a bifid limb. Capsule fleshy, 1-celled.

6 Sile'ne. Calyx tubular, 5-toothed, naked. Petals 5, unguiculate, with an entire or bifid limb, usually furnished with a crown of petal-like bifid scales in the throat. Stamens 10. Styles 3. Capsules 3-celled at the base, opening at the top, 6-toothed.

7 Visca'ria. Calyx cylindrical, 5-toothed, naked. Petals 5, unguiculate, with scales in the throat. Stamens 10. Styles 5. Capsule 5-celled. Anthophorum long.

8 Ly'chnis. Calyx tubular, cylindrically-clavate, 5-toothed, naked. Petals 5, unguiculate, usually furnished with a crown of petals like scales in the throat. Stamens 10. Styles 5. Capsule 1-celled. Anthophorum long.

9 Agroste'mma. Calyx egg-shaped, 5-toothed, naked. Petals 5, unguiculate, furnished with a crown of petal-like scales in the throat. Stamens 10. Styles 5. Capsule 1-celled. Anthophorum short or wanting.

10 Githa'go. Calyx campanulate, coriaceous, with 5 long segments. Petals 5, unguiculate, naked. Stamens 10. Styles 5. Capsule 1-celled. Anthophorum wanting.

11 Vele'zia. Calyx tubular, 5-toothed. Petals 5, with long filiform bearded claws (f. 79. *c.*), and an emarginated limb. Stamens 10. Styles 2. Capsule 1-celled (f. 79. *b.*).

12 Dry'pis. Calyx tubular, 5-toothed. Petals 5, unguiculate, with 2-parted limbs and with a crown of bifid petal-like scales in the throat. Stamens 5. Styles 3. Capsule 1-celled, cut round about, 1-seeded from abortion.

13 Vivia'nia. Calyx campanulate, 5-toothed. Petals 5, unguiculate. Stamens 10. Stigmas 3. Capsule 3-celled, half 3-valved, many-seeded.

Tribe II.

Asine'æ. *Sepals 4-5, free, or hardly connected at the base.*

14 Orte'gia. Calyx 5-parted. Corolla wanting. Stamens 3; anthers cordate. Style 1, crowned by a capitate stigma. Capsule 1-celled, 3-valved. Seeds fixed to the bottom of capsule.

15 Gou'ffeia. Calyx 5-parted, spreading. Petals 5, entire. Stamens 10. Styles 2. Capsule globose, 1-celled, 2-valved, 1-2-seeded.

16 Buffo'nia. Calyx of 4 sepals. Petals 4, entire. Stamens 4. Styles 2. Capsule compressed, 1-celled, 2-valved, 2-seeded.

17 Sagìna. Calyx 4-5-parted. Petals 4-5, or wanting. Stamens 4-5. Capsule 4-5-valved, 1-celled, many-seeded.

18 Mœ'nchia. Sepals and petals 4. Stamens 4. Styles 4. Capsule membranous, 1-valved, 1-celled, 8-10-toothed at the apex, many-seeded; seeds kidney-shaped.

19 Hymene'lla. Calyx 4-parted, spreading. Petals 4, oblong, entire, length of the calyx. Stamens 4, alternate with the petals, joined at the base by a little 8-toothed crown. Ovary ovate. Styles 3. Capsule 3-celled.

20 MOEHRI'NGIA. Calyx 4-parted. Petals 4. Stamens 8. Styles 2. Capsule 4-valved, 1-celled, many-seeded.

21 ELA'TINE. Calyx 3-4-parted. Petals 3-4, without claws. Stamens 3-4 or 6-8. Styles 4, capitate at the top. Capsule 4-valved, 4-celled, many-seeded. Seeds cylindrical.

22 BE'RGIA. Calyx 5-parted. Petals 5. Stamens 10. Style 5, approximate. Capsule 5-valved, 5-celled.

23 MOLLU'GO. Calyx 5-parted. Petals wanting. Stamens 3. Styles 3. Capsule 3-valved, 3-celled, many-seeded.

24 PHARNA'CEUM. Calyx 5-parted. Petals wanting. Stamens 5. Styles 3. Capsule 3-valved, 3-celled, many-seeded.

25 PHY'SA. Calyx of 5-sepals. Petals wanting. Stamens 10. Stigmas 3. Capsule 3-furrowed, 3-valved, 3-celled. Valves septiferous, conniving with the receptacle.

26 HOLO'STEUM. Calyx of 5 sepals. Petals 5, toothed. Stamens 5, or only 3-4 from abortion. Styles 3. Capsule 1-celled, opening at the apex by 6 teeth.

27 SPE'RGULA. Calyx 5-parted. Petals 5, entire. Stamens 10. Styles 5. Capsule 1-celled, 5-6-valved, many-seeded.

28 SPERGULA'RIA. Calyx 5-parted or 5-sepalled. Petals 5, entire. Stamens 5-10. Styles 3-5. Capsule 1-celled, 3-5-valved, many-seeded; seeds marginate.

29 DRYMA'RIA. Calyx 5-parted. Petals 5, bifid. Stamens 5. Styles 3. Capsule 3-valved, even to the base, 5 or many-seeded. Embryo perepheric, rather annular.

30 SCHÍEDEA. Calyx of 5 sepals. Petals 5, minute, bifid. Stamens 10. Styles 3, stigmatose on the inside. Capsule 1-celled, 3-valved, separating near to the base, many-seeded.

31 STELLA'RIA. Calyx 5-parted. Petals 5, bifid. Stamens 10, or from abortion only 3-8. Styles 3. Capsule 1-celled, 6-valved at the apex, many-seeded.

32 ARENA'RIA. Calyx of 5 sepals. Petals 5, entire. Stamens 10 or fewer from abortion. Styles 3. Capsule 1-celled, 3-6-valved at the apex, many-seeded.

33 ME'RCKIA. Calyx of 5 sepals. Petals 5, entire. Stamens 5. Styles 3. Capsule inflated, depressed, globose, 3-valved, imperfectly 3-celled, with the dissepiment 2-parted, many-seeded.

34 CERA'STIUM. Calyx 5-parted (f. 80. *a*.). Petals 5, usually bifid. Stamens 10. Styles 5. Capsule 1-celled, cylindrical or globose, opening at the top, 10-toothed.

35 BRACHYSTE'MMA. Calyx deeply 5-parted. Petals 5, minute, acute. Stamens 5. Styles 2. Capsule spherical, 1-celled, 4-valved, 1-seeded, opening to the base.

36 CHERLE'RIA. Calyx of 5 sepals (f. 81. *b*.). Petals 5, small, emarginate. Stamens 10. Styles 3 (f. 81. *g*.). Capsule 3-celled, 3-valved; cells 2-seeded?

37 SPERGULA'STRUM. Calyx of 5 sepals. Petals 5, very minute, entire or wanting. Stamens 10, perigynous. Stigmas 4, sessile, ligulately-setaceous. Capsule ovate, longer than the calyx, 4-valved.

38? HYDROPI'TYON. Calyx of 5 sepals. Petals 5, ovate, roundish. Stamens 10, pilose. Style 1, crowned by an orbicular stigma. Capsule 1-celled, 1-seeded; seed filling the capsule.

Tribe I.

SILE'NEÆ (plants agreeing with *Silène*, in having a tubular calyx.) D. C. prod. 1. p. 351.—Caryophýlleæ, Lam. Sepals grown together into a cylindrical or campanulate tube, 4 or 5-toothed at the apex.

I. GYPSO'PHILA (from γυψος, *gypsos*, lime, or plaster, and φιλεω, *phileo*, to love; because the plants of this genus chiefly prefer a limestone or chalky soil.) Lin. gen. no. 768. D. C. prod. 1. p. 351.

LIN. SYST. *Decándria, Digýnia.* Calyx campanulate, angular, somewhat 5-lobed; margins of lobes membranous. Petals 5, not unguiculated. Stamens 10. Styles 2. Capsule 1-celled. Annual, or perennial evergreen herbaceous plants, with leaves resembling the pink, and small white or pink flowers, usually disposed in diffuse panicles.

SECT. I. STRU'THIUM (*Struthium* is the Latin for fullers'herb.) Ser. mss. and D. C. prod. 1. p. 352. Calyxes free from scales at the base.

1 G. OCCELLA'TA (Sibth. et Smith, fl. græc. t. 387.) flowers capitate; petals ovate, marked by a purple circle; stems diffuse; leaves spatulate, downy on both surfaces. ♃. H. Native of mount Delphi in the island of Negropont. Cucúbalus polygonoìdes, Willd. spec. 2. p. 690? Petals entire, white, marked with a purple circle as in *Diánthus deltoìdes*. Stems diffuse, 3 or 6 inches long.

Occellated-petalled Gypsophila. Fl. July, Aug. Pl. ½ foot.

2 G. THYMIFÒLIA (Sibth. et Smith, fl. græc. t. 388.) flowers somewhat capitate; stems diffuse, somewhat dichotomous; leaves spatulate, downy on both surfaces; petals obovate, rounded, not spotted. ♃. H. Native of mount Parnassus. Habit of *G. occellàta*. Stem more elongated and more branched. Calyx hairy. Flowers 2 or 3 in each tuft, white. Plant diffuse.

Thyme-leaved Gypsophila. Fl. July. Pl. ½ foot.

3 G. STRU'THIUM (Lin. spec. 582.) flowers in dense round panicled tufts; stems simple, roughish; leaves linear, fleshy, nearly semi-cylindrical, axillary ones crowded. ♃. H. Native of Spain.—Barrel. icon. 64. t. 119. Stems shrubby at the base. Flowers white. Petals hardly emarginate. This herb is said to be used instead of soap for scouring by the Spaniards at present, as it was by the ancients. It would be curious to know if the plant contains fossil-alkali, like many succulent maritime plants, and whether the saponaceous qualities of *Saponària officinàlis* be owing to the same cause.

Fullers'-herb Gypsophila. Fl. July, Aug. Clt. 1729. Pl. 1½ ft.

4 G. FASTIGIA'TA (Lin. amœn. 3. p. 23.) flowers corymbosely-fastigiate; stems ascending; leaves lanceolate-linear, obsoletely triquetrous, smooth, obtuse, secund; stamens exserted. ♃. H. Native of France, Switzerland, Germany, and Siberia, among rocks.—Gmel. sib. 4. p. 144. f. 61. f. 1. Stem procumbent before flowering. Flowers white. Segments of the calyx obtuse, pruinose.

Fastigiate-flowered Gypsophila. Fl. June, July. Clt. 1759. Pl. 1 foot.

5 G. DICHÓTOMA (Besser. prim. fl. galiz. 1. p. 372.) flowers fastigiately-corymbose; stem erect, dichotomous, compressed, glabrous; leaves linear, somewhat fleshy, triquetrous, acute; petals oblong, spreading; styles equalling the stamens in length. ♃. H. Native of Poland among stones about Jaslo. Flowers white or pink.

Dichotomous-stemmed Gypsophila. Fl. July. Pl. 2 feet.

6 G. COLLÌNA (Stev. in litt. and D. C. prod. 1. p. 252.) stem branched, smooth; flowers fastigiate; leaves linear, somewhat fleshy, acute, roughish; lobes of calyx bluntish; stamens long. ♃. H. Native about Odessa. Flowers white or pink.

Hill Gypsophila. Fl. July, Aug. Clt. 1821. Pl. 1½ foot.

7 G. ARENA'RIA (Walds. et Kit. hung. 40. t. 41.) flowers corymbosely-fastigiate; petals very rarely emarginated; leaves linear, rather fleshy, glabrous, flat. ♃. H. Native of Hungary and Volhynia, in a sandy or gravelly soil. Flowers pale-red. Capsules globose.

Sand Gypsophila. Fl. July, Aug. Clt. 1801. Pl. 1 foot.

8 G. VISCÒSA (Murr. in comm. gœtt. 1783. p. 9. t. 3.) flowers fastigiately-corymbose; branches divaricating; leaves ovate-lanceolate, smooth, cordate at the base, and clasping the stem; space of stem between the leaves clammy in the middle; petals retuse; segments of calyx broad, obtuse. ⊙. H. Native of the Levant. Flowers white or pink.

Clammy Gypsophila. Fl. July, Aug. Clt. 1773. Pl. ½ to 1 ft.

9 G. TENE'LLA (Poir. suppl. 2. p. 874.) flowers paniculately-umbellate, on long pedicels; stems very pliant. ⊙. H. Native? Bracteas short, ovate-lanceolate. Flowers white or pink.

Delicate Gypsophila. Fl. July, Aug. Clt. 1816. Pl. ½ to ¾ ft.

10 G. GRANDIFLÒRA (Poir. suppl. 2. p. 874.) stem straight; flowers panicled; branchlets almost naked, few-flowered; petals emarginate; leaves linear-awl-shaped, hairy. ♃? H. Native? Panicles few-flowered. Flowers large, white or pink.

Great-flowered Gypsophila. Fl. July. Pl. 1½ foot.

11 ALTI'SSIMA (Lin. spec. 582.) branches spreading; flowers panicled, small; panicle much branched; pedicels clammy; stems erect; leaves lanceolate, somewhat 3-nerved. ♃. H. Native of Siberia and Greece.—Gmel. sib. 4. p. 143. t. 60. Capsules small, roundish. Segments of calyx obtuse, frosted. Flowers pink or sometimes nearly white. Petals entire?

Tallest Gypsophila. Fl. July, Aug. Clt. 1759. Pl. 3 to 5 ft.

12 G. PERFOLIA'TA (Lin. spec. 583.) flowers loosely panicled; panicle much branched; leaves ovate-lanceolate, ribbed, half stem-clasping, horizontal; petals entire. ♃. H. Native of Spain and the Levant. Dill. elth. 368. t. 276. Flowers pale-red.

Var. β, tomentòsa (D. C. prod. 1. p. 352.) leaves downy. G. pubéscens, Hort. G. tomentòsa, Lin. spec. 582? ♃. H. Native of Tauria.—Barrel. icon. t. 1002. Flowers white or pink.

Perfoliate Gypsophila. Fl. July, Aug. Clt. 1732. Pl. 2 ft.

13 G. SCORZONERIFÒLIA (Hort. mus. par. and D. C. prod. 1. p. 352.) flowers panicled; panicles clammy; leaves lanceolate, half stem-clasping, acute, 3-5-nerved, smooth. ♃. H. Native of Siberia near Kislar. G. sabulòsa, Stev. in litt. G. perfoliàta, Bieb. fl. taur. cauc. ex Stev. This plant differs from *G. perfoliàta*, in the panicles being clammy, flowers larger, and segments of calyx more acute. Flowers pink. Panicle dichotomous.

Salsafee-leaved Gypsophila. Fl. July, Aug. Clt. 1817. Pl. 1½ to 3 feet.

14 G. ACUTIFÒLIA (Fisch. cat. hort. gor. 1812. p. 59.) flowers trichotomously panicled; peduncles villous, clammy; petals emarginate, twice as long as the calyx, longer than the stamens; leaves linear, lanceolate, acuminated, flat, obscurely 3-nerved. ♃. H. Native of Caucasus on stony hills. G. altíssima, Bieb. fl. taur. cauc. 1. p. 280. but not of Lin. Flowers white.

Acute-leaved Gypsophila. Fl. July, Aug. Clt. 1817. Pl. 2 or 3 feet.

15 G. PANICULA'TA (Lin. amœn. 3. p. 23.) flowers panicled, minute, dioeceous; peduncles smooth, filiform, divaricating; segments of calyx obtuse; leaves linear-lanceolate, scabrous, acute. ♃. H. Native of Sicily in sandy or gravelly places, also in Siberia and Hungary about Buda. Jacq. fl. austr. 5. t. 1. A diffuse plant, with numerous small whitish flowers.

Panicled-flowered Gypsophila. Fl. June, July. Clt. 1759. Pl. 2 to 3 feet.

16 G. ARRÓSTII (Guss. pl. rar. p. 160. t. 30.) flowers panicled, small, hermaphrodite; branches of panicle trichotomous, 1-flowered; stamens rather longer than the corolla; calycine segments obtuse, dotted, scabrous; leaves linear-lanceolate, flattish, smooth; stems round, prostrately ascending, smooth. ♃. H. Native of Calabria. Arróstia dichótoma, Raf. carat. p. 76. Flowers small, white. Capsule 4-5-valved. Calyx bractless.

Arrost's Gypsophila. Fl. June, July. Pl. prostrate.

17 G. ASCE'NDENS (Jacq. hort. vind. 2. t. 138.) flowers panicled, small; peduncles smooth, filiform, divaricating; segments of calyx acute, the same length with the corolla, stamens, and pistils; stems prostrate; leaves lanceolate-linear. ♃. H. Native of the Levant. Petals emarginate, white.

Ascending-stemmed Gypsophila. Fl. July, Aug. Clt. 1800. Pl. prostrate.

18 G. GLAU'CA (Stev. in litt. and D. C. prod. 1. p. 353.) flowers panicled; panicle divaricating; branches few-flowered, pubescent, clammy; leaves linear-lanceolate, somewhat fleshy, obtuse. ♃. H. Native of Caucasus. G. rèpens, Bieb. fl. taur. 318. ex Stev. in litt. Flowers white.

Glaucous-leaved Gypsophila. Fl. Jul. Aug. Clt. 1822. Pl. 1½ ft.

19 G. E'LEGANS (Bieb. fl. taur. 1. p. 319. suppl. 296.) flowers dichotomously-panicled, glabrous; petals emarginate, twice as long as the calyx and stamens; leaves lanceolate, somewhat fleshy. ⊙. H. Native of Tauria in gravelly places. Schrank. pl. mon. t. 21. Very like *G. viscòsa*, but the leaves are narrower, and acute at both ends. Flowers pinkish.

Elegant Gypsophila. Fl. June, Sep. Clt. 1818. Pl. 1 foot.

20 G. CRE'TICA (Sibth. et Smith, fl. græc. t. 384.) stem paniculately branched, smooth, viscid, but pubescent towards the top; flowers small, erect; calyx many-nerved; leaves linear-awl-shaped, 3-nerved, smooth; petals small, entire. ♃. H. Native of Candia in arid places. Saponària Crética, Lin. spec. 584.—Alp. exot. 292. t. 291. Flowers small, white above but flesh-coloured beneath. Habit of *G. rígida*.

Cretan Gypsophila. Fl. May, July. Clt. 1810. Pl. ½ foot.

21 G. OCHROLEU'CA (Sibth. and Smith, fl. græc. t. 385.) stems dichotomous, divaricating; petals entire, spotted at the base; leaves awl-shaped, the lower ones linear and flaccid. ♃. H. Native on mount Hymettus near Athens. Flowers like those of *G. Crética*, but the petals are spatulate, of a pale straw-colour, and elegantly striped and spotted with purple at the base.

Cream-coloured-flowered Gypsophila. Fl. July. Pl. 1 foot.

22 G. ILLY'RICA (Sibth. and Smith, fl. græc. t. 386.) pubescent; stem tufted at the base, but dichotomously fastigiate at the top; leaves linear, 3-nerved, awl-shaped; calyx 5-angled, bractless; petals obovate, white, with 3 dark purple dots at the base of each. ♃. H. Native of Greece, Illyria, and Calabria. Saponària Illýrica, Lin. mant. p. 70.—Ard. spec. 2. p. 24. t. 9.—Cup. panph. 2. t. 22. Flowers fastigiate, white, each petal with 3 purple spots at the base, entire. Anthers blue.

Illyrian Gypsophila. Fl. May, June. Pl. ½ foot.

23 G. STEVE'NI (Fisch. in litt. Schrank. hort. mon. t. 32.) flowers panicled; stem diffuse; leaves linear-lanceolate, grassy, keeled, grey; petals broad-linear, obtuse, entire. ♃. H. Native of Iberia in stony places about Tiflis. G. rèpens, Bieb. fl. taur. 1. p. 318. exclusive of the synonymes. Flowers whitish.

Steven's Gypsophila. Fl. Ju. Aug. Clt. 1818. Pl. 1 to 2 ft.

24 G. GRAMÍNEA (Sibth. and Smith, prod. 1. p. 279.) flowers panicled; stem almost naked; radical leaves linear, tufted; petals emarginate; calyx pubescent, with roughish edges. ♃. H. Native on the mountains of the Morea. Radical leaves numerous, grassy, pale-green, with scabrous margins. Flowers rose-coloured.

Grassy-leaved Gypsophila. Fl. July, Aug. Clt. 1810. Pl. prostrate.

25 G. ARMERIOÌDES (Ser. mss. and D. C. prod. 1. p. 353.) stems tufted, stiff; flowers dichotomously-panicled; peduncles and calyxes beset with glandular hairs; calyx striated, with acutish segments, which have scarious margins; petals spatulate, almost entire; leaves linear, bluntish, firm, length of internodes. ♃. H. Native of Troada. Habit of *Diánthus Armèria*. Flowers pink or white.

Armeria-like Gypsophila. Fl. July. Pl. 1 foot.

26 G. PUBE'SCENS; flowers panicled, small; branches of panicle trichotomous, divaricate; stamens longer than the corolla; calycine segments obtuse, dotted, scabrous; leaves linear-lanceolate, flat, clothed with glandular hairs; stem prostrate, also beset with glandular hairs. ♃. H. Native of Calabria. G. Arróstii β, pubéscens, Guss. pl. rar. p. 160. Flowers small.

Pubescent Gypsophila. Fl. July. Pl. prostrate.

27 G. TENUIFÒLIA (Bieb. fl. taur. 1. p. 319. suppl. 296.) stems somewhat panicled, few-flowered; petals emarginate, twice as long as the calyx and stamens; leaves awl-shaped, filiform, glabrous. ♃. H. Native about the Caucasian ports. Root twisted, very thick, and with the leaves similar to those of *Plantàgo subulàta*. Petals rose-coloured, inflexed, emarginate.

Fine-leaved Gypsophila. Fl. July, Aug. Clt. 1824. Pl. 1 ft.

28 G. RE'PENS (Lin. amœn. 3. p. 23. spec. 581.) stems somewhat panicled, few-flowered; stamens shorter than the emarginate petals; leaves linear, glabrous. ♃. H. Native of the Alps of Europe, as well as in the Pyrenees, among stones by road sides and along the borders of torrents. Lam. ill. t. 375. f. 2. Jacq. fl. aust. 5. p. 4. t. 407. Petals white, streaked with green or red. Root creeping. This plant resembles a species of *Cerástium* or *Arenària*.

Creeping Gypsophila. Fl. July, Sept. Clt. 1774. Pl. ½ ft.

29 G. PATRÍNII (Ser. mss. and D. C. prod. 1. p. 353.) stems somewhat panicled, few-flowered; segments of calyx bluntish; petals equal in length with the stamens; leaves very narrow, thick, three times longer than the space of the stem between the leaves. ♃. H. Native of Siberia in fields at Irtish about Oustka-Menogorik. Flowers pink.

Patrin's Gypsophila. Fl. July. Pl. 1 foot.

30 G. DU'BIA (Willd. enum. suppl. p. 23.) petals obovate, emarginate; stamens shorter than the campanulate corolla; leaves linear, rather fleshy. ♃. H. Native — ? Perhaps G. rèpens, Lin. ex Treveranus. Flowers white.

Doubtful Gypsophila. Fl. May, June. Clt. 1815. Pl. ½ foot.

31 G. PROSTRA'TA (Lin. spec. 1. p. 581.) stems diffuse, panicled; pistils longer than the emarginate petals; stamens shorter than the corolla; leaves linear-lanceolate, smooth. ♃. H. Native on the Alps of Europe? Sims, bot. mag. t. 1281.—Pluk. alm. 22. t. 75. f. 2. Flowers white or pale rose-coloured. Like *G. rèpens*.

Prostrate-stemmed Gypsophila. Fl. July, Sep. Pl. prostrate.

32 G. ROKE'JEKA (Del. fl. ægyp. 87. t. 29. f. 1.) stem erect; branches weak, panicled, dichotomous; peduncles capillary; petals large, painted with lines; radical leaves ovate, oblong, upper ones linear. ⊙? ♃? H. Native of Egypt near Soueys. Rokéjeka, Forsk. decr. 90. no. 77. Flowers white striped with violet. Capsules globose. Seeds hemispherical, black, rough.

Rokejeka Gypsophila. Pl. 1 to 2 feet.

33 G. THESIIFÒLIA (Ser. mss. and D. C. prod. 1. p. 354.) stems numerous, somewhat panicled, few-flowered, straight; petals almost entire, equal in length with the stamens; leaves linear, very narrow, glabrous. ♃. H. Native of Siberia about the mines of Schamanaikha (Patrin.) Flowers pink.

Thesium-leaved Gypsophila. Fl. July. Pl. ½ foot.

34 G. MURA'LIS (Lin. amœn. 3. p. 24. spec. 583.) stem dichotomously-panicled, much branched; flowers axillary, solitary; petals crenated; leaves linear, flat, length of pedicels. ♂. H. Native of France, Switzerland, Germany, Sweden, and Tauria, by road sides and in corn-fields. Sibthorp gathered it on the Bythinian Olympus. Lam. ill. 375. G. serotìna, Hayne. Flowers small, pinkish. This is a small biennial upright bushy herb.

Wall Gypsophila. Fl. July, Oct. Clt. 1739. Pl. ½ to 2 ft.

35 G. COMPRE'SSA (Desf. atl. 1. p. 343. t. 97.) stem erect, panicled, compressed; pedicels pubescent; flowers terminal; calyxes elongated, striated, with acute lobes; leaves awl-shaped, lanceolate, striated. ⊙. H. Native of Barbary in sandy corn-fields. Petals white, variegated on the under surface with violet-coloured veins, entire.

Compressed-stemmed Gypsophila. Pl. 1 foot.

36 G. CERASTIOÌDES (D. Don, prod. fl. nep. p. 213.) stems erect, 4-sided, pilose; pedicels and calyxes pilose; flowers corymbose; lobes of calyx lanceolate, acute, girded by a membranaceous fringed margin; petals emarginate; leaves pilose on both surfaces, as well as ciliated on the margins, radical ones spatulate on long footstalks, mucronulate, cauline ones obovate, almost sessile. ♃. H. Native of Nipaul in Gosaingsthan. Flowers white.

Chick-weed-like Gypsophila. Pl. ¼ to ½ foot.

SECT. II. PETRORHA'GIA (probably from πετρος, *petros*, a rock, and ρηγνυμι, *rhegnumi*, to break; because the plants grow on rocks, which they break with their roots.) Ser. mss. and D. C. prod. 1. p. 354. Calyxes furnished at their base with 2 or 4 opposite scarious scales.

37 G. GLOMERA'TA (Pall. ined. taur. ex Bieb. fl. taur. 1. p. 321. suppl. 297.) flowers in clustered heads; stems straight, simple, herbaceous; leaves linear, triquetrous from being keeled, rather scabrous; stamens rather longer than the retroflexed obovate petals; bracteas of calyx scariose. ♃. H. Native of Tauria and Caucasus in stony places. Flowers white.

Glomerate-flowered Gypsophila. Fl. July, Aug. Clt. 1818. Pl. 1 foot.

38 G. CAPITA'TA (Pall. ex Bieb. fl. taur. 1. p. 321.) stem suffruticose, much branched; branches dichotomous, scabrous, compressed, angular; flowers capitate; stamens exserted; leaves lanceolate, smooth, glaucous. ♄. F. Native of Asia Minor. G. glomeràta β, capitàta, D. C. prod. 1. p. 354. Flowers white.

Capitate-flowered Gypsophila. Pl. 1 to 2 feet.

39 G. SAXI'FRAGA (Lin. spec. 584.) stems numerous, erect, stiff; flowers panicled, terminal; calyx girded with 4 unequal lanceolate scales; leaves linear, stiff. ⊙. H. Native of the south of Europe on rocky or stony places. Smith, exot. bot. 2. t. 90. Diánthus saxífraga, Lin. spec. ed. 1. p. 413.—Barrel. icon. t. 998. Roots fibrous. Petals rose-coloured, emarginate.

Var. β, *capillàcea* (Ser. mss. and D. C. prod. 1. p. 354.) leaves and stems capillary, elongated. G. filifórmis, Lam.

Var. γ, *hispídula* (Ser. mss. and D. C. l. c.) leaves and stems rather hispid. Native of Vallais.

Saxifrage-like Gypsophila. Fl. July, Aug. Clt. 1774. Pl. ½ foot.

40 G. RI'GIDA (Lin. amœn. 3. p. 24.) stems numerous, moderately branched; calyx girded by 4 equal ovate scales or bracteas; petals emarginate; leaves linear erect. ♃. H. Native of rocky dry places in the south of Europe. Found on the Bithynian Olympus by Dr. Sibthorp. Root woody. Stem spreading a span long, more or less downy on the upper part. Leaves nearly pressed close to the stem, dilated and membranous at the base. Flowers solitary, rarely in pairs, terminal, pale rose-coloured. Teeth of calyx mucronate. Styles short.

Rigid Gypsophila. Fl. Jul. Aug. Clt. 1769. Pl. prostrate.

41 G. DIANTHOÌDES (Sibth. et Smith, fl. græc. t. 383.) leaves

linear, obtuse; flowers capitate; bracteas crowded, pointed, membranous; petals obtuse, quite entire. ♃. H. Native of Candia. Flowers 4-6 in a head. Teeth of calyx acute. Petals white, variegated on the under surface with 3 red lines.

Pink-like Gypsophila. Fl. July. Pl. 1 foot.

42 G. multicaùlis (Poir. suppl. 2. p. 875.) stems numerous, straight, simple; leaves pressed to the stem and sheathing at the base, awl-shaped, nervose; flower terminal, solitary, sessile. ♃. H. Native of Switzerland. Perhaps a variety of *G. saxífraga*. Flowers pink.

Many-stemmed Gypsophila. Fl. July, Aug. Pl. ½ foot.

Cult. The species of *Gypsóphila* are for the most part ornamental plants, and are well adapted for flower-borders or rock-work, particularly the smaller ones for the latter purpose. A chalky soil suits them best, and cuttings planted under a hand-glass root freely, but the best mode of increasing them is by seeds, which ripen in abundance. The annual species only require to be sown in the flower-border or on rock-work in the beginning of April.

II. BA'NFFYA (Banffy the name of some botanist known to Baumgarten.) Baumg. fl. trans. ex Spreng. neue. entd. 1. p. 300. D. C. prod. 1. p. 355.

Lin. syst. *Decándria, Digýnia.* Calyx tubular, deeply 5-parted, permanent. Petals 5, undivided. Stamens 5 fertile, and 5 sterile. Pistils 2. Capsules 1-celled, few-seeded.—Scarcely differing from *Gypsóphila*, unless in the tubular calyx, and number of seeds.

1 B. petræ'a (Baumg. l. c.) stems herbaceous, straight, tufted; leaves linear, obtuse, keeled; bracteas minute; calyx coloured. ♃ ? H. Native of Transylvania in the Alps of Dinaria. Gypsóphila Transylvánia, Spreng. syst. append. p. 179. Flowers white or red.

Rock Banffya. Fl. June, July ? Pl. ½ to 1 foot.

Cult. This plant is well adapted for rock-work. It may be either propagated by seeds or by cuttings, which will root freely if planted under a hand-glass.

III. DIA'NTHUS (from διος, *divine*, and ανθος, *anthos*, a flower; in allusion to the exquisite fragrance of the blossoms of most of the species, as well as from the unrivalled neatness and brilliancy of the flowers.) Lin. gen. no. 770. D. C. prod. 1. p. 355.

Lin. syst. *Decándria, Digýnia.* Calyx tubular, 5-toothed, furnished at the base with 2-4-6 opposite imbricate scales. Petals 5, with long claws. Stamens 10. Styles 2. Capsules 1-celled. Seeds flat, convex on one side and concave on the other, peltate. Embryo scarcely curved. Evergreen mostly glaucous herbs. The *Pink*, *Carnation*, *Clove*, *Deptford Pink*, and *Sweet-William*, give a very good idea of this genus.

Sect. I. Armeria'strum (*Armeria* is the Latin for Sweet-William, and *astrum*, an affixed signification, in allusion to the plants agreeing with *Sweet-William* in having aggregate flowers). Ser. mss. and D. C. prod. 1. p. 355. Flowers capitate or corymbose, sessile, or stalked.

§ 1. *Bracteas ovate, blunt.*

1 D. pro'lifer (Lin. spec. 587.) flowers aggregate, capitate; calyx scales ovate, awnless, higher than the tube; leaves serrulated. ⊙. H. Native throughout Europe by the margins of woods and fields. In England in gravelly places, but rare. In Selsey island, Sussex; meadows between Hampton Court and Teddington; in the border of a field opposite St. Austin's gates, Norwich; in a marl pit at Landridge hill, Hanley, Worcestershire. Smith, engl. bot. t. 956. Fl. dan. 221. Túnica prolífera, Scop. carn. no. 503. Flowers small, pale-red. Seeds ovate, flat. Heads of flowers involucrate.

Var. β, diminùtus (D. C. fl. fr. 5. p. 741.) flowers generally solitary. Diánthus diminùtus, Lin. spec. 587. fl. græc. 394.

Proliferous Pink. Fl. July, Aug. England. Pl. 1 to 1½ ft.

2 D. spinòsus (Desf. in ann. mus. 1. p. 198. t. 16. f. 1.) shrubby, procumbent; flowers capitate, sessile; leaves stiff, awl-shaped, pungent. ♄. F. Native of Persia. Petals linear, of a very pale rose-colour. Habit of Drỳpis spinòsa, and with the flowers about the same size. Calycine scales equal in length to the tube.

Spinose-leaved Pink. Fl. June, July. Shrub ½ foot.

§ 2. *Bracteas lanceolate, acute. Calyx striated, villous. Flowers scentless.*

* *Herbaceous. Annual.*

3 D. Arme'ria (Lin. spec. 586.) flowers aggregate, in loose bundles; scales of calyx 2, lanceolate-awl-shaped, equal in length with the tube; leaves lanceolate-awl-shaped, and are as well as calyx hairy; petals beardless. ⊙. H. Native in pastures and about hedges on a gravelly soil in many parts of Europe. In several parts of Britain. Smith, engl. bot. t. 317. Curt. fl. lond. 134. fl. dan. t. 230. D. hírtus, Lam. fl. fr. 2. p. 533. but not of Vill. Flowers speckled with pink and white, only one open at a time in each tuft.

Var. β; flowers solitary.

Armeria or Deptford Pink. Fl. Jul. Aug. Brit. Pl. 1 foot.

4 D. corymbòsus (Sibth. and Smith, fl. græc. t. 395.) flowers somewhat aggregate; calycine scales 2, lanceolate, villous, shorter than the tube; stem branched, divaricating, many-flowered, pubescent. ⊙. H. Native of Asia Minor. Flowers rose-coloured above and spotted, but yellowish-green below.

Corymbose-flowered Pink. Fl. July. Pl. 2 feet.

5 D. armerioìdes (Rafin. in Desv. journ. bot. 1814. vol. 2. p. 269.) flowers aggregate; calycine scales longer than the calyx, striated, scabrous; leaves linear, scabrous, shorter than the spaces of the stem between the leaves; stem simple, upper part rough. ⊙. H. Native of North America in meadows in New Jersey. Flowers red.

Armeria-like Pink. Fl. Jul. Aug. Clt. 1826. Pl. 1 foot.

* * *Herbaceous. Perennial.*

6 D. pseu'do-Arme'ria (Bieb. fl. taur. 1. p. 323. suppl. 297.) flowers in dense, aggregate bundles; calycine scales ovate-awl-shaped, equal in length to the tube; petals bearded; leaves awl-shaped, strict, beset with scabrous pubescence. ♃. H. Native of Tauria in dry stony places. Sims, bot. mag. t. 2288. D. barbàtus, Pall. ined. Taur. Very like *D. Armèria*, but is covered all over with hoary down, not hairy. Flowers rose-coloured, pale beneath.

Var. β; bracteas divaricating; calyx short. This is a monstrosity.

False Armeria Pink. Fl. July, Aug. Clt. 1820. Pl. 1 ft.

7 D. díscolor (Sims, bot. mag. t. 1162.) flowers aggregate; calycine scales longer than the tube, striated, rough; leaves green, linear, shorter than the internodes; stem simple, branched at the top, rough. ♃. H. Native of Caucasus. Flowers purple, pale beneath. Perhaps the same as the preceding.

Two-coloured-flowered Pink. Fl. Jul. Sept. Clt. 1803. Pl. 1 foot.

8 D. Carolinia'nus (Walt. fl. car. 140.) flowers aggregate, on long stalks; calycine scales one-half shorter than the tube. ♃? H. Native of Carolina. Flowers red.

Carolinian Pink. Fl. June, Sept. Clt. 1811. Pl. ¾ foot.

§ 3. *Bracteas ovate or lanceolate; calyx hardly striated, glabrous. Flowers fragrant.*

* *Herbaceous perennial. Flowers large, aggregate. Leaves broadish-lanceolate.*

9 D. BARBA'TUS (Lin. spec. 586.) flowers aggregate, in bundles; calycine scales ovate-awl-shaped, equal in length to the tube; petals bearded; leaves lanceolate, nerved. 2. H. Native of the South of France and Germany in gravelly or sandy places. Flowers very variable in colour, from dark purple to white or variegated or speckled, single and double.

Sweet-William is a very old inhabitant of the gardens, and was very much esteemed in the time of Gerarde for its beauty, to deck up the bosoms of the beautiful, and garlands and crowns for pleasure. The varieties are endless, but as the plant has never been treated as a leading florist's flower, they have not been named or improved. A hybrid variety called the *mule* or *Fairchild's Sweet-William* is supposed to be produced from the seeds of the *carnation* impregnated with *Sweet-William*, but we think it more likely to be the double variety of *D. Poiretiànus*.

Var. β, *latifòlius* (Ser. mss. and D. C. prod. 1. p. 356.) leaves ovate-lanceolate; flowers aggregate.

Var. γ, *paniculàtus* (Ser. mss. and D. C. l. c.) leaves ovate-lanceolate; stem panicled.

Var. δ, *pedunculòsus* (Ser. mss. and D. C. l. c.) leaves lanceolate; flowers stalked, loose.

Var. ε, *dentòsus* (Fisch. in litt.) this plant does not appear to differ from some varieties of *D. barbàtus*. Native of Siberia?

Bearded Pink or Sweet-William. Fl. June, July. Clt. 1573. Pl. 1 foot.

10 D. LATIFÒLIUS (Willd. enum. p. 466.) flowers aggregate, racemosely-corymbose; calycine scales ovate-lanceolate, at last exceeding the length of the calyx; leaves oblong-lanceolate. 2. H. Native? Sweet, fl. gard. t. 2. The habit of this plant is referable to *D. barbàtus*, but the leaves are broader and the flowers are disposed in corymbose racemes, and double the size. Perhaps it is the var. γ of *D. barbàtus*. Flowers pink.

Broad-leaved Pink. Fl. July, Aug. Clt.? Pl. 1½ foot.

11 D. CARIOPHYLLOÌDES (Schult. obs. 78.) flowers aggregate, in bundles; calycine scales ovate, mucronate, short; petals toothed, beardless; leaves glaucous, broad, channelled, without nerves, connate and ciliated at the base. 2. H. Native? Flowers red, sweet-scented.

Clove-like Pink. Fl. July, Aug. Clt. 1817. Pl. 1½ foot.

12 D. SILENOÌDES (Poir. dict. 4. p. 514.) stem? calycine scales ovate-lanceolate; leaves somewhat aggregate, rather obovate, covered with glandular dots, ciliated. 2. H. Native? Flowers probably red. This plant is hardly known.

Catchfly-like Pink. Fl. July. Pl. 1 foot.

13 D. AGGREGA'TUS (Poir. suppl. 4. p. 124.) flowers aggregate, sessile; calycine scales broad, mucronate, with membranaceous margins, longer than the tube; leaves lanceolate, many-nerved. 2. H. Native? Perhaps only a variety of *D. barbàtus*. Flowers purple.

Aggregate-flowered Pink. Fl. Ju. Jul. Clt. 1817. Pl. 1 ft.

14 D. JAPO'NICUS (Thunb. fl. jap. 183. t. 23.) flowers aggregate in bundles; calycine scales lanceolate, acute, ciliated, one-half shorter than the tube; leaves ovate, short, nerveless. 2. F. Native of Japan. Habit of *D. barbàtus* var. pedunculòsus, but the leaves are very short. Flowers pink or dark red.

Japan Pink. Fl. July, Sept. Clt. 1804. Pl. 1 foot.

15 D. CHINE'NSIS (Lin. spec. 588.) stem branched, flowers solitary or somewhat aggregate; calycine scales linear-lanceolate, leafy, cuspidate, spreading, equal in length with the tube; petals toothed, purple, or white, spotted with red; leaves lanceolate, pale-green. ♂. H. Native of China. Mill. icon. 81. f. 2. Curt. bot. mag. 28. Flowers very variable in colour, but usually reddish, and are either single or double.

China Pink. Fl. July, Sept. Clt. 1713. Pl. ½ to 1 foot.

16 D. POIRETIA'NUS (Ser. mss. and D. C. prod. 1. p. 360.) flowers terminal, corymbose, lower ones solitary; calycine scales awl-shaped at apex, much shorter than the tube; leaves oblong-lanceolate, with rough margins. 2. H. Native? D. corymbòsus, fl. purpùreo, Poir. suppl. 4. p. 124. but not of Sibth. and Smith. Flowers purple. There is a variety of this plant with double flowers, which is probably *D. hýbridus* or *mule pink* of the gardens. See *D. barbàtus*, no. 9.

Poiret's Pink. Fl. June, July. Clt. 1816. Pl. ½ to ¾ foot.

17 D. PULCHE'LLUS (Schrad.) flowers terminal, aggregate, rarely solitary; calycine scales ovate-lanceolate, cuspidate, equal with or longer than the tube; lowest leaves obovately-lanceolate, upper ones lanceolate, all ciliated, particularly towards the base. 2. H. Native? Flowers purple. Leaves green.

Pretty Pink. Fl. June, July. Clt. 1827. Pl. ½ to ¾ foot.

** *Herbaceous, perennial. Flowers capitate, usually involucrate. Leaves narrow, pungent.*

18 D. PINIFÒLIUS (Sibth. and Smith, fl. græc. prod. 1. p. 284.) flowers aggregate, capitate; bracteas obcordate, awned, equal in length with the head of flowers; calycine scales shorter than the tube; leaves setaceous. 2. or ♄. H. Native of Thrace and about Constantinople.—Tab. icon. 668. f. 13. Very like *D. juniperìnus* of Lin. trans. 2. p. 303. Flowers pink.

Pine-leaved Pink. Fl. July. Pl. 1 foot.

19 D. CEPHALÒTES (Ser. mss. and D. C. prod. 1. p. 356.) flowers almost sessile, capitate; calycine scales imbricated, mucronulate at top and spreading, a little shorter than the tube; leaves elongated, narrow; stem angular, rather hairy. 2. H. Native of? D. capitàtus, Poir. dict. 4. p. 124. Flowers red.

Headed Pink. Fl. June, Oct. Clt. 1823. Pl. 1 to 2 feet.

20 D. CAPITA'TUS (D. C. cat. hort. monsp. 1813. p. 103.) plant somewhat glaucous; flowers aggregate, capitate; calycine scales ovate, awned, shorter than the tube; involucrum ovate, awned, length of the head of flowers; leaves linear-lanceolate, nerveless; upper ones dilated at the base. Flowers dark red. 2. H. Native in grassy places of Tauria and Caucasus. D. atrorùbens, Bieb. fl. taur. 1. p. 324. but not of Allioni. D. Carthusianòrum, Pall.

Capitate-flowered Pink. Fl. June, Oct. Clt. 1817. Pl. 1½ ft.

21 D. POLYMO'RPHUS (Bieb. fl. taur. 1. p. 324. suppl. 298.) plant dark green; flowers sessile, capitate; involucrum short; calycine scales 6, ovate, acute, not above half as long as the calyx; leaves narrow, scabrous. 2. H. Native of Tauria and Caucasus, and on the Lower Volga, abundant. D. atràtus, Beaupre in litt.? Flowers pale red.

Polymorphous Pink. Fl. Ju. Oct. Clt. 1817. Pl. 1 foot.

22 D. DIU'TINUS (Kit. in Link. enum. 1. p. 419.) plant green; flowers paniculately-fastigiate and solitary, stalked; calycine scales ovate, acute, not above half the length of the calyx; leaves narrow, scabrous. 2. H. Native of Hungary. Sweet, fl. gard. icon. ined. Flowers pale red.

Durable or Day Pink. Fl. June, Aug. Clt. 1816. Pl. 1 ft.

23 D. BALBI'SII (Ser. mss. and D. C. prod. 1. p. 356.) plant glaucous; flowers almost sessile, in capitate bundles; calycine scales lanceolate, spreading a little, shorter than the tube; leaves lanceolate-linear; stem angular. 2. H. Native near Genoa, Sweet, fl. gard. n. s. t. 23. D. glaucophýllus, Horn. ex herb. Balb. Leaves lanceolate-linear, not unlike those of the *carnation*. Flowers red.

Var. β, *paniculàtus* (Ser. mss. and D. C. l. c.) flowers in panicled bundles.

Balbis's Pink. Fl. Aug. Oct. Clt. 1817. Pl. 1 to 2 feet.

24 D. GIGANTE'US (D'Urv. enum. pl. archip. p. 45.) plant green; flowers numerous, sessile, disposed in hemispherical

heads, supported at the base by leafy bracteas; calycine scales ovate, acuminated, pressed to the calyx, much shorter than the tube; leaves linear, very long, connate at the base a long way; stem round. ♃. H. Native on the shores of Bulgaria on rocks by the sea-side. Sweet, fl. gard. 208. Flowers of a rusty purple colour.

Giant Pink. Fl. July, Oct. Clt. 1828. Pl. 2 to 4 feet.

25 D. FERRUGI'NEUS (Lin. mant. 563.) flowers aggregate; involucres and calycine scales scarious, brown, oblong, awned, both a little shorter than the calyx; leaves linear, connate at the base. ♃. H. Native in the Pyrenees about Narbonne. —Barrl. icon. t. 497. Mill. dict. icon. 1. t. 81. f. 1. Perhaps a variety of *D. Carthusianòrum*. Petals bifid; segments 3-toothed, rufous on the under surface and yellow on the upper surface.

Ferrugineous-petalled Pink. Fl. Jul. Sept. Clt. 1756. Pl. 1 ft.

26 D. CARTHUSIANÒRUM (Lin. spec. 586.) flowers aggregate, capitate, stalked; calycine scales 4, ovate, awned, shorter than the tube; involucre oblong, awned, shorter than the head of flowers; petals crenate, bearded; leaves linear, 3-nerved. ♃. H. Native in uncultivated and sterile places almost throughout the whole of South Europe. Lois. prus. 37. f. 7. Smith, fl. græc. t. 392. Flowers red.

Carthusians' Pink. Fl. July, Aug. Clt. 1573. Pl. 1 foot.

27 D. ATRORU'BENS (All. ped. no. 1548. Jacq. icon. rar. 3. t. 467.) flowers sessile in aggregate heads; calycine scales ovate, awned, shorter than the tube; involucre ovate, awned, shorter than the head of flowers; petals bearded? leaves linear, 3-nerved. ♃. H. Native of Vallais and Austria. Flower small, dark red.

Var. β, mìnus (Ser. mss. and D. C. l. c.) almost stemless; flowers aggregate. Native of St. Gothard.

Var. γ, anisópodus (Ser. mss. and D. C. l. c.) flowers aggregate, stalked and sessile. D. atrorùbens, var. prólifer, Schleich. pl. helv. Native of Vallais, also about Paris. Flowers dark red.

Dark-red-flowered Pink. Fl. July, Aug. Clt. 1802. Pl. 1 ft.

28 D. RUTHE'NICUS (Rœm. in Poir. suppl. 4. p. 131.) flowers solitary or aggregate; calycine scales involucrate, lanceolate, acute, shorter than the tube; leaves linear, acute. ♃. H. Native of Russia. D. pàtens, Horn.? Flowers purplish.

Russian Pink. Fl. June, July. Clt. 1816. Pl. 1 foot.

29 D. A'SPER (Willd. enum. p. 466.) flowers aggregate, in bundles; calycine scales ovate-lanceolate, pointed, shorter than tube; petals bearded, acutely toothed; leaves linear-lanceolate, 3-5-nerved, serrulated, and are scabrous as well as stem. ♃. H. Flowers red, pale beneath.

Var. α, angustifòlius (Ser. mss. and D. C. prod. 1. p. 357.) few-flowered; leaves linear, acute. Native of Vallais. D. scàber, Schleich. ex Sut. fl. helv. 1. p. 259. D. serràtus β, D. C. fl. fr. 5. p. 601.

Var. β, collìnus (Ser. mss. and D. C. l. c.) many-flowered; leaves linear-lanceolate. Native in Hungary. D. collìnus, Waldst. et Kit. hung. 1. p. 36. t. 38. Sal. par. lond. t. 62. D. umbellàtus, D. C. cat. hort. monsp. p. 104.

Var. γ, serràtus (Ser. mss. and D. C. l. c.) stems 1-3-flowered; flowers larger than the preceding varieties; leaves linear. Native of the Eastern Pyrenees. D. serràtus, Lapeyr. abr. 241. and D. C. fl. fr. 5. p. 601. var. α.

Rough Pink. Fl. July, Sept. Clt. α 1817, β 1800. γ 1817. Pl. ¾ foot.

* * * *Shrubby. Flowers aggregate.*

30 D. ARBÒREUS (Lin. spec. 590.) stem shrubby; flowers aggregate; claws of petals very long; calycine scales numerous, mucronulate, closely imbricated, very short; leaves linear-glaucous. ♄. G. Native of Crete on rocks by the sea-side. Lodd. bot. cab. t. 459. Smith, fl. græc. t. 406. Flowers large, pink, palest beneath. Petals pilose at the base, and with 3 deeper coloured lines.

Tree Pink. Fl. June, Aug. Clt. 1820. Shrub 1 to 2 feet.

31 D. ARBU'SCULUS (Lindl. bot. reg. t. 1086.) flowers panicled, aggregate, solitary; leaves lanceolate, and are as well as shrubby stem glabrous; calycine scales 4, broad-ovate, leafy, erect; petals toothed. ♄. G. Native of China. Flowers single or double, of a rich purple crimson, inner petals spotted at the base.

Little-tree Pink. Fl. Jul. Oct. Clt. 1824. Shrub 1½ foot.

32 D. ACIPHY'LLUS (Sieb. ex sicc. D. C. prod. 1. p. 358.) shrubby; flowers panicled, few, somewhat aggregate; bracteas obovate, very blunt, somewhat obcordate, and very acutely mucronate, one-half shorter than the calyx; petals entire or 2-lobed; leaves rather distich, linear, pungent, not striated, numerous, with the margins scarcely serrulated. ♄. F. Native of Crete. Flowers red?

Pointed-leaved Pink. Fl. July, Aug. Shrub 1 foot.

33 D. JUNIPERI'NUS (Smith, in Lin. trans. 2. p. 303.) stem shrubby; flowers aggregate, rather corymbose; scales of calyx 4, obovate, mucronate, one-half shorter than the tube; leaves awl-shaped, pungent. ♄. F. Native of Greece. Flowers red. Petals deeply crenate.

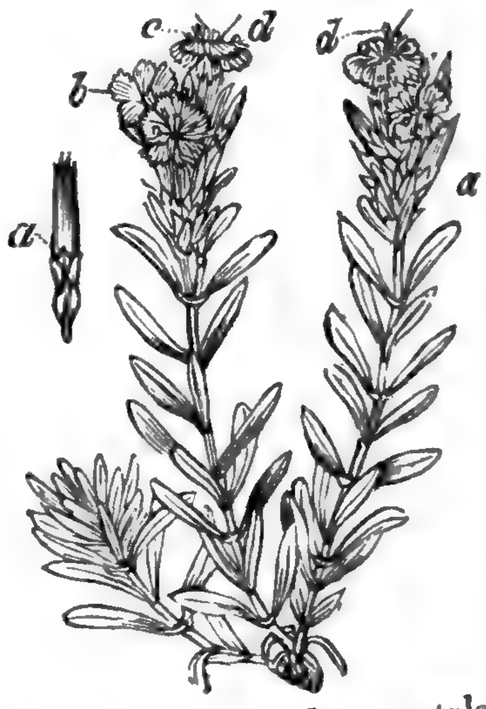
Juniper-like Pink. Fl. July. Shrub ½ foot.

34 D. RUPI'COLA (Biv. Bern. sicul. cent. 1. p. 31.) flowers aggregate in bundles, bracteate; calycine scales imbricate, in 3 series, short, ciliated, outer ones bristly awl-shaped, very long; petals bearded; leaves thickish, linear, semicylindrical, glaucous, stiff, very entire, connate at the base. ♃. F. Native in the fissures of rocks in Sicily and Calabria. Flowers rose-coloured, fragrant. D. Bisignàna, Tenor. cat. giard. S. Bisig. 1809. p. 18. fl. neop. t. 39. D. involucràtus, Poir. suppl. 4. p. 132.

Rock-inhabiting Pink. Fl. May, Aug. Clt. 1820. Sh. 1 ft.

35 D. FRUTICÒSUS (Lin. spec. 591.) stem shrubby; flowers aggregate; claws of petals equal in length with the calyx; calycine scales numerous, mucronulate, closely imbricate, very short; leaves obovate, lanceolate, obtuse. ♄. F. Native of Crete. Smith, fl. græc. t. 407. Tourn. itin. 1. p. 183. t. 9. Flowers dark in the middle, rose-coloured in the circumference, and white and pilose at the base.

FIG. 78.



Shrubby Pink. Fl. July, Sept. Clt. 1815. Shrub 1 to 2 feet.

36 D. SUFFRUTICÒSUS (Willd. enum. 466.) stem suffruticose; flowers somewhat aggregate; calycine scales ovate, awl-shaped, thrice as short as the tube; petals beardless; leaves linear-lanceolate, and are scabrous as well as the stem. ♄. F. Native? Bracteas linear-reflexed. Nerve of the calycine scales protruding and reflexed. Corolla large, pink. Bracteas reflexed.

Subshrubby Pink. Fl. June, July. Clt. 1804. Shrub 1½ ft.

SECT. II. CARYOPHY'LLUM (from *καρυοφυλλον*, the Greek name of the clove, in allusion to the flowers of *D. caryophýllus* smelling like the clove). Ser. mss. and D. C. prod. 1. p. 357. Flowers either panicled or solitary.

* *Stem few or many-flowered, panicled, scattered. Petals crenate or toothed.*

37 D. CAMPE'STRIS (Bieb. fl. taur. 1. p. 326.) stem branched, rather hairy; branches 1-flowered; calycine scales 4, ovate, acute, one-half shorter than the calyx; leaves awl-shaped, 3-

nerved. ♃. H. Native of Tauria in sandy pastures. D. bícolor, Adams. Very like *D. ásper*. Flowers deep purple, about the size of those of *D. deltoìdes*. Petals villous at the throat.

Field Pink. Fl. July, Aug. Clt. 1815. Pl. ½ to ¾ foot.

38 D. ALPE'STRIS (Balb. act. acad. taur. 7. p. 11. t. 1.) flowers generally in pairs; calycine scales 4, two inner ones broad, mucronate; petals emarginate. ♃. H. Native in alpine pastures of Europe. Perhaps a variety of *D. nítidus* or *ásper*. Flowers red.

Alp Pink. Fl. July. Clt. 1817. Pl. ½ to ¾ foot.

39 D. NÍTIDUS (Walds. et Kit. pl. hung. 2. p. 209. t. 191.) flowers disposed somewhat in bundles, two together; calycine scales ovate, awned, shorter than the tube; petals deeply crenated; stem decumbent, flexuous, scabrous; leaves linear, lanceolate, obtuse. ♃. H. Native of the Carpathian mountains at the termination of the beech trees. Flowers red.

Shining Pink. Fl. July, Aug. Clt. 1822. Pl. ½ foot.

40 D. RAMOSI'SSIMUS (Poir. suppl. 4. p. 130.) flowers solitary; calycine scales 4, ovate, mucronate, shorter than the cylindrical tube; leaves flat, narrow; stem weak, much branched. ♃. H. Native of Tartary. Flowers white.

Much-branched Pink. Fl. July, Aug. Pl. ½ foot.

41 D. DIFFU'SUS (Sibth. and Smith, fl. græc. t. 396.) flowers somewhat corymbose; calycine scales 2, furrowed, mucronate, one-half shorter than the tube; stems diffuse, ascending, smoothish. ♃. H. Native of the island of Cyprus. Flowers usually twin, rose-coloured above and hairy at the base, reddish beneath and yellowish-green at the base.

Var. β, graminifòlius (Presl. ex Spreng. syst. append. p. 179.) leaves narrow. ♃. H. Native of Sicily.

Diffuse-stemmed Pink. Fl. July, Aug. Clt. 1820. Pl. ½ ft.

42 D. ATTENUA'TUS (Smith, in Lin. trans. 2. p. 301.) stem branched at the base; flowers solitary; calycine scales generally 6, short, lanceolate, acuminated, with membranaceous margins; calyx long, tapering at the top; petals crenated; claws exceeding the calyx; leaves awl-shaped. ♃. H. Native of the south of France by the sea-side. D. Lusitánicus, Brot. fl. lus. 2. p. 173. t. 73. D. longiflòrus, Lam. dict. 4. p. 522. Stems diffuse, much twisted and branched at the base; floriferous stems divided. Flowers flesh-coloured, scentless.

Tapered-calyxed Pink. Fl. July. Clt. 1822. Pl. ½ foot.

43 D. CAUCA'SICUS (Bieb. fl. taur. 1. p. 327.) stem branched, smooth; flowers almost sessile, solitary; calycine scales ovate, awned, erect; shorter than the calyx; leaves awl-shaped, with scabrous margins. ♃. H. Native of Eastern Caucasus in subalpine fields. Sims, bot. mag. 795. This plant differs from *D. campéstris*, in the leaves being less glaucous. The petals are more deeply toothed in the figure in the botanical magazine than they are in the wild plant, and the leaves are more glaucous. Flowers small, deep purple.

Caucasian Pink. Fl. July, Aug. Clt. 1803. Pl. ½ foot.

44 D. HI'RTUS (Vill. dauph. 3. p. 593. t. 46.) flowers generally solitary; calycine scales 6, ovate, awned, much shorter than the calyx; petals crenate, villous at the base; leaves awl-shaped, with scabrous margins. ♃. H. Native on hills in the province of Dauphiny, also in Tauria. D. scàber, Chaix. but not of Thunb. nor Schleich. D. virgíneus, Habl. Perhaps only a variety of *D. attenuàtus*. Flowers pale-red. Stem pubescent, simple or a little branched at the top.

Hairy Pink. Fl. July, Aug. Clt. 1821. Pl. ½ to 1 foot.

45 G. GUTTA'TUS (Bieb. fl. taur. 1. p. 328. suppl. 300.) stem panicled, smooth; flowers solitary; calycine scales 4, ovate, awned, about equal in length to the tube; leaves awl-shaped, nervously striated, scabrous. ♃. H. Native in fields about Odessa, &c. Petals purple, marked with numerous white spots.

Spotted-flowered Pink. Fl. July, Sep. Clt. 1816. Pl. ½ to 1 ft.

46 D. PALLIDIFLÒRUS (Ser. mss. and D. C. prod. 1. p. 358.) stem smooth, loosely panicled; flowers solitary; calycine scales ovate-lanceolate, awned, one-half shorter than the tube; leaves awl-shaped, straight, with scabrous margins. ♃. H. Native in grassy places on the borders of the river Volga. D. pállens, Bieb. fl. taur. 1. p. 325. suppl. 298. but not of Sibth. Flowers pale-red, rather villous at the base.

Pale-flowered Pink. Fl. Ju. Aug. Clt. 1817. Pl. 1 to 2 ft.

47 D. VERSÍCOLOR (Fisch. in Link. enum. 1. p. 420.) stem panicled, many-flowered, smooth; calycine scales cuspidate, spreading, shorter than the tube; petals from the throat pubescent; leaves linear, roughish. ♃. H. Native of the Russian empire. Flowers red above and yellowish beneath?

Party-coloured-flowered Pink. Fl. July, Aug. Clt. 1823. Pl. ½ to 1 foot.

48 D. PUBE'SCENS (Sibth. and Smith, fl. græc. t. 397. prod. 1. p. 286. and D'Urv. enum. 47.) stem ascending, villous, 2-5-flowered; flowers solitary; calyx scales ovate, awl-shaped, twice as short as the tube; calyx striated, villous, clammy, with short teeth; leaves linear, villous. ♂. H. Native of Greece about Athens. Sweet, fl. gard. n. s. t. 27. Flowers deep rose-coloured above, dotted and hairy at the base, but greenish-yellow beneath.

Pubescent Pink. Fl. June, July. Clt. 1820. Pl. ¾ foot.

49 D. PRATE'NSIS (Balb. fl. taur. suppl. 300.) stem suffruticose, panicled; flowers solitary; calycine scales leafy, acuminated, rather pressed to the calyx, outer ones lanceolate, equal in length with the tube, inner ones shorter, ovate at the base; petals acutely toothed, rather bearded; leaves linear-lanceolate, lower ones bluntish, lanceolate. ♃. H. Native of Tauria. D. ochroleùcus, Link. enum. 1. p. 420. but not of Persoon. D. Tatáricus, Fisch. in litt. Flowers pale-yellow, greenish beneath.

Meadow Pink. Fl. July, Sep. Clt. 1820. Pl. ½ to 1 foot.

50 D. MONTA'NUS (Bieb. fl. taur. 1. p. 328.) stem smooth, branched at the top, crowdedly dichotomous; flowers solitary, approximate; calycine scales 6, ovate, awned, shorter than the tube, with a leafy spreading point; leaves linear-awl-shaped, 3-nerved, hairy. ♃. H. Native of Caucasus on grassy mountains. D. díscolor, Sims, bot. mag. 1162.? Flower large, purple, olive-coloured on the under surface. Petals sharply-toothed, villous in the throat.

Mountain Pink. Fl. July, Sep. Clt. 1803. Pl. ¾ to 1 foot.

51 D. OCHROLEU'CUS (Pers. ench. 1. p. 494. but not of Link.) stems elongated, branched; flowers solitary; calycine scales 2, ovate-lanceolate, almost one-half shorter than the tube; segments of calyx narrow, long; petals obovate-linear, almost entire; leaves short, linear-awl-shaped. ♃. H. Native of the Levant. Flower small, pale-yellow, or whitish.

Cream-coloured-flowered Pink. Fl. July, Aug. Pl. 1 foot.

52 D. CARYOPHY'LLUS (Lin. spec. 587.) stem branched; flowers solitary; calycine scales 4, very short, ovate, rather mucronate; petals very broad, beardless; leaves linear-awl-shaped, channelled, glaucous. ♃. H. Native of the south of France; in England on old ruinous walls, particularly on Rochester, Deal, Sandown, and other old castles, plentifully on walls in Norwich, and other old towns. Smith, engl. bot. t. 214. Sims, bot. mag. t. 39. Flowers from single to double, white, yellow, purple, and variegated, indeed of all colours, blue excepted.

Var. β, flòre plèno; flowers double, called *Carnation*, Sims, bot. mag. t. 89.

Var. γ, fructicòsus; called *Tree Carnation*.

Var. δ, imbricàtus (Sims, bot. mag. t. 1622.) branches short; calycine scales numerous, imbricating; called *Wheat-ear Carnation*, or *Clove*. The flowers of the *Clove Gillyflower* or *Clove Pink* are used in pharmacy to give a pleasant flavour and beautiful colour to an officinal syrup. The variety which is officinal surpasses all the others in the richness of its smell; it is of a

dark blood colour, with the stigmas protruding beyond the petals.

Var. ε, cardùinus (Ser. mss.) leaves, calyx, and petals beset with fistular prickles. D. caryophýllus var. Tratt. in flora, 1821. p. 717. icon.

The flowers of the *Clove* are very variable in size and colour, the double varieties of which are called *Carnations*, and the smaller flower of the latter are called *Picotees*.

D. caryophýllus is considered the source whence have sprung the numerous varieties of the *Carnation* and the *Picotee*. The *Carnation* seems to have been unknown to the ancients, at least in its cultivated state, not being mentioned by Pliny, or sung by any of the Roman poets. It has, however, been cultivated from time immemorial in Europe, and is in the highest favour for its beauty and rich spicy odour. It is the principal florist's flower in Germany and Italy, from which countries the British florists procure their best Carnation seed, and also some esteemed varieties. The varieties amounted nearly to 400 named sorts in the beginning of the eighteenth century, and the number has not since diminished. They are arranged in three classes, *flakes*, *bizarres*, and *picotees*. *Flakes* have two colours only, and their stripes large, going quite through the leaves of the flower. *Bizarres*, (Fr. odd, irregular,) are variegated in irregular spots and stripes, and with no less than three colours. *Picotees*, (Fr. piquettee, pricked or spotted,) have a white ground, spotted or pounced with scarlet, red, purple, or other colours. Of each class there are numerous varieties, arranged under farther subdivisions, according to the predominance of the colours, as scarlet-flake, pink-flake, purple-flake, yellow-flake, &c.; scarlet-bizarre, crimson-bizarre, &c.; and purple-picotee, yellow-picotee, &c. *Picotees* are rather smaller flowers than *Carnations*, and are distinguished by the serrated margins of their petals; the colours are principally yellow and white spotted, and the plants are considered hardier than the other sorts. Whatever colours the flowers may be possessed of, they should be perfectly distinct, and disposed in long regular stripes, broadest at the edge of the lamina, and gradually becoming narrower as they approach the claw or base of the petal, there terminating in a fine point. Each petal should have a due proportion of white, *i. e.* one-half, or nearly so, which should be perfectly clear and free from spots. *Bizarres*, or such as only contain two colours upon a white ground, are esteemed rather preferable to flakes, which have but one, especially when their colours are remarkably rich and very regularly distributed. Scarlet, purple, and pink, are the three colours most predominant in the *Carnation*, the two first are seldom to be met with in the same flower, but the two last are very frequently. New varieties are procured from seeds, and thousands of seedlings are annually blown by florists and amateurs, sometimes without one being found worth keeping. Established or approved varieties are continued by layering or cuttings, or as they are commonly called pipings. The soil in which the *Carnation* thrives best is a rich loam rather sandy than otherwise; the climate should be free from extremes of every kind, for which reason they are commonly grown in pots, and protected by a frame during winter, and covered by an awning while in bloom. *Carnations* grow exceedingly well in beds of properly prepared soil, over which frames are placed in winter, and an awning of canvas or bunting when the plants are in blossom.

Propagation by layers. The time of performing this operation is when the plants are in full bloom. Layering, by the wounds it inflicts, considerably impairs the bloom, and generally kills the parent plant. The practical part of the operation has nothing remarkable in it; a sufficient quantity of hooked pegs and of compost being provided; the pot containing the plant to be laid is placed on a table, and the layers prepared by cutting off their lower leaves, the earth is then stirred and the pot filled up with light rich mould, not of too fine a grain. The incision is made by entering a quarter of an inch below the joint, and passing the knife up through the centre of it; the shoot is then to be pegged down, and buried not more than half an inch deep. Maddock says it is adviseable to peg down the layers when in a dry state, being then less brittle than when they are wet and succulent; for this after the layers have been dressed, the pot should be placed half an hour in the sun, in order to render them more flaccid and pliant than they otherwise would be. When the layers have been properly rooted, which will be the case with most sorts in about three weeks after laying, provided due care be taken in keeping them regularly moist, and shading them from the heat of the meridian sun; they are then to be cut off from the old plant with about half of the stalk which connects them with it, and be immediately planted in small pots, three or four plants in each, placed round the sides. The pots are to be placed under an arch of hoops, where they can be covered with mats in case of excessive rains, till the severity of the winter renders it necessary to remove them into their winter repository, which is to be constructed as follows:—there should be a bed of coal-ashes formed in the place where it is to be erected, six inches thick; or a platform of square tiles, closely fitted together, rows of bricks are to be placed in lines, 3 inches asunder, which will allow a free circulation under and between the pots placed upon them. Two rows of substantial stakes should be stuck into the ground on each side, 3 or 4 inches distance from the outer pots, and have notches cut on their tops to receive the edges of the shutters. Three shutters, which will reach the whole length on one side, and three of the notched stakes will be sufficient to support the shutters, and will give room to move them backwards and forwards without any chance of slipping. It is necessary that a row of stakes should be placed between the two middle rows of pots to support the shutters when closed. The south side should consist of frames of glass in severe weather, so as to admit light when they cannot be opened.

Hogg commences laying when the flowers are sufficiently expanded to shew which are in colour or true to their kinds, or which not; this he finds to be about the 21st of July, and he continues laying from that time to the 21st of August. The plants receive a good watering the day previous to layering, because they can receive it only through a fine rose of a watering pot for some time after, for the purpose of preserving the earth on the layered shoots. In performing the operation he cuts off the extreme end of the tongue below the joint, because if left on it is apt to decay and prevent the protrusion of the granulous matter from which the fibres issue; under favourable circumstances they will be fit to take off in 6 or 7 weeks, and may then be planted 2 or 3 in a no. 48 pot. The pots are then to be set on tiles, slates, or boards, there to remain till the middle or end of October. *Hogg's Treatise*, p. 56.

Propagation by pipings. This mode of propagating *Carnations* is very precarious, as seldom so many as the half ever strike root; nevertheless some sorts succeed better by pipings than by layers, and make healthier plants; it requires attention to discover such sorts from the rest. Pipings, however, are a very necessary resource, where the shoots are too short for laying, or where the laying shoots are broken by accident. The first thing to provide is a slight hot-bed, cover it 4 or 5 inches thick with fine light mould, laid regularly and even. The piping should have two or even three complete joints; they are to be cut horizontally, close under the second or third joint. Some people recommend the shortening of the leaves, but this we think is rather deleterious than otherwise, both in piping and in laying. The earth of the bed where the pipings are to be planted should be moderately moistened, then take a small

hand-glass, and make an impression on the surface, in order to know where to put in the pipings. The pipings should then be planted in neatly and regularly, but never more than half an inch deep, and about an inch distant from each other; after this they should receive a gentle watering, in order to fix the earth more closely about them, and thereby keep out the air; after this watering they are to remain open, but not exposed to the sun till their leaves become dry, after which the glass is to be placed over them carefully on the same mark that was made by it previously upon the surface of the soil. The bottom edge of the glass is to be pressed into the soil to prevent the admission of too much air. What further remains to be done is diligently to attend to their management with respect to sun and air. The soil ought to be kept regularly moist until they have emitted fibres. Whenever they are watered the glasses should remain off until their leaves are dry. The pipings should have a little of the morning sun, but must be shaded when the heat becomes considerable; this may be prevented by placing mats upon a slight frame of hoops. The glasses should be occasionally taken off to admit air, dull cloudy warm weather is the best time, but if this should not occur, the glasses may be removed a little time in the morning. After the cuttings are tolerably well rooted, the glass may be taken off altogether, as they will be no longer necessary. But as the pipings do not all root at one time, those that strike first should be taken out and planted in pots, these may be known by the superior verdure and growth of the plants.

It is necessary to know the exact plants that the pipings have been taken from, because it seldom happens that the pipings taken from run or degenerated flowers, produce any thing but run flowers, and consequently not worth preserving. The layers and pipings of the most beautifully variegated flowers will frequently produce run blossoms, but it is impossible to prevent this, especially amongst the rich high-coloured sorts, when they grow in a rich compost. Hogg begins sooner to put in pipings than putting down the layers, before the shoots get hard and woody; he begins about the 1st of July. Plants raised from pipings are much sounder than those raised from layers, but still as layering is the surest mode he only makes pipings of such shoots as appear crowded, or too short, or too high up on the plant, to be laid easily. He plants them on a bed of dung blood warmth, in a compost of equal parts of maiden earth, leaf-mould, rotten horse dung, adding a portion of sand equal to a sixth of the mass, finely sifted together, that the cuttings when stuck in may enter easily and without injury. The best glasses for pipings are those made of common window glass, 8 inches square and 6 inches deep, and the less air they contain the sooner will the cuttings strike root. If the weather proves dry and hot they will require to be watered occasionally with a fine rose early in the morning over the glasses, which for one fortnight at least need not be removed if they are doing well. After this the glasses may be taken off for half an hour occasionally in the morning, and dried before they are put on again, and if you find any of the pipings mildewed or rotten, pull them up. At the end of 6 weeks they will be sufficiently rooted to be transplanted into small pots or a prepared bed, over which it would be adviseable to place a frame and lights for a week or ten days, till they take fresh root. There they may remain till the middle of September. In taking them up, if you find any not rooted, but sound, and their ends hard and callous, do not let them remain upon the same spot, but remove them to another bed, with a little temporary heat, and cover them with glasses as before; this will not fail to start them, and hasten their fibring.

Propagation by seed. *Carnation-seed* is rather difficult to raise or ripen in this country, owing to the moisture and cold of the autumnal months. It is generally procured from Vienna, and different towns of Switzerland, and if put in vials and well corked will keep for years. To raise it in this country Maddock gives the following directions. Those flowers which have few petals generally produce most seed, but they should be possessed of the best properties in other respects, viz. their petals should be large, broad, substantial, and perfectly entire at the edge, and their colours rich and regularly distributed, and in due proportion throughout the whole blossom. The plants should be selected from the rest, and their pots should stand upon a stage, defended against earwigs, in an open part of the garden, in which situation they should remain during bloom, and until the seed is perfectly matured; their blossoms should be defended against rain, by having glass paper or tin covers suspended over them in such a manner as to admit the free circulation of the air; the pots should neither be kept very wet nor very dry; nor will it be proper to cut or mutilate the plants either for their layers or for pipings, till the seed becomes ripe, because it would certainly weaken them, and consequently injure, if not destroy their seed. When the bloom is over, and the petals become withered and dry, they should be carefully drawn out of the pod or calyx, being apt to retain a degree of moisture at their base, engendering a mouldiness or decay in that part, which will destroy the seed. There is another method adopted successfully in ripening seed, which is, when the petals begin to decay, they are to be taken out as above, taking care to leave the two styles; the calyx is then to be carefully shortened, and an aperture made on one side of the remainder, so that no water can possibly get between the capsule and the calyx; but this must be performed with great care, not to injure the capsule. It is best to allow the open side of the calyx to incline a little down, so as to prevent moisture from entering. The seeds ripen in August; this may be known by the capsule turning brown, or the seed black, or of a dark-brown colour, but if gathered before it is perfectly ripe, the greatest part proves small, pale-coloured, and unproductive. When gathered it should remain in the capsule till the middle of May in the next year; it is then to be sown in pots filled with the compost, and have a little fine mould sifted upon it, barely sufficient to cover the seed; the pots should then be placed in an airy situation in the garden, be shaded from the heat of the sun, and kept moderately moist, but never very wet. As soon as the young plants have six leaves, and are about three inches high, they should be planted out on a bed of good rich garden mould at about 10 or 12 inches asunder, and be defended from excess of rain and severe frosts by mats on hoops, placed over the bed in the usual manner; they will generally blow the following summer. Hogg's directions differ in nothing of importance from Maddock's. He says it often happens out of 200 blooming plants, you will not be able to get two pods of perfect seed. More seed was saved in the dry summer of 1818, than in any seven preceding years. Seedlings require two years to bloom, and the chance of getting a good new flower is reckoned as 1 to 100. If a florist raises 6 good new *Carnations* in his life time he is to be considered fortunate. Seed out of the same pod, he says, is reported to produce flowers of all the different varieties, flakes, bizarres, &c. Emmerton experienced that seed from a scarlet flake will produce a scarlet-bizarre and a rose or pink flake.

Soil.—Hogg takes three barrows of loam, one and a half of garden mould, ten ditto of horse-dung, one ditto of coarse sand; let these be mixed and thrown together in a heap, and turned two or three times in the winter, particularly in frosty weather, that it may be well incorporated. On a dry day towards the end of November, he takes a barrow full of fresh lime, which, as soon as it is slacked, he strews over while hot in turning the heap; this accelerates the rotting of the fibrous particles of the loam, lightens the soil, and destroys the grub-worms and

slugs. If there has been much rain during the winter, so that the strength of the compost is reduced, and the salt washed from it, he takes about seven pounds of damaged salt, and adds it to it, either dissolved in water or strewed over with the hand; this he finds to be attended with the most beneficial result upon the future health and vigour of the plants. During very heavy rains many florists cover their compost with tarpaulin or double mats, to prevent the nutritious particles from being washed out; this is also an excellent precaution. This compost is allowed to lie at least six months before it is used. For flowers that are apt to sport in colour, and yellow picotees, he lowers the compost, and uses three barrows of sound staple loam, two ditto old rotten cow-dung, one ditto horse-dung, a half ditto sand, a half ditto lime rubbish, to be prepared and well incorporated as before.—*Hogg's Treatise*, &c. p. 45.

Maddock's compost (Florist Direct.) is as follows:—one-half rotten horse-dung, one year old, one-third fresh sound loam, one-sixth coarse sea or river sand. These ingredients are to be mixed together in autumn, laid in a heap about three feet thick, turned three or four times during winter, and in frosty weather it should be laid sufficiently thin, in order that the whole mass may be thoroughly frozen, this will be fit for use the following spring; the earth and sand may be added to it in March, the whole should then be well mixed. Where the air is pure, experience has pointed out the propriety of using less dung and more loam, therefore the quantity of sand, loam, and dung should in this case be reversed.

Pots and potting.—The select kinds are always grown in pots. Maddock uses pots 12 inches wide at the top, 6 inches at the bottom and 10 inches deep, with a hole at the bottom an inch in circumference, also three or four smaller holes round the sides at the bottom, to prevent the possibility of water lodging in the pot. Hogg uses pots rather smaller than those recommended by Maddock, 12 or 16 to the cast. Potting should commence about the middle of March, but it should never be deferred later than the end of the month: this is to be done in the common way of potting, but the earth should be much more raised at the edges of the pots than in the centre. It is necessary in the repotting the plants that they neither should be planted deeper nor shallower than they were before, within an inch of the top of the pot, this is necessary for the purpose of laying, as they will then require additional mould. Hogg considers the first week in April the safest and best time to pot *Carnations*.

General culture.—When the plants are potted off for bloom, the pots should be placed in an open airy part of the garden, under an arch of hoops, that in case of cold drying winds, heavy rains or frosty nights, mats may be thrown over to preserve them from such unfavourable weather; but in this situation they are always to remain open, except in the cases above mentioned, and to be kept regularly watered with soft water from a fine rose watering-pot. When their flower-stems are grown 8 or 10 inches high it will be necessary to support them with sticks, to which the stems are to be loosely tied with twisted pieces of bass-mat; this should be carefully looked after, as the stems are extremely brittle and apt to be broken by the wind. When the stems have grown about a foot and a half high, the plants should be removed to the stages, there to remain till they flower.

If any small green winged insects appear on the plants, they must be effectually extirpated, either by means of a small soft brush or feather, by the application of a strong infusion of tobacco-water, or some similar easy and safe expedient; even Scotch snuff, dusted upon the infested parts early in the morning, while the plants are wet with the dew of the night, has been sometimes tried in this case with success.

The calyx of many sorts are apt to burst on one side, if not timely prevented, and totally destroy that compact graceful circular form which a perfect flower ought to possess; but this may be entirely prevented by fastening a small, narrow slip of bladder round the middle of the calyx, where it is most swelled, and appears to have the greatest inclination to burst; these slips should lap over at the ends and be fixed by a little gum-water. Small slips of bass-mat, tied with a single knot, will answer nearly as well. When any of the flowers open, such should be shaded both from sun and rain by means of paper covers, about 12 inches in diameter, painted white or green, and formed like an umbrella; each should have a tin tube in the centre, that will permit the stick to which the stem is tied to pass through it as far as is necessary. But when the major part are in bloom a cloth awning should be placed over the whole, and be drawn up or let down in the same manner and on the same occasions as for the bloom of hyacinths and tulips. As earwigs are very destructive to the flowers of *Carnations*, it is necessary to have a reservoir of water round the stages in order to prevent them, at all events the plants should be frequently examined.

Those who are particularly curious in blowing their carnations, carefully extract such petals as are plain or run from their true colours; they perform this by means of an instrument adapted to the purpose, and with the same arrange the remaining petals so as to supply the defect; in like manner they dispose the whole with such regularity, that the flowers appear to have an equal distribution of beautiful petals; and if the blossoms consist of too many petals, they extract the smaller ones, and thereby afford the others more room to expand. Four or five plants in a pot have always a more elegant appearance than one or two, and seldom more than four or five blossoms should be allowed to expand on the same plant; the smaller buds should be picked off.

Carnations are to be treated in winter much like *auriculas*; they are seldom injured by a moderate dry frost, though it is safer to defend them from too much of it; but it is necessary to caution against covering up too close when the plants are wet, as they are apt in that state to contract a destructive mildew, if they have not the benefit of a free circulation of air; this mildew makes its first appearance in purple spots on the foliage, which can only be cured or prevented from spreading amongst the adjacent plants by cutting of the infected parts, or removing the plants so diseased. It is necessary to defend the plants from excessive rain in winter and autumn, for it is safer at this season to keep them rather too dry than too moist, but a moderate degree of moisture is always to be preferred, except when the weather is severely frosty. As too long a deprivation from light is at all times prejudicial to plants, whenever the winter repository is required to be closely covered up with mats for several days and nights, no opportunity should be lost during the middle of the day, if the sun shines, to take off the mats in front of the glasses. When the pots become green with moss on the top, or too compact, it will be proper to stir it up carefully about half an inch deep, and sprinkle a little coarse dry sand upon it, this will be of great service to the plants and may be repeated as often as necessary. In spring, before the potting commences, the pots will probably require to be frequently watered. Hogg gives a top dressing to his blooming plants about the middle of June, with about half an inch of rotten horse-dung, passed through a sieve, which he finds materially to assist the plants, and promote the growth of the shoots for layers. He waters freely while the flower-buds are swelling, and during the whole time they are in blossom. As soon as the side shoots appear, a paper collar is put round the bottom of the blossom to support it. These collars are made of white card paper, of the form of a circle, 3 or 4 inches in diameter,

with a hole in the centre just large enough to admit the calyx without much compressing, and with a cut extending from the centre to the outside. On these cards the flower is preserved in shape and form a long time, on these the petals are also finely disposed, and the beauty of the *Carnation* displayed to great advantage.

When placed on the stage they should have the benefit of the morning sun till about 9 o'clock, according to the intense heat of its rays; the same in the evening, with as much open exposure to the air at all times, as may be allowed without injury to the bloom. In winter Hogg preserves them in frames, in the same manner as he recommends for *auriculas*. When he has more plants than he can blow in pots, he plants them in beds of the same compost used for the others, protecting them from severe frosts and heavy rains, and in other respects treating them in the same manner as if in pots.—*Hogg's Treatise.*

Criterion of a fine double Carnation.—The stem should be strong, tall, and straight; not less than 30 inches or more than 45 inches high; the footstalks supporting the flowers should be strong, elastic, and of a proportionate length. The flower should be at least 3 inches in diameter, consisting of a great number of large, well-formed petals, but neither so many as to give it too full and crowded an appearance, nor so few as to make it appear thin and empty. The petals should be long, broad, and substantial, particularly those of the lower or outer circle, commonly called the guard leaves, these should rise perpendicular about half an inch above the calyx, and then turn off gracefully in an horizontal direction, supporting the interior petals, and altogether forming a convex and nearly hemispherical corolla. The interior petals should rather decrease in size as they approach the centre of the flower, which should be well filled with them. The petals should be regularly disposed alike on every side, imbricating each other in such a manner as that both their respective and united beauties may captivate the eye at the same instant; they should be nearly flat, however, a small degree of concavity or inflection at the broad end is allowable, but their edges should be perfectly entire, that is to say, free from fringe or indenture. The calyx should be at least one inch in length, terminating in broad points sufficiently strong to hold the narrow bases of the petals, in a close and circular body. Whatever colours the flowers may be possessed of, they should be perfectly distinct, and disposed in long, regular stripes, broadest at the edge of the lamina, and gradually becoming narrower as they approach the unguis or base of the petal, there terminating in a fine point. Each petal should have a due proportion of white; *i. e.* one half or nearly so, which should be perfectly clear and free from spots.

Clove Pink, Carnation, and Picotee. Fl. June, Aug. England. Pl. 1 to 3 feet.

53 D. SYLVE'STRIS (Jacq. coll. 1. p. 237. icon. rar. t. 82.) stem branched or simple; flowers solitary; calycine scales 4, very short, ovate, outer ones acute, inner ones bluntish; petals very broad, beardless, toothed; leaves crowded, awl-shaped, stiff. ♃. H. Native on the Alps of Jura on rocks and among stones. D. virgíneus, Sims. bot. mag. t. 1740. but not of Lin. Perhaps this plant is the type of *D. caryophýllus.* Stem bearing one or many flowers. Flowers deep red, scentless.

Wild Pink. Fl. June, Aug. Clt. 1732. Pl. ¼ to 1 foot.

54 D. LONGICAU'LIS (Tenore, cat. 1819. p. 76.) stem panicled, many-flowered, tufted; flowers solitary; calycine scales ovate, all emarginate, cuspidate; leaves linear-lanceolate, thickish, glaucous. ♃. H. Native near Naples. Flowers red?

Long-stemmed Pink. Fl. July. Clt. 1820. Pl. 1 to 2 ft.

55 D. GRANDIFLÒRUS (Poir. dict. 4. p. 514.) stem? flowers somewhat aggregate; bracteas ovate, acute, one-half shorter than the tube. ♃. H. Native of Spain. Flowers red? This plant ought perhaps to be placed near *D. corymbòsus.*

Great-flowered Pink. Fl. July, Aug. Pl. 1 foot.

56 MONADE'LPHUS (Vent. hort. cels. t. 39.) glaucous; stem panicled; flowers solitary; calycine scales 4, lanceolate, rather pungent, spreading, shorter than the tube. ♃. H. Native of the Levant. D. procúmbens, Pers. ench. 1. p. 494. Calyx tapering. Ovary stipitate. Petals white, under surface cinereous, with purple margins. Filaments united at the base.

Monadelphous Pink. Fl. June, July. Clt. 1800. Pl. 1 ft.

57 D. BURCHE'LLII (Ser. mss. and D. C. prod. 1. p. 359.) stem branched; flowers solitary; calycine scales 4, ovate-lanceolate, very short, somewhat mucronate; petals deeply serrated? leaves linear, awl-shaped, striated; lower ones very numerous and very long, those of the stems and branches are very short, and scale-formed. ♃. G. Native of the Cape of Good Hope. Burch. cat. pl. afr. aust. no. 2456. Flowers white.

Burchell's Pink. Pl. 1 to 2 feet.

58 D. EMARGINA'TUS (Ser. mss. and D. C. prod. 1. p. 359.) stems tufted? 1 or 2-flowered; calycine scales very blunt and very broad; calyx short, striated, with bluntish lobes; petals emarginate, small, inside white, outside purple; lower leaves numerous, linear, flat, serrated. ♃. H. Native about Astypalea.

Emarginate-petalled Pink. Fl. July, Aug. Pl. ½ to ¾ foot.

59 D. LIBOSCHITZIA'NUS (Ser. mss. and D. C. prod. 1. p. 360.) stem generally 1-2-flowered, glabrous; calycine scales 4, ovate, acuminate, a little shorter than the tube; leaves straight, awl-shaped, with scabrous margins. ♃. H. Native on rocks in Armenia and Iberia. D. petræ'us, Bieb. fl. taur. 1. p. 328. suppl. p. 300. but not of Waldst. and Kit. D. bracteàtus, herb. Willd. ex Steven. There is a variety having the calycine scales almost one-half shorter than the tube. Flowers rose-coloured, beardless, about the size of the *clove.*

Liboschitz's Pink. Fl. June, July. Clt. 1817. Pl. ½ foot.

60 D. SYLVA'TICUS (Hoppe, in Willd. enum. 467.) stem panicled? flowers solitary or somewhat corymbose; calycine scales ovate-lanceolate. shorter than the tube; leaves linear-lanceolate, obsoletely 3-nerved, glabrous; petals doubly toothed. ♃. H. Native at Ratisbon. Flowers red?

Wood Pink. Fl. June, Sept. Clt. 1815. Pl. 1 foot.

61 D. CINNAMÒMEUS (Sibth. and Smith, fl. græc. t. 400. prod. 1. p. 287.) stem panicled or simple, branches 1-flowered; calycine scales 4, rhomboid, very blunt and very short; petals emarginate, toothed; leaves lax, bluntish. ♃. H. Native on heaths in Laconia, Asia Minor, Cyprus, and about Constantinople. Petals beardless, white or flesh-coloured above, but of a red or dark cinnamon colour beneath.

Cinnamon-coloured Pink. Fl. June, Aug. Pl. 1 foot.

62 D. POMERIDIA'NUS (Lin. spec. 1673.) stem branched; flowers solitary; calycine scales ovate, acute, very short; petals emarginate or entire. ♃. H. Native of Palestine, Smith, in Lin. soc. trans. 2. p. 300. Sal. par. lond. 57. D. trícolor, Adam. Fisch. Petals pale yellow, with revolute sides, lead-coloured on the under surface. The flowers of this plant, as well as the following, opens at mid-day and closes about 10 at night.

Afternoon-flowering Pink. Fl. June, Aug. Clt. 1804. Pl. 1 foot.

63 D. LEPTOPE'TALUS (Willd. enum. 468.) stem branched; flowers solitary; calycine scales 4, ovate, acute, very short, a little awned, 2 outer ones very small; petals lanceolate, narrow, with entire revolute sides, sometimes a little 3-toothed; leaves awl-shaped, roughish. ♃. H. Native of Caucasus. Sims, bot. mag. t. 1739. D. pomeridiànus, Bieb. fl. taur. 1. p. 329. but not of Lin. D. cretàceus, Adam. Petals white on the upper sur-

face, but lead-coloured on the under surface, sometimes entire and acutish. Perhaps a variety of *D. pomeridiànus*.

Slender-petalled Pink. Fl. Jul. Aug. Clt. 1814. Pl. 1 ft.

64 D. pu'ngens (Lin. mant. p. 240.) stem few-flowered; flowers solitary; calycine scales very short, mucronate, spreading; tube of calyx gibbous; petals entire; leaves tufted, awl-shaped. ♃. H. Native of Spain by the sea-coast. Flowers pink or white.

Var. β, Hispánicus (Ser. mss. and D. C. prod. 1. p. 360.) calycine scales ovate; petals linear, very entire. Asso, syn. no. 371. t. 3. Dufour, ann. gen. 7. p. 309. Flowers pink.

Pungent-leaved Pink. Fl. July, Aug. Clt. 1781. Pl. ½ to 1 foot.

65 D. divarica'tus (D'Urv. enum. pl. archip. p. 46.) stem branched, divaricating; branches very long, straight, 1-flowered; calycine scales 4, ovate-lanceolate, very acute, with membranaceous margins, almost equalling in length the calyx; calyx conical, striated, with the stripes granularly-dotted; petals acutely-toothed; leaves very narrow, flaccid. ♂. H. Native of the island of Samo. Flowers pale purple, but green on the outside.

Divaricate-branched Pink. Fl. July, August. Clt. 1822. Pl. ½ to 1 foot.

66 D. bi'color (Bieb. fl. taur. 1. p. 329.) stem panicled, flowers solitary; calycine scales 4, very short, almost orbicular, mucronulated; petals dilated; leaves awl-shaped, lower ones tomentose. ♃. H. Native of Tauria in arid fields. D. saxátilis, Pall. ined. taur. Stature and size of flowers like those of *D. caryophýllus*. Petals white above and lead-coloured beneath. Calycine scales truncate, mucronate.

Var. β, minor (Ser. mss. and D. C. prod. 1. p. 361.) leaves shorter; flowers smaller; calyx shorter and more turgid at the base. ♃. H. Native of the south of Tauria in stony places.

Two-coloured-flowered Pink. Fl. June, July. Clt. 1816. Pl. 1 to 2 feet.

67 D. inte'ger (Vis. in bot. Zeit. 1828.) smooth; stem prostrate, diffuse; branches ascending, 1-flowered; leaves linear, flat, with scabrous margins; calycine scales 4, broad-ovate, unequally awned; petals obovate, entire, beardless, short. ♃. H. Native of Dalmatia. Flowers small, white. Calyx dark-purple; stems decumbent, and nearly creeping.

Entire-petalled Pink. Fl. July. Pl. decumbent.

68 D. racemòsus (Vis. l. c.) smooth, root woody; stem erect, simple; leaves linear, stiff, acute, channelled with scabrous margins; flowers solitary or in fascicles, loosely racemose, secund, lower ones stalked, upper ones sessile; calycine scales in a triple series, imbricate, lanceolate, acuminated, nerved, with scarious margins; petals obovate, beardless, entire. ♃. H. Native of Dalmatia. Flowers rose-coloured, hardly sweet-scented.

Racemose-flowered Pink. Fl. July, Aug. Pl. 1 foot.

69 D. furca'tus (Balb. act. acad. taur. 7. p. 12. f. 2. but not of Horn.) stem smooth, dichotomously-branched, 2-4-flowered; flowers solitary; peduncles distant from each other; calycine scales opposite, generally twin, much shorter than the tube. ♃. H. Native of Piedmont near Tenda. D. geminiflòrus, Lois. fl. gall. p. 725? Flowers flesh-coloured.

Forked-stemmed Pink. Fl. June, July. Clt. 1819. Pl. ½ to 1 foot.

70 D. virgíneus (Lin. spec. 590.) stem generally 1 or few-flowered; calycine scales very short and very blunt, twin, distant; petals crenated; leaves tufted, linear, stiff, serrulated. ♃. H. Native about Montpelier. D. rupéstris, Lin. fil. suppl. p. 240. D. púngens, Poir. dict. 4. p. 526.—Dill. elth. 401. p. 298. t. 385? Flowers red or blood-coloured.

Var. β, subacaúlis (Ser. mss. and D. C. prod. 1. p. 361.) stems tufted, very short, 1-flowered; leaves and calycine scales short. ♃. H. Native of Mount Ventoso on rocks. D. subacaúlis, Vill. delph. 3. p. 597. Lois. not p. 66. t. 6. f. 1.

Virgin Pink. Fl. June, Aug. Clt. 1816. Pl. ½ to 1 foot.

71 D. cilia'tus (Guss. pl. rar. p. 168. t. 33.) stem erect, a little branched at the top; leaves nerveless, with ciliately-serrulated margins; flowers solitary; peduncles bifid; calycine scales 6, pressed, acuminately-awned, about one half shorter than the calyx; petals smooth, obovate, entire, or obsoletely-toothed. ♃. H. Native on arid chalky hills at the bottoms of the mountains in South Abruzzo. Plant hardly glaucous. Stem rather pubescent. Flowers of a reddish-blue colour. This plant comes near to *D. Hornemánni*, D. C. but differs from it in the leaves being nerveless, and in the petals being entire or obsoletely toothed, not deeply toothed.

Ciliated-leaved Pink. Fl. June, July. Pl. 1 to 2 feet.

72 D. deltoìdes (Lin. spec. 588.) stems ascending, branched; flowers solitary; calycine scales ovate-lanceolate, acute, 4, but generally twin; upper leaves narrow, acute, pubescent; lower ones oblong, obtuse. ♃. H. Native on sandy banks and in woods in many parts of Europe. In Britain in pastures and the grassy borders of fields on a gravelly or sandy soil and on banks. Smith, engl. bot. 61. D. supìnus. Lam. fl. fr. 2. p. 534. D. pyrenàicus, Pourr. act. toul. 3. p. 318. D. volgénsis, hort. erf. ex. herb. Balb. D. hyssopifòlius, Hort.—Dill. elth. 400. t. 298. f. 384. Flowers rose-coloured, with a dark circle.

Var. β, glaúcus (Ser. mss. and D. C. prod. 1. p. 361.) flowers white with a dark circle; leaves and stems rather glaucous. D. glaúcus, Lin. spec. 588. Native of King's Park, Edinburgh.

Deltoid-leaved or Maiden Pink. Fl. July, Oct. Britain. Pl. ½ to ¾ foot.

73 D. pa'llens (Sibth. et Smith, fl. græc. t. 399.) stem panicled, many-flowered; branches 1-2-flowered at the apex and rising from the axils of the leaves; calycine scales 4, ovate, acuminated, very short; leaves lax, acute. ♃. H. Native of Asia Minor near Smyrna. Petals beardless, bifid, white above but brownish-green beneath.

Pale-flowered Pink. Fl. June, Aug. Pl. 1 foot.

74 D. Nasaræ'us (Clark. itin. vol. 3. ex Spreng. neue. entd. 3. p. 161.) flowers solitary; stems somewhat branched; calycine scales one-half shorter than the tube, ovate, acute, pressed to the calyx; petals 6-toothed; leaves elongated, linear, awl-shaped, 3-nerved, with scabrous margins. ♃. H. Native of Palestine.

Nazare Pink. Fl. July, Aug. Pl. 1 foot.

75 D. margina'tus (Poir. suppl. 4. p. 131.) stem branched; flowers solitary; calycine scales acute, unequal, shorter than calyx; leaves linear, marginated. ♃. H. Native on Mount Jura. Very near *D. nítidus*. Scales of calyx marginated. Flowers white.

Marginated-leaved Pink. Fl. Ju. Jul. Clt. 1820. Pl. ½ to ¾ ft.

76 D. crena'tus (Thunb. prod. 81.) stem branched; flowers solitary; calycine scales 6, lanceolate, cuspidate, pressed to the calyx; petals glabrous, obovate, fringed; claws of petals longer than calyx; leaves linear-acuminated, channelled. ♃. G. Native of the Cape of Good Hope. Ker. bot. reg. 256. Flowers white. Calyx long-tubular.

Crenated-petalled Pink. Fl. Aug. Clt. 1817. Pl. 1 to 3 ft.

77 D. Sternbe'rgii (Sibth. ex cat. hort. taur. 1821. p. 24.) stems generally 2-flowered; calycine scales 4, ovate, acute, pressed, one-half shorter than the tube; petals wedge-shaped, serrated, pubescent; leaves linear. ♃. H. Flowers red.

Sternberg's Pink. Fl. June, July. Clt.? Pl. 1 foot.

78 D. biflòrus (Smith, fl. græc. t. 393.) flowers in pairs; calycine scales 4, cuneated, very obtuse, awned, spreading, shorter than the calyx; leaves linear, 3-nerved. ♃. H. Native on

Mount Delphi Eubœa. Flowers rose-coloured above and rather hairy, but smooth and cream-coloured beneath.

Two-flowered Pink. Fl. June, July. Clt.? Pl. ½ foot.

79 D. Ibe'ricus (Willd. enum. suppl. p. 24.) stem smooth; leaves roughish; calycine scales spreading, with lanceolate points; petals pubescent. ♃. H. Native of Iberia. D. Willdenòvii, Link. enum. 1. p. 420. Stem few-flowered. Bracteas spreading, a little shorter than the calyx. Flowers purple.

Iberian Pink. Fl. June, July. Clt. 1817. Pl. ½ foot.

80 D. tripuncta'tus (Sibth. and Smith. fl. græc. t. 398. prod. 1. p. 286.) stem spreading, many-flowered; flowers solitary; calycine scales scarious, finely awned, a little shorter than the tube. ♂. H. Native of the island of Cyprus. Flowers rose-coloured, palest beneath, with 3 dark short lines at the base of each petal.

Three-spotted-petalled Pink. Fl. July. Pl. 1 foot.

81 D. Hornema'nni (Ser. mss. D. C. prod. 1. p. 262.) peduncles bifid, terminal; calycine scales lanceolate-cuspidate, erect, shorter than the tube; petals cut; leaves linear, nerved, with serrulated, scabrous margins. ♃. H. Native of Italy and at Trieste. D. furcàtus, Horn. hafn. suppl. p. 47. but not of Balb. Flowers red.

Hornemann's Pink. Fl. June, Jul. Clt. 1818. Pl. ½ to 1 ft.

82 D. ri'gidus (Bieb. fl. taur. 1. p. 325. suppl. p. 298.) stems tufted, suffruticose, few-flowered; flowers solitary; calycine scales 4, ovate, acute, short; leaves awl-shaped, spreading, covered with rough pubescence. ♃. H. Native of Tauria on sandy hills near Sarepta. Stem woody, distorted. Flowers pale rose-coloured.

Rigid Pink. Fl. June, Oct. Clt. 1802. Pl. ¾ to 1 foot.

** *Stem* 1-*flowered. Petals toothed or crenate.*

83 D. serratifòlius (Sibth. and Smith. fl. græc. t. 402. prod. 1. p. 287.) stems 1-flowered, woody at the base; calycine scales 4; petals deeply toothed, beardless; leaves serrated, pungent. ♃. H. Native on Mount Hymettus near Athens. Flowers small, flesh-coloured above and ash-coloured beneath.

Saw-leaved Pink. Fl. June, Aug. Pl. ¾ foot.

84 D. clava'tus (Spreng. neue. entd. 2. p. 169.) stem 1-flowered; calycine scales twin, ovate, rather acute, very short, spreading; calyx narrowed in the middle; petals crenated, naked; leaves linear, channelled, with roughish margins. ♃. H. Native? Perhaps D. cæ'sius. (Spreng.) Perhaps D. plumàrius (Ser.). Flowers flesh-coloured?

Clavate-calyxed Pink. Fl. June, Oct. Clt.? Pl. 1 foot.

85 D. gra'cilis (Sibth. and Smith, fl. græc. t. 404.) stem 1-flowered; calycine scales generally 6, mucronate; petals crenated, bearded; leaves acuminated, with scabrous margins. ♃. H. Native of Mount Athos in Greece. Flowers rose-coloured.

Slender Pink. Fl. June, Aug. Pl. 1 to 1½ foot.

86 D. micrope'talus (Ser. mss. and D. C. prod. 1. p. 359.) stems tufted, 1-flowered; calycine scales 4, ovate-lanceolate, mucronulate, one-half shorter than the striated calyx; teeth of calyx ciliated; petals very short, toothed; radical leaves small, awl-shaped, ciliary toothed, cauline ones scale-formed. ♃. G. Native of South Africa. Leaves like those of *Plantàgo subulàta*. Calyx like that of *D. caryophyllus*. Burch, cat. pl. afr. aust. no. 1851. Flowers pale red or white.

Small-petalled Pink. Pl. ½ foot.

87 D. cæ'sius (Smith in Lin. soc. trans. 2. p. 302. engl. bot. t. 62.) stem tufted, generally 1-flowered; calycine scales 4, roundish, short; petals crenated, pubescent; leaves short, with scabrous margins. ♃. H. Native of Jura, and several other parts of Europe on rocky mountains. In England on dry limestone rocks, but rare, particularly on the abrupt precipices of Chedder rocks, Somersetshire. D. pulchéllus, Pers. ench. 1. p. 495. D. cæspitòsus, Lam. dict. 4. p. 525. D. glaúcus, Huds. ang. p. 185.—Dill. elth. p. 401. t. 298. f. 385. and referable to D. nitídus, Poir. suppl. 4. p. 131? Plant very glaucous. Flowers of a delicate rose-colour, very fragrant.

There are evidently two or three species in the gardens under the name of *D. cæ'sius*, the most common is with simple serrate petals, but the British plant has them doubly crenate.

Grey Chedder or Mountain Pink. Fl. June, July. England. Pl. ¼ to ½ foot.

88 D. alpìnus (Lin. spec. 590.) stem leafy, 1-flowered; outer calycine scales 2, about equal in length or shorter than the tube; petals crenated; leaves oblong-linear, obtuse, green. ♃. H. Native of Styria and Austria. Sims, bot. mag. 1205. Jacq. fl. austr. t. 52. D. glaciàlis var. γ, latifòlius, D. C. prod. 1. p. 362.—Clus. hist. 1. p. 283. f. 1. Flowers large, red, or rose-coloured, pale beneath, scentless.

Alpine Pink. Fl. June, July. Clt. 1759. Pl. ¼ foot.

89 D. glacia'lis (Hænk. in Jacq. coll. 2. p. 84.) stems erect, tufted, short, generally 1-flowered; calycine scales 2, elongated, equal in length with the tube or exceeding it; calyx striated; petals serrated; leaves linear, acute, serrulated, green. ♃. H. Native of the mountains of Provence and Dauphiny. D. alpìnus, D. C. fl. fr. 4. p. 746. var. β, Willd. D. negléctus, Lois. not. 65? Flowers small, purple, scentless.

Var. β, *acaúlis* (D. C. prod. 1. p. 362.) stem very short. Native of mount Cenis.

Icy Pink. Fl. June, July. Clt. 1820. Pl. ¼ foot.

90 D. re'pens (Willd. spec. 2. p. 681.) stems procumbent at the base, but erect at the top, 1-flowered; calycine scales twin, ovate, acuminated, spreading nearly the length of the tube; petals toothed, bearded; root perpendicular. ♃. H. Native of Siberia and Eschscholtz Bay. Like *D. glaciàlis*, Hænke, but the habit is more loose, and the leaves less fleshy.

Creeping Pink. Fl. June, July. Clt.? Pl. ½ foot.

91 D. e'legans (D. Urv. enum. pl. arch. p. 46. no. 875.) stem erect, straight, 1-flowered; calycine scales ovate, mucronate, equal in length to the middle of the tube; calyx striated, with blunt rather membranaceous lobes; petals toothed; leaves linear acute, very long, striated, and very entire. ♃. H. Native of the island of Cos. Flowers white?

Elegant Pink. Fl. June, July. Pl. ½ foot.

92 D. multipuncta'tus (Ser. mss. and D. C. prod. 1. p. 362.) stems erect, straight, generally 1-flowered, elongated; calycine scales ovate, with long points and membranaceous margins, equal in length to the tube; calyx punctately warted, with nerved segments; petals spotted, bearded, 3-5-toothed; leaves linear, acute, entire, very long. ♃. H. Native of the island of Cos by road sides.

Many-dotted-petalled Pink. Fl. June, July. Pl. ½ to 1 foot.

93 D. pu'milus (Vahl. symb. 1. p. 32.) tufted; scape short, 1-flowered; leaves linear, acute, smooth; calycine scales 6, oblong, acuminated, outer ones shortest. ♃. H. Native of Arabia Felix. D. uniflòrus, Forsk. cat. pl. arab. p. 111. no. 284. Calyx glabrous, striated. Flowers rose-coloured?

Dwarf Pink. Fl. June, July. Pl. ⅛ foot.

94 D. leucophæ'us (Sibth. and Smith, fl. græc. t. 405.) stem 1-flowered; calycine scales 4; petals tridentate, beardless: leaves ovate-lanceolate, 5-nerved at the base. ♃. H. Native on the summit of Mount Olympus, in Bithynia. Flowers white above and rusty beneath. A small tufted plant, woody at the neck. Calycine scales mucronate, shorter than the tube.

White-brown Pink. Fl. June, July. Pl. ¼ foot.

95 D. purpu'reus (Lam. dict. 4. p. 523. ill. t. 376. f. 2.) stem generally 1-flowered; calycine scales broad, acute, one-half shorter than the tube; petals almost entire; leaves linear,

acute, glaucous, rather ciliated. ♃. H. Native ? Calyx ample, short. Flowers purple.

Purple-flowered Pink. Fl. June, July. Pl. ½ foot.

96 D. STRI'CTUS (Smith, fl. græc. t. 403.) stem 1-flowered; calycine scales 4, short; petals crenate, beardless; leaves flat, bluntish, with scabrous margins. ♃. H. Native of Mount Athos. Flowers small, white, rather flesh-coloured in the disk.

Straight-stemmed Pink. Fl. June, July. Pl. ½ to 1 foot.

97 D. SCA'BER (Thunb. prod. p. 81. but not of Schleich.) stem 1-flowered, pubescent; calycine scales 4, lanceolate, shorter than the tube; petals entire or crenate; leaves triquetrous, villous, serrulated? ♃. G. Native of the Cape of Good Hope. Flowers white or pinkish.

Scabrous Pink. Fl. June, July. Pl. ½ foot.

98 D. CÆSPITÒSUS (Thunb. prod. 1. p. 81.) stems 1-flowered; calycine scales 4, lanceolate; petals entire; leaves triquetrous. ♃. G. Native of the Cape of Good Hope.

Tufted Pink. Fl. June, July. Pl. ¼ to ½ foot.

§ 2. *Petals fringed, or very deeply fringe-toothed.*

* *Stem simple, 1-flowered.*

99 D. GA'LLICUS (Pers. ench. 1. p. 495.) stems ascending, generally 1-flowered: calycine scales short, ovate, somewhat mucronate; petals dentately-multifid; leaves linear, somewhat ciliated. ♃. H. Native of the south of France in sandy places. D. arenàrius, D. C. syn. no. 4325. icon. Gall. rar. p. 14. t. 41. but not of Lin. Flowers white, livid at the base.

French Pink. Fl. June, Aug. Clt.? Pl. ½ foot.

100 D. SUA'VIS (Willd. enum. suppl. p. 24. Spreng. neue entd. 2. p. 168.) stem generally 1-flowered; calycine scales 4, acute, short; petals bearded, doubly and deeply serrated; leaves linear, spreading, glaucous. ♃. H. Native of? Flowers pink, sweet-scented. Diánthus cæ'sius, Smith in Lin. trans. vol. 2.?

Sweet Pink. Fl. June, July. Pl. ½ foot.

101 D. TE'NER (Balb. act. acad. taur. 7. p. 13. t. 3.) stem 1-flowered; petals fringed, glabrous; calycine scales 4, lanceolate-linear, a little shorter than the tube. ♃. H. Native of Tenda, on the margins of fields. Flowers red.

Tender Pink. Fl. June, July. Clt. 1817. Pl. ¼ to ½ foot.

102 D. SQUARRÒSUS (Bieb. fl. taur. 1. p. 331. suppl. p. 302. cent. 1. t. 33.) stems generally 1-flowered; calycine scales ovate, acute, very short; petals multifid; leaves awl-shaped, channelled, stiff, short, recurved. ♃. H. Native of Tauria on hills in the colony of Sarepta. D. arenàrius, Pall. itin. 3. p. 600. Flowers like those of *D. plumàrius*, but the calyx is longer. Petals white, finely jagged.

Squarrose Pink. Fl. June, Aug. Clt. 1817. Pl. ½ foot.

103 D. MUSSÌNI (Horn. hort. hafn. 1. p. 408.) stems generally 1-flowered, procumbent; calycine scales oval, mucronate, thrice shorter than the tube; petals multifid, beardless; leaves awl-shaped, reflexed. ♃. H. Native of Caucasus. Flowers white.

Mussin-Puskin's Pink. Fl. Ju. Aug. Clt. 1823. Pl. ½ ft.

104 D. FRA'GRANS (Bieb. fl. taur. 1. p. 331. suppl. p. 301.) stems generally 1-flowered; calycine scales 6, ovate-lanceolate, acuminated, shorter than the tube; petals semi-multifid, beardless; leaves awl-shaped, with roughish margins. ♃. H. Native of subalpine situations in Caucasus. Sims, bot. mag. 2067? D. multífidus, Willd. herb. ex Steven. in litt. Leaves long, very narrow. Calyx long. Petals white, suffused with purple. Segments of calyx narrow, acute.

Fragrant Pink. Fl. July, Sept. Clt. 1804. Pl. ½ to ¾ foot.

105 D. SERÓTINUS (Waldst. et Kit. hung. 2. p. 188. t. 172.) stems generally 1-flowered; calycine scales 6, somewhat ovate, bluntish, four times shorter than the calyx; petals multifid, almost naked; leaves awl-shaped, glaucous, ciliated. ♃. H. Native of Hungary. D. arenàrius, Towns, itin. hung. 3. p. 488. t. 16. D. plumàrius β, Wahl. fl. carp. p. 126. Flowers purplish or white.

Late-flowering Pink. Fl. Aug. Sep. Clt. 1804. Pl. ¾ to 1 ft.

106 D. SPRENGE'LII; stem 1-flowered; calycine scales ovate, cuspidate, 3 times shorter than the tube of the calyx; petals fringed, somewhat bearded; leaves linear, smooth. ♃. H. Native of the south of Germany. D. alpéstris, Sternb. ex Spreng. syst. 2. p. 381. Flowers white.

Alp Pink. Fl. June, July. Clt. Pl. ½ foot.

107 D. PETRÆ'US (Waldst. et Kit. hung. 3. t. 222.) stem usually 1-flowered; calycine scales obovate, mucronate; petals beardless, multifid; leaves awl-shaped, entire, glabrous, nerved. ♃. H. Native of Hungary. Flowers white, usually with a dark circle.

Var. β; flowers larger; petals deflexed. ♃. H. D. petræ'us, Sims, bot. mag. 1204. Flowers whitish.

Rock Pink. Fl. June, Aug. Clt. 1804. Pl. ½ foot.

108 D. ARENA'RIUS (Lin. spec. 589.) stems generally 1-flowered; calycine scales ovate, obtuse; petals multifid; leaves linear. ♃. H. Native of the colder parts of Europe in sandy places. Sims, bot. mag. t. 2038. Petals divided beyond the middle of the disk into very narrow lobes, furnished with a livid spot and pressed purple hairs at the base of each, the rest white. Perhaps a variety of *D. plumàrius*.

Sand Pink. Fl. May, July. Clt.? Pl. ½ foot.

109 D. CRINI'TUS (Smith in Lin. soc. trans. 2. p. 300. fl. græc. 401.) stem 1-flowered; calycine scales 4, oval, mucronate, somewhat diverging, three times shorter than the tube; petals multifid, beardless. ♃. H. Native of the Levant. Willd. spec. 2. p. 678. Petals white, divided into capillary segments. A spreading plant.

Hair-petalled Pink. Fl. July, Aug. Pl. ½ foot.

110 D. ARRO'STII (Presl. ex Spreng. syst. p. 179.) stems tufted, usually 1-flowered; calycine scales 4, emarginate, mucronate, 4 times shorter than the tube of the calyx; petals fringe-toothed, beardless; leaves linear, channelled, glaucescent, stiff, serrulated. ♃. H. Native of Sicily.

Arrost's Pink. Fl. June, July. Pl. ½ foot.

** *Stems branched. Flowers solitary, aggregate, or panicled.*

111 D. SUAVE'OLENS (Spreng. nov. prov. 16.) stem erect, smooth; flowers somewhat corymbose; calycine scales ovate-lanceolate, acute, adpressed, shorter than the calyx; petals multifid, bearded, spotted; leaves linear-lanceolate, glaucous, nerveless, with scabrous margins. ♃. H. Native? Received under the name of *D. Chinénsis*. Flowers white, spotted with purple?

Sweet-scented Pink. Fl. Ju. Aug. Clt. 1820. Pl. ½ to ¾ ft.

112 D. SI'CULUS (Presl. ex Spreng. syst. p. 179.) stem tufted, few-flowered; calycine scales about 6, obovate, mucronate, 3 times shorter than the tube of the calyx; petals fringe-toothed; leaves linear, channelled, ciliately-scabrous, glaucous. ♃. H. Native of Sicily. Flowers pale red.

Sicilian Pink. Fl. June, July. Clt. 1828. Pl. ½ foot.

113 D. A'LBENS (Ait. hort. kew. ed. 1. vol. 2. p. 90. ed. 2. vol. 3. p. 8.) stems branched; flowers solitary; calycine scales 4, lanceolate, short; petals emarginate. ♃. G. Native of the Cape of Good Hope. Differing from *D. deltoìdes*, in the petals being hardly crenated, and destitute of the purple circle. Leaves very narrow, striated, and serrulated. Calyx very long. Petals ovate, dentately fringed at the apex, white. Perhaps *D. crenàtus*, Thunb. no. 76. and *D. Burchéllii*, Ser. no. 57.

Whitish Pink. Fl. Aug. Clt. 1787. Pl. 1 to 3 feet.

114 D. SERRULA'TUS (Desf. fl. atl. 1. p. 346.) stem erect,

few-flowered; leaves linear-lanceolate, serrulated; peduncles 1-flowered; outer calycine scales imbricated, ovate, acute, shorter than the inner ones and calyx; petals fringed. ♃. H. Native of Tunis in sand. Corolla pale rose-coloured, one-half smaller than those of *D. plumàrius*. (Desf.)

Serrulated-leaved Pink. Fl. June, Aug. Pl. 1 foot.

115 D. pluma`rius (Lin. spec. 589. hort. ups. 105. no. 4.) glaucous; stem 2-3-flowered; teeth of calyx obtuse; calycine scales somewhat ovate, very short, mucronulate, close pressed; petals jagged, multifid, bearded, leaves linear, with scabrous margins. ♃. H. Native of Europe? D. dùbius, Horn. hort. hafn. 1. p. 408? D. moschàtus, hort. Par. *D. plumàrius* is the type of the common garden Pink. In France it is called *Mignardise*. The flowers are either double or single, white, purple, spotted or variegated, and more or less fringed on the margins, sweet-scented.

Var. β, horténsis (Ser. mss. and D. C. prod. 1. p. 363.) petals bearded in the throat. D. horténsis, Schrad. ex Willd. enum. p. 469.

Var. γ, Portènsis (Ser. mss. and D. C. prod. 1. p. 363.) leaves smaller; petals hardly fringed. D. Portènsis, Libosch. ex herb. Balb.

From *D. plumàrius* spring all the varieties of the common garden pink. As a florist flower the *Pink* is of much less antiquity than the *Carnation;* it is scarcely mentioned by Gerarde, and Parkinson gives very few varieties. It was chiefly grown as a border flower till within the last 50 years, since which it has been greatly improved, and many fine varieties originated. Being one of the hardiest and least expensive of fine flowers, it is much cultivated by operative mechanics and manufacturers round large towns, and no where to such an extent as at Paisley by the weavers there. The varieties most cultivated are chiefly those called Pheasants'-eyes. Cob Pinks are a large sort seemingly intermediate between pinks and picotee carnations; red early pinks are smaller plants than Cobs or Pheasants'-eyes, and seem to have sprung from Cobs and *D. armèria*, or *D. deltoìdes*. The Paisley growers reckon above 300 hundred varieties of the Pheasants'-eyes. Parkinson in 1629 only mentions 6 or 8 sorts. Ray in 1704 says there are many sorts, but of little esteem. Hogg in 1820 gives a list of 100 names, containing the best sorts in England. Davey, who has raised numerous fine varieties, enumerates double that number. The culture and propagation of the Pink is the same as that of the Carnation, excepting that it is less frequently kept in pots or frames, but planted in beds of fresh loamy soil, or into the flower border, and the small side shoots reduced in the autumn, in order to throw more strength into those intended to produce flowers the following season.

Criterion of a fine double Pink. "The stem should be strong and erect, and not less than 12 inches high. The calyx smaller and shorter than that of the carnation, but nearly similar in proportion, as well as in the formation of the flower, which should not be less than 2 inches and a half in diameter. The petals should be large, broad, and substantial, and have very fine fringed or serrated edges, free from deep notches or indentures; in short, they approach nearest to perfection when the fringe or the edge is so fine as scarcely to be discernible, but if they could be obtained entire it would be a very desirable object. The broadest part of the lamina or broad end of the petals, should be perfectly white and distinct from the eye, unless it be a laced pink, that is, ornamented with a continuation of the colour of the eye round it, bold, clean, and distinct, having a considerable proportion of white in the centre, perfectly free from tinge or spot. The eye should consist of a bright or dark rich crimson or purple, resembling velvet, but the nearer it approaches to black, the more it is esteemed; its proportion should be about equal to that of the white, that it may neither appear too large nor too small." *Maddock.*

Propagation. Pinks are ordinarily increased by pipings or cuttings, sometimes by layers to preserve rare sorts, and by seed for new varieties. The time to commence putting in pipings is previous to or during the time of flowering, or as soon as the barren shoots are grown of a sufficient length for that purpose. Hogg commences about the 21st of June. The operation is the same as for pipings of carnations, only some do not apply bottom heat. This last, however, is the more certain mode, and the pipings are ready to remove sooner, and generally in a fortnight or three weeks. For seed proceed as directed for carnations.

Soil. Maddock says, A good fresh loamy soil dug 2 feet deep, and manured with a stratum of cow-dung, 2 years old, mixed with an equal proportion of earth; this stratum to be about 6 inches thick, and placed 5 or 6 inches below the surface, is all the preparation that appears necessary for this flower.

General culture. As soon as the pipings are struck, they are to be removed and planted on a bed of common garden mould, and after a few weeks the strongest of them should be removed into the blooming bed. This bed should be raised 3 or 4 inches above the paths. The plants intended for the principal bed for bloom should be planted upon it in August, or early in September, as they do not blow quite so well if removed later in the season; they should be planted at about the distance of 9 inches from each other, and the bed should be laid rather convex or rounding, to throw off excess of rain, but will require no other covering than a very slight one, in case of severe frost. The surface of the bed should be stirred up a little as it inclines to bind or become firm. There should never be more than 10 or 12 flowers allowed to bloom on the same plant, the lateral smaller buds should be pulled off a month or 6 weeks before blooming, taking care always to leave the leading bud which terminates the shoot; by this means the flowers will be much larger than they otherwise would be. Strong healthy plants, consisting of a leading stem in the centre, with but little surrounding increase, are the best to select for the best bed, these will seldom put up more than 1 or 2 stems, which will, however, be very strong, grow tall, and produce 3 or 4 flowers, as large and fine as the kind is capable of.

Those buds which become much swelled nearly at the time of flowering, and appear in danger of bursting, should be tied up in the same manner directed for carnations. It is very desirable to have a long calyx, for it is hardly possible to prevent those with short calyxes from bursting. But in this case it is much better to assist nature by making an incision at each tooth of the calyx, as far down as may be thought necessary, in order to let the petals regularly out on every side, and preserve the circular form of the blossoms; for if left to nature, the calyx will burst on one side only, and produce a loose irregular unsightly flower. When the flower-stems are grown sufficiently long they should be supported with small sticks, but these ought to be tied in such a manner as to keep the blossoms distinct from each other, that the whole may have an easy graceful appearance. Those who can bestow sufficient time and attention to the bloom of pinks, may contribute greatly to their effect by placing circular cards in the manner directed for carnations, but as these cards are apt to warp from heat and wet, it is necessary to replace them from time to time: however, some sorts do not require any assistance of this kind, particularly if their guard petals are sufficiently strong to support the rest. At the time of bloom, which is about the end of June, it is proper to defend the bed by an awning or covering: they, however, should always enjoy the advantage of light and air, and the soil should be kept regularly moist by soft water administered between the plants, carefully avoiding to wet the blossoms. *Maddock, Florist Direct.* p. 220.

Hogg says that those which are removed or transplanted in the spring never do well, nor shew half the beauty which those do that were planted in August or September; the laced pinks in particular appear almost plain, and without their distinguishing character. Pinks should never be suffered to remain more than 2 years without either change of soil or situation.

Emmerton (Treatise on Auricula, p. 191.) says, your pink-beds should be top dressed in the spring if you have a desire to excel in blooms, with some old night-soil or sugar-bakers' scum, finely sifted and sown over them. Your strong blowing plants should not be allowed to bloom more than 8 or 10 blossoms, and those that are weaker, of a less size, not more than 4.

Common Garden or *Feathered* Pink. Fl. June, Aug. Clt. 1629. Pl. ¾ to 1 foot.

116 D. SAXA'TILIS (Pers. ench. 1. p. 494.) tufted, somewhat decumbent; stem 2-3-flowered; calycine scales ovate, distinct, with longish points, shorter than the tube; petals multifid. ♃. H. Native of France on rocks near Clermont. Leaves not glaucous. Corolla not pubescent in the throat, white.

Stone Pink. Fl. June, July. Clt. 1816. Pl. ½ foot.

117 D. PUNCTA'TUS (Spreng. neue. entd. 2. p. 169.) stem erect, branched, few-flowered; calycine scales 4, bluntish, very short, pressed to the calyx; petals bearded, multifid, spotted; leaves glaucous, linear, flaccid. ♃. H. Native? Flowers pale lilac or white, spotted. Lodd, bot. cab. 896.

Spotted-petalled Pink. Fl. Ju. Aug. Clt. 1823. Pl. ¾ foot.

118 D. PROSTRA'TUS (Jacq. hort. schœnb. 3. p. 11. t. 271.) stems shrubby, prostrate at the base, but erect at the apex; flowers in lax panicles; calycine scales 4, lanceolate, acute, 3 times shorter than the elongated calyx; petals fringed, glabrous; leaves linear, very entire. ♄. G. Native of the Cape of Good Hope. Allied to *D. fimbriàtus* or *supérbus*. Flowers pale-red.

Prostrate Pink. Fl. June, July. Clt. 1824. Pl. prostrate.

119 D. FIMBRIA'TUS (Bieb. fl. taur. 1. p. 332. suppl. p. 302.) stem suffruticose at the base, branched; flowers solitary; calycine scales 6, lanceolate, shorter than the calyx; petals oblong, multifidly toothed, beardless; leaves awl-shaped, scabrous. ♄. H. Native of Iberia on rocks about Tiflis. D. orientàlis, Sims, bot. mag. t. 1069. D. contórtus, Smith in Rees' cyclop. vol. xi. Flowers like those of *D. plumàrius*, but smaller, rose-coloured, rarely white.

Fringed-petalled Pink. Fl. June, Aug. Clt. 1815. Pl. 1 ft.

120 D. PLUMO'SUS (Spreng. pugill. 2. p. 64.) flowers few, solitary; calycine scales lanceolate-linear, erect, a little shorter than the tube; petals bearded, deeply multifid; leaves linear, nerved, flaccid. ♃. H. Native of mount Baldo. Flowers red and sometimes white.

Feathery-petalled Pink. Fl. July, Septemb. Clt.? Pl. ½ to 1 foot.

121 D. MONSPESSULA'NUS (Lin. amœn. 4. p. 313. spec. p. 588.) stem panicled, few-flowered; flowers solitary; calycine scales awl-shaped, straight, one-half shorter than the tube; petals digitately multifid, smooth in the throat; leaves linear, serrulated. ♃. H. Native of the Pyrenees and Jura. D. Monspelìacus, D. C. fl. fr. no. 4324. D. Sternbérgii, Schleich. Flowers red?

Var. β, *brevifòlius* (Ser. mss. and D. C. prod. 1. p. 365.) leaves and stems short. ♃. H. Native of the Pyrenees near St. Jean de Luz.

Montpelier Pink. Fl. July, Aug. Clt. 1764. Pl. ½ to 1 ft.

122 D. SUPE'RBUS (Lin. amœn. 4. p. 272. spec. 589.) stem smooth, panicled, many-flowered; flowers somewhat fastigiate; calycine scales short, ovate, mucronate; petals divided beyond the middle, feathery, bearded at the base. ♃. H. Native of mountainous groves and shady meadows in many parts of Europe. Delaun. herb. amat. t. 21. Sims, bot. mag. t. 297. Caryophýllus sylvéstris vi. Clus. hist. 1. p. 284. Flowers rose-coloured, very fragrant, particularly at night.

Var. β, *rubicúndus* (Ser. mss. and D. C. prod. 1. p. 365.) petals purple.

Superb Pink. Fl. July, Sep. Clt. 1596. Pl. 1 to 2 feet.

123 D. FISCHE'RI (Spreng. cat. sem. hort. hall. 1810. pl. min. cogn. 2. p. 62.) stem panicled, many-flowered; flowers somewhat aggregate; calycine scales ovate, pointed, erect, one-half shorter than the tube; petals multifid, almost beardless; leaves lanceolate, serrulated. ♃. H. Native near Moscow. Sweet, fl. gard. 245. Petals rose-coloured.

Fischer's Pink. Fl. July, Aug. Clt. 1820. Pl. 1 foot.

124 D. LIBANO'TIS (Labill. pl. syr. 1. p. 14. t. 5.) stem erect; flowers rather aggregate; calycine scales 6, acuminated, divaricating, shorter than the tube; petals multifid, bearded; leaves lanceolate. ♃. H. Native of Mount Lebanon. Flowers rose-coloured.

Rosemary Pink. Fl. June, Aug. Pl. 1 foot.

† *A species belonging to section Armenástrum and should follow D. capitàtus.* No. 20. p. 385.

125 D. PO'NTICUS (Wahl. in Isis. 1828. vol. 21. cah. 10. p. 972.) flowers in fasciculate heads; involucre oblong, membranous, smooth, acuminate, length of calyx and bracteas; petals crenate, quite smooth; leaves sheathing. ♃. H. Native of the East on hills behind Sarijari. This plant is like *D. Carthusianòrum* and *D. capitàtus*.

Pontic Pink. Pl. 1 to 1½ foot.

Cult. Most of the species of this genus are highly valued, not only for the beauty of their flowers, but as being evergreens; their foliage in winter being as abundant and vivid as in summer. The fragrance of some of the species is peculiarly grateful. Many of them are well adapted for ornamenting rock-work or the front of flower borders, but the rarer kinds should be grown in pots, that they may be protected by a frame during winter. They may be increased by seeds or by cuttings (the latter mode is preferable), which should be planted under a hand-glass. A light loamy soil, mixed with a little rotten dung, or decayed leaves and sand, suits them best. For the manner of making cuttings, and time at which they should be planted, see *D. caryophýllus* and *D. plumàrius*. The annual and biennial species only require to be sown in the open border.

IV. SAPONA'RIA (from *sapo*, soap; so called because the bruised leaves are said to produce a lather like soap when agitated in water). Lin. gen. no. 769. D. C. prod. 1. p. 365.

LIN. SYST. *Decándria*, *Digýnia*. Calyx tubular, 5-toothed, naked at the base. Petals unguiculate; claws equal in length to the calyx. Stamens 10. Styles 2. Capsules 1-celled.

SECT. I. VACCA'RIA (from *vaccarius*, a cow-herb; this plant was said to be sought after by cowherds, because it was believed to excite the lacteal secretion in cows). Dod. pempt. 104. D. C. prod. 1. p. 365. Flowers panicled. Calyx inflated, angular, smooth. This section does not appear to differ materially from *Gypsóphila*.

1 S. VACCA'RIA (Lin. spec. 585.) flowers panicled; calyxes pyramidal, smooth, 5-angled; bracteas membranaceous, acute; leaves ovate-lanceolate, sessile. ⊙. H. Native among corn in many parts of Europe, particularly France, Germany, Switzerland and the Levant. Sims, bot. mag. 2290.—J. Bauh. hist. 3. p. 357. f. 2. (bad). Lychnis vaccària, Scop. fl. carn. no. 511. Gypsóphila vaccària, Smith, fl. græc. 380. Flowers red.

Var. β, *grandiflòra* (Fisch. in litt.) petals broad. ⊙. H. Native of Iberia. Petals naked, crenate, emarginate.

Cow-herb Soapwort. Fl. Jul. Aug. Clt. 1596. Pl. 1 to 2 ft.

2 S. PERFOLIA'TA (Roxb. hort. beng. p. 34. Willd. enum.

p. 464.) flowers panicled; calyxes pyramidal, 5-angled, glabrous; bracteas leafy, acute; leaves oblong-lanceolate, connate at the base. ⊙. H. Native of the East Indies. Flowers red. Perhaps only a variety of *S. vaccària*. Petals naked.

Perfoliate Soapwort. Fl. Jul. Aug. Clt. 1800. Pl. 1 to 2 ft.

3 S. dioi'ca (Schlecht. et Cham. in Linnæa. 1. p. 38.) flowers dioecious, panicled; calyx egg-shaped, 5-angled at the base, smooth; bracteas leafy, acute; leaves lanceolate, sessile. ⊙. H. Native of Buenos Ayres. Gypsóphila dioíca, Spreng. syst. append. p. 178. Like *S. vaccària*. Flowers reddish, on long peduncles. Petals naked.

Dioecious Soapwort. Fl. July, Aug. Pl. 1 to 2 feet.

Sect. II. Boo'tia (evidently from the name of some botanist). Neck. delic. gallo-belg. 1. p. 193. Flowers disposed in panicled bundles. Calyx terete, usually hairy. Petals crowned.

4 S. officina'lis (Lin. spec. 584.) flowers disposed in dense panicled bundles; calyx cylindrical, villous, yellowish; appendages of petals cloven; leaves elliptic-lanceolate, acute or obtuse. ♃. H. Native of many parts of Europe by road sides. In Britain in meadows by river sides and under hedges. Smith. engl. bot. 1060. Curt. fl. lond. fasc. 2. t. 29. Fl. dan. t. 543. Wood. suppl. t. 251. Ludw. ect. t. 170. Boòtia vulgàris, Neck. delic. gallo-belg. 1. p. 193. Flowers either single or double, of a rose or pink colour, seldom white. The double variety of this plant is considered a very ornamental border-flower, but is inconvenient unless kept in pots, from its spreading very much by the roots, which creep underground like those of couch. The leaves form a lather like soap, and take out spots of grease in the same manner. The whole plant is bitter, and a decoction of it was formerly used to cure the itch, syphilis, and jaundice.

Var. β, glabérrima (Ser. mss. and D. C. prod. 1. p. 365.) leaves and calyxes very smooth.

Var. γ, hýbrida (Lin. spec. 584.) some of the upper leaves combined and sheathing, with a monopetalous corolla. ♃. H. Native of England. Found by Gerarde in Northamptonshire and on sandy hills 7 miles north of Liverpool.—Mor. hist. 2. p. 548. sect. 5. t. 22. f. 52.

Officinal Soapwort. Fl. Jul. Oct. Engl. Pl. 1 to 1½ foot.

5 S. ocymoi'des (Lin. spec. 585.) stems procumbent, dichotomous; flowers in panicled bundles; calyx cylindrical, villous, purple, beset with glandular hairs; leaves ovate-lanceolate, generally 1-nerved. ♃. H. Native of many parts of Europe, particularly Switzerland, Italy, south of France and Austria on calcareous rocks. Jacq. fl. aust. 5. t. 23. Curt. bot. mag. 154. Cav. icon. 2. p. 29. t. 134. An elegant trailing plant with red or pink flowers, well adapted for ornamenting rock-work.

Basil-like Soapwort. Fl. May, Aug. Clt. 1768. Pl. prostrate.

6 S. Cala'brica (Guss. pl. rar. p. 164. t. 31.) root fibrous; stem erect, dichotomously-branched; leaves obovate-spatulate, usually 1-nerved; flowers axillary, solitary; calyx cylindrical, beset with glandular villi; petals orbicular, narrowed at the base; seeds tubercular, rather globose. ⊙. H. Native of Calabria on arid hills. Flowers beautiful rose-coloured. This plant differs from *S. ocymoìdes*, which it is very much like, in the root being annual and the stem being erect. Leaves smooth, or slightly pubescent, ciliated on the margins.

Calabrian Soapwort. Fl. May. Pl. ½ to 1 foot.

7 S. glutinòsa (Bieb. fl. taur. 1. p. 322. cent. 2. t. 66.) stem erect branched; flowers panicled, in corymbose bundles; calyx long, terete, beset with glandular hairs; leaves ovate, 3-nerved. ♂. H. Native of Tauria on the mountains. Hook. bot. mag. t. 2855. Silène armèria, Pall. ind. taur. Flowers about the size of those of *Silène conoìdea*. Petals minute, blood-coloured, bidentate at the top, crowned with scales in the throat.

Clammy Soapwort. Fl. Ju. Jul. Clt. 1817. Pl. 1½ foot.

Sect. III. Protei'nia (from προτεινω, *proteino*, to stretch out; in allusion to the flowers standing on long peduncles). Ser. mss. and D. C. prod. 1. p. 366. Flowers solitary, axillary, or terminal. Petals 2-parted, usually naked. Calyx hairy, rarely smooth.

8 S. po'rrigens (Lin. mant. 239.) stem erect; branches divaricating, hairy, viscid; flowers axillary, on long stalks; peduncles filiform; calyx terete; fruit egg-shaped, drooping; leaves lanceolate, connate. ⊙. H. Native of the Levant. Jacq. hort. vind. 2. p. 49. t. 109. Silène pórrigens, Gouan. ill. 29. Petals flesh-coloured. Stamens white.

Stretching-peduncled Soapwort. Fl. July, Aug. Clt. 1680. Pl. 1 to 2 feet.

9 S. orienta'lis (Lin. spec. 585.) stem dichotomous; branches divaricating; flowers axillary and terminal; peduncles stiff, equal in length with the flower, and are rather hispid, as well as terete, ovate calyx; segments of calyx acute; leaves linear-spatulate. ⊙. H. Native of the Levant and Carniola.—Dill. elth. 205. t. 167. f. 204. Stems much branched at the top. Flowers small, purplish.

Var. β, glabérrima; very smooth; branches divaricating much.

Oriental Soapwort. Fl. Jul. Aug. Clt. 1732. Pl. ½ foot.

10 S. cæspitòsa (Smith, fl. græc. t. 339.) plant tufted; stems simple, 1-flowered, few-leaved; calyx contracted at the base, glabrous; petals crowned; leaves spatulate, tufted. ♃. F. Native of Negropont on Mount Delphi. S. Smíthii, Ser. in D. C. prod. 1. p. 367. Flowers small, white; anthers purple.

Tufted Soapwort. Pl. ¼ foot.

11 S. saxa'tilis (Bory. ann. gen. 3. 1820. p. 13.) stems divaricating, dichotomous; leaves ovate-oblong, opposite, sessile; peduncles very long; petals emarginate. ♃. H. Native of Spain on rocks in Sierra Nevada.

Rock Soapwort. Pl. 1 to 2 feet.

Sect. IV. Bola'nthus (from βωλος, *bolos*, a ball, and ανθος, *anthos*, a flower; because the flowers are collected in heads). Ser. mss. and D. C. prod. 1. p. 366. Stems and leaves tufted. Flowers aggregate. Calyx terete, villous.

12 S. prostra'ta (Willd. enum. 465.) stem trailing; branches ascending, short; flowers corymbose, much crowded; calyx cylindrical, hairy; leaves oblong-spatulate. ♃. H. Native of Galatia. Corolla like that of *S. ocymoìdes*, but a little smaller.

Prostrate Soapwort. Fl. May, Aug. Pl. prostrate, long.

13 S. hirsu'ta (Labill. icon. pl. syr. dec. 4. t. 4. f. 2.) stems ascending, few-flowered; flowers terminal, somewhat capitate, sessile; calyxes 5-angled, and are hairy, as well as lanceolate leaves; petals very entire. ♃. F. Native of the Levant. Flowers pink.

Hairy Soapwort. Fl. June, July. Pl. ¼ to ½ foot.

14 S. depre'ssa (Biv. stirp. rar. manip. 2.) plant tufted; flowers somewhat umbellate, stalked; calyx very long, 5-angled, covered with clammy pubescence; petals bifid, crowned with acute scales; radical leaves tufted, elliptical-obovate, depressed. ♃. F. Native of gravelly or sandy hills in the open regions of Mount Etna. S. cæspitòsa, Biv. in Rafin. stat. gen. di. sicil. p. 27. Bon. t. 163. f. 1. S. Sícula, Rafin. specch. 2. p. 7. —Cupan. panphyt. t. 167. f. 1. Flowers terminal, large, rose-coloured.

Depressed-leaved Soapwort. Pl. ¼ foot.

15 S. e'legans (Lapeyr. abr. pyr. 238.) tufted; stems almost naked, bearing flowers at the top; flowers somewhat umbellate; calyxes cylindrical, villous, profoundly lobed; lobes acute; petals emarginate at the apex, with bifid appendages in the throat, the lobes of which are very narrow; leaves linear, glabrous, almost all radical, hardly toothed. ♃. H. Native of

sterile places on the higher Pyrenees. S. cæspitòsa, D. C. rap. voy. 2. p. 78. 1808. fl. fr. 5. p. 601. icon. Gall. rar. fasc. 2. ined. Habit of *S. lùtea*, but the flowers are larger and rose-coloured.

Elegant Soapwort. Fl. Jul. Aug. Clt. 1824. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

16 S. lu'tea (Lin. spec. 585. exclusive of the synonyme of Bocc.) tufted; stems 2-leaved; flowers capitate, involucrated; calyx cylindrical, woolly, with obtuse, short lobes; petals obovate, entire, naked; leaves linear, ciliated at the base, almost all radical. ♃. F. Native of the Alps of Vallais and Piedmont on Mount Cenis. All. fl. ped. no. 1560. t. 23. f. 1. Corolla yellow. Stamens violaceous. Habit of *Viscària alpìna*.

Yellow-flowered Soapwort. Fl. June, Aug. Clt. 1804. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

17 S. bellidifòlia (Smith, spic. bot. 5.) tufted; stems 4-leaved; flowers capitate, dense; calyx terete, hairy; petals linear, crenate; leaves ovate-lanceolate, with waved margins. ♃. F. Native of the highest mountains in Italy and Calabria, &c. Portenschlag. pl. dalm. t. 7. f. 2.—Bocc. mus. p. 75. t. 62. f. 1. Radical leaves, very like those of *Globulària*. Petals red. Stamens yellow.

Daisy-leaved Soapwort. Fl. Ju. Aug. Clt. 1825. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

Cult. All the species of *Saponària* are very ornamental. The *S. ocymoides* is one of the most beautiful plants we have in our gardens, and is well adapted for ornamenting rock-work. Those species belonging to section *Bolánthus* require to be kept in pots, that they may be protected during winter by a frame. A mixture of sand, loam, and peat suits them best, and the pots should be well drained with potsherds. They are all easily increased by parting the plants at the root or by seed; young cuttings of the branching species, planted under a hand-glass, will root freely. The annual and biennial kinds only require to be sown in the open border in spring.

V. CUCU'BALUS (altered from *Cacóbolus*, which is derived from *κακος, kakos*, bad, and *βολη, bole*, a shoot or sprig, that is to say, a plant destructive of the soil, a bad plant, a weed. The English name of this plant, *campion*, is derived from campus, a field; in allusion to its being a pest in fields). Gært. fruct. 1. p. 376. t. 77. f. 7. D. C. prod. 1. p. 367.

Lin. syst. *Decándria, Trigýnia.* Calyx campanulate, 5-toothed, naked. Petals 5, unguiculate, with a bifid limb. Capsules fleshy, 1-celled. Habit of plant very near to some species of *Silène*, but differs from all in the fruit being a black berry.

1 C. ba'ccifer (Lin. spec. 591.) branches divaricating; leaves ovate; calyx campanulate; petals distant. ♃. H. Native of Europe in shady places, particularly in Tartary, Germany, France, Switzerland, and Italy. Mill. icon. t. 112. Smith, engl. bot. t. 1577. Lychnánthus volùbilis, Gmel. act. petrop. 1759. vol. 14. p. 525. t. 17. f. 1. Silène báceifera, Willd. spec. 2. p. 700. Petals white, serrated. Notwithstanding Sir J. E. Smith has rejected this plant as not being of British origin, see engl. fl. vol. 2. p. 290. we have seen it growing plentifully along with *Silène inflàta*, by hedge sides, not far from Roslin Castle near Edinburgh, in the year 1817.

Berry-bearing Campion. Fl. May, Jul. Scotl. Pl. 1 to 2 ft.

Cult. This plant is not worth cultivating, except in botanical gardens. Any common soil will suit it, and it may be either increased by seeds or by dividing the plants at the root.

VI. SILE'NE (said to be derived from *σιαλον, sialon*, in allusion to the viscid frothy moisture on the stalks of many of the species, by which flies of the smaller kinds are entrapped, hence the English name of the genus, Catchfly. Du Theis deduces the name from the drunken god Silenus, whose name he supposes to have a similar origin). Lin. gen. no. 772. Gært. fr. 1. p. 376. t. 77. f. 7. D. C. prod. 1. p. 367.

Lin. syst. *Decándria, Trigýnia.* Calyx tubular, 5-toothed, naked. Petals 5, bifid, unguiculate, usually crowned in the throat with as many bifid scales. Stamens 10. Styles 3. Capsules 3-celled at the base, ending in 6 teeth at the apex.

Sect. I. Nanosile'ne (from *nanus*, dwarf, and *Silene*). Otth. mss. and D. C. prod. 1. p. 367. Plants tufted. Stems almost wanting. Calyx somewhat inflated. Scapes or peduncles 1-flowered.

1 S. acau'lis (Lin. spec. 603.) glabrous; stems dense, humble; leaves linear-lanceolate; flowers dioecious from abortion; peduncles solitary, short, 1-flowered; calyx campanulate; petals obovate or obcordate. ♃. H. Native of many parts of Europe on the Alps. In Britain on the summits of the loftiest mountains; upon the steep and higher rocks of Snowden; almost every where on all the elevated mountains of Scotland, and when in flower constitutes one of the most charming ornaments of the Scottish Alps. The plant has lately been found by Chamisso in the islands of Unalaschka, St. George, and St. Lawrence, on the west coast of America. Smith, engl. bot. t. 1081. Lightf. 227. t. 12. f. 1. Fl. dan. t. 21. Sims, bot. mag. 1881. All. ped. t. 79. f. 1. Flowers small, of an elegant rose-colour.

Var. α, mas (D. C. prod. 1. p. 367.) flowers larger, on longer stalks; stamens protruding; ovary and styles abortive. S. acaúlis, Lin. spec. 603. D. C. fl. fr. 4. p. 749.

Var. β, fœ'mina (D. C. prod. 1. p. 367.) flowers smaller, almost sessile; stamens abortive; styles protruding a long way. S. éxscapa, All. ped. no. 1584. t. 79. f. 2. S. acaúlis *β*, éxscapa, D. C. fl. fr. 4. p. 749.

Var. γ, elongàta (D. C. fl. fr. 4. p. 749.) peduncles elongated; flowers male.

Var. δ, parviflòra (Otth. mss. and D. C. prod. 1. p. 367.) peduncles wanting; flowers small, female.

Var. ε, álba (Otth. mss. and D. C. prod. 1. p. 367.) flowers white, growing along with var. *α* on the Scottish Alps.

Var. ξ, plèna (Otth. mss. and D. C. prod. 1. p. 367.) flowers large, of many petals. Native on mount Joms in the alps of Rhætia.

Stemless Catchfly or Moss Campion. Fl. June, July. Britain. Pl. 1 to 2 inches.

2 S. Dina'rica (Spreng. syst. 2. p. 405.) stem tufted; leaves linear, elongated, smooth; peduncles erect, pubescent; calyx hairy, blackish; petals bifid. ♃. H. Native of Transylvania. Flowers white or red. S. deprèssa, Baumg.

Dinarian Catchfly. Pl. $\frac{1}{4}$ foot.

3 S. pumi'lio (Sturn. deutschl. fl. 1. fasc. 22. t. 11.) stems less dense than in *S. acaúlis*; leaves linear-spatulate, rather pubescent; peduncles or scapes short, 1-flowered; calyx inflated, hairy. ♃. H. Native of the alps of Germany. Cucùbalus pumílio, Lin. mant. 71. Wulf in Jacq. coll. 2. p. 126. t. 10. Jacq. aust. 5. app. t. 2. Flowers large; petals obcordate, crowned.

Var. β, álba (Otth. mss. and D. C. prod. 1. p. 367.) flowers white. Sturm. l. c.

Dwarf Catchfly. Fl. Ju. Aug. Clt. 1823. Pl. 2 to 3 inches.

Sect. II. Behena'ntha (from *Behen*, the Bladder Campion, *ανθος, anthos*, a flower; in allusion to the calyx of all the species contained in this section being bladdery). Otth. mss. D. C. prod. 1. p. 367. Caulescent. Flowers solitary or panicled. Calyx inflated, bladdery.

* *Petals jagged or fringed.*

4 S. fimbria'ta (Sims, bot. mag. t. 980.) pubescent; leaves large, ovate-lanceolate, on long footstalks, undulated; flowers

in large spreading panicles; calyx greatly inflated, with broad teeth; petals fringed, incurved after flowering. ♃. H. Native of Crete, Sicily, and Caucasus. Cucùbalus fimbriàtus, Bieb. fl. taur. 1. p. 333. suppl. 303. Flowers white.

Fringed-petalled Catchfly. Fl. May, Aug. Clt. 1803. Pl. 2 to 4 feet.

5 S. la'cera (Sims, bot. mag. t. 2255.) hispid; leaves ovate-lanceolate, undulated, on long footstalks; calyxes greatly inflated; petals jagged, with the appendages 2-parted; alternate stamens deflexed. ⊙? H. Native of Caucasus in the alps. Cucùbalus lácerus, Bieb. fl. taur. 3. p. 303. Flowers white.

Jagged-petalled Catchfly. Fl. May, Aug. Clt. 1818. Pl. procumbent, 1½ foot long.

6 S. stella'ta (Ait. hort. kew. 2. p. 84.) stems erect, branched, pubescent; leaves 4 in a whorl, lanceolate, acuminated, glabrous; flowers panicled; calyxes bladdery, pubescent; petals fringed. ♃. H. Native of North America on hills and in shady woods from New England to Virginia and in Canada. Sims, bot. mag. 1107. Flowers white, without a crown.

Stellate-leaved Catchfly. Fl. June, Aug. Clt. 1696. Pl. 1 to 1½ foot.

* *Petals bifid.*

7 S. Coulteria'na (Otth. mss. in D. C. prod. 1. p. 368.) very smooth; stem branched; leaves small, linear-lanceolate; flowers in spreading panicles; those flowers in the forks of the panicle are on very long stalks; calyx somewhat spherical, greatly inflated; petals with the claws wedge-shaped, and with the limb 2-parted, into broad, somewhat truncate lobes. ♃? H. Native of Iberia and about Constantinople. Flowers white.

Coulter's Catchfly. Fl. June, July. Pl. 1 foot.

8 S. infla'ta (Smith, fl. brit. 467.) stems branched; flowers panicled; calyx bladdery; petals bifid, naked; claws of petals wedge-shaped; styles very long. ♃. H. Native very common throughout Europe. Common in Britain in fields, pastures, and by way-sides. Fl. græc. 293. Cucùbalis Bèhen, Lin. spec. 591. Smith. engl. bot. t. 164. Fl. dan. 914. Bull. fr. t. 321. Flowers white, drooping. Plant glaucous.

Var. α, vulgàris (Otth. mss.) smooth; leaves lanceolate.

Var. β, hirsùta (Smith, engl. fl. 2. p. 291.) hairy; leaves broad, lanceolate. Near Cromer, Norfolk, and near Edinburgh.

Var. γ, angustifòlia (D. C. fl. fr. 4. p. 741.) smooth; leaves linear. Cucùbalus angustifòlius, Schrank. hort. monac. t. 83. Ten. fl. nap. t. 37.

Var. δ, rùbra (Ram. pyr. ined.) petals purple. In the Pyrenees and the Alps about Bern in Switzerland.

Var. ε, viridiflòra (D. C. fl. fr. 4. p. 747.) calyx leafy, profoundly 5-lobed; petals half abortive, green. Cucùbalus víridis, Lam. dict. 2. p. 221.

Var. ζ, castràta (Lapeyr. abr. pyr. 247.) unisexual; petals abortive. In humid meadows of the Pyrenees.

Var. η, uniflòra (Otth, mss.) humble, glabrous; flowers solitary, rarely in twos or threes. In the Alps. S. uniflòra, Roth. cat. 1. p. 52. This is probably a variety of *S. marítima*.

This species may be used as a substitute for *asparagus* or *green peas*, the young shoots having the flavour of both. They ought to be gathered when about two inches long, and the more they are blanched the better. Bryant (Fl. Dietetica) says its culture would well reward the gardener's trouble. In Gothland they apply the herb externally in erysipelous eruptions. The leaves boiled have also somewhat the flavour of peas, and proved of great use to the inhabitants of Minorca in 1685, when a swarm of locusts had destroyed the harvest.

Inflated or Bladder Catchfly. Fl. July. Brit. Pl. ½ to 3 ft.

9 S. mari'tima (With. 414.) root creeping; stems prostrate, branched; flowers slightly panicled, or solitary, terminal; calyxes bladdery; petals bifid; with a bifid scale at the base of each at the throat; claws of petals wedge-shaped; styles occasionally 4 or 5; leaves lanceolate. ♃. H. Native of many parts of Europe on the sandy and stony sea-coast, as well as in the beds of alpine torrents in Britain. Smith, engl. bot. 957. S. amœ'na, Huds. 188. S. inflàta *β*, Hook. scot. 135. *δ*. D. C. prod. 1. p. 368. Cucùbalus Bèhen *β*, Lin. spec. 591. Fl. dan. 857. Plant glaucous. Stems prostrate. Flowers white, larger than those of *S. inflàta*.

Var. β, màjor; plant larger.

Sea Campion or Catchfly. Fl. July, Sept. Brit. Pl. ¼ to ½ ft.

10 S. faba'ria (Willd. spec. 2. p. 685. Smith, fl. græc. 315.) smooth, glaucous; stems erect, dichotomous; flowers in racemose fascicles; calyx bladdery; petals 2-parted, narrowed, with 2-parted, emarginate appendages; leaves obovate, fleshy, acute. ♃. H. Native of Sicily and the Grecian islands. Cucùbalus fabàrius, Thore, chl. land. 172.? S. uniflòra *γ*, D. C. fl. fr. 4. p. 747.?—Bocc. mus. 133. t. 92. Flowers white or pale red.

Bean-leaved Catchfly. Fl. Jul. Sept. Clt. 1731. Pl. 1 to 3½ ft.

11 S. ova'ta (Pursh, fl. amer. sept. 1. p. 316.) stem simple; leaves ovate-lanceolate, acuminated; flowers panicled; calyx ovate, inflated; stamens protruding. ♃. H. Native of the western part of Georgia and Carolina. Flowers pale red or white. Perhaps a variety of *S. inflàta*.

Var. β, flòre-plèno (D. C. prod. 1. p. 368.) flowers double. Cucùbalus polypétalus. Walt. fl. carol. 141.?

Ovate-leaved Catchfly. Fl. July, Aug. Clt. 1820. Pl. 1 ft.

12 S. Be'hen (Lin. spec. 599.) plant glabrous and glaucous; leaves obovate-lanceolate, mucronulate, lower ones stalked, upper ones ovate-lanceolate, sessile; flowers panicled; calyx oval, inflated, veiny; petals 2-parted; lobes very short and obtuse, with the appendages 2-parted and emarginate. ♂. H. Native of Candia. Smith, fl. græc. 416. Lychnis vesicària, Lin. l. c.—Dill. elth. 427. t. 317. f. 409. Flowers pale pink.

Bladdery Catchfly. Fl. June, Aug. Clt. 1713. Pl. 1½ ft.

13 S. cæ'sia (Smith, fl. græc. t. 417.) plant smooth, glaucous; stems numerous, branched; leaves obovately roundish; flowers corymbosely-panicled; petals 2-parted, narrow, with 2-parted entire appendages; calyx obovate, 10-nerved. ♃. H. Native of Mount Parnassus. Flowers greenish-white. Habit of *Silène inflàta*.

Grey Catchfly. Fl. June, July. Pl. 1 foot.

14 S. lævига'ta (Smith, fl. græc. 418.) plant smooth, glaucous; branched from the base; stem paniculately-dichotomous; leaves elliptically-roundish, obtuse, upper ones more acute; petals deeply emarginate, obtuse, without any appendages. ⊙. H. Native of the island of Cyprus on the mountains. Flowers small, red, erect, with one always in the forks of the stem.

Smoothed Catchfly. Pl. ½ foot.

15 S. I'ndica (Roxb. hort. beng. p. 34.) canescent; stems ascending, branched; leaves large, lanceolate, acute; flowers solitary, stalked, drooping; calyx inflated, tomentose, netted; teeth of calyx broad, blunt, with scarious margins; petals 2-lobed, crowned by entire appendages. ⊙. H. Native of Nipaul. Flowers purple.

Indian Catchfly. Fl. July, Aug. Clt. 1823. Pl. 3 to 4 ft.

16 S. lanuginòsa (Bertol. journ. bot. 4. p. 76.) plant shrubby, tufted; stems woolly; leaves lanceolate-linear, 3-nerved, with woolly margins, lower ones very long; calyx ovate, inflated, pubescent; petals bifid (quadrifid according to Bertol). ♃. H. Native of Italy. Lychnis alpìna, Bert. l. c. Till. cat. 4. pil. 105. t. 41. f. 2. Flowers white.

Woolly Catchfly. Pl. 1 foot.

17 S. auricula'ta (Smith, fl. græc. t. 435.) plant tufted, woody at the base; stem pubescent, 1-flowered; flower terminal; lower leaves rosulate, lanceolate, mucronate, fringed,

upper ones pubescent, opposite, usually 6; calyx campanulate, inflated; petals 2-parted, with an auricle on each side, hence quadrifid, with bifid, entire, divaricate appendages. ♃. H. Native of Negropont on Mount Delphi. Habit of plant and size of flowers like that of *S. pumílio*.

Auricled-petalled Catchfly. Pl. ½ foot.

18 S. GRAMINIFÒLIA (Otth. mss. in D. C. prod. 1. p. 368.) plant glabrous; stem erect, simple, very leafy at the base, almost naked above; leaves linear, scarcely ciliated; flowers in panicled spikes; peduncles opposite, sometimes longer than the calyx, sometimes shorter; calyx ovate, 10-striated; petals semibifid, with ciliated claws. ♃. H. Native of the Altaian mountains. Flowers white.

Grassy-leaved Catchfly. Fl. Jun. Jul. Clt. 1819. Pl. 1 to 2 ft.

19 S. VISCAGINOÌDES (Horn. hafn suppl. 4. p. 49.) plant glabrous; stem erect, simple, somewhat leafy; leaves linear, hardly ciliated; flowers in panicled spikes; peduncles opposite, length of calyx; calyxes ovate, 10-striated; petals semibifid, with the claws not ciliated. ♃. H. Native of Dahuria. Flowers pink. Root woody, with many stems rising from the neck.

Viscago-like Catchfly. Fl. Ju. Aug. Clt. 1824. Pl. ½ to ¾ ft.

20 S. PROCU'MBENS (Murr. com. gœtt. 1784 and 1785. p. 83. t. 2.) plant glabrous; stems procumbent, branched, very leafy; leaves lanceolate; flowers axillary opposite, and terminal; calyxes ovate; petals somewhat auricled, bifid; anthophorum long. H. ♃. Native of Siberia. S. decúmbens, Schreb. S. amœ'na, Lin. spec. 596. exclusive of synomymes. Flowers white.

Procumbent Catchfly. Fl. June, Aug. Clt. 1823. Pl. procumbent.

21 S. RUBE'LLA (Lin. spec. 600.) plant smooth, glaucous, branched; leaves obovate, rather scabrous on the margin; flowers fastigiately-panicled; calyx 10-striated, clavate, but inflated after flowering; petals emarginate, with bifid, entire appendages. ⊙. H. Native of Portugal and the Levant. Smith, fl. græc. t. 426. Delisle, fl. ægyp. t. 29. f. 3.—Dill. elth. 314. f. 406. Flowers rose-coloured.

Red Catchfly. Fl. May, Aug. Clt. 1732. Pl. 1 foot.

22 S. OBLONGIFÒLIA (Otth. mss. in D. C. prod. 1. p. 369.) plant hardly pubescent; stems assurgent; leaves oblong, obtuse; flowers small, panicled, lax; calyx only a little inflated, hardly 10-striated; anthophorum long. ⊙. H. Native? Flowers red?

Oblong-leaved Catchfly. Fl. July, Aug. Pl. ½ to 1 foot.

23 S. APE'TALA (Willd. spec. 2. p. 703.) plant hoary-pubescent; stem erect, branched; leaves lanceolate, upper ones linear; flowers few, terminal, or in the forks; calyx obovate, 10-striated; petals wanting. ⊙. H. Native of Spain. Flowers apetalous. Perhaps this species does not belong to this section.

Apetalous-flowered Catchfly. Fl. Ju. Jul. Clt. 1801. Pl. ½ ft.

24 S. TENUIFLÒRA (Guss. pl. rar. 1. p. 177. t. 36.) stem erect; radical leaves spatulate, obtuse, pubescent, upper cauline ones lanceolate-linear, smooth, tapering to the top; panicle rather dichotomous, few-flowered; peduncles elongated, usually 1-flowered; calyx smooth, oblong, at length much inflated, 10-nerved; petals emarginate. ⊙. H. Native of Abruzzo on the edges of fields. Flowers red or white?

Fine-flowered Catchfly. Fl. May, July. Pl. 1 to 2 feet.

25 S. SPERGULIFÒLIA (Bieb. fl. taur. suppl. 305.) villous; stems procumbent, diffused, branched; branches 3-flowered; leaves small, linear, reflexed in fascicles; flowers somewhat panicled, crowded; calyx inflated, 10-striated, beset with glandular hairs; petals semibifid, somewhat deflexed; appendages of petals obcordate. ♃. H. Native of Armenia and on dry hills about Tiflis. Desf. cor. Tour. 73. t. 55. S. polyphýllus, Bieb. fl. taur. no. 835. exclusive of the synonymes. Flowers white or tinged with purple, about the size of those of *S. Bèhen*.

Spurry-leaved Catchfly. Fl. Ju. Jul. Clt. 1817. Pl. ¾ ft.

26 S. CARYOPHYLLOI'DES (Otth. mss. in D. C. prod. 1. p. 369.) stems erect, slender; leaves linear, very narrow, upper ones broader; flowers large, terminal; calyx inflated, somewhat funnel-shaped, narrowed at the base; petals 2-lobed. ♃. H. Native of the Levant. Cucùbalus caryophylloìdes, Poir. dict. suppl. 2. p. 416. Perhaps belonging to a separate section. Flowers white or pinkish.

Clove-pink-like Catchfly. Fl. July. Pl. 1 foot.

27 S. HISPA'NICA (Otth. mss. in D. C. prod. 1. p. 369.) plant pilose; stems procumbent, somewhat 4-sided; leaves linear-oblong, obtuse; flowers axillary, generally solitary; calyx ovate, 10-striated; petals small; anthophorum wanting. ♃. H. Native of Spain. S. parviflòra, Zea, in Poir. dict. suppl. 5. p. 150. Flowers cream-coloured? Perhaps belonging to a different section, as well as the two following species.

Spanish Catchfly. Fl. June, July. Clt. 1819. Pl. ½ foot.

28 S. CARNO'SA (Mœnch. suppl. 206.) plant glabrous; stem erect; leaves acute, glaucous; flowers solitary; calyx smooth, veiny; petals lanceolate, with 2-parted appendages. ⊙. H. Native? Petals purple, bordered with white.

Fleshy Catchfly. Fl. June, July. Clt. 1823. Pl. 1 foot.

29 S. ANGUSTIFO'LIA (Bieb. fl. taur. 1. p. 337.) stem branched; leaves linear, glabrous; flowers terminal; calyx somewhat campanulate, rather hairy; petals bifid; anthophorum scarcely the length of the capsule. ♃. H. Native of Caucasus about the falls of the Terek. Flowers white.

Narrow-leaved Catchfly. Fl. June, July. Pl. 1 foot.

SECT. III. OTI'TES (from *ους ωτος, ous otos*, an ear, the form of the leaves of *S. otìtes* is compared to an ear-picker.) Otth. mss. and D. C. prod. 1. p. 369. Caulescent. Flowers disposed in verticillate spikes, or verticillate panicles, or racemes.

30 S. OTI'TES (Pers. ench. 1. p. 497.) stems erect, rarely branched, hardly pubescent, rather leafy; lower leaves numerous, spatulate, somewhat fleshy, upper ones lanceolate; flowers small, dioecious; calyx of the female flowers spherical, those of the male flowers somewhat club-shaped; petals linear, undivided, naked. ♃. H. Native of Silesia, Austria, France, Switzerland, &c. In England in dry sandy or gravelly open grassy fields; chiefly in Norfolk, Suffolk, or Cambridgeshire; between Swaffham and Narford, Norfolk, on the grassy ridges of the road; also about Thetford, Barton-mills, and Bury. Cucùbalus Otìtes, Lin. spec. 594. Smith, engl. bot. t. 85. Fl. dan. 518. Lýchnis Otìtes, Scop. carn. 1. p. 305. Flowers small, yellowish. Ray says this plant is useful in hydrophobia.

Var. β, umbellàta (Otth. mss. and D. C. prod. 1. p. 369.) root thick, branched; stems leafless, humble; radical leaves spatulate; flowers umbellate. ♃. H. Native of Syria.

Var. γ, macrophýlla (Otth. mss. and D. C. l. c.) plant rather pubescent; stem very high, branched; leaves large, spatulate, obtuse or acute; flowers very numerous, somewhat panicled. ♃. H. Native of Provence on Mount Cousson.

Var. δ, densiflòra (Otth. mss. and D. C. l. c.) plant hairy; stem very high; whorls many-flowered, very distant, dense. ♃. H. Native of Tauria. S. densiflòra, D'Urv. enum. 48.

Ear-leaved or Spanish Catchfly. Fl. July, Aug. England. Pl. 1 to 3 feet.

31 S. WOLGE'NSIS (Otth. mss. in D. C. prod. 1. p. 370.) stem branched, pubescent; lower leaves large, lanceolate-spatulate, ciliated, upper ones linear, long; flowers in panicled whorls, stalked; petals linear. ♃. H. Native on the banks of the river Volga. Cucùbalus Wolgénsis, Willd. enum. suppl. 24. Flowers yellowish.

Volga Catchfly. Fl. July, Aug. Clt. 1824. Pl. 1 to 2 feet.

32 S. PARVIFLÒRA (Pers. ench. 1. p. 497.) plant hoary-pubes-

cent; stems erect, almost simple; leaves spatulate-lanceolate; lower whorls of flowers elongated into panicles; calyx spherical, with 10 stripes; petals linear, ciliated, naked. ♃. H. Native of Hungary. Cucùbalus parviflòrus, Willd. spec. 2. p. 689. Flowers whitish or yellowish-green, small. Petals undivided.

Small-flowered Catchfly. Fl. July, Aug. Clt. 1796. Pl. 1 to 2 feet.

33 S. EFFU'SA (Otth. mss. and D. C. prod. 1. p. 370.) stems erect, almost simple; leaves linear, lower ones bluntish; flowers very numerous, small, effusely panicled; branches in whorls; calyx obovate, clavated, with 10 stripes. ♃. H. Native on the banks of the Volga. Cucùbalus effùsus, Fisch. in litt. Flowers whitish-yellow.

Effuse-flowered Catchfly. Fl. Ju. Aug. Clt. 1823. Pl. 1 to 2 ft.

34 S. VERTICILLA'TA (Otth. mss. and D. C. prod. 1. p. 370.) plant very smooth; stem much branched, and very leafy; leaves linear, acute; flowers in whorled spikes; whorls distant; calyx ovate, clavated; petals bifid. ♃. H. Native? Cucùbalus cæspitòsus, Poir. dict. suppl. 2. p. 416. Flowers whitish-yellow.

Whorled-flowered Catchfly. Fl. July, Aug. Pl. 1 to 2 feet.

35 S. SIBI'RICA (Pers. ench. 1. p. 497.) suffruticose, glabrous; stems much branched; leaves linear-lanceolate, numerous, ciliated or pubescent; flowers disposed in interrupted spikes; calyx rather inflated, clavated, with 10 stripes; petals emarginate; stamens long. ♃. H. Native of Siberia in the deserts. Cucùbalus Sibíricus, Lin. spec. 592. Flowers greenish-yellow.

Siberian Catchfly. Fl. July, Aug. Clt. 1773. Pl. 1 to 2 feet.

36 S. GYPSO'PHILA (Desf. cat. hort. par. 184.) plant branched, pubescent, flexuous, leafy; leaves linear-lanceolate, acuminated; branches of panicle whorled; calyx clavate, bladdery, 10-striped, hairy; petals 2-lobed. ♃. H. Native of? Flowers whitish.

Gypsophila-like Catchfly. Fl. June, Aug. Clt. 1818. Pl. ½ ft.

37 S. DI'STANS (Otth. mss. and D. C. prod. 1. p. 370.) stem very long, twiggy, hardly pubescent; radical leaves broad, lanceolate-spatulate, obtuse, cauline ones linear, rounded at the apex; whorls very distant, few-flowered; calyx long, clavated. ♃. H. Native? Flowers yellowish.

Distant-whorled Catchfly. Fl. July, Aug. Pl. 1 to 2 feet.

38 S. MULTIFLO'RA (Pers. ench. 1. p. 497.) plant hardly pubescent; stem simple, clammy; leaves scabrous, linear-lanceolate, lower ones spatulate, stalked; flowers disposed in interrupted whorled spikes; peduncles short; calyx cylindrical, clavated, with 10 stripes; petals 2-parted; lobes narrow; stamens very long. ♂? H. Native of Siberia and Hungary. Cucùbalus multiflòrus, Walds. and Kit. hung. 1. p. 56. t. 56. Flowers yellowish-white.

Many-flowered Catchfly. Fl. July, Aug. Clt. 1794. Pl. 1 to 2 feet.

39 S. ELA'TA (Otth. mss. and D. C. prod. 1. p. 370.) plant glabrous; stem very long, twiggy, simple; cauline leaves few, linear, radical ones lanceolate-spatulate; flowers disposed in interrupted spikes; whorls 2-6-flowered; calyx clavated, not striped; petals 2-parted. ♃. H. Native of Tauria. S. chlorántha, Stev. in litt. not Willd. Flowers greenish-yellow.

Tall Catchfly. Fl. July, Aug. Clt. 1819. Pl. 2 to 3 feet.

40 S. RUTHE'NICA (Otth. mss. and D. C. prod. 1. p. 370.) stems creeping, much branched; branches opposite, erect; leaves linear-lanceolate, serrulated; spikes of flowers very long; peduncles equalling in length the calyx; calyx clavated, with 10 stripes; petals 2 parted. ♃. H. Native of Russia. Very like *S. Sibírica*, but very distinct. Perhaps *S. Tatárica?* Flowers yellowish.

Var. β, *pedunculàta* (Otth. mss. and D. C. l. c.) peduncles much longer than the calyx, lower ones branched. ♃. H. Native of Russia and Volhynia.

Russian Catchfly. Fl. July, Aug. Clt. 1820. Pl. 1 to 2 ft.

41 TATA'RICA (Pers. ench. 1. p. 497.) plant glabrous; stems erect, simple, very leafy; leaves lanceolate, small; spike of flowers elongated, dense; whorls 2-4-flowered; calyx clavated, with 10 stripes, reticulated; petals 2-parted; stamens very long. ♃. H. Native of Tartary. Cucùbalus Tatáricus, Lin. spec. 592. Flowers turned towards one side, white.

Tartarian Catchfly. Fl. June, Aug. Clt. 1769. Pl. 2 feet.

42 S. GIGANTE'A (Lin. spec. 598.) plant villous; leaves obovate, fleshy, upper ones connate at the base; whorls of flowers distant; calyx clavate, with 10 stripes; petals bifid, rounded, bicallose at the base; stamens long. ♂. G. Native of the north of Africa and Candia. Smith, fl. græc. 432. Lýchnis, &c., Walth. hort. 32. t. 11. Leaves large, obovate. Flowers cream-coloured, expanding at night.

Giant Catchfly. Fl. June, July. Clt. 1738. Pl. 2 to 4 ft.

43 S. INVOLU'TA (Forsk. fl. ægyp. arab. suppl. 210. no. 47.) stems thick, rather woody, villous; leaves linear-lanceolate, under surface tomentose; flowers opposite, but usually in whorls at the apex; calyx with 10 angles; petals bifid. ♃. F. Native near Constantinople. Flowers olive-coloured.

Involute Catchfly. Pl. 2 feet.

44 S. SCOULE'RI (Hook, fl. bor. amer. p. 88.) plant pubescent, viscid; stem simple, erect, remotely leafy; joints knotted; leaves lanceolate or linear-lanceolate, flat; spike long; flowers erect; calyx oblong, clavate, 10-ribbed. ♃. H. Native of the north-west coast of America, and upon the low hills of the Columbia. Flowers white.

Scouler's Catchfly. Pl. 1 to 3 feet.

SECT. IV. CONOIMO'RPHA (from κωνος, *konos*, a cone, and μορφη, *morphe*, form; form of calyx.) Otth. mss. and D. C. prod. 1. p. 371. Caulescent. Calyx cone-shaped, much swelled out at the bottom, with very long teeth.

45 S. CO'NICA (Lin. spec. 598.) pubescent; stem simple, dichotomous; leaves linear, soft; flowers solitary or panicled; calyx conical, with 30 stripes; petals deeply emarginate, with acute emarginate appendages; capsule ovate. ☉. H. Native of sandy corn-fields in France, Spain, and the Levant. In England a little to the north of Sandown Castle plentifully; opposite the Warren house at New Romney, Kent. Smith, engl. bot. t. 922. Jacq. aust. 253. S. conoídea, Huds. 189. Petals red. There is a flower always in the fork of the stem.

Var. β, *ramòsa;* stem much branched; leaves more downy; calyx not so much inflated. ☉. H. Native of Candia. S. cónica, Smith, fl. græc. t. 422. Flowers pale-red. This is probably a distinct species. It is a weed in Chelsea garden under the name of *S. conoídea.*

Conical-calyxed Catchfly. Fl. July, Aug. England. Pl. ½ to 1 feet.

46 S. CONOI'DEA (Lin. spec. 598.) stems pubescent; leaves lanceolate-linear, almost glabrous; flowers solitary or panicled; calyxes long, conical, with 30 stripes; petals entire, obovate, crested; capsules bottle-formed. ☉. H. Native of sandy corn-fields in France, Germany, &c.—Clus. hist. 1. p. 288. f. 2.—Mor. hist. 2. p. 542. sect. 5. t. 36. f. 6. Petals red. This is perhaps a variety of the last.

Conoid-calyxed Catchfly. Fl. June, July. Clt. 1683. Pl. 1 ft.

47 S. CONIFLÒRA (Nees. in litt. D. C. prod. 1. p. 371.) stems pubescent; leaves long, grassy, acute, hardly pubescent; flowers panicled; calyxes cylindrically-conical, with 30 stripes; petals obcordate. ☉. H. Native of the Levant. Petals red. This is probably the *S. cónica*, Smith, fl. græc. t. 422.

Cone-flowered Catchfly. Fl. June, July. Pl. ½ to 1 foot.

48 S. cylindriflòra (Otth. mss. D. C. prod. 1. p. 371.) pubescent; stems branched; leaves linear-lanceolate; flowers few, panicled; calyxes cylindrically-conical, with 30 stripes; claws of petals exceeding the calyx; petals bifid. ⊙. H. Native of the Levant. Flowers red.

Cylindrical-flowered Catchfly. Fl. June, July. Clt. 1824. Pl. 1 foot.

49 S. undula'ta (Ait. hort. kew. 2. p. 96.) pubescent; leaves lanceolate, undulated, lower ones stalked; flowers large, in lax dichotomous panicles; calyxes very long, cylindrically-conical, with 10 stripes. ♂. G. Native of the Cape of Good Hope. Claws of petals very long. Flowers red.

Waved-leaved Catchfly. Fl. Aug. Clt. 1775. Pl. 1½ foot.

Sect. V. Stachymo'rpha (from σταχυς, *stachys*, a spike, and μορφη, *morphe*, form; in allusion to the flowers being disposed in something like spikes in the axils of the leaves.) Otth. mss. D. C. prod. 1. p. 370. Caulescent. Flowers spiked, axillary, not opposite, usually on short pedicels. Calyxes with 10 stripes. The plants of this section are to be known by their flowers being disposed in spikes or racemes, and by their alternate pedicels being always axillary.

§ 1. *Calyxes cylindrical when in flower.*

50 S. A'nglica (Lin. spec. 594.) hairy and viscid; stems branched; leaves lanceolate, acute; calyx 5-striped, cylindrical, with very long acute teeth; petals obcordate, small, with erect cloven pyramidal appendages. ⊙. H. Native of France in cultivated fields on a gravelly or sandy soil. In Britain about Combe in Surry; in Cambridgeshire; between Dundee and St. Andrews, and near Perth; in Hertfordshire; at Lakenham and Costesy near Norwich. Smith, engl. bot. 1178. Curt. fl. lond. fasc. 4. t. 30. Petals white, occasionally marked with a red spot of each.

English Catchfly. Fl. June, July. Britain. Pl. ½ to 1 foot.

51 S. Lusita'nica (Lin. spec. 594.) hairy; stems much branched; lower leaves obovate-spatulate, upper ones lanceolate, obtuse; spike distich; calyx rather ventricose, cylindrical, with long teeth; petals crenate, not bifid, with a triangular border. ⊙. H. Native of Spain and Sardinia. S. Sardòa, Mor. sard. elench. ex Spreng.—Dill. elth. t. 311. f. 401. Petals flesh-coloured.

Portugal Catchfly. Fl. June, July. Clt. 1732. Pl. ¾ foot.

52 S. tridenta'ta (Desf. atl. 1. p. 349.) stems branched; leaves linear-lanceolate; spikes secund; calyx sub-cylindrical, with 10 ribs, teeth very long; petals 3-toothed. ⊙. H. Native of Algiers and Spain in corn-fields. Petals rose-coloured.

Three-toothed-petalled Catchfly. Fl. June, July. Clt. 1823. Pl. ½ to ¾ foot.

53 S. Ga'llica (Lin. spec. 595.) hairy and viscid; stems branched; lower leaves spatulate, upper ones lanceolate, obtuse; spike secund; calyx rather ventricosely cylindrical, with short acute teeth; petals obovate, entire, crowned. ⊙. H. Native of France; also of Chili and Buenos Ayres.—Vaill. par. t. 16. t. 12.—Dill. elth. 419. t. 310. f. 399. Petals flesh-coloured, with darker streaks. The *S. Anglica*, *S. Lusitánica*, Lin. *S. cerastoìdes*, Hænke, not Tenore, and *S. micropétala* of D. C. are perhaps only slight variations of *S. Gállica*, Lin.

French Catchfly. Fl. May, July. Clt. 1683. Pl. ½ to 1½ ft.

54 S. coarcta'ta (Lag. gen. et spec. 15.) hairy; lower leaves lanceolate, stalked, upper ones lanceolate-linear; flowers almost sessile; calyx hairy, fruit-bearing ones ovate, compressed at the mouth; petals bifid. ⊙. H. Native of Spain in the provinces of Valencia and Murcia. Flowers rose-coloured or white.

Compressed-calyxed Catchfly. Fl. June, July. Clt. 1825. Pl. ¾ to 1 foot.

55 S. ocymoi'des (Desf. cat. hort. par. 184.) hairy; stems branched; leaves spatulate; spike secund, few-flowered; calyx cylindrical, rather ventricose, very hairy, with long teeth; petals obovate, hardly crenate, with 2 longer appendages. ⊙. H. Native? S. pedicellàta, Poir. suppl. 5. p. 150. Petals purple, with pale edges.

Basil-like Catchfly. Fl. May, June. Clt. 1823. Pl. ¾ to 1 ft.

56 S. di'sticha (Willd. enum. p. 476.) hairy; stem much branched; leaves ovate-lanceolate, acute; spikes twin, dense, with a solitary flower in the fork; calyx cylindrical; petals small, bifid. ⊙. H. Native of Minorca. S. microphýlla, Rœm. in Schrank. pl. rar. t. 39. Annal. mus. 14. t. 12. Petals rose-coloured.

Distich-spiked Catchfly. Fl. Ju. July. Clt. 1817. Pl. 2 feet.

57 S. cerastioi'des (Lin. spec. 596.) stems branched, villous; branches dichotomous; leaves pubescent, lower ones rather spatulate, upper ones linear-lanceolate, hardly stalked; spike few-flowered; calyxes ovate-globose, rather ventricose, very hairy; petals emarginate, with the appendages 4-toothed. ⊙. H. Native of the south of Europe and north of Africa. Smith, fl. græc. 412. S. rigídula, Lin. amœn. 4. p. 313. S. matutìna, Presl. ex Spreng.—Dill. elth. 416. t. 309. f. 307. Flowers rose-coloured.

Chickweed-like Catchfly. Fl. June, Aug. Clt. 1732. Pl. ½ to 1 foot.

58 S. quinquevu'lnera (Lin. spec. 595.) pubescent, viscid; stems branched; leaves lanceolate, lower ones obtuse; spike secund; calyx very villous, with short teeth; petals roundish, entire, with bicuspidate appendages. ⊙. H. Native of Spain, France, Italy, Siberia, Carniola, &c. In England in sandy corn-fields near Wrotham, Kent. Smith, engl. bot. t. 86. Cucùbalus variegàtus, Lam. fl. fr. 8. p. 28. Petals deep crimson in the middle, with pale borders. The specific name alludes to the 5 dark crimson spots, one in the centre of each petal.

Five-wounded Catchfly. Fl. June, July. England. Pl. 1 ft.

59 S. Scio'tica (Otth. mss. and D. C. prod. 1. p. 372.) hairy; stem erect, simple; leaves shining, acuminated, radical ones broad, spatulate, upper ones lanceolate, acute; flowers spiked in two rows, crowded; calyx bladdery, cylindrical; petals obcordate. ⊙. H. Native of the island of Scio. S. Chìa, Spreng. syst. 2. p. 409. Petals crimson, with a white margin.

Scio Catchfly. Fl. June, July. Pl. 1 foot.

60 S. noctu'rna (Lin. spec. 595.) stem simple, branched, hairy; leaves scabrous, on ciliated petioles, lower ones spatulate, upper ones lanceolate; spikes secund, loose; flowers pressed to the stem; calyxes obovate or rather clavate, scabrous; petals deeply 2-parted, narrow. ♂. ⊙. H. Native of Spain, France, Greece, &c. Smith, fl. græc. 408.—Dill. elth. 420. t. 310. f. 400. Barrel. icon. t. 27. f. 1. S. spicàta, D. C. fl. fr. p. 759. Petals rose-coloured, but lead-coloured beneath, minutely crowned. Capsule ovate, standing on a short stipe.

Var. β, pauciflòra (Otth. mss. and D. C. prod. 1. p. 372.) flowers few, distant; petals smaller than in var. *a*. Cucùbalus refléxus, Lin. spec. 594. S. mutábilis, Lin. spec. 596. Flowers small, white, greenish externally.

Night-flowering Catchfly. Fl. June, Aug. Clt. 1683. Pl. 1 to 2 feet.

61 S. Græffe'ri (Guss. pl. rar. p. 170. t. 34.) root creeping; stem erect, simple, few-flowered; leaves lanceolate, ciliated, hairy; flowers in secund racemes; calyx 10 striped, rather scariose, tubular, at length clavate; petals 2-parted, crowned by 2-parted truncate scales in the throat. ♃. H. Native of Abruzzo in the higher pastures. S. ciliàta, Moretti, pl. ital. 6. p. 4. Flowers white above, but greenish beneath.

Græffer's Catchfly. Fl. June, Aug. Pl. ½ to 1½ foot.

62 S. cine'rea (Desf. atl. 1. p. 355.) silky-hoary; stem

branched; lower leaves ovate; flowers almost sessile, solitary twin or tern; calyx cylindrical; petals narrow, bifid. ⊙. H. Native of Algiers in corn-fields. Petals white.

Grey Catchfly. Fl. June, July. Clt. 1818. Pl. ½ to 1 foot.

63 S. BRACHYPE'TALA (Rob. et Cast. mem. ined. in D. C. fl. fr. suppl. 607.) stem simple; leaves obovate-spatulate, obtuse, hairy, ciliated at the base; flowers secund, erect; calyx somewhat cylindrical, hairy, with very long teeth; petals small, bifid. ⊙. H. Native about Marseilles. Petals white or reddish.

Short-petalled Catchfly. Fl. June, July. Clt.? Pl. ½ to 1 ft.

64 S. CRYPTA'NTHA (Viv. fl. lyb. ex Spreng. syst. 2. p. 406.) stem humble, branched; leaves obovate, acutish, connate, hairy; flowers axillary, sub-sessile; calyx cylindrical. ⊙. H. Native about Tripoli. Perhaps belonging to this section.

Hidden-flowered Catchfly. Pl. ½ to 1 foot.

65 S. HIRSUTI'SSIMA (Otth. mss. and D. C. prod. 1. p. 372.) plant beset with long white hairs; stem branched; leaves linear-lanceolate; bracteas long; flowers secund, erect; calyx cylindrical; anthophorum short. ⊙. H. Native of Spain. S. hirsùta, Lag. varied. de cienc. 1805. p. 212. Petals reddish.

Very-hairy Catchfly. Fl. June, July. Clt. 1821. Pl. 1 foot.

66 S. MICROPE'TALA (D. C. cat. monsp. 146. but not of Lag.) hairy; stem much branched, leafy; leaves linear-lanceolate; flowers terminal, or in the forks of the stem; calyx cylindrical; petals bifid; anthophorum short. ⊙. H. Native? Petals red.

Small-petalled Catchfly. Fl. Ju. July. Clt. 1821. Pl. ½ to ¾ ft.

67 S. MICRA'NTHA (Link, in Cav. herb. D. C. prod. 1. p. 372.) hairy; flowers sessile, secund; calyx cylindrical, appressed; petals small, profoundly emarginate. ⊙. H. Native of Portugal. S. micropétala, Lag. gen. et spec. 15, but not of D. C. Petals red?

Small-flowered Catchfly. Fl. June, July. Clt. 1823. Pl. ½ to ¾ foot.

68 S. INCLU'SA (Horn. hort. hafn. 1. p. 413.) hairy; flowers stalked or sessile; calyx pilose; common peduncle flexuous; fruit erect; petals emarginate. ⊙. H. Native of Europe. This plant does not appear to us to differ from *S. micropétala*, D. C. The flowers are probably reddish.

Inclosed Catchfly. Fl. June, July. Clt. 1817. Pl. ½ to ¾ foot.

69 S. ARTICULA'TA (Viv. fl. lyb. icon. ex Spreng. syst. 2. p. 409.) stem erect, knotted; leaves oblong, rather hairy, ciliated; racemes few-flowered; calyx striped, hispid; petals bifid, exceeding the cylindrical calyx. ⊙. H. Native of the north of Africa in the Great Syrtis. Flowers red?

Jointed-stemmed Catchfly. Pl. 1 foot.

70 S. LIGULA'TA (Viv. fl. lib. icon. ex Spreng. l. c.) stem erect, rather hairy; leaves linear, ciliated; racemes few-flowered; flowers stalked, hispid; petals 2-parted, obtuse, crowned by spatulate scales. ⊙. H. Native of Tripoli.

Ligulate-crested Catchfly. Pl. ½ to 1 foot.

71 S. CANARIE'NSIS (Spreng. neue. endt. t. 3. p. 60.) stem a little branched, leafy, hairy; leaves large, ovate-lanceolate, ciliated; flowers secund, rather drooping; calyx long, cylindrical, hairy. ⊙. H. Native of the Canary Islands. Petals red, with deeper veins.

Canary Island Catchfly. Fl. June, July. Pl. 1 to 1½ foot.

72 S. SETA'CEA (Otth. mss. and D. C. prod. 1. p. 372.) stems numerous, diffuse, usually simple; leaves obovate, obtuse, very closely beset with bristly hairs; flowers lax, secund; calyx cylindrical, hairy; petals bifid, narrow, with their claws exceeding the calyx. ⊙. H. Native of the island of Melos, and the north of Africa. Petals red.

Bristly-haired Catchfly. Fl. June, July. Pl. ½ to 1 foot.

§ 2. *Calyxes club-shaped when in flower.*

73 S. VILLO'SA (Forsk. descr. pl. cent. 3. p. 88.) clammy-pubescent; stems numerous, procumbent, leafy; leaves oblong, obtuse; flowers lax, secund; peduncles deflexed after flowering; calyx cylindrically-clavated; petals bifid, with very long claws. ♃? F. Native of Egypt near the pyramids about Gizah. Petals violaceous.

Villous Catchfly. Pl. procumbent.

74 S. HI'SPIDA (Desf. atl. 1. p. 348. but not of Gardener's.) plant beset with long white hairs; stems much branched; leaves broad-lanceolate, bluntish, ciliated; bracteas short; flowers secund, rather erect; spikes usually dichotomous; calyx clavated; petals semi-bifid. ⊙. H. Native of Barbary in corn-fields. S. hirsùta, Poir. dict. 7. p. 169. Petals red.

Hispid Catchfly. Fl. June, July. Clt. 1817. Pl. ½ to 1 ft.

75 S. LAXIFLÒRA (Brot. fl. lus. 2. p. 188.) hairy; stems erect, jointed, branched; lower leaves lanceolate, upper ones almost linear; flowers secund, rather remote; calyx somewhat clavated; petals bifid; capsules cylindrical. ⊙. H. Native of Portugal in sandy fields near Coimbra, and elsewhere in northern Biera. Petals flesh-coloured.

Lax-flowered Catchfly. Fl. June, Aug. Clt. 1820. Pl. 1 to 1½ foot.

76 S. CANE'SCENS (Tenore, prod. 25.) hairy-canescent; stems prostrate, branched; leaves obovately-spatulate, ciliated at the base; flowers secund, erect; calyx bladdery, somewhat cylindrical; petals bifid. ♃. H. Native of Naples. Petals red?

Canescent Catchfly. Fl. May, June. Clt. 1822. Pl. trailing.

77 S. STATICIFO'LIA (Smith, fl. græc. t. 434.) smooth, woody at the base; leaves in tufts, linear-lanceolate, mucronate, rather glaucous; floriferous stem simple; flowers erect, on short pedicels; calyx long, clavate; petals 2-parted; lobes obtuse, incurved, with short bifid entire appendages. ♃. H. Native of the Morea. Flowers rather large, white above, and rusty beneath.

Thrift-leaved Catchfly. Pl. 1 foot.

78 S. DECU'MBENS (Bern. sicul. cent. 1. p. 75.) pubescent; stems numerous, decumbent, diffuse, branched; leaves small, spatulate-lanceolate; flowers inclinate; spike dichotomous; calyxes clavated when in fruit; petals 2-parted, with long claws, crowned. ⊙. H. Native of Spain and about Naples. Flowers flesh-coloured.

Decumbent-branched Catchfly. Fl. June, Aug. Pl. ½ foot.

79 S. OLIVERIA'NA (Otth. mss. in D. C. prod. 1. p. 373.) somewhat pubescent; stem erect, almost simple; leaves linear, ciliated at the base; flowers few; calyxes clavated; petals semi-bifid, rather narrow. ⊙. H. Native between Aleppo and Mossul. Petals red?

Oliver's Catchfly. Fl. June, July. Clt. 1828. Pl. 1 foot.

80 S. DIANTHIFO'LIA (Otth. mss. in D. C. prod. 1. p. 373.) almost glabrous; stem much branched, leafy; leaves linear, acute; flowers terminal or axillary; calyxes clavated; petals 2-parted; stamens very long. ♂. H. Native of Siberia. S. fruticòsus, Pall. Petals red or white.

Pink-leaved Catchfly. Pl. 1 foot.

81 S. DIFFU'SA (Otth. mss. in D. C. prod. 1. p. 373.) pubescent; stems diffuse, branched; leaves small, spatulate, obtuse, ciliated at the base; flowers rather erect; spike 2-5-flowered; calyx clavated, rather narrow; petals bifid, with long claws. ♃? H. Native of France on the sea-shore about Masin. S. serícea, Bert. in litt. but not of All.

Diffuse-branched Catchfly. Pl. ½ to 1 foot.

82 S. IBE'RICA (Bieb. fl. taur. 1. p. 335.) stem branched, pubescent; leaves lanceolate, pubescent; spikes secund, dichotomous; calyx short, ovate, clavated, glabrous; petals bifid. ♂. H. Native of Tartary and Iberia. Flowers white. Like the following.

Iberian Catchfly. Fl. June, July. Pl. ½ to 1 foot.

83 S. DICHO'TOMA (Ehrh. beitr. 7. p. 144.) stems forked, once or twice, villous, as well as the leaves; leaves scabrous, ciliated, lower ones rosulate, spatulate, upper ones lanceolate; spikes twin, secund; flowers nearly sessile, erect; calyxes roundish, ventricose, with 10 ribs, villous; petals 2-parted, narrow, almost destitute of appendages. ♂. H. Native of Hungary, Tauria, and Candia. Walds. et Kit. hung. 1. t. 29. Smith, fl. græc. 413. S. membranàcea, Poir. dict. 7. p. 165. S. trinérvis, Sol. in Russ. aleppo, 2. p. 252. Flowers white, one always in the fork of the stem.

Dichotomous-spiked Catchfly. Fl. June, July. Clt. 1791. Pl. 1½ foot.

84 S. NYCTA'NTHA (Willd. enum. 472.) pubescent; leaves somewhat fleshy, lower ones spatulate, upper ones lanceolate; flowers secund; calyx clavated, 10-ribbed, after flowering somewhat 4-sided; petals bifid. ⊙. H. Native? Petals greenish-yellow.

Night-flowered Catchfly. Fl. Ju. July. Clt. 1815. Pl. 1 foot.

85 S. TRINE'RVIA (Seb. et Maur. fl. rom. 152.) plant covered with knotted hairs; stem slender, branched; leaves linear-lanceolate, under surface 3-nerved; flowers secund; calyx clavated, hispid from imbricating hairs, which are turned upwards; petals semi-bifid. ⊙. H. Native about Rome. Petals whitish.

Three-nerved-leaved Catchfly. Fl. Ju. July. Pl. ½ to 1 foot.

86 S. DIVARICA'TA (Smith, fl. græc. 414.) hoary-pilose; stem once or twice forked, divaricate: leaves all lanceolate, acute; flowers distant on short pedicels, rather nodding; petals 2-parted; lobes obovate, rounded as well as the appendages. ♂. H. Native of the Morea in fields. Flowers whitish, one always in the forks of the stems.

Divaricate Catchfly. Fl. Ju. July. Clt. Pl. 1 to 2 feet.

87 S. RACEMO'SA (Otth. in D. C. prod. 1. p. 384.) stem dichotomous, divaricate, racemose; leaves lanceolate, narrow; petals 2-parted, rounded, as well as the appendages. ♂. H. Native of the Canary Islands. Flowers whitish? Perhaps the same as the preceding.

Racemose Catchfly. Fl. June, July. Pl. 1 to 2 feet.

88 S. VELUTI'NA (Pour. in Desf. herb. ex Lois. in journ. 2. p. 324.) plant velvety; stem erect, branched; lower leaves obovate-lanceolate, upper ones lanceolate-linear; flowers sometimes solitary in the axils, sometimes crowded; calyxes clavated; petals semi-bifid. ♃. H. Native of Corsica. Petals red?

Velvety Catchfly. Fl. May, July. Pl. 1 to 1½ foot.

89 S. SABULETO'RUM (Link. in Spreng. 1. nov. prov. 39.) hairy; leaves lanceolate; flowers spiked also in the forks of the branches; calyx covered with long hairs, narrow, cylindrically-clavated; petals emarginate. ⊙. H. Native? Petals purplish-violet.

Gravel-pit Catchfly. Fl. Ju. Jul. Clt. 1818. Pl. ½ to 1 ft.

90 S. BELLIDIFO'LIA (Jacq. hort. vind. 3. t. 81.) hairy; stem erect, slender, nearly simple; leaves spatulate, lanceolate, acute; spikes twin, secund; calyx cylindrically clavated, smoothish; petals bifid; anthophorum long. ⊙. H. Native —? Petals pink, crowned.

Daisy-leaved Catchfly. Fl. Ju. July. Clt. 1794. Pl. ¾ to 1 ft.

91 S. PI'NGUIS (Vahl. ex horn. hafn. suppl. 49.) plant covered with silky hairs; leaves fleshy; radical ones spatulate, superior ones obovate-lanceolate; calyx erect, clavate; petals bifid. ⊙. H. Native of Denmark at Cape Spartel. Petals rose-coloured. Perhaps the same as *S. bellidifòlia*, Jacq.

Fat Catchfly. Fl. June, July. Clt. 1816. Pl. ½ to ¾ foot.

92 S. CHEIRANTHIFO'LIA (Schott, in isis. 1818. fasc. 5. p. 821.) flowers secund; calyx short, clavated; petals 2-parted; capsules cylindrical; seeds hardly revolute, channelled on the back. ⊙. H. Native at San Rocco. Petals rose-coloured on the upper surface.

Wallflower-leaved Catchfly. Fl. June, July. Pl. 1 foot.

93 S. VESPERTI'NA (Retz. obs. 3. p. 31.) pubescent; stems branched, diffuse; leaves spatulate, acute, on ciliated petioles; racemes secund; calyx bladdery-clavated; petals 2-parted; lobes obtuse. ⊙. H. Native of Mauritania, Greece, and Portugal in corn-fields. Curt. bot. mag. 677. S. bipartìta, Desf. atl. 1. p. 352. t. 100. Smith, fl. græc. 409. Petals rose-coloured, appendages deeply bifid, acute. This is a beautiful plant with diffuse or decumbent stems. Sweet, fl. gard. t. 11.

Evening-flowered Catchfly. Fl. Ju. Jul. Clt. 1796. Pl. 1 ft.

94 S. DISTA'CHYA (Brot. fl. lus. 2. p. 189.) hairy; stem forked at the top; racemes secund; flowers almost sessile; leaves spatulate, upper ones lanceolate, acute; calyx clavate; petals 2-parted, crowned. ⊙. H. Native of Portugal near Coimbra. Petals pale-purple above, but greenish beneath, and rather keeled.

Two-spiked Catchfly. Fl. June, July. Clt. 1817. Pl. 1 ft.

95 S. OBTUSIFÒLIA (Willd. enum. p. 473.) stem villous; leaves elliptically-spatulate, rounded, rather pubescent; flowers secund, drooping, nearly sessile; calyx clavated, pubescent; petals bifid. ⊙. H. Native? Petals purple. Perhaps *S. coloràta*.

Blunt-leaved Catchfly. Fl. June, July. Clt. 1820. Pl. ¾ to 1 foot.

96 S. DI'SCOLOR (Smith, fl. græc. t. 410.) stem usually forked at the top, diffuse, villous; leaves obovate, obtuse, villous at the base, with the petioles rather connate; flowers in two rows, on short pedicels, pressed to the stem; calyx clavate, villous, with 10 red ribs; petals bifid; lobes narrow, obtuse, with the appendages emarginate and white. ⊙. H. Native of Cyprus. Plant branched from the base. Flowers rose-coloured on the upper surface, but greenish on the under surface.

Discoloured-flowered Catchfly. Fl. June, July. Pl. ½ foot.

97 S. COLORA'TA (Schousb. maroc.) stems branched, very hairy; leaves obovate-spatulate, numerous, pubescent, ciliated at the base; flowers secund; calyx bladdery, clavated; petals 2-parted, crowned. ⊙. H. Native of Morocco and the island of Scio in corn-fields. Horn. hort. hafn. 1. p. 412. Petals purple on the upper surface and greenish below. Perhaps the same as *S. díscolor*.

Coloured Catchfly. Fl. Ju. July. Clt. 1819. Pl. ½ to 1 ft.

98 S. THYMIFÒLIA (Smith, fl. græc. t. 411.) stem procumbent, ligneous, branched, hairy; leaves ovate, acute, rather hairy, ciliated, with fascicles of smaller axillary ones; flowers sessile, or on pedicels, furnished with 2 bracteas or leaves; petals bifid, narrow, with the appendages deeply emarginate. ♄. H. Native of Cyprus by the sea-side. Flowers white above but greenish beneath.

Thyme-leaved Catchfly. Fl. June, July. Shrub procumbent.

99 S. CRASSIFÒLIA (Lin. spec. 597.) velvety; stem procumbent, branched, leafy; leaves ovate-spatulate, fleshy; bracteas very small; flowers secund; calyx bladdery, clavated; petals emarginate, with long claws, properly crowned. ⊙. H. Native of the Cape of Good Hope. Petals of a brownish dull colour.

Thick-leaved Catchfly. Fl. July, Aug. Clt. 1774. Pl. procumbent.

100 S. BURCHE'LLII (Otth. mss. in D. C. prod. 1. p. 374.) pubescent; stems assurgent, simple; leaves small, lanceolate; flowers few, almost sessile, clavated; anthophorum very long. ⊙? H. Native of the Cape of Good Hope. Burch. cat. geogr. no. 271. Flowers white?

Burchell's Catchfly. Fl. June, July. Pl. decumbent.

101 S. PILOSELLOI'DES (Cham. et Schlecht. in Linnæa. 1. p. 41.) stems decumbent at the base, rather scabrous, naked above; radical leaves spatulate-lanceolate, rather mucronate, roughish; flowers racemose, secund; calyx club-shaped, drooping, when in flower, when in fruit erect; petals 2-parted, with linear, obtuse segments, furnished with 2-lobed appendages. ♃. G.

Native of the Cape of Good Hope near Plettensberg's bay. Many stems rising from the same root, usually decumbent. Flowers white.

Pilosella-like Catchfly. Pl. procumbent.

102 S. CE'RNUA (Thunb. fl. cap. ed. Schult. 1. p. 394.) plant hairy; flowers racemose, secund, drooping, calyxes with 10 stripes, fruit-bearing ones clavated; leaves linear, villous, scabrous. Native of the Cape of Good Hope. 4. G. Flowers white. Perhaps *S. piloselloìdes*, Cham.

Drooping-flowered Catchfly. Pl. procumbent?

103 S. GRA'CILIS (D. C. cat. monsp. 145.) glabrous; stem erect, branched; leaves linear, hardly ciliated, lower ones ovate; flowers erect, alternate, distant; peduncles long; calyxes bladdery, clavated; petals 2-parted; lobes linear. ⊙. H. Native? Petals white. Perhaps this species should have been placed in section *Rupífraga* on account of the long peduncles.

Slender Catchfly. Fl. Ju. Jul. Clt. 1823. Pl. $\frac{3}{4}$ to 1 foot.

104 S. IMBRICA'TA (Desf. atl. 1. p. 349. t. 98.) stems erect, branched, hairy at the base; leaves villous, lower ones obtuse, upper ones lanceolate, acute; spikes secund, dense; flowers erect, appressed; calyx clavated; petals obcordate, with 2 marginal teeth, crowned. ⊙. H. Native of the north of Africa near Mascar in corn-fields. Petals white.

Imbricate-flowered Catchfly. Fl. June, July. Clt. 1818. Pl. 1 to $1\frac{1}{2}$ foot.

105 S. PERNO'CTANS (Link. ex Spreng. syst. 2. p. 408.) stem naked above, bifid, villous as well as the leaves, which are spatulate; racemes twiggy; calyxes erect, stalked, without stripes. ⊙. H. Native of Portugal. Perhaps belonging to this section.

Whole Night-flowering Catchfly. Pl. 1 foot.

106 S. LINEARIFO'LIA (Otth. mss. and D. C. prod. 1. p. 374.) stems erect, a little branched, glabrous; leaves very narrow, acute; flowers erect, secund; petals bifid, crowned. ⊙. ♂. H. Native of the alps of Caucasus. Petals white?

Linear-leaved Catchfly. Fl. June, July. Pl. 1 foot.

107 S. JENISEE'NSIS (Willd. enum. 473.) glabrous; stems usually simple; leaves rather fleshy, linear-lanceolate; flowers secund; calyx ovate, inflated; petals bifid, with 4-lobed appendages. 4. H. Native of Siberia on the banks of the Yenisee. S. Jenísea, Poir. dict. suppl. 5. p. 154. Flowers white.

Yenisee Catchfly. Fl. June, Jul. Clt. 1817. Pl. 1 to $1\frac{1}{2}$ ft.

108 S. ALTA'ICA (Pers. ench. 1. p. 497.) root thick, woody, rather branched; stem simple, assurgent; leaves linear, very acute; flowers few, on the top of stems, alternate; calyx cylindrically-ventricose; petals revolute, bifid, linear. 4. H. Native of Siberia on the Altaian mountains. Cucùbalus fruticulòsus, Gmel. syst. 2. p. 713. Pall. itin. 2. app. no. 110. t. T. Petals white or purple. Perhaps *S. ciliàta*.

Altaian Catchfly. Fl. June, Aug. Pl. 1 foot.

109 S. CILIA'TA (Pour. act. toul. 3. p. 328.) pubescent; stems numerous, prostrate, very leafy at the base; leaves linear, ciliated with bristles; flowers few, secund; calyx inflated, clavated; petals 2-parted; recesses of calyx deflexed. 4. H. Native of Crete and the Pyrenees. S. stellàta, Lapeyr. but not of hort. kew. S. Arvática, Lag. in varied de cienc. 1805. p. 212. S. Pourréttii, Poir. Petals purple.

Var. β, geniculàta (D. C. fl. fr. 4. p. 756.) hardly pubescent; calyx paler; petals white. S. geniculàta, Pourr. act. toul. 3. p. 328.

Ciliated-leaved Catchfly. Fl. Ju. July. Clt. 1804. Pl. trailing.

110 S. LEGIONE'NSIS (Lag. gen. et spec. p. 14.) stem slender, simple; radical leaves lanceolate, acute, ciliated, stem ones few, linear-awl-shaped; bracteas ovate, acuminated; flowers 5-6, secund; calyx clavated, membranaceous. 4. H. Native of Spain in the province of Leone. Petals purple or white.

Leone Catchfly, Fl. June, July. Pl. $\frac{1}{2}$ to 1 foot.

111 S. SESSILIFLÒRA (Desf. in Poir. dict. suppl. 5. p. 154.) villous; stems erect or procumbent, almost simple, somewhat quadrangular; lower leaves oblong-spatulate, rather fleshy, upper ones narrow-linear; flowers sessile, in dichotomous spikes; calyx turgid; petals 2-parted. ⊙. H. Native of Syria. Petals purple or flesh-coloured?

Sessile-flowered Catchfly. Fl. June, July. Pl. $\frac{1}{2}$ to 1 foot.

112 S. PE'NDULA (Lin. spec. 599.) pubescent, branched, trailing; leaves ovate-lanceolate; flowers axillary, pendulous; calyx inflated; petals bifid, crowned. ⊙. H. Native of Italy, Sicily, and Candia. Curt. bot. mag. t. 114. Petals flesh-coloured. This plant has some of the habit of *Lýchnis dioíca*.

Var. β, erectiflòra (Otth. mss. in D. C. prod. 1. p. 375.) flowers erect, smaller. ⊙. H. Native of Portugal in sandy places at the bottom of the hills, and on the banks of the rivers Munda and Douro, beyond the Tagus, and elsewhere in Beira and Estramadura. S. scabriflòra, Brot. fl. lus. 2. p. 184. Petals pale purple.

Pendulous-flowered Catchfly. Fl. May, Aug. Clt. 1731. Pl. procumbent.

113 S. LONGICAU'LIS (Pour. elench. hort. reg. madr. an. 1803.) lower leaves spatulate, pubescent; flowers spiked; calyx ovate, glabrous; petals 2-parted, acute. ⊙. H. Native of Spain. Petals red?

Long-stemmed Catchfly. Fl. June, July. Pl. procumbent.

114 S. SECUNDIFLÒRA (Otth. mss. in D. C. prod. 1. p. 375.) very smooth, glaucous; leaves lanceolate, ciliated; flowers secund, stalked; floriferous calyx cylindrical, fructiferous ones clavated; petals 2-parted. ⊙. H. Native of Spain. S. glaúca, Pour. elench. hort. madr. an. 1803. Lag. gen. et spec. 15. but not Zea. Petals pale purple or white.

Side-flowered Catchfly. Fl. Ju. Jul. Clt. 1820. Pl. 1 foot.

115 S. VISCOSI'SSIMA (Ten. prod. fl. nap. xxvi.) villous; clammy; hairs jointed; stems erect, smooth; leaves fleshy, radical ones obovate-spatulate, cauline ones lanceolate-oblong, obtuse, channelled; flowers in spike-like racemes; petals 2-parted. ⊙. H. Native of fields near Naples. Perhaps belonging to this section? Petals red or white.

Very clammy Catchfly. Fl. June, July. Clt. 1824. Pl. 1 ft.

116 S. DRUMMO'NDI (Hook. fl. bor. amer. p. 89.) plant clothed with glandular pubescence; stems erect, simple; leaves remote, linear-lanceolate; racemes loose, few-flowered; pedicels elongated, for the most part alternate; calyx oblong-cylindrical, erect. 4. H. Native of North America on elevated gravelly places, near the Saskatchawan. Flowers white.

Drummond's Catchfly. Pl. 1 to 2 feet.

117 S. FISTULÒSA; stems slender, fistular, branched; leaves ovate, acuminated, smooth; upper ones as well as bracteas ciliated; flowers axillary, solitary, 2 or 3, terminal; calyx somewhat clavated; petals bifid. 4? H. Native of Barbary. S. latifòlia, Poir. voy. barb. 2. p. 165.

Fistular-stemmed Catchfly. Pl. 2 feet?

SECT. VI. RUPI'FRAGA (from *rupes*, a rock, and *frango*, to break; because the plants grow usually on rocks, which the roots are supposed to break). Otth. mss. in D. C. prod. 1. p. 375. Caulescent. Stems straight. Peduncles filiform. Calyx campanulate, cylindrical, or clavate. The plants of this section may always be known by their long filiform peduncles.

§ 1. *Petals 4-toothed.*

118 S. QUADRIDENTA'TA (D. C. fl. fr. 4. p. 748.) plant tufted; stems erect, slender, branched; leaves small, narrow, pilose; flowers small, panicled; calyx campanulate, clavated; petals 4-toothed. 4. H. Native of the alps of Europe. Cucùbalus quadridentàtus, Lin. spec. 414. Lýchnis quadriden-

tàta, Jacq. fl. aust. t. 120. suppl. t. 5. f. 1. A pretty little alpine plant with white flowers.

Four-toothed petalled Catchfly. Fl. May, July. Clt. 1822. Pl. 2 or 3 inches.

119 S. pusí'lla (Waldst. et Kit. hung. p. 235. t. 212.) stems tufted, branched at the base; leaves pilose, lower ones spatulate; peduncle erect, 1-flowered, rarely 2-3-flowered; flowers small; calyx campanulate, rather clavated; petals 4-toothed. ♃. H. Native of Hungary on the alps. Sweet, fl. gard. n. s. t. 40. S. quadridentàta β, pusílla, D. C. prod. 1. p. 375. A pretty little alpine plant, with small white flowers.

Small Catchfly. Fl. May, Aug. Clt. 1804. Pl. 1 to 2 inch.

120 S. fonta'na (Tenore, fl. nap. append. 1. p. 26.) calyx clavate, and is as well as the peduncles clammy-villous; petals quadrifid; stem erect; leaves linear, flaccid, with pilose margins; anthophorum long. ♃. H. Native of Naples by the sides of fountains. Flowers white.

Var. β; leaves shorter, stiffer and recurved; flowers larger.

Fountain Catchfly. Pl. ¼ foot.

121 S. alpe'stris (Jacq. fl. austr. 1. p. 60. t. 96.) glabrous; root somewhat creeping; stem simple, few-leaved; leaves almost all radical, lanceolate, bluntish; flowers rather large, panicled; calyx campanulately-clavated; petals with a broad 4-toothed border and 2-parted appendages; seeds ciliated. ♃. H. Native of Austria on the alps. Sweet, fl. gard. t. 111. Flowers white, shining.

Alp Catchfly. Fl. May, July. Clt. 1774. Pl. ½ foot.

§ 2. *Petals emarginate, or bifid.*

* *Small perennial plants, with lanceolate leaves.*

122 S. Tomasi'nii (Vis. in bot. zeit. 1829.) clammy-pubescent, dwarf; stem slender, branched, woolly at the base; radical leaves spatulate, stalked, cauline ones lanceolate-linear, sessile; flowers dichotomously-panicled; calyx conico-clavate; petals emarginate. ♃. H. Native of Dalmatia. This is an intermediate plant between *S. alpéstris* and *S. quadridentàta*, but differs in the leaves being broader and blunter, and in all parts of the plant being viscid, as well as in the petals being emarginate, not 4-toothed. Flowers white.

Tomasin's Catchfly. Fl. May, July. Pl. ¼ to ½ foot.

123 S. gra'ta (Hænk. adumbr. plant. 28.) glabrous; stem filiform, diffuse, branched; leaves turned backwards, fleshy, channelled, mucronate; flowers terminal; calyx clavated, ventricose; petals 2-parted, reticulated. ♃. H. Native? Poir. dict. suppl. 5. p. 155. Flowers pinkish or white.

Grateful Catchfly. Fl. May, July. Pl. ¼ to ½ foot.

124 S. rupe'stris (Lin. spec. 602.) glabrous; stems rather procumbent, branched; leaves ovate-lanceolate; flowers small, panicled; calyx campanulate, clavated; petals obcordate, hardly crowned. ♃. H. Native of the alps of Sweden and Switzerland, &c. Sturn. deutschl. fl. 1. fasc. 22. t. 10. Flowers very pale pink. A pretty little glaucous plant, something like chickweed in habit.

Rock Catchfly. Fl. May, Jul. Clt. 1774. Pl. procumbent.

125 S. glaucifòlia (Lag. in varied de cienc. 1805. p. 213.) glabrous; stem procumbent, branched, leafy; leaves ovate, obtuse, lower ones stalked, upper ones cordate; flowers small, panicled; calyx clavated; petals obovate. ♃. H. Native of Spain on the mountains of Leone. Flowers pale pink, nearly white. Very like *S. rupéstris*, but the anthophorum is longer.

Glaucous-leaved Catchfly. Fl. May, July. Clt. 1820. Pl. procumbent.

126 S. lychnidiflòra (Otth. mss. in D. C. prod. 1. p. 375.) clammy; stem erect, branched, pubescent at the base; lower leaves lanceolate-spatulate, pubescent; upper ones linear-lanceolate, glabrous; flowers loosely panicled; calyx somewhat ovate; petals with a broad obcordate border. ♃? H. Native of Candia. Flowers white or reddish.

Lychnis-flowered Catchfly. Fl. June. July. Pl. ½ to 1 foot.

** *Annual plants, with flowers on long peduncles. Hardly differing from the annual species in the next section.*

127 S. clandesti'na (Jacq. coll. suppl. 5. t. 3. f. 3.) plant pubescent; stems erect, much branched, slender; lower leaves oblong, obtuse, upper ones lanceolate, rather narrow; flowers loosely panicled; calyx ventricose; petals short, erect, bifid, with long claws, naked. ☉. H. Native of the Cape of Good Hope. Petals red with a white border.

Hidden-flowered Catchfly. Fl. June, July. Clt. 1801. Pl. ½ foot.

128 S. Porte'nsis (Lin. spec. 704.) glabrous; stem erect, dichotomously-branched; leaves linear, acute, glabrous, lower ones stalked; flowers loosely panicled, on long slender pedicels; calyx clavated, purplish, but with white stripes; petals bifid. ☉. H. Native of Portugal in sandy and gravelly places about Coimbra and Oporto. S. clandestìna β, angustifòlia, Otth. mss. in D. C. prod. 1. p. 876. Petals white on the upper surface, under surface purplish-green; appendages in the throat white, rather bifid. Flowers only opening in the evening or while the sun is overclouded.

Oporto Catchfly. Fl. June, July. Clt. 1759. Pl. ½ to 1 ft.

129 S. antirrhi'na (Lin. spec. 600.) almost smooth; stem erect, branched, rather leafy; leaves lanceolate, acute, somewhat ciliated; flowers small, panicled; calyx ovate, glabrous; petals obcordate, crowned. ☉. H. Native of North America in waste fields and on the banks of rivers from Pennsylvania to Carolina, common throughout Canada. Viscàgo amer. &c. Dill. elth. p. 422. t. 313. Flowers small, white, or greenish.

Snapdragon-like Catchfly. Fl. June, Jul. Clt. 1732. Pl. 1 ft.

130 S. geminiflòra (Willd. enum. 472.) pubescent; stems rather branched; lower leaves elliptical-spatulate, upper ones lanceolate, bluntish; flowers terminal, twin; calyxes clavated, 10-ribbed; petals bifid. ☉. H. Native of? Flowers solitary or twin, on the top of the branches, purple, but of a livid-purplish colour externally.

Twin-flowered Catchfly. Fl. June, July. Clt. 1816. Pl. ½ to ¾ foot.

131 S. linifòlia (Willd. enum. 473.) stems branched; leaves linear-spatulate; flowers dichotomous, terminal; calyx cylindrically clavated, 10-ribbed; petals bifid. ☉. H. Native of? Petals greenish-yellow.

Flax-leaved Catchfly. Fl. Ju. Jul. Clt. 1817. Pl. 1 foot.

132 S. divarica'ta (Clem. elench. hort. reg. madr. ann. 1806. p. 105.) clammy; stem erect, pubescent, branched; leaves ciliated, lower ones spatulate, obtuse, upper ones lanceolate, acute; flowers terminal, as well as in the forks of the stem; calyx cylindrically-clavated; petals obovate, emarginate, crowned. ☉. H. Native of Sicily. S. Sícula, Cyrillo. Petals rose-coloured.

Divaricate-branched Catchfly. Fl. June, July. Clt. 1818. Pl. 1 foot.

133 S. rigídula (Smith. fl. græc. t. 430.) stem much branched from the base, divaricate, with the joints smooth and the internodes clammy; branches filiform; leaves lanceolate, smooth; peduncles 1-flowered; calyx long, clavate; petals 2-parted, with quadrifid appendages. ☉. H. Native near Athens on Mount Hymettus. An elegant, much branched plant, with the habit of *S. pícta*. Flowers rose-coloured. Stigmas twisted, pubescent.

Stiff-leaved Catchfly. Pl. 1 foot.

134 S. villòsa (Cambess. in mem. mus. 14. p. 221. t. 14.) stem dwarf, villous, branched; leaves sessile, broad, linear, ob-

tuse, fleshy, pubescent; peduncles long, axillary, solitary, filiform, at first erect, but afterwards reflexed; calyx very villous, cylindrical at time of flowering, but afterwards clavate; petals deeply emarginate, crowned with bifid scales. ⊙. H. Native of the south of Spain in the sand by the sea-side. Silène péndula, Salzm. not Lin. Flowers rose-coloured.

Villous Catchfly. Fl. June, July. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

135 S. sedoi'des (Jacq. coll. suppl. p. 112. t. 14. f. 1.) rather scabrous; stem much branched; leaves rather fleshy, scabrous, spatulate, obtuse; flowers small, terminal, or in the forks of the stem; calyxes tubular, very villous; petals emarginate, crowned with bifid appendages. ⊙. H. Native of Crete. A pretty little much-branched herb. Flowers rose-coloured above, but greenish beneath.

Stone-crop-like Catchfly. Fl. June, July. Clt. 1804. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

136 S. ramosi'ssima (Smith, fl. græc. t. 425.) plant beset with clammy red hairs; stem much branched; leaves spatulate, recurved, obtuse; flowers loosely panicled, small, terminal or in the forks of the stem; petals bifid, furnished with 4-parted appendages. ⊙. H. Native of Candia on rocks by the sea-side. Calyx oblong-clavate, 10-angled. Flowers numerous, rose-coloured.

Much-branched Catchfly. Fl. June, July. Pl. $\frac{1}{2}$ foot.

*** *Small herbaceous permanent rock plants, with linear narrow-lanceolate or lanceolate-spatulate leaves.*

137 S. linoi'des (Otth. in D. C. prod. 1. p. 384.) plant woody at the base, much branched; stem simple, few-flowered, rather hoary; peduncles 1-flowered; leaves linear-lanceolate, mucronate, rather scabrous; calyx cylindrical, rather clavate; petals bifid, obtuse, with bifid, obtuse, entire appendages. ♃. H. Native of Mount Parnassus. S. linifòlia, Smith, fl. græc. t. 433. not of Willd. Flowers of a whitish-flesh-colour above, but greenish-brown beneath.

Flax-like Catchfly. Pl. 1 to $1\frac{1}{2}$ foot.

138 S. creta'cea (Fisch. in litt. ex Spreng. syst. 2. p. 407.) stem suffruticose, erect, branched; leaves terete, awl-shaped, spreading; peduncles 1-flowered, elongated; calyx glabrous, clavated. ♃. H. Native of Siberia. Flowers white.

Cretaceous Catchfly. Pl. 1 foot.

139 S. costa'ta (Otth. mss. in D. C. prod. 1. p. 376.) pubescent; stems much branched, erect; leaves small, linear, very narrow; flowers terminal, solitary, rarely twin; calyx clavate, scabrous, with 10 ribs; petals semi-bifid. ♃. H. Native of? Petals white, crowned?

Ribbed-calyxed Catchfly. Fl. June, July. Pl. $\frac{1}{2}$ foot.

140 S. parvifòlia (Otth. mss. in D. C. prod. 1. p. 376.) pubescent; stems creeping, branched; leaves small, linear-lanceolate, acute; flowers terminal; calyx cylindrically-clavated, pilose; petals bifid. ♃. H. Native of? Petals white?

Small-leaved Catchfly. Fl. June, Aug. Pl. $\frac{1}{4}$ foot.

141 S. fruticulòsa (Sieb. pl. ex sic. in D. C. prod. 1. p. 376.) plant hardly pubescent; root woody, branched; stems simple, diffuse, filiform; leaves small, lanceolate-spatulate; flowers terminal, on long stalks; calyx clavate. ♃. H. Native of Candia. Petals whitish on the upper surface, and greenish-brown on the under?

Fruticulose Catchfly. Fl. June, Aug. Pl. $\frac{1}{4}$ foot.

142 S. multicau'lis (Guss. pl. rar. p. 172. t. 35.) stem ascending, dichotomously panicled; leaves linear, narrow, puberulous, acute, ciliately scabrous; flowers rather panicled; calyx smooth, clavated; petals 2-parted, crowned with bicuspidate appendages; capsules ovate-oblong, on short pedicels. ♃. H. Native of Abruzzo in high gravelly mountains in moist places. Stems filiform, hanging from the rocks. Peduncles long, 1-flowered. Flowers white above, but dirty green beneath.

Many-stemmed Catchfly. Fl. July, Sep. Pl. 1 foot.

143 S. saxi'fraga (Lin. spec. 602.) plant smooth, rather viscid, tufted; stems assurgent; leaves linear-acute; peduncles very long; flowers terminal, solitary, rarely axillary; calyx clavate; petals 2-parted, with ciliated claws, and bicuspidate appendages. ♃. H. Native of France, Italy, Hungary, &c. on cretaceous mountains. Lodd. bot. cab. t. 454. Waldst. et Kit. hung. 2. t. 163. Petals yellowish on the upper surface, and reddish-brown on the under.

Saxifrage Catchfly. Fl. June, Aug. Clt. 1640. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

144 S. petræ'a (Waldst. et Kit. hung. 2. t. 164.) tufted, beset with short bristles; stems assurgent; leaves linear, with bristly teeth; flowers small, terminal, solitary; calyx clavate; petals bifid, with bifid appendages. ♃. H. Native of Hungary. Petals white, but brownish on the under surface.

Hungarian *Rock* Catchfly. Fl. Ju. Aug. Clt. 1822. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

145 S. falca'ta (Smith, fl. græc. t. 436.) root fusiform; plant tufted; floriferous stems 1-flowered, pilose; leaves awl-shaped, falcate, pilose, numerous; calyx cylindrically clavate; petals 2-parted, with entire 2-parted appendages. ♃. H. Native on mount Olympus in Bithynia. A tufted evergreen alpine plant. Flowers largish, cream-coloured. Anthophorum very long.

Sickle-leaved Catchfly. Pl. $\frac{1}{2}$ foot.

146 S. campa'nula (Pers. ench. 1. p. 500.) glabrous; stems erect or assurgent, rather branched, leafy at the base; leaves lanceolate-linear, acute, lower ones spatulate; flowers terminal, solitary or twin, rather drooping; peduncles very long; calyxes campanulate, large; petals 2-parted, naked. ♃. H. Native of Piedmont on rocks. Cucùbalus alpéstris, All. auct. p. 28. t. 1. f. 3. Very like the preceding plant. Petals whitish, but reddish-brown on the under surface.

Campanulate-calyxed Catchfly. Fl. June, Aug. Clt. 1823. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

147 S. nodulòsa (Viv. append. fl. cors. in Schlecht. Linnæa, 1. p. 501.) stem erect, simple, usually 1-flowered, knotted; radical leaves spatulate-lanceolate, hispid, cauline ones lanceolate, short; calyx smooth, clavate; petals exserted, naked, semibifid, with obovate oblong segments. ♃. H. Native of Corsica. S. pauciflòra, Salz.? Flowers white?

Knotted-stemmed Catchfly. Pl. $\frac{1}{2}$ to 1 foot.

148 S. Cano'pica (Del. ex Spreng. syst. 2. p. 406.) stem erect, beset with glandular hairs, viscid; branches angular; lower leaves spatulate, upper ones lanceolate, villous; peduncles axillary, remote, at length reflexed; calyx clavate. ⊙. H. Native of Upper Egypt. Perhaps belonging to this section.

Canopic Catchfly. Pl. $\frac{1}{2}$ to 1 foot.

149 S. vi'scida (Spreng. fl. min. cogn. 2. p. 65.) very clammy from glandular hairs; stems diffuse, branched; leaves linear-lanceolate; flowers solitary, terminal, or in the axillæ of the leaves; petals toothed. ♃? H. Native of Carniola. Petals greenish-white or yellowish?

Viscid Catchfly. Fl. June, Aug. Clt. 1820. Pl. $\frac{1}{2}$ to 1 foot.

150 S. Urvi'llii (Schott. mon. sil. ined. in D. C. prod. 1. p. 377.) rigid, almost glabrous; stem suffruticose at the base, branched, very leafy; leaves horizontal, linear, pungent; flowers terminal, rarely axillary; calyx clavated; petals semi-bifid. ♃. H. Native of the island of Cos. Petals white or cream-coloured.

D'Urvill's Catchfly. Fl. June, Aug. Pl. $\frac{1}{2}$ foot.

151 S. ni'vea (Muhl. catal. in D. C. prod. 1. p. 377.) stem branched above; leaves oblong-lanceolate, powdery, pubescent; flowers solitary; calyx campanulate, inflated, rather hairy; petals small, reflexed, bifid, with long claws. ♃. H. Native of North America in the vicinity of the Columbia. Nutt. gen.

amer. 1. p. 287. Petals white, almost naked. Peduncles half an inch long. Perhaps belonging to the section *Behenántha*.

Snowy Catchfly. Fl. June, Aug. Pl. ½ to 1 foot.

152 S. Menzie'sii (Hook. fl. bor. amer. p. 90. t. 30.) plant pubescent; stem erect, branched, dichotomous; leaves broad-lanceolate, acuminated at both ends; peduncles scarcely higher than the leaves; calyx obovate, 5-cleft; petals naked, bifid, with linear segments. ♃. H. Native of the north-west coast of America on low hills of Oakanagan. Flowers white. It is doubtful whether this plant belongs to this section.

Menzies's Catchfly. Pl. 1 to 2 feet.

153 S. alsinoi'des (Viv. append. fl. cors. in Schlecht. Linnæa, 1. p. 501.) procumbent; stem hispid; hairs on the calyx glandular; leaves oblong, hairy, ciliated at the base; flowers terminal, stalked; petals bifid, with ovate segments; capsule roundish. ♃ ? H. Native of Corsica. Perhaps belonging to the present section.

Chickweed-like Catchfly. Fl. June, July. Pl. procumbent.

154 S. flave'scens (Walds. et Kit. hung. 2. p. 131. t. 175.) hoary pubescent; stems erect, much branched, straight; lower leaves lanceolate-spatulate, upper ones linear; flowers loosely panicled; calyx cylindrical; petals 2-lobed. ♃. H. Native of Hungary. S. móllis, Horn. hafn. 1. p. 418. Petals yellowish, crowned.

Yellowish-flowered Catchfly. Fl. June, July. Clt. 1804. Pl. ½ to 1 foot.

Sect. VII. Siphonomo'rpha (from *σιφων*, *siphon*, a siphon, or tube, and *μορφη*, *morphe*, form; in allusion to the long tubular form of the calyx.) Otth. mss. in D. C. prod. 1. p. 377. Caulescent. Flowers erect or drooping, panicled, rarely solitary, on short opposite pedicels. Calyx tubular, cylindrical or clavate at the apex.

§ 1. *Flowers nodding. Calyxes clavate or cylindrical.*

155 S. longipe'tala (Vent. hort. cels. p. 83. t. 83. Smith, fl. græc. t. 419.) glabrous, clammy; stems erect; leaves rather fleshy, lanceolate, with scabrous margins; flowers nodding, loosely panicled; calyxes clavated; petals with a very long 2-parted involute border, and with 2-parted emarginate appendages. ☉. H. Native about Aleppo and in the island of Cyprus. Flowers greenish. Petals, stamens, and styles hairy at the base.

Long-petalled Catchfly. Fl. June, Aug. Clt. 1822. Pl. 1½ to 2 foot.

156 S. longicí'lia (Otth. mss. in D. C. prod. 1. p. 377.) root woody; stems pubescent at the base, branched; leaves lanceolate, acute, lower ones stalked, pubescent, fringed with woolly hairs; flowers nodding, panicled; calyxes clavated; petals 2-parted, each crowned with 2 callosities. ♃. H. Native of Portugal on calcareous soil near Coimbra, &c. Cucùbalus longicílius, Brot. fl. lus. 2. p. 180. Flowers white on the upper surface, but purplish on the under.

Long-haired Catchfly. Fl. May, Aug. Pl. 1 to 2 feet.

157 S. nu'tans (Lin. spec. 596.) pubescent; stems very leafy at the base; radical leaves spatulate, upper ones lanceolate; flowers panicled, drooping one way; calyx cylindrical-ventricose; petals 2-parted, involute, with long 2-parted acute appendages. ♃. H. Native almost throughout the whole of Europe in arid meadows. In Britain on limestone rocks and chalky cliffs, particularly on the walls of Nottingham castle and thereabout; in Dovedale, Derbyshire; near north Queensferry, Scotland; in Carnarvonshire; on rocks about Knaresborough, Yorkshire; also on the Dover cliffs. Smith, engl. bot. 465. Fl. dan. 242. S. latifòlia, Horn. hafn. suppl. 49. ? Lýchnis nùtans, Scop. carn. 2. p. 525. Peduncles clammy. Flowers white, drooping, sweet-scented, expanding in the evening.

Var. β, incána (Ser. herb. D. C. l. c.) stem leaves and calyxes hoary-tomentose; calyx pale or purplish. ♃. H. Native of Vallais.

Var. γ, oligophýlla (Otth. mss. D. C. l. c.) plant dwarf, pubescent; stem simple, almost wanting, purplish; leaves small, spatulate; peduncles 1-2-flowered.

Var. δ, alpìna (Reyn. in litt. D. C. l. c,) plant humble; stems almost leafless; leaves linear, pilose; panicles few-flowered. ♃. H. Native on mount Ganterberg.

Nodding-flowered, Nottingham or Dover Catchfly. Fl. June, July. Britain. Pl. ½ to 1½ foot.

158 S. viscòsa (Pers. ench. 1. p. 497.) plant pubescent, very clammy; stem simple, leafy; lower leaves large, lanceolate, upper ones linear-lanceolate, undulated; flowers large, nodding; spike panicled, long; calyx cylindrically-clavated, with 10 stripes; petals 2-parted, without a crest; stamens very long. ♃. H. Native of Italy, Sweden, and the Levant, on mount Ararat; also in Britain on the Dover cliffs. Cucùbalus viscòsus, Lin. spec. 592. Leaves almost like those of *Cynoglóssum officinàle*, but smaller. Flowers white, fragrant at night, drooping all round, not to one side.

Clammy Catchfly. Fl. June, July. Clt. 1739. Pl. 1 to 2 feet.

159 S. infra'cta (Waldst. et Kit. hung. 3. p. 257. t. 213.) glabrous; stems very leafy at the base; radical leaves rather spatulate, upper ones lanceolate-linear; flowers panicled, drooping one way; calyx cylindrically-ventricose; petals 2-parted, crowned. ♃. H. Native of Hungary. Flowers white, sweet-scented, expanding in the evening.

Infracted-peduncled Catchfly. Fl. June, July. Clt. 1800. Pl. 1 to 1½ foot.

160 S. li'vida (Willd. enum. p. 474.) pubescent; stem flexuous; leaves oblong-lanceolate; flowers panicled, drooping to one side; petals bifid, crowned. ♃. H. Native of Carniola. Like *S. nùtans* and *S. viridiflòra*, but differing from both in having a flexuous infracted stem. Flowers livid-green on the under surface, and white on the upper surface. S. nùtans *κ* lívida, D. C. prod. 1. p. 378.

Var. β, viridélla (D. C. prod. 1. p. 377. under *S. nùtans*,) pubescent, much branched; petals green or clothed with green pubescence. ♃. H. Native of the south of Europe.

Var. γ, saxátilis (Sims, bot. mag. 689.) glabrous; leaves linear-lanceolate; flowers usually white. ♃. H. Native of Siberia and France. S. Amblevàna, Lej. fl. spa. 1. p. 199. S. nùtans var. *ε*, glàbra, D. C. prod. 1. p. 377.

Livid-flowered Catchfly. Fl. June, July. Clt. 1816. Pl. 1 ft.

161 S. saxa'tilis (Bieb. fl. taur. 1. p. 338.) smooth; stem few-leaved; radical leaves oblong, bluntish, stalked, cauline ones lanceolate-linear; calyx clavate, 10-striped; flowers panicled, nakedish, drooping; petals bifid, crowned. ♃. H. Native of Caucasus on rocks. Flowers small, white, with the lobes of the limb of the petals narrow. Panicle rather naked; peduncles opposite, usually 3-flowered, erect after flowering. Calyx purplish. Anthophorum short. Perhaps the same as *S. saxátilis*, Sims, bot. mag. 689.

Stone Catchfly. Fl. June, July. Clt. 1800. Pl. 1 foot.

162 S. quadri'fida (Otth. mss. and D. C. prod. 1. p. 378.) stem single, rather tomentose; radical leaves elliptical or spatulate, upper ones lanceolate; flowers panicled, secund; peduncles 1-flowered, nodding; calyxes cylindrical; petals 2-4 cleft, or 2-parted, with bifid lobes. ♃. H. Native about Verona. Cucùbalus quadrífida, Pollin. pl. ver. p. 11. Petals white?

Four-cleft-petalled Catchfly. Fl. June, July. Clt. 1818. Pl. ½ to 1 foot.

163 S. ru'bens (Vest. in fl. 1821. p. 150.) pilose; stem erect; cauline leaves lanceolate, floral ones dilated at the base; flowers nodding, panicled; peduncles 3-6-flowered; calyx co-

loured; petals bifid, crowned. ♃ ? H. Native near Clangenfurt. Petals white?

Red-calyxed Catchfly. Fl. June, July. Pl. 1 foot.

164 S. LATIFÒLIA (Horn. hort. hafn. 1. p. 414.) stem branched, tall, hairy; leaves ovate-oblong, hairy beneath; panicle diffuse, with the branches very clammy; flowers drooping; pedicels and calyx coloured, very villous; calyx clavate; petals 2-parted, crowned. ♃. H. Native of Barbary? Flowers white.

Broad-leaved Catchfly. Fl. June, July. Clt. 1817. Pl. 1 to 1½ foot.

165 S. VIRIDIFLÒRA (Lin. spec. 597.) covered with soft hairs; stem branched, leafy; leaves large, elliptic-lanceolate, acute, lower ones stalked; flowers elongated, panicled, drooping; calyx ventricose, clavated; petals bifid, with long claws, crowned with bifid linear appendages. ♂. H. Native of Portugal and Spain. Lýchnis, &c. Herm. par. 199. t. 199. Flowers greenish-white.

Green-flowered Catchfly. Fl. Ju. July. Clt. 1739. Pl. 1 to 2 ft.

166 S. CHLORA'NTHA (Willd. spec. 2. p. 694.) plant glabrous; stems erect, simple, rather leafy; radical leaves lanceolate-spatulate, with scabrous margins, upper ones short, linear; flowers panicled, drooping one way; calyx cylindrical; petals 2-parted, with filiform lobes. ♃. H. Native of Germany, Viscàgo, &c. Dill. elth. 425. t. 316. f. 408.—Mentz. pug. t. 2. f. 1. (bad.) Panicle clammy. Flowers numerous, greenish-yellow.

German *green-flowered* Catchfly. Fl. June, July. Clt. 1732. Pl. 1 to 2 feet.

167 S. PSAMMI'TIS (Link. in Spreng. nov. prov. p. 39.) hairy; leaves lanceolate; flowers lateral, solitary, drooping; petals profoundly 2-lobed. ♃. H. Native of? Petals cream-coloured.

Sand Catchfly. Fl. June, July. Clt. 1818. Pl. 1 foot.

§ 2. *Flowers erect; calyxes elongated, clavated.*

* *Small plants, probably belonging to section Rupífraga. Calyxes not clavate.*

168 S. NICÆE'NSIS (All. ped. no. 1576. t. 44. f. 2.) plant villous, very clammy; stems branched, rather procumbent; leaves linear, obtuse; flowers panicled, nearly erect; calyx cylindrical; petals semibifid, with long claws, and bifid appendages; lobes of petals ovate-flat. ⊙. H. Native in the fields about Nice, and in Portugal, &c. in sand by the sea-side. S. villòsa, Mœnch. meth. 708. S. arenària, Desf. atl. 1. p. 354. S. arenícola, Presl. ex Spreng. Petals white on the upper surface, but of a pale yellowish-purple colour on the under surface, expanding in the evening. Radical leaves like those of *Cerástium vulgàtum*.

Nice Catchfly. Fl. June, July. Clt. 1820. Pl. procumbent.

169 S. RAMO'SA; plant pubescent, clammy; stems erect, much branched; leaves narrow, lanceolate; flowers numerous, panicled, erect; calyx ovate; petals bifid. ⊙. H. Native of Barbary in the sand by the sea-shore. S. ramosíssima, Desf. atl. 1. p. 354. Petals small, white.

Much-branched Catchfly. Fl. June, July. Clt. 1820. Pl. ½ to 1 foot.

170 S. ARENARIOI'DES (Desf. atl. 1. p. 355.) pubescent; stems somewhat tufted, slender, branched; leaves narrow-linear; flowers panicled; calyx tubular, villous; claws of petals a little higher than the calyx, with a bifid border. ♃. H. Native of Barbary in corn-fields. Petals white. Calyx purplish.

Arenaria-like Catchfly. Fl. June, July. Pl. ½ foot.

171 S. FUSCA'TA (Link. et Brot. ex Spreng. syst. 2. p. 413.) stem simple, clothed with glandular pubescence; leaves lanceolate; flowers panicled, on short pedicels; calyx campanulate, viscid, striated, coloured; petals somewhat emarginate. ♃. H. Native of Portugal. Flowers reddish brown.

Darkened Catchfly. Pl. 1 foot.

* * *Perennial, flowers white or cream-coloured.*

172 S. CATHÓLICA (Otth. mss. in D. C. prod. 1. p. 378.) plant velvety, clammy above; stem erect, branched, leafy; leaves ovate-lanceolate, acute, nearly smooth; flowers small, loosely panicled; calyx clavate; petals 2-parted, naked; stamens very long. ♃. H. Native of Italy and Sicily. Cucùbalus Cathólicus, Lin. spec. 593. Cucùbalus glutinòsus, Retz. S. Mussìni, Horn. hort. hafn. 1. p. 415. Jacq. vind. 1. t. 59. Panicle very large and spreading. Petals white, with linear lobes.

Universal Catchfly. Fl. July, Sept. Clt. 1711. Pl. 1 to 3 ft.

173 S. SPINE'SCENS (Smith, fl. græc. t. 431.) stem shrubby at the base, much branched, tufted; branches opposite, horizontal, as stiff as spines, pubescent; leaves stalked, spatulate, mucronulate, pubescent, upper ones narrow, lanceolate; floriferous branches erect, panicled; peduncles 1-flowered; calyx clavate; petals bifid, with small bifid entire appendages. ♄. F. Native of Asia Minor. Flowers cream-coloured.

Spinescent-branched Catchfly. Shrub 1 to 1½ foot.

174 S. TE'NUIS (Willd. enum. p. 474.) glabrous; leaves linear-lanceolate, lower ones rather spatulate, ciliated at the base; flowers panicled, erect; peduncles 3-flowered; bracteas lanceolate, with membranous ciliated margins; calyx cylindrically campanulate; petals 2-parted, with profoundly 2-lobed obtuse appendages. ♃. H. Native of Siberia. Petals pale cream-coloured.

Slender Catchfly. Fl. June, July. Clt. 1816. Pl. ¾ foot.

* * * *Annual plants, with white flowers.*

175 S. DIVERSIFÒLIA (Otth. mss. in D. C. prod. 1. p. 378.) stem erect, much branched, hardly pubescent; cauline leaves oblong-ovate, those on the branches linear, bluntish; flowers small, panicled; calyx clavate, almost glabrous; anthophorum short. ⊙. H. Native of? S. antirrhìna, Hort. madr. Petals whitish?

Divers-leaved Catchfly. Fl. June, July. Pl. 1 foot.

176 S. E'LEGANS (Brot. fl. lus. 2. p. 185.) stem short, generally 2-flowered, somewhat pubescent; radical leaves lanceolate-linear, acute, cauline ones very short; calyx with 10 stripes; petals bifid. ⊙. H. Native of Portugal on the tops of the mountains called Herminius, near Cantharus. Petals white, but reddish on the outside.

Elegant Catchfly. Fl. June, July. Clt. 1819. Pl. ⅛ foot.

177 S. INAPE'RTA (Lin. spec. 660.) root creeping; stems numerous from the root, simple; leaves all linear, scabrous or villous, with the margins serrulately-ciliated; flowers few, panicled, erect; calyx clavate at the apex; petals 2-parted, narrow, obtuse, with bifid entire appendages. ♃. H. Native of Greece on the mountains, and many places in the south of Europe. Smith, fl. græc. t. 420.—Dill. elth. t. 314. f. 407. Panicle clammy. Flowers cream-coloured above, but rust-coloured beneath.

Unopen Catchfly. Fl. May, July. Clt. Pl. ½ to ¾ foot.

* * * * *Perennial, flowers small, red, or flesh-coloured.*

178 S. SPATULA'TA (Bieb. fl. taur. 1. p. 341.) plant dwarf, pubescent; root thick, woody; stems numerous, ascending, rather dichotomous; lower leaves spatulate, upper ones ovate; flowers few, panicled; calyx short, clavate; petals bifid. ♃. H. Native of Caucasus. S. pygmæ'a, Adam. app. Web. et Mohr. cat. 1. p. 58. no. 26. Flowers deep-purple, about the size of those of *S. quinquevúlnera*.

Spatulate-leaved Catchfly. Fl. June, July. Clt. 1823. Pl. ⅛ ft.

179 S. RE'PENS (Patrin. herb. in D. C. prod. 1. p. 379.) plant hardly pubescent; root long, creeping; stems erect, almost simple; leaves linear, grassy, acute; flowers few, erect, pa-

nicled; calyx clavate; petals semi-bifid; stamens long. ♃. H. Native of Siberia. Petals red?

Creeping-rooted Catchfly. Fl. June, Aug. Clt. 1823. Pl. ½ to 1 foot.

180 S. GLAU'CA (Zea. in Poir. dict. suppl. 5. p. 153.) plant glabrous, glaucous; stems erect; leaves oblong-linear, acute; flowers 2 or 3, rising from the forks of the branches; calyx somewhat cylindrical; petals rather crenated at the apex. ⊙. H. Native of? Petals purple.

Glaucous Catchfly. Fl. June, July. Pl. ½ to 1 foot.

181 S. UNDULÆFÒLIA (Mor. sard. elench. fasc. 1. 1827.) plant clothed with glandular hairs; stem erect; leaves thickish, oblong-obovate or lanceolate, waved; flowers dichotomously-panicled, erect; calyx clavate; petals rather emarginate. ⊙. H. Native of Sardinia. Flowers red?

Waved-leaved Catchfly. Fl. June, July. Clt. 1829. Pl. 1 ft.

182 S. TENUIFÒLIA (Otth. mss. in D. C. prod. 1. p. 379.) plant hardly pubescent; stem erect, much branched, leafy, leaves filiform, acute, ciliated at the base; flowers few, panicled; calyx bladdery, clavated; petals bifid. ⊙. H. Native of Dahuria. Petals purple.

Fine-leaved Catchfly. Fl. June, July. Clt. 1820. Pl. ½ to 1 foot.

* * * * * *Flowers large, purple, or red.*

183 S. ALLAMA'NI (Otth. mss. in D. C. prod. 1. p. 379.) plant pubescent; stems erect, simple; leaves linear-lanceolate; flowers large, few, panicled; calyx cylindrical, coloured; petals broad, obcordate. ⊙. H. Native of Mexico. Petals purple.

Allaman's Catchfly. Fl. June, July. Pl. 1 foot.

184 S. VIRGI'NICA (Lin. spec. 600.) plant covered with clammy pubescence; stems procumbent, assurgent, branched; leaves lanceolate, lower ones on very long footstalks, ciliated at the base; flowers large, panicled, sometimes crowded; calyx amply clavated; petals broad, bifid, crowned, with long claws. ♃. H. Native of North America in the western parts of Virginia and Carolina, and in the Illinois country. S. cheiranthoìdes, Poir. dict. 7. p. 176. S. coccínea, Mœnch. suppl. 306.—Pl. alm. 231. t. 203. f. 1.? Petals dark-purple. A beautiful species. The leaves of this species are like those of the *Globe Amaranth*. The plant is reputed anthelmintic.

Virginian Catchfly. Fl. May, Aug. Clt. 1783. Pl. procumbent, ¼ to ¾ foot.

185 S. CATESBÆ'A (Walt. carol. 141.) branched, decumbent, clammy; leaves lanceolate, broad, with roughish margins; flowers panicled; calyx clavated, coloured; petals bifid, with 2 lateral teeth, lobes acute; claws of petals long; stamens exserted. ♃. H. Native of Carolina. Lýchnis viscòsa, &c. Catesb. carol. 54. t. 4. S. Virgínica, Michx. and Pursh, but not of Lin. A beautiful species, with dark-crimson flowers.

Catesby's Catchfly. Fl. June, July. Clt. 1810. Pl. ¼ to 1 ft.

186 S. MEXICA'NA (Moc. et Sesse, fl. mex. ined. and D. C. prod. 1. p. 379.) plant glabrous; root thick, horizontal; stems erect, branched; leaves lanceolate, acute; flowers panicled; calyx clavate, pilose; petals 4-cleft, lobes acute, furnished with scale-like appendages; stamens hardly longer than the petals. ♃. F. Native of Mexico. Petals red or purple.

Mexican Catchfly. Fl. June, July. Pl. 1 to 2 feet.

187 S. CAPE'NSIS (Otth. mss. in D. C. prod. 1. p. 379.) plant covered with clammy pubescence; stems horizontal, branched, leafy; branches erect; leaves large, linear-lanceolate; flowers large, panicled, few; calyx clavate, reticulate; petals broad, 2-parted, naked. ⊙. H. Native of the Cape of Good Hope. Flowers red.

Cape Catchfly. Fl. June, July. Pl. ½ to 1 foot.

188 S. NOCTIFLÒRA (Lin. spec. 599.) plant clammy, pubescent; stems erect, branched; leaves large, lower ones spatulate, upper ones lanceolate; flowers large, panicled; calyx cylindrical, ventricose, with alternate veins and stripes, teeth very long; petals 2-parted, crowned. ⊙. H. Native of Sweden and Germany. In England in fields on a sandy or gravelly soil, particularly in Cambridgeshire, Oxfordshire, very common about Wetherby, Yorkshire; not rare in Suffolk and Norfolk, especially on the west side of Norwich. Smith, engl. bot. 291. Lýchnis noctiflòra, Schreb. spic. p. 31. Ocymoìdes noctiflòrum, Comm. 109. t. 34. Petals of a pale blush-colour, expanding at night, with a short blunt bifid crest. This plant resembles the *Lýchnis dioíca* in habit.

Night-flowering Catchfly. Fl. July. England. Pl. 1 to 2 ft.

189 S. ORNA'TA (Ait. hort. kew. 2. p. 96.) plant pubescent; stems erect, branched; leaves lanceolate, bluntish; flowers panicled; calyx cylindrical, ventricose, with alternate stripes and veins; petals 2-parted; lobes broad, denticulated, crowned. ♂. G. Native of the Cape of Good Hope. Sims, bot. mag. 382. Flowers the size of a *clove-pink*, dark-purple.

Ornamented Catchfly. Fl. May, Sep. Clt. 1775. Pl. 2 ft.

* * * * * * *Flowers middle-sized, red, white, or cream-coloured.*

190 S. STRI'CTA (Lin. spec. 599.) plant hardly pubescent; stem erect, branched; leaves linear-lanceolate, lower ones stalked; flowers panicled, erect; calyx cylindrically-clavated, netted; petals small, emarginate, crowned. ⊙. H. Native of Spain. S. linæòla and S. eránthema, Wib. Petals red.

Straight Catchfly. Fl. June, July. Clt. 1802. Pl. 1 foot.

191 S. CRE'TICA (Lin. syst. 421.) stem erect, pubescent at the base, with the joints clammy; leaves scabrous, lower ones obovate, upper ones linear-lanceolate; flowers panicled, on long bractless pedicels; calyx clavate; petals 2-parted, narrow, with 2-parted, entire, acute appendages. ⊙. H. Native of Crete on rocks by the sea-side. Smith, fl. græc. t. 422.—Dill. elth. 422. t. 314. f. 404. Flowers deep rose-coloured.

Cretan Catchfly. Fl. June, July. Clt. 1732. Pl. 1 to 1½ foot.

192 S. MUSCI'PULA (Lin. spec. 601.) plant smoothish, clammy; stem erect; branches alternate, long; lower leaves lanceolate-spatulate, upper ones linear; flowers panicled; calyx amply clavated, netted; petals bifid. ⊙. H. Native of Spain.—Clus. hist. 1. p. 289. f. 1. Petals intensely red.

This plant is very clammy, and when flies light upon it they become entangled; hence the name of *Catchfly* for the whole genus.

Fly-trap Catchfly. Fl. June, July. Clt. 1596. Pl. 1 foot.

193 S. LEUCOPHÆ'A (Smith, fl. græc. t. 424.) plant villous, clammy, branched; leaves linear-oblong, recurved, sessile; stem usually dichotomous, somewhat panicled; calyx clavate; petals 2-parted, narrow, with 2-parted entire appendages. ⊙. H. Native of the island of Cyprus. Flowers cream-coloured above, but brownish beneath.

White-brown-flowered Catchfly. Fl. June, July. Pl. ½ foot.

194 S. CO'RSICA (D. C. fl. fr. 4. p. 756.) plant pubescent, very clammy; stems procumbent, leafy; leaves small, obovate; flowers terminal, erect; calyx clavate; petals 2-parted, crowned, with long claws. ♃. H. Native of Corsica.—Bocc. mus. t. 54. Petals purple?

Corsican Catchfly. Fl. June, July. Clt. 1820. Pl. procumbent.

195 S. XERA'NTHEMA (Viv. fl. cors. app. in Schlecht. Linnæa, 1. p. 501.) hairy; stem ascending; leaves all lanceolate, sessile; peduncles axillary, opposite, usually 1-flowered; petals semi-bifid, exserted; calyx elongated, membranous, hairy, glandular; capsules elliptically-clavate. ♃? H. Native of Corsica.

Dry-flowered Catchfly. Pl. ascending.

196 S. PUBE'SCENS (Lois. fl. gall. p. 727.) stem dwarf, much branched; leaves lanceolate, obtuse, tapering to the base, ciliated; flowers terminal, erect; calyx clavate, hairy; petals 2-parted, crowned, with very long claws. ⊙. H. Native of Corsica about Ajaccio. S. hírta, Willd. hort. berl. t. 23. Petals rose-coloured.

Pubescent Catchfly. Fl. June, July. Clt. 1818. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

197 S. ÆGYPTI'ACA (Lin. fil. suppl. 241.) plant somewhat tomentose; stems branched; leaves obovate, stalked; flowers terminal, erect; calyx clavate; petals obcordate, bidentate at the base. ⊙. H. Native of Egypt. Petals flesh-coloured, furnished with obtuse, emarginate appendages.

Var. β, *retroflèxa* (Pers. ench. 1. p. 500.) petals turned backwards; leaves linear; petals flesh-coloured.

Egyptian Catchfly. Fl. July, Aug. Clt. 1800. Pl. $\frac{1}{2}$ to 1 ft.

198 S. SERI'CEA (All. ped. no. 1573. t. 79. f. 3.) silky; stems branched; leaves ciliated with long hairs at the base, lower ones spatulate, upper ones oblong; flowers large, terminal, or in few-flowered panicles; calyx clavate; petals 2-parted, crowned, with long claws. ⊙. H. Native of Corsica. Petals rose-coloured, with the scales acute.

Var. β, *mìnor* (Otth. mss. in D. C. prod. 1. p. 380.) leaves opaque, somewhat fleshy; flowers and plant smaller. ⊙. H. Native of Portugal in the sand by the sea-side at the Tagus, not far from Lisbon and elsewhere; it also occurs on dry hills not far from the sea shore. S. littòrea, Brot. fl. lus. 2. p. 186. Petals dark purple, with the scales crenulated.

Silky Catchfly. Fl. June, July. Clt. 1801. Pl. α 1 foot; β $\frac{1}{2}$ foot.

199 S. PI'CTA (Pers. ench. 1. p. 498.) stems much branched, hardly pubescent; lower leaves obovate-spatulate, upper ones linear, acute; flowers loosely panicled; calyx clavate, striped with red; petals 2-parted, reticulated, crowned? ⊙. H. Native of France near Dax. Sweet, fl. gard. 92. S. Reinwárdtii, Roth. S. reticulàta, Hort. S. anastomòsans, Lag. gen. et spec. 15. Petals reticulated, with red nerves and veins. A beautiful rush-like plant.

Painted-flowered Catchfly. Fl. June, Aug. Clt. 1817. Pl. 1 to 2 feet.

200 S. RUGO'SA (Pers. ench. 1. p. 498.) plant glabrous; stems branched; leaves linear-lanceolate, acute; flowers terminal or somewhat panicled; calyx clavate, rather rough from wrinkled crenated stripes. ⊙. H. Native of? Petals reticulated, with red veins.

Wrinkled-calyxed Catchfly. Fl. June, July. Pl. 1 foot.

201 S. BI'COLOR (Thore, land. p. 174.) plant tufted, glabrous; rather clammy; stems branched at the base; leaves linear, flowers panicled; calyx clavate, reticulated; petals bifid, lobes lanceolate. ⊙. H. Native in the west of France, near Dax. D. C. icon. rar. gall. t. 42. S. Porténsis, Bonam. prod. Petals reticulated, with red nerves and veins?

Two-coloured-flowered Catchfly. Fl. June, Aug. Clt. 1820. Pl. 1 foot.

202 S. KAULFU'SII (Spreng. pl. min. cog. 2. p. 64. no. 123.) plant very smooth; root fusiform; stem almost simple; radical leaves oblong, cauline ones ovate-lanceolate; flowers panicled; calyx clavate; petals toothed, with long claws. ♃. H. Native at Politz. Flowers purple?

Kaulfus's Catchfly. Fl. June, July. Pl. 1 foot.

203 S. ATO'CION (Murr. syst. ed. 13. p. 421.) stem branched, viscid, pubescent; leaves roundish-obovate, lower ones on long footstalks, uppermost ones sessile; panicle fastigiate, trichotomous; calyx long, clavate; petals obcordate, obtuse, with an acute tooth on each side at the base, crowned by 2 protuberances. ⊙. H. Native of the Levant. Jacq. vind. 3. t. 32. Flowers pink. This plant ought to follow *S. orchídea*, Lin. p. 413. no. 245.

Atocion Catchfly. Fl. June, July. Clt. 1781. Pl. $\frac{1}{2}$ to 1 ft.

§ 3. *Flowers erect; calyxes long, clavated. The plants contained in this division are easily distinguished by their long, narrow calyx, sometimes even an inch in length.*

204 S. RETICULA'TA (Desf. atl. 1. p. 350. t. 99.) plant glabrous, clammy; stems branched; leaves lanceolate-linear; flowers dichotomously panicled; calyx very long, clavated, reticulated; petals obcordate, crowned with bifid acute appendages. ⊙. H. Native of Algiers. Calyx with 10 stripes, reticulated, with purple veins. Flowers small, rose-coloured, fastigiate.

Reticulated-calyxed Catchfly. Fl. June, Aug. Clt. 1804. Pl. 1$\frac{1}{2}$ foot.

205 S. ECHINA'TA (Otth. mss. in D. C. prod. 1. p. 380.) plant pubescent; stem slender, branched; cauline leaves small, linear; flowers panicled; calyx long, cylindrically-clavated, with 10 bristly echinated ribs; petals bifid. ⊙? H. Native of?

Echinated-calyxed Catchfly. Fl. June, July. Pl. 1 foot.

206 S. PENNSYLVA'NICA (Mich. fl. bor. amer. 1. p. 272.) plant clammy-pubescent; stems procumbent; leaves lanceolate, lower ones rather spatulate; flowers panicled; calyx long, tubular; petals emarginate and rather crenated. ♃. H. Native of North America in dry sandy woods, and on rocks from New York to Virginia. Ker, bot. reg. 247. Lodd. bot. cab. t. 41. Perhaps the same as S. Virgínica, Willd. spec. 2. p. 702. S. Caroliniàna, Walt. carol. 142. Flowers purple, very handsome.

Pennsylvanian Catchfly. Fl. May, June. Clt. 1806. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot, procumbent.

207 S. SUCCULE'NTA (Forsk. descr. p. 89.) plant clammy-pubescent; stems diffuse, thick, branched, leafy; leaves obovate, fleshy; flowers panicled; calyx long, somewhat ventricose, ribbed; petals 2-parted, crowned, with very long claws. ♃? H. Native of Egypt at the catacombs of Alexandria. Delile, fl. ægypt. t. 29. f. 2. Flowers purple?

Succulent-leaved Catchfly. Fl. May. Pl. $\frac{1}{2}$ foot.

208 S. VALLE'SIA (Lin. spec. 603.) plant tufted, clammy, pubescent; root woody; stems dwarf, assurgent, a little branched; leaves lanceolate, lower ones spatulate; flowers terminal, rarely twin; calyx very long, clavate, reticulated; petals bifid, crowned. ♃. H. Native in the alps of Vallais. All. ped. no. 1574. t. 23. f. 2.—Bocc. mus. 65. t. 54. Flowers flesh-coloured or white, smelling at night, of a deeper colour beneath.

Vallesian Catchfly. Fl. June, Aug. Clt. 1765. Pl. $\frac{1}{2}$ foot.

209 S. CA'SPICA (Pers. ench. 1. p. 497.) plant scabrous; stems branched; leaves spatulate-lanceolate; flowers terminal, and in the forks of the stem; calyx oblong, cylindrical, pubescent; petals 2-parted, and furnished with a tooth on each side at the base. ♃. H. Native of Caucasus on sterile hills. S. fruticulòsa, Bieb. tab. no. 17. S. frutéscens, Bieb. casp. 175. S. suffrutéscens, Bieb. fl. taur. 1. p. 340. Stems shrubby. Petals pink.

Caspian Catchfly. Fl. June, July. Clt. 1823. Pl. 2 feet.

210 S. SALZMA'NNII (Otth. mss. in D. C. prod. 1. p. 381.) plant tomentosely-pilose; root woody, branched; stems simple, leafy; leaves lanceolate-spatulate, numerous at the base; flowers densely panicled, erect; calyx long; petals broad, obcordate, naked. ♃. H. Native of Corsica. Flowers red? Perhaps belonging to section *Atocion*.

Salzmann's Catchfly. Fl. June, July. Pl. 1 foot.

211 S. REQUIE'NII (Otth. mss. in D. C. prod. 1. p. 381.) plant pubescent; root thick, woody; stem erect, simple, leafy; leaves oblong-obovate, acuminated; flowers few, panicled; calyx very long. ♃. H. Native of Corsica near Bonifacio.

Requien's Catchfly. Fl. June, Aug. Pl. 1 foot.

212 S. AMŒ'NA (Lin. spec. 596.) plant rather pubescent; root woody; stems decumbent, branched; leaves soft, numerous at the bottom, lanceolate, rather acute, nearly smooth; flowers numerous, disposed in ample secund panicles; calyx cylindrically clavated, obovate; petals bifid, with a converging crest. ♃. H. Native of Tartary. Calyx long. Petals white.

Pleasing Catchfly. Fl. July. Clt. 1779. Pl. decumbent.

213 S. SUPI'NA (Bieb. fl. taur. 1. p. 336.) plant tufted, covered with clammy pubescence; stems woody, procumbent, branched; leaves linear, acute; flowers on short alternate pedicels; calyxes long, cylindrically clavated, tomentose; petals with long claws, bifid, crowned; lobes narrow, diverging. ♃. H. Native of Caucasus. Sims, bot. mag. t. 1997. Petals white.

Var. β, latifòlia; leaves broader and flat.

Supine Catchfly. Fl. June, Aug. Clt. 1804. Pl. procumbent ½ foot.

214 S. DEPRE'SSA (Bieb. fl. taur. 1. p. 336.) plant clammy; root woody; stems numerous, branched at the base, leafy, pubescent; leaves small, lanceolate, somewhat ciliated; flowers solitary, terminal, rarely twin; calyx very long, cylindrically-clavated; petals bifid, with long claws, crowned. ♃. H. Native of Iberia on rocks about Tiflis. Flowers white.

Depressed Catchfly. Fl. Ju. Aug. Clt. 1816. Pl. procumbent.

215 S. PARADO'XA (Lin. spec. 1673.) stem erect, pubescent; leaves smooth, hardly ciliated, lower ones obovately-lanceolate, upper ones linear; flowers large, disposed in racemose panicles; calyx long, cylindrically clavated, downy; petals 2-lobed; lobes broad, obovate, with 2-parted appendages. ♃. H. Native of Dauphiny. Jacq. hort. vind. 3. t. 84. Flowers large, white. This plant is said to grow on the Dover Cliffs, but certainly not to be found there at present. What the older botanists found on Dover Cliffs appear to be *Silène nùtans* and *S. viscòsa*, the one with naked petals and the other with crested petals.

Var. β, tenuifòlia (Otth. mss. in D. C. prod. 1. p. 381.) stem twiggy, simple; leaves linear, acute. Native about Genoa.

Paradoxical or Dover Catchfly. Fl. July. Clt.? Pl. 1½ ft.

216 S. CHLORÆFÒLIA (Smith, icon. ined. 1. p. 13. t. 13.) plant very smooth and glaucous; stems branched; leaves elliptical, pointed, upper ones rather cordate; flowers large, disposed in a terminal panicle; calyx long, cylindrical, rather clavated, striped; petals cloven half-way down, with a 2-lobed crest. ♃. H. Native of Armenia. Sims, bot. mag. t. 807. Flowers white, turning reddish as they fade.

Chlora-leaved Catchfly. Fl. Aug. Sept. Clt. 1796. Pl. 1 to 2 feet.

217 S. ITA'LICA (D. C. fl. fr. 4. p. 753.) pilosely-pubescent; stems branched at the base; lower leaves spatulate, obtuse, stem ones lanceolate, acute, connate; flowers in spreading panicles; branches of panicle 3-flowered; calyx long, clavated; petals 2-lobed, obtuse, naked. ♃. H. Native of Italy and Laconia, l. c. Smith, fl. græc. 429. Cucùbalus Itálicus, Lin. spec. 593. Jacq. obs. 4. p. 12. t. 79. Cucùbalus silenoìdes, Vill. dauph. 3. p. 614. S. Sícula, Presl. Petals white above but flesh-coloured underneath.

Var. β, càna (Otth. mss. in D. C. prod. 1. p. 382.) plant a little branched, very soft; panicle dense. S. mollíssima, Lois. not. p. 166. Petals white above, l. c.

Var. γ, rubriflòra (Otth. mss. in D. C. l. c.) plant very soft; calyx purplish; petals purple.

Italian Catchfly. Fl. May, Jul. Clt. 1759. Pl. 1 to 2 ft.

218 S. PANICULA'TA (Otth. mss. in D. C. prod. 1. p. 382.) plant velvety, clammy; stem erect, much branched, leafy; leaves lanceolate, thickish; flowers in simple panicles; calyx cylindrically-clavated, long; petals bifid; stamens long. ♃. H. Native of? Petals white?

Panicled Catchfly. Fl. June, July. Pl. 1½ foot.

219 S. PAUCIFLÒRA (Salzmann, exsic. in D. C. prod. 1. p. 382.) plant tufted, pubescent; stems numerous, simple, slender, almost leafless; leaves linear-lanceolate, numerous at the base of the stems; flowers terminal and in few-flowered panicles; calyx narrow, cylindrical; petals 2-parted, reticulated, crowned. ♃. H. Native of Corsica. Petals striped.

Few-flowered Catchfly. Fl. May, July. Pl. 1 foot.

220 S. JU'NCEA (Smith, fl. græc. t. 421.) stem simple, pubescent, panicled at the top; lower leaves obovate, acute, stalked, hoary-pilose, upper ones sessile, linear-lanceolate, smooth, but ciliated at the base; calyx elongated, clavate; petals 2-parted, narrow, with 2-parted tridentate appendages. ♂. H. Native of Asia Minor. Branches long, paniculate, few-flowered. Flowers white above and rusty beneath.

Rushy Catchfly. Pl. 2 to 3 feet.

221 S. PA'TULA (Desf. atl. 1. p. 356.) plant pubescent, clammy; stems erect, branched, branches spreading; lower leaves ovate-spatulate, upper ones lanceolate; flowers panicled; calyx long, clavated, narrow; petals semibifid, crested, with long claws. ♃. H. Native of Barbary in corn-fields. Petals white, about the size of those of *Lýchnis dioíca*. Peduncles 3-flowered.

Spreading-branched Catchfly. Fl. May, July. Clt. 1823. Pl. ½ to 2 feet.

222 S. POLYPHY'LLA (Lin. spec. 601.) plant pubescent; stems assurgent, much branched, very leafy; leaves linear, acute; flowers erect, panicled; calyx clavated; petals bifid. ♃. H. Native of Austria, Hungary, and Bohemia.—Clus. hist. 1. p. 290. f. 2. Flowers white above but purplish below.

Many-leaved Catchfly. Fl. June, July. Clt. 1800. Pl. 1 to 1½ foot.

223 S. NEMORA'LIS (Waldst. et Kit. hung. 3. p. 277. t. 249.) stem simple, pubescent; leaves pubescent, lower ones large, roundish, stalked, upper ones lanceolate; flowers panicled; calyx long, clavated; petals 2-parted, crowned. ♂. H. Native of Hungary. Cucùbalus floccòsus, Fic. Petals white above but purplish below.

Grove Catchfly. Fl. Ju. Jul. Clt. 1816. Pl. 1 to 1½ foot.

224 S. CALYCI'NA (Presl. sic. ex Spreng. syst. app. p. 182.) stem simple, erect, scabrous, clammy at the top; leaves linear-lanceolate, acute, ciliately-serrulated; flowers panicled, bracteate; calyx long, clavate, and is as well as the pedicels clothed with clammy pubescence; petals bifid, coloured. ♃? H. Native of Sicily.

Calycine Catchfly. Fl. June, July. Pl. 1 to 2 feet.

225 S. LONGIFLÒRA (Ehrh. beitr. 7. p. 144.) plant glabrous; stems erect, twiggy; leaves linear-lanceolate, rather glaucous, radical ones very long; flowers panicled; peduncles 1-flowered; calyx very long, clavated; petals 2-parted, crowned. ♃. H. Native of Hungary and Tauria, Waldst. et Kit. hung. 1. p. 7. t. 8. Petals whitish above but tinged with red below. A tall, smooth plant, with purplish stems.

Var. β, júncea (Otth. mss. in D. C. prod. 1. p. 382.) leaves all linear; panicle small. ♃. H. Native of Iberia. S. júncea, Roth. catalect. 1. p. 54.

Long-flowered Catchfly. Fl. July, Sept. Clt. 1793. Pl. 1½ to 3 feet.

226 S. BUGLOSSIFÒLIA (Smith, in Rees' cycl. vol. 32.) plant hairy, clammy; stem simple, leafy; leaves undulated, the upper ones lanceolate; flowers panicled; peduncles 1-flowered, opposite, shorter than the flowers; calyx cylindrical, an inch long; petals 2-parted, naked. ♂. H. Native of the Levant at the foot of Mount Ararat. Flowers white above.

Bugloss-leaved Catchfly. Fl. Aug. Pl. 3 feet.

227 S. BUPLEUROÌDES (Lin. spec. 598.) plant glabrous, clammy; stem assurgent, branched; leaves linear-lanceolate, acute, lower ones very long; upper bracteas with broad, mem-

branaceous margins; flowers panicled; peduncles generally 2-3-flowered; calyx long, clavate, purplish; petals 2-lobed, crowned. ♃. H. Native of Persia and on Mount Atlas. Petals white on the upper surface but pale violet underneath. Desf. atl. 1. p. 351.—Tourn. itin. 2. p. 139. t. 154.

Bupleurum-like Catchfly. Fl. June, Aug. Clt. 1801. Pl. 1 to 2½ feet.

228 S. ca'na (Otth. mss. in D. C. prod. 1. p. 382.) plant hoary-pubescent; stem twiggy, simple; lower leaves ovate-oblong, stalked, ciliated at the base, upper ones linear; flowers panicled; peduncles 3-flowered; calyx long, clavated, purplish; petals bifid, with long claws. ♃. H. Native of? Petals whitish above, but brownish underneath?

Hoary Catchfly. Fl. Ju. Jul. Clt. 1824. Pl. 2 feet.

229 S. molli'ssima (Pers. ench. 1. p. 498.) stem herbaceous, fleshy; leaves fleshy, silky pubescent, radical ones ovate-spatulate; panicle corymbose, somewhat dichotomous; petals bifid, naked; calyx cylindrically-clavate. ♃. H. Native of Italy and Asia Minor. Flowers white. Cucùbalus mollíssimus, Lin. spec. 593.

Very soft Catchfly. Fl. Jul. Sept. Clt. 1739. Pl. 1 to 2 ft.

230 S. pilòsa (Spreng. syst. 2. p. 411.) plant hoary, villous; stems erect, branched, clammy; leaves undulated, lower ones large, spatulate, upper ones lanceolate; flowers in ample trichotomous panicles; calyx cylindrically clavated; petals 2-parted, crowned. ♃. H. Native of Italy, Hungary, and Transylvanica by the sea-side. Cucùbalus pilòsus, Willd. enum. 471. Cucùbalus mollíssimus, Waldst. et Kit. hung. 3. t. 248. Flowers white above but brownish or reddish beneath.

Pilose Catchfly. Fl. Jul. Sept. Clt. 1739. Pl. 1 to 1½ ft.

231 S. re'gia (Sims, bot. mag. t. 1724.) plant clammy, pubescent; leaves ovate-lanceolate; flowers large, panicled; calyx downy, long, tubular; petals oblanceolate, undivided, crowned with bicuspidate appendages; stamens very long. ♃. H. Native of North America on the Mississippi. S. Virgínica, var. Illinoénsis, Mich. fl. bor. amer. 1. p. 272. Flowers large, dark crimson, in trichotomous panicles.

Royal Catchfly. Fl. May, Aug. Clt. 1811. Pl. 2 to 5 feet.

232 S. Baldwy'nii (Nutt. gen. amer. 1. p. 288.) plant pilose; leaves somewhat lanceolate; flowers very large, in trichotomous panicles; petals jagged, divaricating. ♃. F. Native of Florida. Flowers very large, rose-coloured.

Baldwyn's Catchfly. Fl. May, July. Pl. 1 to 3 feet.

233 S. Mocinia'na (D. C. prod. 1. p. 382.) plant rather villous; stem simple, erect; leaves lanceolate; flowers panicled; calyx cylindrically clavated, very long; petals 6-cleft, furnished with 2 bifid appendages. ♃. F. Native of Mexico. Moc. et Sesse. pl. mex. icon. ined. Flowers purple.

Mocino's Catchfly. Fl. Ju. Jul. Clt. 1827. Pl. 3 to 4 ft.

234 S. lacinia'ta (Cav. icon. 6. p. 44. t. 564.) plant pubescent; stem erect, branched; leaves large, lanceolate, acute; flowers very large, terminal, rather drooping; peduncles 1-flowered; calyx long, cylindrically ventricose: petals somewhat 4-cleft; stamens short. ♃. F. Native of South America. Flowers crimson, with a white, 2-parted crest.

Jagged-petalled Catchfly. Fl. June, July. Pl. 3 to 4 feet.

235 S. rotundifòlia (Nutt. gen. amer. 1. p. 288.) stems decumbent, pilose; leaves broad-oval, stalked, ciliated; flowers few, panicled; calyx angular, cylindrically-clavated; petals jagged, somewhat 4-cleft, crowned. ♃. H. Native of North America on the banks of the Ohio and Tenessee. Petals scarlet.

Round-leaved Catchfly. Fl. June, Aug. Pl. decumbent.

236 S. adsce'ndens (Lag. gen. amer. 15.) plant villous, clammy; leaves linear-lanceolate, obtuse, ciliated; peduncles 1-flowered, fruit-bearing ones spreading; calyx oblong, clavated, circularly reflexed at the base; petals bifid. ⊙. H. Native of Spain. Flowers red.

Ascending-stemmed Catchfly. Fl. June, July. Clt. 1822. Pl. ½ foot.

237 S. dianthoi'des (Pers. ench. 1. p. 500.) leaves linear; flowers panicled; calyx striated, sessile between 2 leaves, which form an involucrum: petals bifid. ⊙? H. Native of the Levant. Cucùbalus saxífragus, Schreb. dec. 9. t. 5. Flowers pink or purple? Calyx striped with purple.

Dianthus-like Catchfly. Fl. June, July. Pl. ½ to 1 foot.

Sect. VIII. Ato'cion (from *α* priv. and *τοκος*, *tokos*, the young or brood of any thing; because many of the plants contained in this section often produce nothing but male flowers.) Otth. mss. in D. C. prod. 1. p. 383. Caulescent. Flowers corymbose. Calyxes clavated, with 10 stripes.

* *Perennial or shrubby.*

238 S. cordifòlia (All. ped. no. 1581. t. 23. f. 3.) plant clammy, glaucous; stems simple, hairy; leaves ovate, pointed, pubescent, upper ones somewhat cordate; flowers 1-4, terminal, almost sessile; calyx ovate, cylindrically clavated; petals quinquefid with a bifid crest. ♃. H. Native of Piedmont on rocks, also about Nice. Petals pale pink above and yellowish beneath.

Heart-leaved Catchfly. Fl. June, July. Clt. 1819. Pl. ¼ ft.

239 S. fruticòsa (Lin. spec. 597.) stem shrubby at the base, much branched, tufted; flowering stems simple; leaves obovate, mucronate, dark-green, permanent, ciliated, particularly towards the base; flowers crowded, fastigiately-panicled; calyx clavate; petals deeply emarginate, obtuse, with 4-parted appendages. ♄. H. Native of Sicily and the island of Cyprus on rocks. Smith, fl. græc. t. 428. S. nítida, Lag. gen. et spec. p. 15.—Bocc. sic. 48. t. 30. f. 2. Petals with greenish claws, flesh-coloured on the limb above, but greenish below.

Shrubby Catchfly. Fl. June, July. Clt. 1629. Sh. 1 to 1½ ft.

240 S. cæspitòsa (Stev. in mem. soc. mosq. 2. p. 262.) plant tufted, roughish; root thick, woody; stems simple, slender, very leafy at the base; leaves small, linear, acute; flowers 2-3, terminal; calyx clavated; petals 2-lobed, crowned? ♃. H. Native of Caucasus. Petals pink.

Turfy Catchfly. Fl. May, July. Clt. 1824. Pl. ¼ to ½ ft.

241 S. tomentòsa (Otth. mss. in D. C. prod. 1. p. 383.) plant very soft; root woody, branched; stems simple, very leafy at the base, almost leafless above; leaves fleshy, lower ones large, shell-formed, upper ones linear; flowers disposed in a crowded corymb; calyx cylindrically-clavated; petals 2-parted. ♃. H. Native of Gibraltar on rocks. Petals pink.

Tomentose Catchfly. Pl. ½ to 2 feet.

242 S. platype'tala (Otth. mss. in D. C. prod. 1. p. 383.) plant pilosely-pubescent; stem humble, very leafy at the base; leaves ciliated at the base, lower ones lanceolate-spatulate, upper ones linear-lanceolate; flowers few, in a panicled corymb; calyx clavated; petals broad-ovate, with long claws. ♃. H. Native of North America. S. Virgínica, Rafinisque in litt. but not of Lin. Flowers large, crimson.

Broad-petalled Catchfly. Fl. May, Aug. Pl. ½ foot.

243 S. Berge'rii (Schott. ex Spreng. syst. 2. p. 411.) stem simple, pilose at the base; leaves lanceolate, also pilose; panicle corymbose, few-flowered; calyx clavate, hispid; petals obcordate, crowned. ♃? H. Native of Italy. Flowers red?

Berger's Catchfly. Pl. 1 foot.

244 S. polygonoìdes (Pers. ench. 1. p. 500.) plant pilose; root thick; stems procumbent, branched; leaves small, lower ones lanceolate, upper ones elliptical, acute; flowers sessile, in corymbs; calyx cylindrical; petals emarginate, naked? ♃. H. Native of the island of Naxia. Cucùbalus polygonoìdes, Willd. spec. pl. 2. p. 690. Flowers white, with a purple circle in the centre. Leaves like those of *Thýmus serpýllium*.

Polygonum-like Catchfly. Pl. trailing.

* * *Annual or biennial.*

245 S. ORCHI'DEA (Lin. fil. suppl. 241.) plant clammy; stem branched, pubescent; leaves ovate, ciliated, lower ones on short footstalks; flowers in dense corymbs; calyx long clavated; petals deeply 2-lobed, furnished with a lobe on each side at the base, crowned with bifid entire appendages. ⊙. H. Native of the Levant and the Grecian Islands. Smith, fl. græc. t. 427. Calyx and petals rose-coloured. The petals have the appearance of the labellum of some species of *Orchis*. The *S. Atòcion* of Murr. p. 413. no. 203. has been considered by many botanists identical with this species, but it is truly distinct. It ought, however, to have been placed in the present section.

Orchis-like-petalled Catchfly. Fl. June, July. Clt. 1781. Pl. ½ to 1 foot.

246 S. PSEU'DO-ATO'CION (Desf. atl. 1. p. 353.) plant clammy; stem much branched; leaves glabrous, lower ones obovate-spatulate; flowers in lax corymbs; calyx long clavated; petals very entire, linear, crowned. ⊙. H. Native of the north of Africa. Petals rose-coloured.

False-Atocion Catchfly. Fl. Ju. July. Clt. 1820. Pl. ¼ to ¾ ft.

247 S. CRI'SPA (Poir. dict. 7. p. 162.) root slender; stem erect, almost simple, hairy; leaves oblong-linear, obtuse, with curled spinulose margins; flowers solitary, disposed in close bundles; calyx long, clavated; petals bifid. ⊙. H. Native of Barbary. Flowers pink?

Curled-leaved Catchfly. Fl. July, Sept. Pl. 1 foot.

248 S. ARME'RIA (Lin. spec. 601.) plant quite smooth, glaucous; stem branched; leaves ovate-lanceolate, rather cordate at the base; flowers in corymbose panicles; calyx long, clavated; petals obcordate, crowned. ⊙. H. Native of France and Switzerland. In England in fields, or on banks, or on old walls, a doubtful native. Smith, engl. bot. t. 1398. Fl. dan. t. 559. Cucùbalus fasciculàtus, Lam. Flowers pink.

Var. β, álba (D. C. prod. 1. p. 384.) flowers white.

Sweet-William or Lobel's Catchfly. Fl. July, Sep. Pl. 1 to 1½ foot.

249 S. LERCHENFELDIA'NA (Baumg, stirp. trans. 1. p. 398.) glabrous; stem filiform, decumbent; leaves oblong or linear-lanceolate, cauline ones ovate-lanceolate, quite smooth, rather crenulated; panicle simple, corymbose, few-flowered; petals emarginate, crowned. ⊙. H. Native of Transylvania on the Alps. Flowers red?

Lerchenfeld's Catchfly. Pl. decumbent.

250 S. SIEGE'RI (Baugm. stirp. trans. 1. p. 400.) stem erect, simple, furrowed; radical leaves numerous, oblong-lanceolate, channelled, stalked; cauline leaves 2, linear; flowers terminal, solitary, or 2-3 in an umbel; calyx clavated, campanulate; petals obcordate, crowned? ⊙? H. Native of Transylvania on the Alps about Rodno. Flowers pink?

Sieger's Catchfly. Fl. June, July. Pl. ½ to 1 foot.

251 S. CONGE'STA (Sibth. and Smith, prod. fl. græc. p. 300.) plant pubescent; stem rather branched, nakedish, rather clammy near the top; leaves obovate, obtuse, green, stalked, crowded at the base of the stem; flowers disposed in dense tufted corymbs; calyx very long, clavated; petals 2-parted, naked. ⊙. H. Native of the Pyrenees and Greece. Flowers greenish.

Crowded-flowered Catchfly. Fl. July, Sept. Clt. 1818. Pl. 1 to 1½ foot.

252 S. COMPA'CTA (Fisch. in Horn. hafn. 1. p. 417.) plant glabrous, glaucous; stem erect, branched; leaves ovate-cordate, sessile, with 2 large ones like an involucre near the corymb, appearing as if they were connate; bracteas narrow, shorter than the pedicels; flowers crowded into dense corymbs; calyx very long, clavated; petals oboval, entire, crowned. ♂. H. Native of Russia. S. Armèria, Bieb. fl. taur. no. 837. Flowers pink. This is very like *S. Armèria*, but easily distinguished by its entire petals.

Compact-flowered Catchfly. Fl. July. Clt. 1810. Pl. 1½ ft.

253 S. PERFOLIA'TA (Otth, mss. in D. C. prod. 1. p. 384.) plant very smooth, glaucous; stems slender, filiform, almost simple; leaves roundish, perfoliate; flowers in capitate corymbs, with a 1-leaved concave involucrum, which is larger than the leaves; calyx rather inflated, oblong; petals small. ♂. H. Native of the Levant. Cucùbalus chloræfòlius, Poir. dict. 2. p. 416. Flowers red?

Perfoliate Catchfly. Fl. June, July. Clt. 1817. Pl. 1½ foot.

254 S. UNDULATIFÒLIA (Mor. ex Spreng. syst. append. p. 182.) stem erect, glabrous; leaves spatulate, oblong, obtuse, waved, smooth; flowers in terminal fascicles; calyx smooth, coloured; petals 2-lobed. ⊙. H. Native of Sardinia. Flowers red.

Wavy-leaved Catchfly. Fl. June, July. Pl. 1 foot.

255 S. FŒ'TIDA (Link. ex Spreng. syst. 2. p. 406.) stem erect, nearly simple, villous, clammy; leaves ovate, acute, also villous and clammy; flowers tern, terminal, peduncled, erect; calyx cylindrical. ♂. H. Native of Portugal. This plant ought perhaps to be placed in section *Siphonomórpha*.

Fœtid Catchfly. Pl. 1 foot?

† *A plant belonging to section Behenántha, which ought to follow S. angustifòlia*, no. 29, p. 400.

256 S. DOUGLA'SII (Hook. fl. bor. amer. p. 88.) pubescent; stems erect, flexuous, slender; leaves remote, long, linear; flowers panicled; calyx obovate, at length inflated, striated, pubescent; petals bifid. ♃. H. Native of North America above the grand rapids of the Columbia, and on the western declivity of the Rocky Mountains. Flowers white.

Douglas's Catchfly. Pl. 1 foot.

Cult. The few green-house kinds of this genus thrive well in a rich light soil, and young cuttings of the shrubby species, planted under a hand-glass, strike root readily. The hardy herbaceous kinds only require to be planted in the open border, but the dwarfer species are well adapted for rock-work. Some of them will not live long unless kept in pots, as alpines, that they may be sheltered with ease in the winter, particularly *Silène cordifòlia perfoliàta, Catesbæ'a, Virgínica, acaúlis, quadridentàta, rupéstris, glaucifòlia, règia, pumìlio, pusílla, Pennsylvánica*, &c.; these may be grown in a mixture of loam and peat, as well as those marked frame. The seeds of the hardy annual and biennial kinds only require to be sown in the beginning of April where they are intended to remain. All the species may be easily increased by seeds, but all the truly perennial kinds are easier increased by dividing the plants at the root in spring. The sections *Nanosilène, Siphonomórpha, Rupífraga*, and *Atòcion*, contain the most elegant species.

VII. VISCA'RIA (from *viscus*, bird-lime; because the stems of the plants are covered with clammy gluten.) Roehler.

LIN. SYST. *Decándria, Pentagýnia*. Calyx cylindrical, clavated at the apex, 5-toothed, naked. Petals 5, unguiculated, with scales in the throat. Stamens 10. Styles naturally 5. Capsule 5-celled. Anthophorum long. Evergreen tufted plants, with glassy leaves, and long clustered or corymbose racemes of red or white flowers.

1 V. VULGA'RIS (Roehl.) stem viscid about the joints; petals slightly cloven; leaves linear-lanceolate, fringed at the base. ♃. H. Native throughout the whole of the north of Europe in dry meadows and in fissures of rocks. In Britain on Arthur's seat, and on rocks by the hermitage a mile south of Edinburgh; on the sides of Craig Wreidhin, Montgomeryshire, &c. Lýchnis viscària, Lin. spec. 625. Smith, engl. bot. 788. Fl. dan. t.

1032.—Clus. hist. 1. p. 289. f. 2. Flowers rose-coloured, scentless, disposed in a crowded clustered raceme. Calyx purplish.

Var. β, flòre-plèno ; flowers double. This plant is very common in rustic gardens, where it is called *Double Catchfly.* It is a very ornamental plant.

Common Red German Catchfly, or Rock Lychnis. Fl. May, June. Britain. Pl. 1 to 1½ foot.

2 V. negle'cta (G. Don, in Loud. hort. brit. p. 186.) stem not clammy ; petals entire ; leaves lanceolate, linear, ciliated at the base. ♃. H. Native of? Lýchnis viscària albiflòra, Hort. Flowers white. An elegant plant.

Neglected Rock Lychnis. Fl. May, June. Clt.? Pl. 1 foot.

3 V. alpi'na ; smooth, not viscid ; petals cloven ; flowers densely corymbose ; leaves linear-lanceolate, naked at the base. ♃. H. Native of several parts in the north of Europe, Lapland, Denmark, &c. also said to grow on the Pyrenees. In Scotland, near the summits of the Clova Mountains, in Angus-shire. Lychnis alpìna, Lin. spec. 626. Smith, engl. bot. 2254. Fl. dan. 62. Flowers crowded into a dense tuft at the top of the stems, of a bright rose-colour, tetragynous in the American plant.

Alpine Red Campion or Rock Lychnis. Fl. June, July. Scotland. Pl. ½ foot.

4 V. Helve'tica (G. Don, in Loud. hort. brit. 186.) smooth, not viscid ; leaves lanceolate, naked at the base ; petals cloven to the middle, acute ; calyx ventricose ; flowers crowded into a convex umbel ; anthophorum long. ♃. H. Native of Switzerland on the Alps. Lýchnis alpìna, Sims, bot. mag. 394. Flowers beautiful rose-coloured ; petals crowned with small protuberances rather than teeth ; this is said to be the case in *V. alpìna.* Hall. hist. 1. p. 400. t. 17. There are several species under the name of *Lýchnis alpìna* in the gardens. The one so named in the Botanical Magazine is a biennial plant.

Swiss Red Campion or Rock Lychnis. Fl. June, July. Clt. 1810. Pl. ½ foot.

5 V. Magella'nica ; plant rather villous, tufted ; leaves linear, acute ; flowers in terminal fascicles ; petals emarginate, with a tooth on each side at the base ? equalling the campanulate calyx in length. ♃. F. Native of the Straits of Magellan. Lýchnis Magellánica, Lam. dict. 3. p. 641.

Magellan Rock Lynchis. Pl. ½ foot.

Cult. Pretty plants, well adapted for rock-work, or the front of flower-borders. They thrive best in light sandy soil. *V. alpìna* and *V. Helvética* grow well in pots as alpines. They are all increased by dividing the plants at the root, this should be done three times in the course of the summer, for when they become large and matted they are apt to be destroyed by a kind of green insect.

VIII. LY'CHNIS (from λυχνος, *lychnos,* a link or lamp ; probably in allusion to the brilliancy of the flowers of most of the species.) Lin. gen. no. 231. D. C. fl. fr. 4. p. 761.

Lin. syst. *Decándria, Pentagýnia.* Calyx cylindrical, clavated, 5-toothed, naked. Petals 5, unguiculate, crowned with scales at the throat. Stamens 10. Styles 5. Capsule 1-celled. Anthophorum long or short. Smooth, hairy, or woolly herbs, with terminal corymbs of flowers rarely solitary.

1 L. Chalcedo'nica (Lin. spec. 625.) plant smoothish, clammy ; flowers corymbose, in bundles ; calyx cylindrical, clavated, ribbed ; petals 2-lobed ; anthophorum long ; leaves lanceolate, rather cordate at the base, and rather pilose, clasping the stem. ♃. H. Native of Siberia about Barnaoul and in Japan. Curt. bot. mag. 257.—Clus. hist. 1. p. 192. f. 1. Flowers either scarlet, rose-coloured, or white.

Var. β, flòre-plèno ; flowers double, scarlet. Double scarlet Lychnis.

Var. γ, albiflòra ; flowers single, white. White Lychnis.

Var. δ, álbo-plèna ; flowers double, white. Double White Lychnis.

This most shewy plant is called *Scarlet Lychnis* in England. *Croix de Malthe* in France and Portugal ; *Croce de Cavaliere* in Italy ; *Croix de Jerusalem* in Spain.

Chalcedonian or Scarlet Lychnis. Fl. June, July. Clt. 1596. Pl. 1½ to 3 feet.

2 L. Flos-jo'vis (Lin. spec. 625.) plant white from tomentum ; flowers in umbellate heads ; calyx cylindrical, clavated, ribbed ; petals 2-lobed ; anthophorum short, thick ; leaves lanceolate, clasping the stem, silky-tomentose. ♃. H. Native of Switzerland and Piedmont on dry rocks. Curt. bot. mag. 390.—Mor. hist. 2. p. 540. sect. 5. t. 36. f. 2. Peduncles short, rather branched. Flowers purple or scarlet.

Var. β, ramòsa (Ser. mss. in D. C. prod. 1. p. 385.) flowers in panicled corymbs. ♃. H. Native of Savoy on mount Breson. Flowers red.

Flower of Jove or Umbellate Lychnis. Fl. July. Clt. 1726. Pl. 1½ foot.

3 L. grandiflo'ra (Jacq. coll. 1. p. 149. pl. rar. t. 84.) plant glabrous ; flowers solitary or tern, terminal and axillary ; calyx terete, clavated, ribbed ; petals lacerated ; anthophorum very long ; leaves ovate, almost sessile. ♃. G. Native of China and Japan. Lýchnis coronàta, Thunb. jap. 187. Delaun. herb. amat. t. 25. Curt. bot. mag. 223. Flowers large, beautiful scarlet, pale beneath.

Var. β, tetrapétala (Ser. mss. in D. C. prod. 1. p. 386.) calyx 4-toothed. Petals 4.

Great-flowered Lychnis. Fl. June, Sept. Clt. 1774. Pl. 1 to 1½ foot.

4 L. fu'lgens (Fisch. in Sims, bot. mag. t. 2104.) plant hairy ; flowers in fastigiate corymbs ; calyx terete, clavated, woolly ; petals 4-cleft, outer segments awl-shaped ; anthophorum short ; leaves ovate, hairy. ♃. H. Native of Siberia. Ker, bot. reg. 478. Rchb. icon. t. 5. Flowers large, beautiful, of a vermilion colour.

Fulgent Lychnis. Fl. June, July. Clt. 1819. Pl. 1 to 2 foot.

5 L. cœ'li-ro'sa (Desrouss. in Lam. dict. 3. p. 644.) plant glabrous ; stem dichotomously panicled, erect ; flowers solitary, terminal ; calyx clavated, with 10 ribs ; lobes very acute ; petals lobed ; leaves linear, acute ; anthophorum long. ⊙. H. Native of Sicily, Barbary, and the Levant, in corn-fields, &c. Agrostémma cœ'li-ròsa, Lin. spec. 624. Curt. bot. mag. 295.—Moris, hist. sect. 5. t. 2. f. 32. Flowers flesh-coloured.

Var. α, pusílla (Poir. suppl. 3. p. 537.) stem much branched at the base ; leaves linear, acute, almost glabrous. ⊙. H. Native of Spain by the sea shore.

Var. β, læ'vis (Poir. l. c.) stem angular, erect ; leaves smooth. ⊙. H.

Var. γ, áspera (Poir. l. c.) stem almost round ; leaves narrow, rough ; angles of the calyx rough, serrulated. ⊙. H.

Var. δ, diffùsa (D. C. cat. hort. monsp. p. 122.) stem flexuous, decumbent. ⊙. H.

Rose of heaven or smooth Lychnis. Fl. July, Aug. Clt. 1713. Pl. ½ to 1 foot.

Cult. All the species of this genus are deserving of cultivation for the brilliancy of their blossoms. The *Lýchnis Chalcedónica* or *scarlet lychnis,* is an old and much esteemed border-flower, the double varieties of which require some care to prevent them from returning to a single state, and to propagate them by cuttings. *L. fúlgens* and *grandiflòra* are truly elegant plants, these may be also increased by cuttings. They all thrive best in light rich loamy soil, but they must often be taken up and divided or they dwindle away ; the best time to do this is early in spring. *L. grandiflòra* will thrive well and flower

abundantly if planted out in the open border in spring; but it requires to be taken up in the autumn and potted, or the frost will kill it. All the species may be reared by cuttings, planted under a hand-glass, or by seeds, which generally ripen in abundance. The *L. cœli-rosa* is an elegant hardy annual plant, the seeds of which only require to be sown in the open border in spring.

IX. AGROSTE'MMA (from *αγρος*, *agros*, a field, and *στεμμα*, *stemma*, a crown; alluding to the beauty of the flowers, which were formerly made into crowns or garlands). Lin. gen. no. 231.

Lin. syst. *Decándria*, *Pentagýnia*. Calyx egg-shaped or campanulate, with 5 short teeth. Petals 5, unguiculate, crowned. Stamens 10. Styles 5. Capsule 1-celled. Anthophorum very short, or wanting. Evergreen plants with broadish leaves and 1-flowered peduncles.

1 A. ape'tala (Lin. spec. 626. under *Lýchnis*,) stem straight, 1-flowered; flower nodding; calyx inflated, bladdery, striated, hairy; petals shorter than the calyx; anthophorum very short; leaves linear, lower ones spatulate. ♃. H. Native of the alps of Lapland and Siberia. Lin. fl. lap. t. 12. f. 1. There are numerous varieties of this plant, but probably as many distinct species.

Var. α, hortènsis (Cham. in Schlecht. Linnæa. 1. p. 43.) stem simple, 2 feet high, 1-flowered, pubescent; flower nodding.

Var. β, pauciflòra (D. C. prod. 1. p. 386.) stem bearing 1-2 or 3 flowers; petals hardly longer than the calyx. L. uniflòra and pauciflòra, Fisch. in litt. L. brachypétala, Cat. hort. berl. ex Horn. hort. hafn. suppl. p. 51. Petals white.

Var. γ, gentianoìdes (Cham. l. c.) stem di-trichotomous, 8 inches high, smooth, one of the stems bearing 7 flowers the other 4 flowers. Native of Eschscholtz Bay.

Var. δ, genuìna (Cham. l. c.) pubescent, but when in fruit smooth, or a little pubescent. ♃. H. Native of Europe.

Var. ε, móllis (Cham. l. c.) plant densely tufted, 9 inches long and trailing, glaucous, and of a more soft habit than the other varieties; calyx more inflated; young leaves ciliated, but smooth in other respects. Native of?

Var. ζ, macrocéphala (Cham. l. c. p. 44.) root woody, with numerous stems rising from it, forming a dense tuft; leaves narrower than in the preceding, pubescent; stems 3-4 inches high; flowers deep red. Native of the island of St. Lawrence.

Two species are described by Ledebour in the Petersburg Transactions. *L. pauciflòra* and *uniflòra*, which do not appear to differ from some of the above varieties.

Apetalous Rose-campion. Fl. June, Jul. Clt. 1810; *β* 1817. Pl. ½ to 1½ foot.

2 A. involucra'ta; plant smooth at the base and pubescent at the apex; radical leaves linear; stems filiform, 1-flowered; with some narrow elongated leaves in the middle and some smaller ones approximating the flower in the form of an involucre; petals longer than the calyx; calyx bladdery. ♃. H. Native of? Lýchnis brachypétala, var. involucràta, Cham. l. c.

Involucrate Rose-campion. Pl. ½ foot.

3 A. variega'ta (Desf. cor. Tourn. 74. t. 56. under *Lýchnis*,) plant glabrous; flowers terminal; calyx inflated; petals emarginate, variegated; stamens protruding; leaves roundish, fleshy, glaucous; footstalks connate at the base. ♃. H. Native on Mount Ida. Flowers variegated.

Variegated-flowered Rose-campion. Pl. ½ foot.

4 L. sylve'stris (Hop. cent. exs. 3. no. 33. D. C. fl. fr. 4. p. 763. under *Lýchnis*,) hairy and viscid; flowers dichotomously-panicled, generally dioecious; petals cloven; lobes narrow, diverging; capsules roundish, with recurved teeth; leaves ovate or lanceolate. ♃. H. Native almost throughout the whole of Europe in humid shady places. In Britain in moist shady places and under hedges, frequent. L. diúrna, Sibth. oxon. 145. L. dioíca *α*, Lin. spec. 626. L. dioíca flòre-rùbro, Smith, engl. bot. 1579. Curt. lond. fasc. 2. t. 32. Flower scentless, rose-coloured or purple. Petals crowned with 4 teeth. Calyx inflated.

Var. β, flòre-plèno; flowers double, red. ♃. H. Cultivated in gardens, where it is called *Bachelors' buttons*.

Var. γ, pygmæ'a (Ser. mss. in D. C. prod. 1. p. 386.) small; leaves rather imbricated; stems bearing only 1 or 2 flowers. ♃. H. Native on Mount Margazola. Flowers red.

Wild Red-campion. Fl. May, June. Britain. Pl. *α* 1 to 2 feet; *β* 1 and *γ* ½ foot.

5 L. dioíca (Lin. spec. 626. var. *β*. D. C. fl. fr. 4. p. 762. under *Lýchnis*,) hairy and viscid; flowers dichotomously-panicled, dioecious; petals cloven; lobes broad, approximating; capsules conical, with erect teeth; leaves ovate. ♃. H. Native throughout the whole of Europe in fields, hedges, and by way-sides; plentiful in Britain. L. vespertìna, Sibth. oxon. 146. L. álba, Mill. dict. no. 4. L. dioíca flòre-álbo. Smith, engl. bot. t. 1580. Fl. dan. t. 792. Flowers white, sweet-scented in the evening. Petals crowned with 4 teeth. Calyx inflated.

Var. β, múltiplex (D. C. prod. 1. p. 386.) flowers white, double, sweet-scented in the evening. ♃. H. Cultivated in gardens, but rare.

Var. γ, ròsea; flowers blush-coloured, often with stamens and pistils together. Bearing white and red flowers on the same plant when transplanted. ♃. H. Native of Britain in hedges and fields, but rare.

Var. δ, viridiflòra (Ser. mss. in D. C. prod. 1. p. 386.) flowers double, with green petals.

Dioecious Rose-campion. Fl. June, Sept. Brit. Pl. 2 to 3 feet.

6 A. declìnis (Lag. gen, et spec. 15. under *Lýchnis*,) plant pilose; stems tufted, dichotomous, leafy; flowers dioecious, on long pedicels, terminal and axillary; calyx terete, striped; fructiferous ones rather globose, teeth small; petals emarginate; stamens not protruding; leaves and bracteas ovate-lanceolate; anthophorum none. ♃. H. Native of Spain in the province of Valentia. Agrostémma dioíca, L. Duf. in litt. Flowers white or red.

Declining Rose-campion. Fl. June, July. Pl. 1 to 1½ foot.

7 A. læ'ta (Ait. hort. kew. 2. p. 118. ed. 2. vol. 3. p. 134. under *Lýchnis*,) flowers solitary; calyxes with 10 ribs; petals bifid; leaves linear-lanceolate, rather ciliated. ⊙. H. Native of Portugal in bogs and moist meadows, particularly about Coimbra. L. palústris, Brot. fl. lus. 2. p. 221. phyt. lus. fasc. 1. A pretty little plant with rose-coloured flowers.

Joyful Rose-campion. Fl. July. Clt. 1778. Pl. ¼ to ½ ft.

8 A. Córsica (Lois. not. 73. under *Lýchnis*,) stem erectish, branched, somewhat dichotomous; peduncles elongated, 1-flowered; petals oblong, somewhat emarginated; leaves linear-lanceolate, glabrous. ♃. H. Native of Corsica. Perhaps distinct from *L. læ'ta*. A beautiful little plant with red flowers.

Corsican Rose-campion. Fl. Ju. Jul. Clt. 1818. Pl. ½ ft.

9 A. niva'lis (Kit. in litt. under *Lýchnis*. Spreng. syst. 2. p. 421.) smooth; radical leaves oblong, ciliated, tapering into the petiole; scape 1-flowered; bracteas linear, elongated, ciliated; calyx campanulate, equal, obtusely-toothed; petals large, lobed, crowned in the throat. ♃. H. Native of the Carpathian mountains.

Snow Rose-campion. Pl. ½ foot.

10 A. Sibi'rica (Lin. spec. 626. under *Lýchnis*,) stems tufted; flowers in dichotomous bundles and solitary in the forks of the stem on long stalks; calyx campanulately-globose; lobes very short, obtuse; petals bifid; anthophorum none; leaves linear, and are as well as stems hairy. ♃. H. Native of Siberia. Stature of *Silène rupéstris*. Flowers pink.

Siberian Rose-campion. Fl. June, July. Clt. 1817. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

11 A. Pyrena'ica (Berg. fl. bass. pyren. 2. p. 264. under *Lýchnis*,) glabrous; stems tufted, diffuse; flowers in dichotomous bundles, with a single flower in each fork, which stands on a long peduncle; calyx campanulate, lobes short; petals rather emarginate, appendiculate; leaves leathery, radical ones spatulate, on long footstalks, cauline ones cordate, sessile. ♃. H. Native of the Pyrenees on rocks. D. C. icon. fl. gall. rar. fasc. 2. ined. L. nummulària, Lapeyr. abr. p. 263. Flowers red or white.

Pyrenean Rose-campion. Fl. June, July. Clt. 1819. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

12 A. triflòra (Sommerfelt, in mag. natur. ann. 1824. cah. 1. p. 151. under *Lýchnis*,) stem 3-flowered; peduncles and calyx clothed with viscid down; stem erect, very short, pubescent; leaves densely-pubescent, radical ones crowded, lanceolate, acutish, entire, ciliated, with a pair of cauline ones hardly an inch from the root; bracteas 6, opposite by twos, approximating the flowers in the manner of an involucrum; calyx ventricose; petals emarginate, longer than the calyx. ♃. H. Native of Greenland. Flowers erect, white, 2 lateral ones on short pedicels, middle one on a long one. Stigmas pubescent.

Three-flowered Rose-campion. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

13 A. pu'lchra; herbaceous, canescent, viscidly-pubescent; stem erect, few-flowered; leaves lanceolate, acute, lower ones tapering into the petiole, upper ones sessile, half-stem-clasping; flowers large, on long peduncles, like those of *A. sylvéstris*, p. 416. no. 4. but nearly twice the size, and red; calyx tubular, 10 lines long, 10-striped, 5-toothed; teeth broad, with pellucid margins, and with a green nerve running through the middle; petals quadrifid, lateral segments smallest. ♃. F. Native of Mexico at the bottom of mount Oriziba. Lýchnis púlchra, Schlecht. et Cham. in Linnæa 5. p. 334.

Fair Rose-campion. Pl. 1 to 2 feet.

14 A. fimbria'ta; stem erect, nearly simple, panicled at the top, pubescent; leaves ovate, acuminated, 3-5-nerved; calyx inflated; petals fringed. ♃. H. Native of Kamoon in the East Indies. Lýchnis fimbriàta, Wall. mss. Flowers white? Like *Silène inflàta*. This plant comes near to *A. apétala*, p. 416. no. 1.

Fringed-petalled Rose-campion. Pl. 1 to 2 feet.

15 A. infla'ta; erect, pubescent; leaves ovate, acute, lower ones stalked, upper ones sessile; stem 1-flowered; flower nodding; calyx much inflated, not much shorter than the petals. ♃. H. Native of Kamoon in the East Indies. Lýchnis inflàta, Wall. mss. This plant comes near to *A. sylvéstris*, p. 416. no. 4.

Inflated-calyxed Rose-campion. Pl. 1 foot.

16 A. flós-cu'culi (Lin. under *Lýchnis*,) stems ascending; smoothish; flowers in dichotomous bundles; calyx campanulate, with 10 ribs; petals torn, appendiculate. ♃. H. Native of Europe in moist meadows and bogs, plentiful in Britain. Lam. ill. t. 391. Smith, engl. bot. 573. Curt. lond. fasc. 1. t. 33. Oed. fl. dan. t. 590. Flowers scentless, rose-coloured.

Var. β, albiflòra; flowers white.

Var. γ, flòre-plèno; flowers double, rose-coloured. Cultivated sometimes in gardens.

Cuckoo-flower or Ragged-robin. Fl. June. Britain. Pl. 1 to $1\frac{1}{2}$ foot.

17 A. corona'ria (Lin. spec. 625.) plant woolly; stems dichotomous; peduncles elongated, 1-flowered; calyx somewhat campanulate, ribbed; petals emarginate, crowned, serrated; leaves lanceolate, very broad, leathery. ♃ H. Native of Italy, Switzerland, and Tauria, by the sides of woods on the Alps. Curt. bot. mag. t. 24. Lýchnis coronària, Lam. dict. 3. p. 643.—Knor. del. 1. t. R. 20. Flowers white, with the middle red.

Var. β, rùbra; flowers single, red. In gardens.

Var. γ, álba; flowers single, white. In gardens.

Var. δ, plèna; flowers double, red. In gardens.

Crowned or Common Rose-campion. Fl. July, Sept. Clt. 1596. Pl. 1 to 2 feet.

A species not sufficiently known.

18 A. Lusita'nica (Mill. dict. no. 8. under *Lýchnis*,) stem erect; calyx striated, acute; petals dissected. ♃. H. Native of Portugal.

Portugal Rose-campion. Pl. 1 foot.

Cult. Some of the species of *Agrostémma* are very ornamental, and well adapted for flower-borders. They will all grow freely in any common garden-soil. The perennial species are either increased by dividing at the root or by seed. The seeds of the annual species require only to be sown in the open border where they are intended to remain.

X. GITHA'GO (from *gith* or *git*, a black aromatic seed, which was employed in the kitchens of the Romans. The seeds of the *Nigélla satìva*, which those of *Githàgo* much resemble. *Ago* in botany, when it terminates a word, usually signifies resemblance with the word that precedes it, as *gith* and *ago*, resembling *gith*). Desf. cat. 159. Agrostémma, spec. Lin. Lýchnis, spec. Lam.

Lin. syst. *Decándria, Pentagýnia.* Calyx campanulate, coriaceous, with 5 long, leafy segments. Petals 5, unguiculate, undivided, naked. Stamens 10. Styles 5. Capsule 1-celled, 5-valved. Anthophorum wanting. Upright annual plants, with largish red or white flowers, and long leafy calycine teeth.

1 G. se'getum (Desf. cat. p. 159.) plant hairy; stem dichotomous; flowers on long stalks; leaves linear; calyx equal in length to the corolla. ☉. H. Native among corn in all parts of Europe, and North America around Quebec; plentiful in Britain. Agrostémma Githàgo, Lin. spec. 624. Smith, engl. bot. 741. Curt. lond. fasc. 3. t. 27. Martyn, rust. t. 105. Fl. dan. 576. Drevers bilderb. t. 22. Lýchnis Githàgo, Lam. dict. 3. p. 643.—Fusch. hist. 127. icone. Flowers purple, with bluish streaks. This is a very troublesome weed in cornfields: it should be eradicated by hand before flowering.

Corn-cockle. Fl. June, July. Britain. Pl. 1 to 3 feet.

2 G. Nicæe'nsis; plant hairy; stem dichotomous; flowers on long peduncles; calyx longer than the corolla. ☉. H. Native in fields about Nice. Lýchnis Nicæénsis, Willd. spec. 2. p. 805. Agrostémma Nicæénsis, Pers. ench. 1. p. 519. Flowers white, sometimes streaked with red.

Nice Corn-cockle. Fl. Ju. Jul. Clt. 1794. Pl. 1 to 2 ft.

Cult. The seeds of these plants only require to be sown in the open border in spring in patches. The plants are very elegant when in flower.

XI. VELE'ZIA (in honour of Franc. Velez, a Spaniard, author of a small book on *Cúbebes*). Lin. gen. no. 448. Gært. fruct. 2. t. 129. f. 12. D. C. prod. 1. p. 387.

Lin. syst. *Decándria, Digýnia.* Calyx tubular (f. 79. *b.*), 5-toothed. Petals 5, short, with filiform claws (f. 79. *d.*), bearded in the throat (f. 79. *c.*), and with an emarginate border. Stamens 10 (f. 79. *e.*). Styles 2 (f. 79. *g.*). Capsules 1-celled, long, cylindrical (f. 79. *i.*). Seed imbricate. Slender prostrate herbs with narrow leaves and long calyxes, like the pink.

1 V. rí'gida (Lin. spec. 474.) calyx filiform, pubescent; petals bifid. ⊙. H. Native of the South of France and in many other parts of the south of Europe and north of Africa, also the Grecian islands, in corn-fields. Smith, fl. græc. 390.—Bocc. mus. 2. p. 50. t. 45.—Buxb. cent. 2. p. 41. t. 47.—J. Bauh. hist. 3. p. 352. icon. Corolla small, with a rose-coloured border. Stem much branched, prostrate.

FIG. 79.

Rigid Velezia. Fl. July. Clt. 1683. Pl. prostrate.

2 V. quadridenta'ta (Sibth. and Smith. fl. græc. t. 391.) calyx long, clavated, smooth; petals 4-toothed. ⊙. H. Native of Asia Minor. V. clavàta, D'Urv. enum. pl. archip. 28. no. 234. Petals rose-coloured.

Four-toothed-petalled Velezia. Fl. Ju. Jul. Pl. ¼ to ½ foot.

Cult. Beautiful little plants, only requiring to be sown in the open border in spring, where they will flower and seed freely. A dry sandy soil suits them best.

XII. DRY'PIS (from δρυπτω, *drypto*, to tear; on account of the leaves being armed with stiff spines). Lin. gen. no. 519. Gært. fruct. 2. t. 28. f. 12. D. C. prod. 1. p. 388.

Lin. syst. *Pentándria, Trigýnia.* Calyx tubular, 5-toothed. Petals 5, unguiculate, with a 2-parted limb, and furnished each with a bifid appendage in the throat. Stamens 5. Styles 3. Capsules 1-celled, cut, round, 1-seeded from abortion. An evergreen furze-like plant, with fastigiate corymbs of small, pale-blue flowers.

1 D. spinòsa (Lin. spec. 390.) ♄. H. Native of Mauritania, Italy, and Istria. Jacq. vind. t. 49. Sims, bot. mag. 2216.—Moris. hist. 3. p. 161. sect. 7. t. 32. f. 8.—Lob. icon. 789. Tabern. icon. 144. Stems at first procumbent, 4-sided, flowering stems erect. Leaves stiff, awl-shaped, somewhat trigonal, mucronated. Bracteas with 3 teeth on each side. Flowers corymbose, pale-blue. A beautiful plant, when in flower.

Spinose Drypis. Fl. June, Aug. Clt. 1775. Shrub ½ foot.

Cult. This pretty little plant is admirably adapted for ornamenting rock-work; in this situation it becomes suffruticose, and produces an innumerable quantity of flowers. It may be either increased by cuttings planted in sand under a hand-glass, or by seeds, which should be sown in a pot filled with an equal mixture of loam, sand, and peat, and when the plants become of sufficient size they should be separated and planted on the top of rock-work, taking care to water them until they have emitted fresh fibres.

XIII. VIVIA'NIA (in honour of Dom. Viviani, M.D. a professor and botanist of Genoa, author of Annali di Botanica, 2 vols. 8vo. Genoa. 1802 and 1804, &c.). Cav. anal. de cienc. 7. p. 212. Macræ'a, Lindl. in Brande's journ. scienc. for Jan. April 1828, vol. 35. p. 204.

Lin. syst. *Decándria, Trigýnia.* Calyx campanulate, 5-toothed. Petals 5, inserted in a short torus, unguiculate, permanent, twisted in æstivation. Stamens 10, inserted on the top of the torus. Style short, crowned by 3 linear stigmas, with reflexed margins. Capsule 3-celled, 3-valved. Valves separating from the axis even to the placenta, as in *Linèæ*. Dry shrubs, natives of Chili, with opposite exstipulate leaves, covered with simple down. Flowers disposed in terminal, corymbose panicles, they are either white or red.

1 V. grandiflòra; leaves grey and glandular beneath with prominent veins; branches pubescent; peduncles shorter than the leaves. ♄. G. Native of Chili near Santiago. Macræ'a grandiflòra, Lindl. l. c. Hook. bot. misc. pt. 2. p. 175. Flowers white or red.

Great-flowered Viviania. Shrub 1 to 2 feet.

2 V. parviflòra; leaves white and glandular beneath, with obscure veins; branches cobwebbed; peduncles shorter than the leaves. ♄. G. Native of Chili with the last. Macræ'a parviflòra. Lindl. l. c. Hook, bot. misc. pt. 2. p. 176. Flowers white.

Small-flowered Viviania. Shrub 1 to 2 feet.

3 V. marifo'lia (Cav. anal. de cien. 7. p. 212. t. 49.) leaves distant, white, and glandless beneath; branches pubescent; peduncles elongated. ♄. G. Native of Chili on the Andes at the pass of Cumbre. Macræ'a ròsea, Lindl. l. c. Hook, bot. misc. pt. 2. p. 176. t. 50. Flowers rose-coloured.

Marum-leaved Viviania. Fl. Nov. Shrub 1 to 2 feet.

4 V. crena'ta; leaves deeply-crenate, with reflexed margins, whitish-tomentose beneath; flowers sub-corymbose; petals white. ♄. G. Native of Chili on the Andes near La Guardia, at the height of 5000 feet. Macræ'a crenàta, Hook. bot. misc. 2. p. 177.

Crenate-leaved Viviania. Pl. 1 foot.

Cult. The species of this genus are very ornamental, but none of them have been introduced to the gardens. A mixture of loam and sand will no doubt suit them, and the plants may be either increased by young cuttings under a hand-glass, or by seeds.

Tribe II. Alsi'neæ (plants agreeing with *Alsìne* in having the calyx cleft to the base) D. C. fl. fr. 4. p. 166. prod. 1. p. 388. Sepals of calyx 4 or 5, free, or hardly connected at the base.

XIV.? ORTE'GIA (in honour of Casimir Gomez de Ortega, a Spanish botanist, once professor of botany at Madrid). Lin. gen. no. 33. Gært. fruct. 2. t. 129. f. 8. D. C. prod. 1. p. 388.

Lin. syst. *Triándria, Monogýnia.* Calyx 5-parted. Corolla wanting. Stamens 3; anthers cordate. Style 1. Stigma capitate. Capsules 1-celled, 3-valved. Seeds fixed to the bottom of the capsule.—The leaves are furnished with a small black gland on each side at the base. Inconspicuous, weed-like plants.

1 O. Hispa'nica (Lin. spec. 49.) stems dichotomous, peduncles short; flowers dichotomously-corymbose. ♃. H. Native of Spain in the provinces of Castile and Salamanca. Flowers greenish-grey.

Spanish Ortegia. Fl. June, July. Clt. 1768. Pl. ½ foot.

2 O. dicho'toma (Lin. mant. 174.) stems dichotomous; peduncles elongated; flowers dichotomously-panicled. ♃. H. Native of Piedmont and Spain. O. Hispánica, Cav. icon. 1. p. 47. All. ped. str. t. 4. f. 1. O. dichótoma of D. C. fl. fr. 4. no. 4376 is perhaps a distinct species. Flowers greenish.

Dichotomous-panicled Ortegia. Fl. Aug. Sept. Clt. 1820. Pl. 1 foot.

Cult. *Ortègia* is a genus of insignificant looking herbaceous plants, consequently not worth cultivating, except in botanical gardens. They should be grown in pots, well drained with potsherds, in a mixture of sand, loam, and peat, or on rock-work; they are easily increased by seeds, and cuttings will root freely under a hand-glass.

XV. GOU'FFEIA (in honour of Gouffé de la Cour, who wrote a memoir on the exotic vegetables naturalized at Marseilles in 1818). Robill. et Cast. diss. ined. D. C. fl. fr. 5. p. 609. prod. 1. p. 388.

Lin. syst. *Decándria, Digýnia.* Calyx 5-parted, spreading. Petals 5, entire. Stamens 10. Style 2. Capsules globose, 1-celled, 2-valved, 1-2-seeded. An inelegant herb like *Arenària tenuifòlia* or *Buffònia tenuifòlia.*

1 G. arenarioi'des (Rob. et Cast. l. c. &c.) branches divaricating; flowers somewhat corymbose; leaves linear, short, deflexed. ⊙. H. Native about Marseilles. Flowers white.

Sand-wort-like Gouffeia. Fl. June, July. Pl. $\frac{1}{2}$ foot.

Cult. Goúffeia only requires to be sown on rock-work, or in the open border, where it will flower and ripen seed freely, but being a weed-looking plant it will be scarcely worth cultivating, except in botanical gardens.

XVI. BUFFO'NIA (in honor of Count de Buffon, the celebrated French naturalist). Sauv. meth. fol. 141. Lin. gen. no. 225. Gært. fruct. 2. p. 129. f. 1. D. C. prod. 1. p. 388.

Lin. syst. *Tetrándria, Digýnia.* Calyx of 4 sepals. Petals 4, entire. Stamens 4. Styles 2. Capsules compressed, 1-celled, 2-valved, 2-seeded. Insignificant slender herbs, with awl-shaped leaves, like some species of *Arenària.*

1 B. a'nnua (D. C. fl. fr. 4. p. 768.) stem loosely panicled from the base; branches divaricating, short, firm; stripes on calyx straight, parallel; capsules scarcely equal in length to the calyx; leaves awl-shaped, dilated at the base. ⊙. H. Native of the south of France on rocks; said to have been found in England on the sea-coast about Boston in Lincolnshire. B. tenuifòlia, Lin. spec. 179. Lam. ill. no. 1710. t. 87. f. 1. Smith, engl. bot. t. 1313.—Pluk. phyt. t. 75. f. 3.—Magn. hort. monsp. 97. t. 15. A slender plant with small white petals.

Annual Buffonia. Fl. June, July. England? Pl. $\frac{1}{2}$ to $\frac{3}{4}$ ft.

2 B. Oliveria'na (Ser. mss. in D. C. prod. 1. p. 388.) stem branching at the top; branches filiform, elongated; stripes on the calyx straight, parallel; capsules almost sessile, shorter than the calyx; leaves very short, form of scales. ⊙? H. Native about Teheran in Persia. A slender plant, with small, white petals.

Olivier's Buffonia. Fl. June, July. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

3 B. macroca'rpa (Ser. mss. in D. C. prod. 1. p. 388.) stem very much branched, dichotomous; branches filiform, rigid, very long, almost naked, and divaricating; sepals ovate, obtuse; stripes on calyx straight, parallel; capsules on long stalks, large, much longer than the calyx; seeds somewhat globose, compressed, echinated on the margins. ♃. F. Native of Persia from Teheran to Ispahan. Flowers small, white.

Long-fruited Buffonia. Fl. June, July. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ foot.

4 B. pere'nnis (Pour. act. toul. 3. p. 319.) stem branching at the top; branches filiform, elongated; stripes on calyx arched, converging. ♃. H. Native of France and Vallais. Lam. ill. no. 1711. t. 87. f. 2. Flowers small, white.

Perennial Buffonia. Fl. June, Jul. Clt. 1817. Pl. $\frac{1}{2}$ to $\frac{3}{4}$ ft.

Cult. Both the perennial and annual species of this genus can only be encreased by seeds; they only require to be sown in the open border or on rock-work, but being weedy looking plants, they are hardly worth cultivating, except in botanical gardens or in those of the curious. A dry sandy soil suits them best. A plant or two of the perennial species should be kept in pots, so that they may be sheltered by a frame during winter, as they are otherwise apt to damp off in that season.

XVII. SAGI'NA (*sagina*, in Latin, signifies fatness; according to Linnæus it is so called for its qualities in fattening sheep). Lin. gen. no. 236. Gært. fr. 2. p. 129. f. 10. D. C. prod. 1. p. 389.

Lin. syst. *Tetra-Pentándria, Tetragýnia.* Calyx 4-5-parted. Petals 4-5, or wanting. Stamens 4-5. Styles 4. Capsules 4-5-valved, 1-celled, many-seeded. Small insignificant herbs.

1 S. procu'mbens (Lin. spec. 185.) plant glabrous; branches procumbent; leaves linear, mucronated; fruit-bearing peduncles, ascending; petals short, obtuse; segments of calyx rounded. ⊙. H. Native on sandy ground, or the walks and beds of neglected gardens, as well as on shady walls and gravelly banks, every where throughout Europe; on the north-west coast of America, and on the banks of the Columbia. In Britain plentiful. Smith, engl. bot. t. 88. Curt. lond. fasc. 3. t. 12. Plant spreading on the ground. Flowers drooping, with white roundish petals.

Var. β, plèna; a pretty variety, with rose-like white double flowers, of from 27 to 32 petals. This plant was formerly cultivated in some curious gardens, but is now, we believe, altogether lost. ♃. H. Native on a green near Beaumaris, in Wales. Rev. H. Davis, July, 1817.

Procumbent Pearlwort. Fl. May, Aug. Britain. Pl. procumbent.

2 S. filifo'rmis (Pourr. chlor. hisp. no. 593.) stems erect, much branched, jointed; leaves linear, glabrous; peduncles axillary and terminal, dichotomous. ⊙. H. Native of the Pyrenees, growing mixed with *S. procúmbens.* Rœm. et Schult. syst. 3. p. 499. Petals white.

Filiform Pearlwort. Fl. May, Aug. Clt. 1824. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

3 S. mari'tima (G. Don, herb. brit. 155.) plant smooth; branches erectish; leaves lanceolate, obtuse, very short; fruit-bearing peduncles ascending; petals none; segments of calyx ovate, obtuse. ⊙. H. Native of Britain: on the coast near Aberdeen, and on the summit of Ben Nevis; at Bally Castle, near the Giant's Causeway, Ireland; on Hartle-pier, Durham; in salt marshes at Southwold, Suffolk, abundantly. Smith, engl. bot. t. 2195. Curt. fl. lond. t. 115. Petals abortive or entirely wanting. Stamens sometimes 8.

Sea-side Pearlwort. Fl. May, Aug. Britain. Pl. 2 to 3 inches.

4 S. stri'cta (Fries. novit. fl. suec. 3. p. 122.) plant very glabrous; stems and peduncles straight; leaves rather cylindrical, not mucronated; lobes of calyx lanceolate, acute (obtuse according to Horn. in hort. hafn. suppl. p. 122.) ⊙. H. Native of Denmark and Sweden at Cimbrishavn, by the sea-side. Petals white.

Straight Pearlwort. Fl. May, Aug. Clt. 1823. Pl. 2 or 3 inches.

5 S. cilia'ta (Fries. in Billb. svensk. bot. ex Spreng. neue. entd. 3. p. 220.) stem diffuse; leaves awl-shaped, spreading, ciliated; segment of calyx acuminated. ⊙? H. Native of Sweden. Petals white.

Ciliated-leaved Pearlwort. Fl. May, Aug. Clt.? Pl. 1 to 2 inches.

6 S. ape'tala (Lin. mant. p. 559.) plant hispid, pubescent; branches erectish, dichotomous; leaves linear, fringed, mucronated; fruit-bearing peduncles ascending; petals very short, roundish; segments of calyx lanceolate, bluntish. ⊙. H. Native on dry sandy barren grounds on walls and waste places; very common in Britain, Italy, and Germany. Smith, engl. bot. t. 881. Curt. lond. fasc. 5. t. 14. Arduin. specel. 2. p. 22. t. 8. f. 1. The petals when present are white, not half the length of the calyx.

Var. β, agglomeràta (D. C. prod. 1. p. 389.) flowers sessile and stalked, glomerated.

Apetalous Pearlwort. Fl. May, June. Britain. Pl. 1 or 2 inches.

7 S. Quite'nsis (H. B. et Kunth, gen. et spec. amer. 6. p. 19.) stems filiform, procumbent? leaves rather falcate; peduncles axillary, 1-flowered, bearing 4 bracteas above the middle; fruit-bearing peduncles straight, elongated; flowers apetalous, somewhat drooping. ⊙. H. Native of South America on the sandy banks of Rio Blanco at the height of 4800 feet. Valves of capsule revolute.

Quito Pearlwort. Fl. May, Aug. Pl. trailing.

8 S. fasciula'ta (Poir. dict. 6. p. 390.) stems creeping, rooting, jointed; branches somewhat erect; leaves secund in bundles; peduncles axillary, 1-flowered. ♃. H. Native about Algiers. Very like *S. procúmbens*. Calyx glabrous, with short oval, obtuse, spreading lobes, which are reflexed after flowering. Petals white.

Bundle-leaved Pearlwort. Fl. May, Aug. Pl. 1 to 3 inches.

Cult. None of the species of this genus are worth cultivating except the double-flowering variety of *S. procúmbens* and *S. fasciculàta*: both should be kept in small pots well drained with potsherds, in a mixture of loam, peat, and sand; and the best way of increasing them is by dividing the plants at the roots. The rest of the species are only worth preserving in Botanical gardens; they require no care, but if once introduced to the garden, it will be hereafter quite impossible to extirpate them.

XVIII. MŒ'NCHIA (in honour of Conrad Mœnch, a professor of botany at Marburgh, who wrote several botanical works between the years 1777 and 1802.) Ehrh. beitr. fasc. 2. 177. Pers. ench. 1. p. 153.

Lin. syst. *Tet ándria, Digýnia.* Calyx of 4 sepals. Petals 4. Stamens 4. Capsules membranous, 1-valved, 1-celled, opening at the summit with 8, occasionally, 10 teeth, many-seeded. Seed kidney-shaped. Small plants, with the habit of *S. Cerástium*.

1 M. ere'cta (Smith, engl. fl. 1. p. 241.) glaucous; stems erect, 1-flowered, glabrous; leaves linear, acute; peduncles straight; petals short; sepals lanceolate, concave, acute, with membranous edges. ⊙. H. Native in pastures and heathy ground on a gravelly soil, in most parts of Europe; also in Britain. M. glaúca, Pers. ench. 1. p. 153. M. quaternélla, Ehrh. phyt. 82. Sagìna erécta, Lin. spec. 185. Smith, engl. bot. t. 609. Curt. lond. fasc. 2. t. 12.—Vaill. par. t. 3. f. 2. Petals white.

Upright Mœnchia. Fl. May. Britain. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

2 M. cerastoìdes (Spreng. syst. 1. p. 497.) green and pilose; stem diffuse, dichotomous, branched; leaves spatulate or obovate, recurved; peduncles axillary, 1-flowered, reflexed after flowering; petals emarginate; sepals lanceolate, acute, with membranous margins. ♃. H. Native of Scotland on rocks about the Firth of Forth, and in many places about Edinburgh. Flowers small, white. Sagìna cerastoìdes, Smith in Lin. trans. vol. 2. p. 343. Cerástium tetrándrum, Curt. lond. fasc. 1. t. 31.

Chickweed-like Mœnchia. Fl. Ju. July. Britain. Pl. trailing.

Cult. Chickweed-looking plants, which may be sown on rock-work, and may be afterwards allowed to scatter their seeds.

XIX. HYMENE'LLA (a diminutive of *υμην, hymen*, a membrane, on account of the thin little petaloid crown at the base of the petals.) Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 389.

Lin. syst. *Tetrándria, Trigýnia.* Calyx 4-parted, spreading, Petals 4, oblong, entire, length of the calyx. Stamens 4, alternating with the petals, connected at the base by an 8-toothed petaloid little crown. Ovary ovate. Styles 3. Capsules 3-celled. An insignificant looking plant, like *Mœhringia*.

1 H. moehringioi'des (Moc. et Sesse, fl. mex. ined. icon. in D. C. prod. 1. p. 390.) ♃. F. Native of Mexico in gardens. P. Carmelitàrum, Sancti Angeli, Buffònia tenuifòlia, Moc. et Sesse, fl. mex. ined. icon. Stems weak; leaves linear, acute, glabrous; pedicels solitary, 1-flowered, axillary; flowers small, white.

Moehringia-like Hymenella. Pl. $\frac{1}{2}$ foot.

Cult. This plant should be kept in pots in a mixture of sand, loam, and peat, and placed in a green-house or frame during winter. It may be either increased by seeds or by dividing the plants at the root, but it is not worth cultivating except in botanical gardens.

XX. MOEHRI'NGIA (in honour of Paul Henry Gerard Moehring, a German physician, author of Hortus Proprius, 1736.) Lin. gen. 264. Gært. fruct. 226. t. 129. f. 11. D. C. prod. 1. p. 390.

Lin. syst. *Octándria, Digýnia.* Calyx 4-parted. Petals 4. Stamens 8. Styles 2. Capsules 4-valved, 1-celled, many-seeded. Pretty alpine plants, with the habit of *Arenària*.

1 M. muscòsa (Lin. spec. p. 515.) leaves linear, connate; segments of calyx flat, lanceolate, acute; flowers axillary, solitary. ♃. H. Native of Europe in humid parts of mountains at the margins of woods. Lam. ill. t. 314. Schkuhr. handb. 1. t. 108. Flowers small, white.

Mossy Moehringia. Fl. June, July. Clt. 1775. Pl. $\frac{1}{4}$ foot.

2 M. sedifòlia (Willd. berl. mag. 1818. p. 101. t. 3. f. 23.) leaves oblong, obtuse, convex on both surfaces, fleshy, somewhat imbricated; flowers terminal, solitary. ♃. H. Native of the Alps of Tenda. M. muscòsa, var. Balb. misc. bot. 20. t. 5. f. 2. M. muscòsa sedoìdes, Pers. ench. 1. p. 438. Flowers like those of *M. muscòsa*, but a little smaller.

Sedum-leaved Moehringia. Fl. Ju. July. Clt. 1823. Pl. $\frac{1}{4}$ ft.

3 S. stri'cta (Sibth. and Smith, fl. græc. t. 362.) leaves strict, scariose, and ciliated at the base, shorter than the joints of the stem. ♃. H. Native of Candia. Flowers small, white.

Strict-leaved Moehringia. Fl. June, July. Pl. $\frac{1}{4}$ foot.

Cult. These pretty little alpine plants are well adapted for rock-work or to be grown in small pots. A mixture of sand, loam, and peat suits those grown in the latter way; and the best method of increasing them is by dividing the plants at the root.

XXI. ELA'TINE (from *ελατη, elate*, a fir in Greek. Its fine leaves have been compared to those of a fir-tree.) Lin. gen. no. 685. Gært. fruct. 2. p. 142. t. 102. f. 2. D. C. prod. 1. p. 390.

Lin. syst. *Tri-Octándria, Tetragýnia.* Calyx 3-5-parted. Petals 3-4, not unguiculate. Stamens equal in number with the petals, and double that number, therefore either 3-4 or 6-8. Styles 4, capitate at the top. Capsules 4-valved, 4-celled, many-seeded. Seeds cylindrical. Small creeping plants, with insignificant flesh-coloured flowers.

1 E. hydro'piper (Lin. spec. 572.) leaves opposite; flowers alternate, stalked, octandrous, 4-petalled. ♃. H. Native in inundated places almost throughout the whole of France. E. hydrópiper var. *α*, Lin. spec. p. 527. D. C. icon. pl. rar. 1. p. 13. t. 43. f. 2.—Vaill. bot. paris, t. 2. f. 2. Flowers rose-coloured.

Water-pepper Waterwort. Fl. July, Aug. Pl. 2 to 3 inches.

2 E. hexa'ndra (D. C. icon. pl. rar. 1. p. 14. t. 43. f. 1.) leaves opposite; flowers alternate, stalked, hexandrous, 3-petalled. ♃. H. Native of inundated places about Paris. E. hydrópiper var. *β*, Lin. spec. 527.—Vaill. Paris, bot. t. 2. f. 1. Tillæ'a hexándra, Lapierre, journ. phys. fl. an. xi. Biròlia paludòsa, Bell. mem. acad. tur. 1808. icone. Flowers rose-coloured.

Hexandrous Waterwort. Fl. July, Aug. Clt.? Pl. 2 inches.

3 E. tripe'tala (Smith, engl. fl. 2. p. 243.) leaves opposite, rough, with minute points; flowers alternate, stalked, octandrous, 3-petalled. ♃. H. Native on the margins of ponds and ditches, in a sandy soil, about the eastern shore of Bomere pool, near Candover, Shropshire, and near Bingfield, Berks. E.

hydrópiper, Smith, engl. bot. t. 955. Petals roundish, slightly pointed, concave, inflexed, reddish or pale flesh-coloured, smaller than the calyx. Anthers yellow.

Three-petalled Waterwort. Fl. July, Aug. England. Pl. 2 or 3 inches.

4 E. tria'ndra (Schkuhr. handb. no. 1023. t. 109. b. f. 2.) leaves opposite; flowers sessile, and opposite, triandrous, 3-petalled. ♃. H. Native of inundated places about Ratisbon. Flowers and seeds rose-coloured.

Triandrous Waterwort. Fl. July, Aug. Pl. 2 or 3 inches.

5 E. alsina'strum (Lin. spec. 527.) leaves in whorls; flowers sessile, and disposed in whorls. ♃. H. Native about Paris and in fountains at Fontainebleau.—Vaill. bot. paris, 1. f. 6. E. verticillàta, Lam. fl. fr. 3. p. 11. D. C. fl. fr. 4. p. 772. Habit of *Hippùris vulgàris*—Pitamópitys, Buxb. act. petrop. t. 1. f. 6.

Chickweed-like Waterwort. Fl. June, Aug. Pl. ¼ foot.

Cult. *Elátine* is a genus of singular water plants. They all grow under water except *E. tripétala*, which grows by the sides of ponds; therefore they should all be planted or sown in ponds except the latter species, which should be planted on the borders of a pond or canal, where they should be allowed to increase themselves. A sandy or gravelly bottom suits them best. Ripe seeds are easily transported in a vegetative state from the places of their natural growth, or plants may be introduced.

XXII. BE'RGIA (in honour of Peter Jonas Bergius, once professor of natural history at Stockholm, who wrote several botanical works between 1757 and 1780, particularly upon mosses and plants of the Cape of Good Hope.) Lin. gen. no. 791. D. C. prod. 1. p. 390.

Lin. syst. *Decándria*, *Pentagýnia*. Calyx 5-parted. Petals 5. Stamens 10. Styles 5, approximate. Capsules 5-valved, 5-celled.

1 B. verticilla'ta (Willd. spec. 2. p. 770.) leaves lanceolate, denticulated at the apex; flowers in whorls, almost sessile, much crowded. ⊙? H. Native of Egypt in rice-fields about Rosetta and Damiata; also in the East Indies, but not at the Cape of Good Hope. B. Capénsis, Lin. mant. 241. Elátine luxúrians, Del. fl. ægypt. p. 13. t. 26. f. 1. Flowers red or whitish.

Whorl-flowered Bergia. Fl. July. Clt. 1820. Pl. 1 foot.

2 B. glomera'ta (Lin. fil. suppl. 243.) leaves ovate, crenulated; flowers glomerate. ⊙? H. Native of the Cape of Good Hope. Thunb. prod. 82. Flowers whitish.

Glomerate-flowered Bergia. Pl. ½ foot.

3 B. re'pens (Blum. bijdr. ex Schlecht. Linnæa, 1. p. 645.) stem branched and creeping; leaves lanceolate, serrated; flowers glomerate, on short peduncles, axillary. ♃? S. Native of Java.

Creeping Bergia. Pl. creeping.

4 B. ammanioi'des (Roth. nov. pl. spec. 219.) stem branched, rough from capitate bristles; leaves elliptical, acute, sharply and deeply serrated, silvery-tomentose on the under surface; flowers axillary, stalked, glomerate, pentandrous. ⊙. S. Native of the East Indies. Corolla white.

Ammania-like Bergia. Fl. July. Pl. ½ foot.

Cult. All the species of this genus are inhabitants of moist places, such as rice-fields, which are irrigated the greater part of the year, consequently they will require to be kept in similar situations in gardens, where they will ripen their seed. None of them are worth cultivating, unless in botanic gardens.

XXIII. MOLLU'GO (the Roman name of what is supposed to be our *Gàlium Mollùgo*, which many of the species of this genus resemble in their whorled leaves and inconspicuous appearance.) Lin. gen. no. 139. Gært. fruct. t. 130. f. 8.

Lin. syst. *Triándria*, *Trigýnia*. Calyx 5-parted. Petals none or very small. Stamens 3. Styles 3. Capsules 3-valved, 5-celled, many-seeded. Leaves in whorls, rarely opposite. Insignificant plants, with 1 or many-flowered peduncles.

* *Peduncles 1-flowered, in whorls.*

1 M. oppositifòlium (Lin. spec. 131.) leaves opposite, lanceolate; branches alternate, dichotomous; peduncles lateral, crowded. ⊙. S. Native of Ceylon.—Pluk. phyt. t. 75. f. 6. Peduncles almost the length of the leaves, in whorls. Flowers white. Plant smooth, diffuse.

Opposite-leaved Mollugo. Fl. July, Aug. Pl. ½ foot.

2 M. hi'rta (Thunb. prod. p. 24. fl. cap. 1. p. 444.) plant decumbent; leaves obovate, villous, 4 in a whorl, stalked; flowers in whorls on very short stalks. ⊙. F. Native of the Cape of Good Hope.

Hairy Mollugo. Fl. July. Pl. decumbent.

3 M. verticilla'ta (Lin. spec. 131.) leaves in whorls, unequal, obovately wedge-shaped, acute; stem decumbent, dichotomous; peduncles 1-flowered, in whorls. ⊙. S. Native of South America in Brazil, and near Cumana on the sea-shore, as well as in Virginia, and on the banks of the Columbia in North America. Rœm. et Schult. syst. 2. p. 871.—Pluk. phyt. 4. t. 332. f. 5.—Ehret. pict. t. 6. f. 3. A decumbent plant, with fleshy leaves.

Whorl-leaved Mollugo. Fl. July, Aug. Clt. 1748. Pl. decumbent.

4 M. Schra'nkii (Ser. mss. in D. C. prod. 1. p. 391.) leaves in whorls, rather linear, acute; stem dichotomous, diffuse; peduncles 1-flowered, few in a whorl. ⊙. S. Native of Brazil and Guiana. M. dichótoma, Schrank. pl. rar. 64. icon. exclusive of the synonyme of Lin. fil. Very like *M. verticillàta*, but differs in the leaves being narrower and longer; and flowers 1-3, rising from each whorl of leaves. Flowers white.

Schrank's Mollugo. Fl. July, Aug. Clt. 1826. Pl. ¼ to ½ ft.

** *Peduncles umbellate or racemose.*

5 M. stri'cta (Lin. spec. 131.) leaves usually 4 in a whorl, lanceolate, radical ones spatulate; branches panicled, dichotomous, nodding; stem erect, angular; capsule equal in length to the calyx. ⊙. S. Native of Asia, Java, &c.—Pluk. alm. p. 21. t. 257. f. 2.—Burm. zeyl. 31. t. 5. f. 3. Flowers nodding.

Upright-stemmed Mollugo. Pl. ½ foot.

6 M. pentaphy'lla (Lin. spec. 131.) leaves usually 5 in a whorl, obovate, glabrous; flowers panicled; stems decumbent. ⊙? S. Native of Ceylon.—Burm. zeyl. 13. t. 8. f. 1. Leaves 3-4-5 in a whorl, dark-green. Peduncles axillary, very long, panicled.

Five-leaved Mollugo. Fl. June, July. Clt.? Pl. procumbent.

7 M. nudicau'lis (Lam. dict. 4. p. 234.) radical leaves oblong, numerous, obovate, crowded; scapes trichotomously-panicled, decumbent, naked. ⊙? F. Native of the East Indies.—Burm. zeyl. 14. t. 8. f. 2. Radical leaves glaucous, green, large. Flowers cream-coloured. Seeds very black. (Burm.)

Naked-stemmed Mollugo. Fl. June, July. Pl. decumbent.

8 M. radia'ta (Ruiz, et Pav. fl. per. 1. p. 48.) stems procumbent, leafy; branches panicled; leaves obovate, acuminated. ⊙. H. Native of Chili in inundated places about Conception.—Rœm. et Schult. 2. p. 872.—Pluk. phyt. t. 118. f. 1.

Radiated Mollugo. Pl. procumbent.

9 M. arena'ria (H. B. et Kunth, gen. et spec. amer. 6. p. 21.) plant glabrous; stems dichotomous, diffuse, round; leaves 5 in a whorl, linear-spatulate, obsoletely 1-nerved, 4-times shorter than the spaces of the stem between the leaves; umbels of flowers almost sessile, generally 5 or 6-flowered. ⊙. H.

Native of Buenos Ayres, and in a sandy island in the river Apures near El Diamante. Stamens 3, shorter than the calyx.

Sand Mollugo. Pl. ¼ to ½ foot.

10 M. TRIPHY'LLA (Lour. fl. coch. ed. Willd. 1. p. 79, but not of Link.) stems diffuse; branches ternate; leaves 3 in a whorl, lanceolate, sessile; flowers dichotomous, on long stalks; peduncles branched at the apex. ⊙? H. Native of China about Canton, and the island of Manilla.

Three-leaved Mollugo. Fl. July. Pl. ¼ to ½ foot.

11 M. LI'NKII (Ser. mss. in D. C. prod. 1. p. 392.) stem erectish; leaves 3 in a whorl, large; panicles of flowers terminal and lateral. ⊙. S. Native of Brazil. M. triphylla, Link. enum. 1. p. 108. but not of Lour. Leaves acute, glabrous.

Link's Mollugo. Fl. July. Clt. 1821. Pl. ¼ to ½ foot.

12 M. GLINOI'DES (St. Hil. fl. bras. 2. p. 171. t. 109.) stem diffuse, trailing; leaves spatulate, tomentose; flowers sessile, fascicled; stamens 3-5. ⊙. H. Native of Brazil on the banks of the Uruguay.

Glinus-like Mollugo. Fl. Jan. Sept. Pl. prostrate.

Cult. The species of the genus *Mollùgo* are all weed-like plants, therefore not worth cultivating unless in botanic gardens. The seed should be sown in pots in any common soil, and the pots placed in the hot-bed, and in June they may be removed into the green-house, or planted out in the open border in a sheltered situation, where they will probably ripen seed.

XXIV. PHARNA'CEUM (an historical name. Pharnaces, king of Pontus, is said to have first used it in medicine.) Lin. gen. no. 517. Gært. fruct. 1. p. 130. f. 4. Mollùgo, sect. 2. Pharnàceum, D. C. prod. 1. p. 39.

Lin. syst. *Pentándria*, *Trigynia*. Calyx 5-parted. Petals very small or wanting. Stamens 5. Styles 3. Capsule 3-valved, 3-celled, many-seeded. Small herbaceous or shrubby plants. Leaves opposite or in whorls.

* *Peduncles bifid, racemose, or umbelliferous.*

1 P. BELLIDIFÒLIUM (Poir. dict. 5. p. 262.) stems erect, leafless; radical leaves rosulate, spatulate, tapering into the footstalk at the base; flowers corymbosely panicled. ⊙. S. Native of the West Indies and Guiana in waste ground and sandy places. Mollùgo bellidifòlia, Ser. mss. in D. C. prod. 1. p. 391.—Plum. amer. t. 21. f. 1. Flowers white.

Daisy-leaved Pharnaceum. Fl. June, July. Clt. 1823. Pl. ¼ foot.

2 P. PARVIFLÒRUM (Roth. nov. pl. spec. p. 186.) leaves ovate, obtuse, strigose on the under surface; umbels lateral; stems herbaceous, ascending. ⊙. S. Native of the East Indies. Mollùgo parviflòra, Ser. mss. in D. C. prod. 1. p. 391.

Small-flowered Pharnaceum. Fl. June, July. Pl. ¼ foot.

3 P. DI'STICHUM (Lin. mant. p. 221.) leaves almost linear, pubescent; racemes 2-parted, flexuous. ⊙. S. Native of the East Indies and the Cape of Good Hope. Mollùgo dísticha, Ser. mss. in D. C. prod. 1. p. 392. M. racemòsa, Lam. ill. no. 1197. —Pluk. phyt. 3. p. 22. t. 130. f. b.

Distich Pharnaceum. Fl. June, July. Pl. ½ foot.

4 P. CORDIFÒLIUM (Lin. amœn. 6. p. 85.) stems decumbent; leaves 4 in a whorl, obversely cordate, mucronated; corymbs axillary and terminal, dichotomous; flowers solitary in the forks. ⊙. F. Native of the Cape of Good Hope. Jacq. hort. schœnbr. t. 349. Mollùgo cordifòlia, Ser. mss. in D. C. prod. 1. p. 392. Petals white, shorter than the sepals.

Heart-leaved Pharnaceum. Fl. June, July. Clt. 1823. Pl. decumbent.

5 P. MULTIFLÒRUM (Ser. mss. in D. C. prod. 1. p. 392. under *Mollùgo*,) stems diffuse, dichotomous; leaves in whorls, lanceolate, unequal; flowers distich, panicled, numerous. ⊙. F. Native of China. Flowers white. Perhaps a species of *Mollùgo*.

Many-flowered Pharnaceum. Pl. ¼ foot.

6 P. DICHO'TOMUM (Lin. fil. suppl. p. 186.) smooth; stems flexuous; leaves 9 or more in a whorl, linear; peduncles axillary, elongated, dichotomous. ⊙. F. Native of the Cape of Good Hope. Rœm. et Schult. syst. 6. p. 689. Mollùgo dichótoma, Ser. mss. in D. C. prod. 1. p. 392.

Dichotomous-peduncled Pharnaceum. Fl. June, July. Clt. 1783. Pl. ¼ to ½ foot.

7 P. GLOMERA'TUM (Lin. fil. suppl. p. 185.) stems flexuous; leaves linear, reflexed, in whorls, acute, glabrous; flowers glomerate, almost sessile; stem decumbent. ⊙. F. Native of the Cape of Good Hope. Mollùgo glomeràta, Ser. mss. in D. C. prod. 1. p. 392.—Pluk. phyt. 163. t. 331. f. 4. Flowers white.

Glomerate-flowered Pharnaceum. Fl. June, Aug. Clt. 1817. Pl. prostrate.

8 P. MARGINA'TUM (Thunb. prod. p. 55. fl. cap. 2. p. 239.) stems filiform, decumbent; leaves small, in whorls, ovate, marginated, obtuse; flowers axillary, sessile, glomerate. ⊙. F. Native of the Cape of Good Hope. Mollùgo marginàta, Ser. mss. in D. C. prod. 1. p. 392.

Marginated-leaved Pharnaceum. Pl. decumbent, ⅛ foot.

9 P. CERVIA'NUM (Lin. spec. ed. 1. p. 272. ed. 2. p. 388.) stems in whorls, rarely dichotomous; peduncles umbellate, lateral, equal in length to the leaves; leaves in whorls of 4 or 5, very narrow, glaucous, obtuse, smoothish. ⊙. H. Native of Russia, Spain, Guinea, and Asia. Mollùgo Cerviàna, Ser. mss. in D. C. prod. 1. p. 392.—Lam. ill. t. 214. f. 1.—Gmel. sib. 3. p. 102. no. 79. t. 20. f. 2.—Buxb. cent. 3. p. 33. t. 62. f. 2. —Pluk. mant. 9. t. 332. f. 11. Calyx white on the inside. A weak-growing plant, at first erect, but at length decumbent.

Cervian's Pharnaceum. Fl. June, July. Clt. 1771. Pl. ½ ft.

10 P. SPERGULOI'DES (Poir. dict. 5. p. 260.) stems in whorls of 3 or 4; branches simple; umbels involucrated, terminal, few-flowered, or rising from the axils of the whorls; leaves in bundles, whorled, numerous, very narrow, and acute. ⊙? S. Native of India. Lam. ill. t. 214. f. 2. Mollùgo sperguloìdes, Ser. mss. in D. C. prod. 1. p. 392.

Spurry-like Pharnaceum. Fl. June, July. Clt. 1819. Pl. ¼ foot.

11 P. LINEA'RE (Lin. fil. suppl. p. 185.) leaves in whorls; branches dichotomous; umbel panicled, terminal, and lateral; leaves linear, obtuse, 6 or 8 in a whorl. ⊙? ♄. G. Native of the Cape of Good Hope. Mollùgo lineàris, Ser. mss. in D. C. prod. 1. p. 392. Andr. bot. rep. 326. Stems prostrate. Flowers white.

Linear-leaved Pharnaceum. Fl. May, June. Clt. 1795. Shrub ½ foot.

12 P. MICROPHY'LLUM (Rœm. et Schult. syst. 6. p. 686.) plant tomentose; peduncles umbellate; umbels compound; leaves ovate, terete, blunt, covered with interwoven wool. ♄. G. Native of the Cape of Good Hope. Mollùgo microphýlla, Ser. l. c. Stem shrubby, rigid; branchlets somewhat whorled, aggregate. Leaves rising from the knots in bundles, and scattered on the stems.

Small-leaved Pharnaceum. Shrub ¼ foot.

13 P. TERETIFÒLIUM (Thunb. prod. p. 53.) glabrous; branches opposite, and a little branched; leaves filiform, mucronated, terete; stem erect, frutescent; umbels erect, simple, stalked. ♄. G. Native of the Cape of Good Hope. Mollùgo teretifòlia, Ser. mss. in D. C. prod. 1. p. 393.

Terete-leaved Pharnaceum. Fl. June, July. Shrub ½ foot.

14 P. QUADRANGULA'RE (Lin. fil. suppl. 185.) smooth; stems suffruticose, erect; branches alternate, flexuous, leafless; leaves linear, quadrifariously imbricated; flowers in umbels; peduncles

short. ♄. G. Native of the Cape of Good Hope. Mollùgo quadrangulàris, Ser. mss. in D. C. prod. 1. p. 393. Plant with the appearance of a heath. Flowers inside white, outside green. Capsule quadrangular.

Quadrangular-capsuled Pharnaceum. Shrub $\frac{1}{4}$ to $\frac{1}{2}$ foot.

15 P. MUCRONA'TUM (Thunb. in phyt. bl. p. 29. fl. cap. 2. p. 239.) stems herbaceous, almost none; leaves ovate-mucronated, entire: flowers in whorls, aggregate, almost sessile. ⊙? G. Native of the Cape of Good Hope. Mollùgo mucronàta, Ser. mss. in D. C. prod. 1. p. 393. Radical leaves aggregate. Peduncles radical, capillary, numerous.

Mucronate-leaved Pharnaceum. Fl. June, July. Pl. $\frac{1}{4}$ foot.

16 P. UMBELLA'TUM (Forsk. fl. ægypt. p. 58.) radical leaves stellate, cauline ones obovate; peduncles umbellate, involucrated; involucres linear. ⊙. H. Native of Egypt in argillaceous places near Lohaga. Flowers brown. Mollùgo umbellàta, Ser. mss. in D. C. prod. 1. p. 393.

Umbel-flowered Pharnaceum. Fl. June, Aug. Clt. 1820. Pl. 1-2 inches.

17 P. INCA'NUM (Lin. fil. suppl. 186.) leaves scattered, or 4 in a whorl, with bundles of smaller leaves rising from the axillæ, smooth, linear; stems erect; branches white from stipulas; stipulas pilose; flowers in proliferous umbels; common peduncles very long. ♄. G. Native of the Cape of Good Hope. Sims, bot. mag. 1883. Flowers white inside, green on the outside.

Hoary-stipuled Pharnaceum. Fl. May, Oct. Clt. 1782. Shrub $\frac{1}{2}$ foot.

18 P. PRUINÒSUM (Haw. succ. pl. suppl. p. 15.) stems branched, thickish; branches pale from membranaceous stipulas; leaves crowded, filiform, terete, acute, fleshy, mealy, or pruinose. ♄. G. Native of the Cape of Good Hope. Peduncles umbellate.

Pruinose-leaved Pharnaceum. Fl. June, Aug. Clt. 1819. Shrub $\frac{1}{4}$ foot.

19 P. A'LBENS (Lin. fil. suppl. p. 186.) smooth, suffruticose; leaves linear, opposite, remote, exstipulate; common peduncle long, umbellate; pedicels filiform. ♄. G. Native of the Cape of Good Hope.

White-stemmed Pharnaceum. Shrub $\frac{1}{2}$ to 1 foot.

* * *Peduncles* 1-*flowered.*

20 P. SERPYLLIFÒLIUM (Lin. fil. suppl. 186.) smooth; stem filiform, dichotomous; leaves opposite, ovate, obtuse, stalked; peduncles axillary, 1-flowered. ⊙. F. Native of the Cape of Good Hope. A weak plant. Mollùgo serpyllifòlia, Ser. mss. in D. C. prod. 1. p. 391. Like *Herniària glàbra.*

Wild-Thyme-leaved Pharnaceum. Pl. decumbent.

21 P. DEPRE'SSUM (Lin. mant. atl. p. 564.) stem prostrate, simple; peduncles 1-flowered, lateral; leaves lanceolate, pubescent, opposite or 4 in a whorl. ⊙. F. Native of the East Indies. Lœflíngia I'ndica. Stems depressed. Leaves somewhat tetragonal, lanceolate. Stipulas scarious. Peduncles dichotomous. Corolla purple.

Depressed Pharnaceum. Pl. prostrate.

22 P. MOLLU'GO (Lin. mant. 561.) leaves in whorls, unequal, on short stalks, 4 or 5 in a whorl, elliptic-lanceolate, smooth, acutish, with scabrous margins; peduncles axillary, 1-flowered; stem procumbent, dichotomous. ⊙. S. Native of Ceylon. Mollùgo Spérgula, Lin. spec. 1. p. 131.—Burm. zeyl. p. 13. t. 7. fl. ind. 31. t. 5. f. 4. Flowers white. Leaves like those of *Gàlium Mollùgo.*

Mollugo-like Pharnaceum. Pl. decumbent.

23 P. MARI'TIMUM (Walt. fl. carol. p. 117.) flowers lateral, solitary, sessile; leaves rather terete, obtuse, fleshy. ⊙. H. Native of Carolina. Mollùgo marítima, Ser. mss. in D. C. prod. 1. p. 392.

Sea-side Pharnaceum. Pl. prostrate.

24 P. LICHTENSTEINIA'NUM (Rœm. et Schult. syst. 6. p. 692.) leaves in whorls, lanceolate-linear, acute; peduncles axillary. ⊙? F. Native of the Cape of Good Hope on Mount Witsemberg. Mollùgo Lichtensteiniàna, Ser. mss. in D. C. prod. 1. p. 393. Pharnáceum galioìdes, Lichten. spicil. fl. cap. mss. Very like a species of *Spérgula*, but the flowers are monogynous. Perhaps a proper genus?

Lichtenstein's Pharnaceum. Pl. $\frac{1}{2}$ foot.

25 P. HOFFMANNSEGGIA'NUM (Rœm. et Schult. syst. 6. p. 692.) leaves lanceolate, acute, in whorls; peduncles 1-flowered, elongated. ⊙. S. Native of Brazil. Mollùgo Hoffmannseggiàna, Ser. mss. in D. C. prod. 1. p. 393. Pharnàceum galioìdes, Willd. mss. ex Schult. l. c. Flowers white.

Hoffmannsegg's Pharnaceum. Fl. June, July. Pl. prostrate.

26 P. BERTERIA'NUM; stem dichotomous, slender; space between the leaves very long; leaves very narrow, bluntish; peduncles filiform, in whorls. ⊙? S. Native of Porto Rico, along the sides of torrents. Pharnàceum lineàre. Bert. ined. Mollùgo Berteriàna, Ser. mss. in D. C. prod. 1. p. 391.

Bertero's Pharnaceum. Pl. procumbent.

Cult. The species of *Pharnàceum* are scarcely worth cultivating, except in botanical gardens, being for the most part weedy-looking plants. The greenhouse shrubby kinds thrive well in a mixture of sandy loam and peat, but the pots should be well drained with potsherds. Cuttings planted under a hand-glass in the same kind of soil will root freely, but they may be increased more easily by seed, which often ripen in abundance. The annual species should be sown in pots in the spring, and placed in a moderate hot-bed, where they may remain until they ripen their seed, or they may be removed into the greenhouse in June.

XXV. PHY'SA (φυσα, *physa*, a bladder; bladdery capsules). Pet. Thouar. nov. gen. mad. p. 20. D. C. prod. 1. p. 393.

LIN. SYST. *Decándria, Trigýnia.* Calyx 5-sepalled. Petals none. Stamens 10. Stigmas 3. Capsules 3-furrowed, 3-celled, 3-valved; valves septiferous, conniving with the receptacle.

1 P. MADAGASCARIE'NSIS (D. C. prod. 1. p. 393.) a little prostrate plant with jointed stems; leaves 4 in a whorl, unequal; peduncles 1-flowered. ⊙. S. Native of Madagascar.

Madagascar Physa. Pl. trailing.

Cult. This plant should be sown in a pot in a mixture of sand, loam, and peat, and placed in a hot-bed, where it may remain until it ripens its seed. Not worth cultivating.

XXVI. HOLO'STEUM (from ολος, *holos*, all; and οστεον, *osteon*, a bone, all bone, applied by antiphrasis to this plant, which is no bone, being soft and delicate. This species of wit is not uncommon, even at the present day, but applied to men not plants). Lin. gen. 136. Gært. fruct. t. 130. f. 5. D. C. prod. 1. p. 393.

LIN. SYST. *Tri-Pentándria, Trigýnia.* Calyx 5-sepalled. Petals 5, toothed. Stamens 5, or from abortion only 3 or 4. Styles 3. Capsules 1-celled, ending in 6 teeth at the apex. Embryo unfolded within the albumen.

1 H. DIA'NDRUM (Swartz. prod. p. 27. icon. t. 7.) stems procumbent, rather stiff; leaves roundish; flowers diandrous; stipulas 4, on both sides. ⊙. S. Native of Jamaica on rocks. Rœm. et Schult. syst. 2. p. 857. Very like *Drymària cordàta*, but much smaller, of which genus it is perhaps a species. Petals white.

Diandrous Holosteum. Fl. May, Sept. Clt. 1824. Pl. procumbent, $\frac{1}{8}$ foot.

2 H. SPERGULOI'DES (Lehm. pug. pl. hort. hamb. 10.) stem decumbent; leaves linear, fleshy, acute, younger ones pubescent,

stipulate; racemes leafy, rather secund; sepals lanceolate, obtuse, and glandular-pilose; petals ovate; stamens 3-4. ⊙. H. Native of Egypt. Flowers rose-coloured.

Spurry-like Holosteum. Fl. June, July. Clt. 1829. Pl. procumbent.

3 H. MUCRONA'TUM (Moc. et Sesse. pl. mex. ined. icon. in D. C. prod. 1. p. 393.) plant pubescent; stems procumbent; leaves cordate; peduncles 3-flowered. ⊙. F. Native of Mexico. Perhaps a variety of *Drymària cordàta*. Petals white.

Mucronate Holosteum. Fl. May, Sept. Pl. trailing, $\frac{1}{8}$ foot.

4 H. SUCCULE'NTUM (Lin. amœn. 3. p. 21.) leaves elliptical, fleshy, glabrous; petals somewhat trifid, smaller than the calyx. ⊙. H. Native of the states of New York and Carolina. Polycárpon uniflòrum, Walt. fl. carol. p. 83. This is a very doubtful plant according to Pursh, he having never been able to find it either in the state of New York nor Carolina. Flowers white.

Succulent Holosteum. Pl. trailing?

5 H. HIRSU'TUM (Lin. amœn. 3. p. 21.) leaves orbicular, hairy; flowers sessile? white. ⊙. S. Native of Malabar.

Hairy Holosteum. Pl. trailing.

6 H. UMBELLA'TUM (Lin. spec. 130.) radical leaves elliptical, glaucous, glabrous; cauline ones larger, ovate; flowers umbellate; common peduncles clammy-pubescent; pedicels deflexed after flowering. ⊙. H. Native of many parts of Europe on old walls and in sandy fields. In England on several walls and roofs of houses about Norwich, about Bury, also on the walls of Chelsea garden. Smith, engl. bot. t. 27. Fl. dan. 1204. Lam. ill. t. 51. f. 1. Cerástium umbellàtum, Huds. 201. Flowers white, sometimes tinged with red.

Umbellate-flowered Jagg-chickweed. Fl. April, May. Engl. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

Cult. Holósteum diándrum, mucronàtum, and *hirsútum,* require to be sown in pots and placed in a hot-bed in any kind of soil, where they may remain. *H. succuléntum* and *umbellàtum* may be sown on rock-work. None of the species are worth cultivating except in botanical gardens.

XXVII. SPE'RGULA (from *spargo,* to scatter; because it scatters its seed abroad, to the great profit of the farmer in Holland. See *Spérgularia arvénsis.*). Lin. gen. no. 798. Gært. fruct. t. 130. f. 4. D. C. prod. 1. p. 394.

Lin. syst. *Decándria, Pentagýnia.* Calyx 5-parted. Petals 5, entire. Stamens 5 and 10. Styles 5. Capsules 1-celled, 6-valved, 5-valved according to Smith, many-seeded. Leaves exstipulate.

1 S. NODÒSA (Lin. spec. 630.) leaves opposite, awl-shaped, smooth, bluntish; lower ones broad, sheathing, upper ones clustered; stems tufted, almost simple, few-flowered; petals twice as long as the calyx: seeds somewhat reniform, rough. ♃. H. Native of many parts of Europe in marshy places. In Canada and on the shores of the Arctic sea. In Britain in moist sandy or turfy ground. Smith, engl. bot. t. 694. Curt. lond. fasc. 4. t. 34. Fl. dan. t. 96. Stems spreading or prostrate. Flowers white.

Var. β, brevifòlia (Pers. ench. 1. p. 522. Poir. dict. 7. p. 305.) stem very simple; clusters of leaves approximate; cauline leaves very short. ♃. H. Native of Europe in arid fields. Flowers larger than in var. *a*.

Var. γ, marítima (Pers. ench. 1. p. 522.) leaves fleshy, incurved, spreading. ♃. H. Native by the sea-side.

Knotted Spurry or Sand-chickweed. Fl. July, Aug. Brit. Pl. 3 to 6 inches long.

2 S. SAGINOÌDES (Lin. spec. 631.) stem creeping; leaves opposite, awl-shaped, smooth, nearly pointless; peduncles solitary, very long; petals obovate, very blunt; hardly equal in length to the obtuse sepals; seeds rather kidney-shaped, dotted. ♃. H. Native of Switzerland, France, Siberia and Sweden, as well as in South Carolina and on the north-west coast of America. In Scotland on Mael-Ghyrdy and Ben Lawers. In the islands of Unalaschka and St. Paul. Smith, engl. bot. 2105. Swartz. in the stockh. trans. for 1789. p. 44. t. 1. f. 2. Stellària biflòra, t. 12. but not of Lin. Plant with the habit of *Sagìna procúmbens,* with several stems in a patch, in their lower part decumbent, then erect. Petals white. Dr. Swartz says his plant has only 5 stamens, but with us they are 10.

Sagina-like Spurry. Fl. June, July. Scotland. Pl. 2 to 3 inches long.

3 S. SUBULA'TA (Swartz, act. holm. 1789. p. 45. t. 1. f. 3.) plant rather pilose; leaves opposite, almost sessile, rather leaning to one side, linear-awl-shaped; somewhat awned, ciliated; peduncles solitary, very long; petals length of calyx. ♃. H. Native of Germany, Denmark, Sweden, and Britain on barren heaths, and North America on the Rocky Mountains. Smith, engl. bot. 1082. S. larícina, Huds. 203. Fl. dan. 858. S. saginoìdes, Curt. lond. fasc. 4. t. 35. Sagìna procúmbens β, Lin. spec. 185. Leaves fringed with glandular or slightly viscid hairs, and terminate each in a very conspicuous hair-like point, not sufficiently expressed in engl. bot. l. c. Flowers white, about half the size of those of *S. saginoìdes.* Stamens more frequently 5 than 10.

Var. β, flòre-plèno; flowers double, white.

Awl-shaped-leaved Spurry. Fl. July, Aug. Britain. Pl. 2 inches.

4 S. PILI'FERA (D. C. fl. fr. 4. no. 4391.) leaves opposite, linear, awned, rather stiff, glabrous, in bundles; stems creeping, branched, tufted; peduncles very long; petals twice as large as the calyx; seeds egg-shaped. ♃. H. Native of Corsica on the higher mountains. Flowers white.

Hair-bearing-leaved Spurry. Fl. July, Aug. Clt. 1826. Pl. $\frac{1}{4}$ foot.

5 S. GLA'BRA (Willd. spec. 2. p. 821.) plant decumbent; leaves opposite, filiform, glabrous, rather acute; petals larger than the calyx. ♃. H. Native of the alps of Europe in shady pastures. Poir. dict. 7. p. 306. Spérgula saginoìdes, All. ped. no. 1735. t. 64. f. 1. Flowers white.

Glabrous Spurry. Fl. June, July. Clt. 1816. Pl. trailing, $\frac{1}{8}$ to $\frac{1}{4}$ foot long.

6 S. GLANDULÒSA (Besser. prim. fl. galic. p. 298.) plant covered with glandular pubescence; leaves opposite, awl-shaped; stems branched, bearing bundles of smaller leaves in the axillæ of the older ones; petals elliptical, twice as long as the obtuse sepals. ♃. H. Native of Galicia in humid pastures. Flowers white.

Glandular Spurry. Fl. June, Aug. Pl. $\frac{1}{4}$ foot.

7 S. ARENARIOÌDES (Ser. mss. in D. C. prod. 1. p. 395.) plant glabrous; root thick; stem prostrate; branches ascending; leaves lanceolate, linear, acute; flowers pentandrous; petals oblong, length of calyx. ♃? F. Native of Mexico. Arenària? pentágyna, Moc. et Sesse, pl. mex. ined. icon. Flowers white.

Sand-wort-like Spurry. Fl. June, July. Pl. prostrate.

8 S. APE'TALA (Labill. nov. holl. 1. p. 112. t. 142.) almost stemless; leaves opposite, connate, imbricate, long; flowers apetalous, pentandrous; sepals lanceolate, very acute. Native of Van Diemen's Land.

Apetalous Spurry. Pl. 1 inch.

9 S. HUMIFU'SA (Cambess in St. Hil. fl. bras. 2. p. 173.) stems trailing, branched, covered with glandular-pubescence beneath; leaves linear, awl-shaped, connate at the base, smoothish; pedicels axillary, solitary, equal in length with the leaves; calyx clothed with glandular pubescence; petals equal in length

to the calyx. ⊙. H. Native of Brazil near the town called Rio Grande de St. Pedro do Sul. Like *Spérgula saginoìdes.*

Trailing Spurry. Fl. Sept. Pl. trailing.

Cult. None of the species of *Spérgula* are wòrth cultivating, except in botanical gardens. They will grow without care in any moist situation.

XXVIII. SPERGULA'RIA (altered from *Spérgula*, which see). Cambess. in St. Hil. fl. bras. 2. p. 171.

LIN. SYST. *Decándria, Tri-Pentagýnia.* Calyx of 5 sepals with membranous edges. Petals 5, entire. Stamens 10, seldom 5. Styles 3-5. Capsule 1-celled, 3-5-valved, many-seeded; seeds compressed, marginate. This genus has been divided from *Spérgula* and *Arenària*, by Cambessedes. We shall therefore retain the authorities for the species under these genera. The genus is remarkable in being furnished with stipulas, in the seeds being bordered with a wing, and in the petals and stamens usually adhering to the base of the calyx.

SECT. I. SPE'RGULA (in allusion to the genus being separated from *Spérgula*). Styles 5. Stamens 10. Capsule 5-valved. Flowers white. Leaves linear, in whorls. Stipulas in pairs under each whorl, membranous, very short. Flowers cymose.

1 S. ARVE'NSIS (Lin. spec. 630.) leaves in whorls; flowers decandrous; seeds spherical, rather hispid, black, with a narrow border. ⊙. H. Native throughout Europe in gardens and cultivated fields. North America on the banks of the Columbia and about Quebec; plentiful in Britain. Smith, engl. bot. t. 1535. Curt. lond. fasc. 5. t. 31. Fl. dan. 1033. Lam. ill. t. 393. f. 1. Flowers white.

Var. β, *geniculàta* (Poir. 7. p. 303.) stem beyond a foot, jointed at the knots, as if it were viviparous. S. geniculàta, Pers. ench. 1. p. 522. no. 3. Petals white.

In the Netherlands and in Germany the seed of this plant is sown on corn stubbles, to supply a bite for sheep during winter. It may be sown and reaped in eight weeks, either in autumn or spring. It is said to enrich the milk of cows, so as to make it afford excellent butter, and the mutton fed on it is said to be preferable to that fed on turnips. Hens eat *spurry* greedily, and it is supposed to make them lay a great number of eggs, whether in hay, or cut green, or in pasture. Von Thaer observes, it is the most nourishing in proportion to its bulk, of all forage, and gives the best flavoured milk and butter. It has been recommended to be cultivated in England, but it is not likely that such a plant can ever pay the expence of seed and labour in this country, even on the poorest soil; or at all events, as Professor Martyn observes, we have many better plants for such soils. *S. pentándra* has the same properties, and is, as well as *S. arvénsis*, called *yarr* in Scotland and *pick-purse* in Norfolk.

Corn Spurry or Yarr. Fl. June, July. Brit. Pl. ½ to 1 ft.

2 S. PENTA'NDRA (Lin. spec. 630.) leaves in whorls; flowers generally pentandrous; seeds lenticular, with dotted winged margins. ⊙. H. Native of Europe in woods in many parts. In Ireland on sandy ground. Lam. illus. t. 392. f. 2.—Moris, hist. 2. p. 551. sect. 5. t. 23. figure last but one marked 2. Petals white.

Var. β, *Spérgula pentándra* (Engl. bot. 1536.) seeds compressed, with a narrow, whitish membranous border. ⊙. H. Native about the Botanic Garden at Liverpool. Petals white.

Pentandrous Spurry. Fl. Ju. Jul. England. Pl. 1 to 1½ ft.

3 S. VILLO'SA (Pers. ench. 1. p. 522.) plant pubescent; leaves in whorls; cymes branched, many-flowered; petals shorter than the sepals. ♃. S. Native of Monte Video. Poir. dict. 7. p. 304. Sepals oblong, acutish. Petals white.

Villous Spurry. Fl. July. Pl. ½ foot.

4 S. VISCO'SA (Lag. in varied. de cienc. 1805. p. 213. gen. et spec. 15.) leaves in whorls, villous, clammy; flowers decandrous; petals longer than the calyx. ♃. H. Native of Spain near the snow on the summit of the mountain commonly called de Los-pozos near Arvas. Petals white.

Clammy Spurry. Fl. June, July. Pl. ½ foot.

5 S. PA'LLIDA (Salisb. prodr. 298.) stem clammy, pubescent; stipulas large; leaves half terete, mucronulate; petals oval, entire, obtuse; stamens 10. ♃. G. Native of the Cape of Good Hope. Seeds imbricated, a little reniform, with scarious margins. Petals pale red.

Pale-red-petalled Spurry. Fl. June, Jul. Clt. 1810. Pl. 1 ft.

SECT. II. ARENA'RIA (in allusion to the plants being separated from *Arenària*). Stipulària, Haw. Lepígonum, Wahlenb. fl. goth. ex Spreng. neue. entd. 3. p. 231. Stamens 10. Styles 3. Capsules 3-valved. Leaves linear, opposite, with bundles of smaller ones in the axillæ. Stipulas scarious, situated at the base of the leaves. Flowers usually cymose, but sometimes solitary, 1-flowered.

6 S. SEGETA'LIS (Lam. fl. fr. 3. p. 43.) plant glabrous; stem erect; leaves awl-shaped, leaning rather to one side; sepals scárious, marked with a longitudinal green line in the centre; petals shorter than the calyx; peduncles after flowering deflexed; seeds rather pear-shaped, rough. ⊙. H. Native among corn in France and Spain. Alsìne segetàlis, Lin. spec. 390.—Vaill. bot. par. t. 3. f. 3. Capsules 3-valved; valves broad, obtuse. Petals white.

Corn-field Sand-spurry. Fl. Jul. Sept. Clt 1805. Pl. ½ to 1 ft.

7 S. LEPTOPHY'LLA; like *Arenària tenuifòlia*, Lin. but differs in the leaves being stipulate; stipulas setaceous, scariose, and white; flowers lateral, and nearly sessile; bracteas all scariose and white. It differs from *Spergulària segetàlis* in the different figure of the stipulas. ♃. F. Native of Mexico. Arenària leptophýlla, Schlecht. et Cham. in Linnæa 5. p. 233.

Slender-leaved Sand-spurry. Pl. ¼ foot.

8 S. MOLLUGI'NEA (Ser. mss. in D. C. prod. 1. p. 400.) plant very smooth; leaves linear, thick, glaucous, rather callose at the apex; stem spreading, forked; flowers axillary; peduncles after flowering deflexed; sepals ovate, obtuse, with membranaceous margins; capsules roundish, 3-valved; valves very blunt, equalling the calyx in length; seeds reniform. ⊙. H. Native of New Spain. Alsìne mollugínea, Lag. gen. et spec. 1815. p. 13. Petals white. Perhaps a different genus from the preceding.

Mollugo-like Sand-spurry. Fl. June, July. Pl. ½ foot.

9 S. PROSTRA'TA (Ser. mss. in D. C. prod. 1. p. 400.) stems forked, prostrate, glabrous; leaves linear, disposed in whorls; extreme branches filiform; peduncles axillary, 1 or 4-flowered; sepals lanceolate, unequal, equal in length with the corolla; style one; stigmas 3; capsules ovate-roundish, 3-valved; valves ovate, bluntish. ♃? H. Native of Egypt. Alsìne prostràta, Forsk. descr. p. 201. Delile, fl. ægypt. p. 68. t. 24. f. 4. Flowers rose-coloured.

Prostrate Sand-spurry. Pl. prostrate.

10 S. SUCCULE'NTA (Ser. mss. in D. C. prod. 1. p. 400.) stems trailing, small, glabrous; branches forked; leaves spatulate; flowers terminal, somewhat panicled; sepals oblong, obtuse, with membranaceous margins, length of corolla; style 1; stigmas 3; capsules rather spherical, 3-valved; valves lanceolate, with the margins involute after opening. ⊙. H. Native of Egypt. Alsìne succulénta, Delil. fl. ægypt. p. 68. t. 24. f. 3. Flowers white.

Succulent Sand-spurry, Pl. trailing.

11 S. PURPU'REA (Pers. ench. 1. p. 50. but not of Schlecht.) plant hispid; stem erect; branches divaricating; leaves setaceous, almost one-half shorter than the spaces of the stem between the leaves; sepals lanceolate, bluntish, with scariose

margins; petals very blunt, shorter than the calyx; peduncles after flowering deflexed; seeds somewhat pear-shaped, black. ⊙. H. Native of Spain. Capsules of 3 lanceolate, acute valves. A neat little plant with fine purple flowers.

Purple Sand-spurry. Fl. Ju. Jul. Clt. 1823. Pl. ¼ to ½ ft.

12 S. rùbra (Lin. spec. 606.) stems prostrate, hairy; leaves linear, bristle-pointed, shorter than the spaces between the leaves; stipulas membranous; sepals lanceolate, bluntish, with scarious margins; peduncles deflexed after flowering; seeds compressed, angular, roughish at the edge, without a margin. ⊙. H. Native abundantly throughout Europe, as well as the north of Africa and California, in sandy fields. Smith, engl. bot. t. 852. A. campéstris, All. ped. 2. p. 114. Flowers light-purple; capsules 3-valved, as long as the calyx.

Red-flowering Sand-spurry. Fl. July, Aug. Britain. Pl. prostrate.

13 S. salìna (Presl. fl. cich. p. 23.) leaves semi-cylindrical, fleshy, pointless, longer than the spaces between the leaves; stipulas membranaceous, sheathing; capsules oblong, larger than the calyx; seeds compressed, angular, roughish. ⊙. H. Native of Bohemia in salt pastures. Arenària salìna, Ser. mss. in D. C. prod. 1. p. 401. Flowers light purple. This plant is said to be like *A. marìna*, and probably is not distinct.

Salt-marsh Sand-spurry. Fl. Jul. Aug. Clt. 1820. Pl. prostr.

14 S. glutinòsa (Bieb. fl. taur. 1. p. 344.) plant villous, clammy; leaves oblong, bluntish; stem erect, few-flowered; petals obovate, longer than the calyx. ⊙. H. Native between Astracan and Kisljar. A little plant with the appearance of *a Cerástium*, and flowers size, form, and colour of *S. rùbra*.

Clammy Sand-spurry. Fl. June, Aug. Pl. ¼ foot.

15 S. Spérgula (Duf. ann. gen. 7. p. 293.) plant prostrate, pubescent; leaves linear, fleshy, longer than the spaces of the stem between the leaves; peduncles rather leaning to one side, at length twisted backwards; sepals somewhat acute, shorter than the capsules; petals scarcely the length of the calyx; seeds girded by a membranaceous border. ⊙. H. Native of humid sandy fields near St. Filipe. Petals red. An intermediate plant between *S. rùbra* and *S. marìna*.

Spurry-like Sand-spurry. Fl. July, Aug. Pl. prostrate.

16 S. media (Lin. spec. 606.) stems prostrate, villous; leaves semi-cylindrical, fleshy, pointless, equal in length to the spaces of the stem between the leaves; sepals lanceolate, bluntish, with scarious margins; peduncles deflexed after flowering; seeds girded by a membranaceous margin. ⊙. H. Native of many parts of Europe on the sandy sea-coast and pastures adjacent. A. marìna, fl. dan. t. 740. Smith, engl. bot. t. 958. A. marginàta, D. C. fl. fr. 4. p. 793. icon. rar. gall. t. 48. A. glandulòsa, Jacq. hort. schœnbr. 3. p. 355. A. rùbra β, Lin. spec. 606. A. rùbra γ, Huds. 193. A much stouter and more succulent plant than *S. rùbra*. The border round the seeds is very variable in colour and width, even in the same capsule. Flower light-purple.

Intermediate Sea-spurry. Fl. Ju. Jul. Brit. Pl. prostrate.

17 S. radicans (Presl. ex Spreng. 2. p. 400.) stem prostrate, glabrous; leaves filiform, semi-cylindrical, obtuse; stipulas ovate, scarious; flowers axillary; capsule equal in length to the calyx; seeds compressed. ♃. H. Native of Mount Etna. Arenària, Spreng. l. c. Flowers red.

Rooting Sea-spurry. Pl. prostrate.

18 S. grandis (H. B. et Kunth, nov. gen. et spec. amer. 6. p. 30. in a note) leaves linear, acute, in whorls, longer than the spaces of the stems between the leaves; cymes corymbose, many-flowered; sepals oblong, acutish, longer than the petals; seeds girded by a membranaceous white wing. ⊙. H. Native about Monte Video. Spérgula grándis, Pers. ench. 1. p. 522. Poir. dict. 7. p. 305. Stems thick. Flowers white, purple at the tip.

Great Sand-spurry. Pl. 1 foot.

19 S. Canadensis (Pers. ench. 3. p. 504.) plant pilose, rather hispid; leaves filiform, longer than the spaces of the stem between the leaves; sepals lanceolate, bluntish, with broad scarious margins; stamens 5; peduncles deflexed after flowering; seeds somewhat semicordate, compressed. ⊙. H. Native of North America on the sea-coast, and in salt marshes from Canada to Carolina. A. rùbra β, Mich. fl. bor. amer. 1. p. 274. Flowers pale red. Capsules rather globose, 3-valved, longer than calyx; valves broad, blunt.

Canadian Sand-spurry. Fl. Ju. Jul. Clt. 1812. Pl. trailing.

20 S. Cervia'na (Cham. in Schlecht. Linnæa. 1. p. 52.) smooth; stems spreading, dichotomous; leaves linear, thick, mucronate, stipulate; flowers dichotomously-panicled, glomerate; capsule 3-valved, exceeding the calyx; seeds kidney-shaped, angular, tubercled. ♃. G. Native of Chili. Habit of *S. rùbra*.

Cervian's Sand-spurry. Pl. ½ foot.

21 S. viscòso-pubéscens (Lois. in Lin. trans. par. vol. 4.) root thick; stems prostrate; leaves linear-awl-shaped, rather longer than the internodes; stipulas membranous, sheathing a little; flowers in racemose panicles; petals and capsule shorter than the calyx; sepals obtuse, marginate. ♃. H. Native of Corsica. Flowers red?

Clammy-pubescent Sand-spurry. Pl. prostrate.

22 S. rupéstris (Camb. in St. Hil. fl. bras. 2. p. 172.) puberulous; leaves linear, awl-shaped, longer than the spaces of the stem between the leaves; cymes few-flowered; sepals obtuse, equal in length with the petals. ♃. F. Native of Brazil in the province of Cis-platine, in the fissures of rocks. Root woody, thick. The whole plant is beset with glandular hairs. Petals white.

Rock Sand-spurry. Pl. ½ foot.

23 S. levis (Camb. in St. Hil. fl. bras. 2. p. 176.) smooth; leaves linear, awl-shaped, longer than the internodes; cymes few-flowered; petals 4 times shorter than the acute sepals. ♃. F. Native of Brazil in the Eastern part of the province of Cis-platine. Stems numerous from the root, which is the case with most of the species. Flowers white.

Smooth Sand-spurry. Pl. 1 foot.

24 S. racemòsa (Camb. in St. Hil. fl. bras. 2. p. 178.) puberulous; leaves linear-awl-shaped, lower ones longer than the spaces of the stem between the leaves, but the upper ones are much shorter; cymes racemose, many-flowered; petals 3-times shorter than the oblong-lanceolate bluntish sepals. ♃. F. Native about Monte-Video. Flowers white.

Racemose-flowered Sand-spurry. Pl. 1½ foot.

Cult. None of the species are worth cultivating for ornament; they will all thrive well on rock-work in any common garden soil. The Brazilian species will require shelter during winter.

XXIX. DRYMA'RIA (from δρυμος, *drymos*, a forest; habitation of most of the species). Willd. herb. ex Rœm. and Schult. syst. 5. p. 406. H. B. et Kunth, gen. et spec. amer. 6. p. 21. D. C. prod. 1. p. 395.

Lin. syst. *Pentándria, Trigýnia.* Calyx 5-parted. Petals 5, bifid. Stamens 5. Styles 3. Capsules 3-valved even to the base, 5 and many-seeded. Embryo perepheric, rather annular.—Diffuse-branched, glaucous herbs, with petiolar, twin, and many stipulas.

1 D. Frankenioìdes (H. B. et Kunth, gen. et spec. amer. 6. p. 21. t. 515.) plant much branched, viscid from glandular hairs, hoary; leaves on short footstalks, lanceolate-oblong; peduncles 1-flowered; petals shorter than the calyx, 6-cleft, with the 4 intermediate segments capillaceous; ovary containing about 50

seeds. ⊙. S. Native of South America in the sand near Pachuca, at the height of 3810 feet. D. arenarioìdes, Rœm. et Schult. syst. p. 406. Seeds angular, reniform, thickly beset with very minute tubercles. Petals white.

Frankenia-like Drymaria. Pl. trailing.

2 D. stellarioi'des (Willd. herb. ex Rœm. et Schult. syst. 5. p. 406.) stems dichotomous at the apex, few-flowered; leaves sessile, glabrous; calyx viscid, pubescent, shorter than the bifid petals; ovary containing about 50 seeds. ⊙. S. Native of Quito near Hambato at the height of 4140 feet. H. B. et Kunth, gen. et spec. amer. 6. p. 22. Petals white.

Stitch-wort-like Drymaria. Fl. July, Sept. Pl. trailing.

3 D. ova'ta (Rœm. et Schult. syst. 5. p. 406.) stems villous at the top as well as the branches; leaves stalked, ovate, acute, mucronated, rounded at the base, puberulous; peduncles bifid, few-flowered; calyx glabrous, equalling in length the corolla; petals profoundly bifid; ovary containing 13 to 17 seeds. ⊙. H. Native near Quito at the height of 4380 feet. H. B. et Kunth, nov. gen. et spec. amer. 6. p. 23. Petals white.

Ovate-leaved Drymaria. Fl. July, Sept. Pl. trailing.

4 D. corda'ta (Willd. herb. ex Rœm. et Schult. 5. p. 406.) stems as well as leaves glabrous; leaves ovate, roundish, acute, mucronated, rounded or obsoletely cordate at the base, on short footstalks; peduncles dichotomous, many-flowered; calyx downy, exceeding in length the petals; ovary 7-10-seeded. ♃. S. Native of the West Indies and Surinam. H. B. et Kunth, nov. gen. et spec. amer. 6. p. 23. Holósteum cordàtum, Lin. amœn. 3. p. 21. mant. 327. Lam. ill. t. 51. f. 2. Petals white. Plant glaucous.

Cordate-leaved Drymaria. Fl. July, Sept. Clt. 1814. Pl. creeping.

5 D. gra'cilis (Schlecht. et Cham. in Linnæa 5. p. 232.) like *D. cordàta*, but differs in the leaves being more ovate, never dilated nor kidney-shaped, longer than the capillary petioles; peduncles and calyxes smooth, not clothed with glandular down as in that plant. The whole plant is more erect, and of a paler green colour, and the seeds are much larger. ⊙. H. Native of Mexico at Jalapa.

Slender Drymaria. Fl. June, Sept. Clt. 1828. Pl. ½ foot.

6 D. palu'stris (Schlecht. et Cham. in Linnæa 5. p. 232.) like *D. cordàta*, but with a much more slender habit, and with the leaves nearly 3 times smaller; bracteas broader and blunter; seeds smaller and echinately-muricated, not granular; peduncles and calyxes smooth; leaves roundish-ovate, rather cordate, acutish, younger ones and stems villous. ♃. F. Native of Mexico at Jalapa.

Marsh Drymaria. Fl. June, Sep. Clt. 1830. Pl. creeping.

7 D. villòsa (Schlecht. et Cham. in Linnæa 5. p. 232.) like the rest, but the whole plant is villous; seeds smaller, tuberculated, not muricated. ♃. F. Native of Mexico.

Villous Drymaria. Fl. April, Sep. Pl. ¼ to ½ foot.

8 D. dia'ndra (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 647.) branched, puberulous; leaves roundish-ovate, mucronate, smooth, tapering to the base; peduncles bifid; flowers diandrous; calyx clothed with glandular pubescence; petals profoundly bifid; capsule 1-seeded. ♃. S. Native of Java. Allied to *D. ovàta* and *D. cordàta*.

Diandrous Drymaria. Pl. trailing.

9 D. divarica'ta (H. B. et Kunth, gen. et spec. amer. 6. p. 24.) stems as well as leaves glabrous; leaves stalked, broadly roundish-ovate, acute, rounded at the base; peduncles irregularly branched, divaricating, many-flowered; calyx glabrous, a little shorter than the petals; ovary containing about 8 seeds. ⊙. H. Native on the shores of the Pacific ocean, near Lima in Peru. Differing from *D. cordàta* in the peduncles being irregularly branched, with longer pedicels. Petals exceeding the calyx, as well as the style being longer. Plant rather glaucous, diffuse. Petals white.

Divaricated-peduncled Drymaria. Fl. July, Sept. Pl. ½ ft.

Cult. *Drymària* is a genus of chickweed-looking plants, consequently not worth cultivating, except in botanical gardens. They only require to be sown in pots in the spring, and placed in a hot-bed. In the month of May they may be planted out in the open border in a warm situation. If kept in a stove most of them will prove perennial. A sandy soil suits them best.

XXX. SCHI'EDEA (William Schiede, a German botanist now in Mexico). Cham. in Schlecht. Linnæa. 1. p. 45.

Lin. syst. *Decándria, Trigýnia.* Calyx of 5 permanent sepals. Petals 5, minute, bifid, permanent, shorter than the calyx. Stamens 10. Styles 3, stigmatose on the inside. Capsule sessile, 1-celled, 3-valved, opening nearly to the base with a seminiferous nerve in the middle of each valve. Seeds 10-12, orbicular, emarginate. A branched, knotted, bifurcate shrub, about 3 feet high. Leaves small, opposite, connate at the base. Flowers small, white, in panicles.

1 S. ligustri'na (Cham. l. c. 1. p. 46.). ♄. G. Native of the Sandwich Islands, particularly in O Wahu.

Privet-like Schiedea. Shrub 3 feet.

Cult. This shrub will grow in a mixture of loam and sand, and young cuttings will strike root under a hand-glass.

XXXI. STELLA'RIA (from *stella*, a star, because of the stellate disposition of the petals). Lin. gen. no. 773. Gært. fruct. 2. t. 130. f. 3. D. C. prod. 1. p. 396.

Lin. syst. *Octo-Decándria, Trigýnia.* Calyx 5-parted. Petals 5, bifid. Stamens 10, or from abortion only 3-8. Styles 3. Capsules 1-celled, 6-valved at the apex, many-seeded.

1 S. ne'morum (Lin. spec. 603.) lower leaves cordate, stalked, upper ones ovate or lanceolate, almost sessile; panicles repeatedly forked; petals twice as long as the calyx; seeds orbicular, compressed, with a tubercled margin. ♃. H. Native of many places in Europe in moist woods and in the neighbourhood of springs. In the north of England and in the Lowlands of Scotland. Smith, engl. bot. t. 92. Fl. dan. 271. Alsine némorum, Schreb. spic. 30. Root slender, creeping. Stems straggling, with a few hairs. Leaves pale-green. Flowers numerous, white.

Grove Stitchwort. Fl. May, June. Britain. Pl. straggling.

2 S. cuspida'ta (Willd. herb. ex Schlecht. berl. mag. 1816. p. 196.) stems dichotomous, glabrous; leaves stalked, ovate-oblong, acuminated, cordate, membranaceous, glabrous; peduncles from the wings; calyx pilose, ciliated at the base, clammy; ovary containing about 30 seeds. ♃. H. Native of South America in groves in the province of Quito as well as in Chili. H. B. et Kunth, gen. et spec. amer. 6. p. 27. Very like *Stellària némorum*. Plant straggling, pale green. Flowers white.

Cuspidate-leaved Stitchwort. Fl. May, June. Pl. straggling.

3 S. saxi'fraga (Bert. pl. ital. rar. ed. 1. p. 55. no. 4.) plant pubescent, diffuse; leaves sessile, ovate, acute, dilated at the base, rough; panicles dichotomous; peduncles terminal, generally in threes, lateral ones furnished with bracteas; sepals narrow-lanceolate, one-half shorter than the petals; seeds rather kidney-shaped, rough. ♃. H. Native of Italy on the Peak of Sagra in the Alps of Appuanus. Flowers white.

Saxifrage Stitchwort. Fl. May, June. Pl. diffuse.

4 S. corda'ta (Willd. herb. ex Schlecht. berl. mag. 1813. p. 179.) leaves roundish-cordate; peduncles axillary. ♃. H. Native of South America near Caripe. Flowers white.

Cordate-leaved Stitchwort. Pl. trailing?

5 S. virga'ta (Ser. mss. in D. C. prod. 1. p. 396.) plant glabrous; stem upright, dichotomous; leaves ovate-cordate, 3-nerved; flowers terminal, 3 or 4 in an umbel, on short peduncles; sepals oblong, bluntish, with scarious margins, much longer than the corolla; styles very short. ♃. H? Native of? Alsine virgàta, Deless. herb.

Twiggy Stitchwort. Pl. ½ foot.

6 S.? arista'ta (Ser. mss. in D. C. prod. 1. p. 396.) stems tufted, dichotomous; leaves ovate, awned at the apex, ciliated at the base, spreading; flowers cymose, stalked; sepals lanceolate, shorter than the corolla; petals bidentate; stamens 5; ovary ovate; style 1; stigmas 3. ♃. H. Native of Mexico. Alsine? aristàta. Moc. et Sesse, pl. ined. icon. Flowers white.

Awned-leaved Stitchwort. Fl. June, July. Pl. ½ foot.

7 S. ra'dians (Lin. spec. 603.) stem dichotomous; leaves lanceolate, acute, somewhat serrulated; petals 5-parted, twice as long as the calyx. ⊙? H. Native of Siberia in bogs. Poir. dict. 7. p. 416. Wikstroem, acad. handl. 1822. Flowers white. Leaves hairy, veined.

Var. β, *uniflòra* (D. C. prod. 1. p. 396.) stem simple, 1-flowered.—Amm. stirp. ruth. t. 10.

Radiant Stitchwort. Fl. June, July. Pl. ¼ to ½ foot.

8 S. villòsa (Poir. dict. 7. p. 416. but not of Schlecht.) stems and peduncles hairy; leaves sessile, ovate-lanceolate, pubescent; flowers on long stalks, somewhat panicled, terminal; petals much longer than the calyx. ♃. S. Native of the island of Bourbon. Flowers white.

Villous Stitch-wort. Pl. ½ foot.

9 S. latifòlia (Pers. ench. 1. p. 501.) stems diffuse, forked, rooting a little at the base; leaves ovate, lower ones stalked, rather cordate, upper ones sessile; pedicels axillary, younger ones crowded into umbels; fruit-bearing ones reflexed; petals shorter than the calyx; seeds disciform, rough. ⊙. H. Native about Montpelier, and of Germany, in watery places. D. C. fl. fr. suppl. 5. p. 614. Stellària Cerástium, Lin. syst. veg. ed. 15. p. 452. Flowers white.

Broad-leaved Stitchwort. Fl. June, Aug. Clt. 1816. Pl. 1 foot.

10 S. Jamesònii (Torrey in ann. lyc. new york, vol. 2. 1827.) plant clothed with clammy pubescence; leaves lanceolate, somewhat falcate, sessile, acute; stem rather branched, yellow; flowers loosely panicled, divaricate; petals 2-lobed, about twice the length of the oblong, acute sepals. ♃. H. Native of North America on the Rocky Mountains.

Jameson's Stitchwort. Pl. ½ foot.

11 S. lanceola'ta (Poir. dict. 7. p. 416.) leaves lanceolate, oblong, acute; panicle pubescent; sepals longer than the corolla. ♃? H. Native of the Straits of Magellan. Flowers white.

Lanceolate-leaved Stitchwort. Pl. ½ foot.

12 S. me'dia (With. 418. Smith, engl. bot. t. 537.) stems procumbent, with an alternate hairy line on one side; leaves ovate; peduncles solitary, axillary; fruit-bearing ones deflexed; capsules profoundly 6-valved, scarcely longer than the calyx; seeds somewhat kidney-shaped, rough. ⊙. H. Common every where throughout the world in waste and cultivated grounds. Alsine mèdia, Lin. spec. 389. Curt. fl. lond. fasc. 1. t. 20. Lam. ill. t. 214. Fl. dan. t. 438 and 525. Stamens 3-5 or 10. Plant pale-green. Petals white. Small birds and poultry eat the seeds and whole herb. The latter may be boiled for the table like spinach.

Var. β, *Javénsis* (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 647.) stem procumbent, with an obverse lateral villous alternate line; leaves ovate, smooth, veinless, upper ones sessile; pedicels axillary, and are as well as the calyxes hairy; young pedicels umbellately aggregate; fructiferous ones reflexed; petals bifid, shorter than the calyx; seed rather reniform, wrinkled.

Intermediate Stitchwort or common Chickweed. Fl. March, Nov. Britain. Pl. trailing.

13 S. mono'gyna (D. Don, prod. fl. nep. 215.) stamens 5; stem much branched, procumbent, glabrous, bearded at the joints; leaves roundish, nerved, glabrous, stalked; umbels dichotomous, stalked; style simple, crowned by 3 stigmas. ⊙. H. Native of Nipaul. Flowers white.

One-styled Stitchwort. Fl. June, July. Pl. trailing.

14 S. rotundifòlia (Poir. dict. 7. p. 416.) leaves stalked, round, thickish, 3-nerved, rather mucronate; panicle terminal, with twiggy branches; corolla longer than the sepals.—Native of the Straits of Magellan. Perhaps a species of *Drymària*?

Round-leaved Stitchwort. Fl. June. Pl. trailing.

15 S. cilia'ta (Vahl. in herb. Juss. Pers. ench. 1. p. 503. but not of Kunth, nor Scop.) leaves cordate, acute, small, on short footstalks, which are ciliated; flowers axillary, solitary; petals hardly exceeding the calyx.—Native of Peru. Petals white.

Ciliated-footstalked Stitchwort. Pl. trailing.

16 S. dicho'toma (Lin. spec. 603. but not of Willd. herb.) plant hairy; leaves cordate, ovate, half stem-clasping; stems dichotomous; flowers solitary; fruit-bearing peduncles reflexed; sepals lanceolate, acute, exceeding the petals. ⊙? H. Native of Siberia on the Alps. Smith, icon. ined. 1. p. 14. t. 14. Petals white.

Dichotomous-stemmed Stitchwort. Fl. year. Pl. 1 foot.

17 S. pu'bera (Michx. fl. bor. amer. 1. p. 273.) plant downy; leaves oval, ciliated; pedicels erect, shortish; sepals ovate; petals longer than the calyx. ♃. H. Native of North America from Pennsylvania to North Carolina in shady woods on rich soil. Flowers large, white.

Downy Stitchwort. Fl. May, June. Pl. trailing?

18 S. bulbòsa (Wulf. in Jacq. coll. 3. p. 21. icon. rar. 3. t. 468.) leaves broad, ovate, lanceolate, veinless on the under surface; stem rather branched; peduncles 1-flowered; sepals lanceolate, acute, shorter than the petals; root filiform, creeping, bearing bulbs. ♃. H. Native of Carinthia on the Alps in shady moist places. Petals white. Anthers at first red, then black.

Bulbous-rooted Stitchwort. Fl. May, June. Clt. 1823. Pl. ¼ to ½ foot.

19 S. vi'scida (Bieb. fl. taur. 1. p. 342.) plant villous, clammy; leaves linear-lanceolate; stems dichotomous erect; petals longer than the calyx; capsules rather cylindrical, twice as long as the lanceolate sepals. ⊙. H. Native of Hungary, Tauria, and Caucasus, in fields. Cerástium anómalum, Willd. spec. 2. p. 812. Waldst. et Kit. hung. 1. t. 22. Petals white. This is probably a species of *Mœ'nchia*.

Var. β, *glabriúscula* (Bieb. fl. taur. suppl. p. 307.) smoothish.

Viscid Stitchwort. Fl. Ju. July. Clt. 1820. Pl. ¼ to ½ ft.

20 S. sabulòsa (Fisch. in litt. D. C. prod. 1. p. 397.) plant villous, clammy; leaves linear, very narrow; stems dichotomously-panicled; petals hardly longer than the calyx; capsules rather cylindrical, almost twice the length of the lanceolate sepals. ⊙? H. Native of Persia about Lenk-heran. Perhaps only a variety of *S. dùbia* of Bast? Petals white.

Gravel Stitchwort. Pl. ¼ to ½ foot.

21 S. du'bia (Bast. suppl. p. 24. D. C. fl. fr. suppl. p. 614.) leaves linear, glabrous, rather ciliated on the margins; stem erect; peduncles erect; sepals 3-nerved. ⊙. H. Native of France. Cerástium arvénse trígynum, Bast. fl. Maine et Loire, p. 163. Petals white.

Doubtful Stitchwort. Pl. ½ foot.

22 S. monospe'rma (Hamilt. mss. in D. Don, fl. prod. nep. p. 215.) leaves broadly lanceolate, acuminated, sessile, and are glabrous, as well as the erect stem; panicle terminal, trichotomous, many-flowered; calyx glabrous, obtuse, shorter than the

corolla; capsules 1-seeded. ♃. H. Native of Nipaul at Narainhetty. S. crispàta, Wall. in litt. Of all the species of *Stellària* this is the largest. Leaves 6 inches long, and an inch or an inch and a half broad. Panicle large, divaricating, many-flowered. Flowers white, and about the size of those of *S. Holóstea*.

One-seeded Stitchwort. Fl. Oct. Pl. 1½ to 2 feet.

23 S. pa'tens (D. Don, fl. prod. nep. p. 215.) leaves linear-lanceolate, acute, sessile, and are as well as the decumbent stem villous; peduncles axillary, trichotomous, few-flowered; sepals acute, glabrous, about the length of the petals. ♃. H. Native of Nipaul. S. longifòlia, Wall. mss. Flowers white.

Spreading Stitchwort. Pl. decumbent.

24 S. holo'stea (Lin. spec. 711.) leaves lanceolate, acuminated, serrulated, rather scabrous, upper ones broader and shorter than the lower ones; peduncles long, filiform; petals inversely heart-shaped, longer than the lanceolate acute sepals. ♃. H. Native throughout Europe in groves, thickets, and dry hedge bottoms. Smith, engl. bot. t. 511. Curt. lond. fasc. 2. t. 30. Fl. dan. 698. Stems square; they stick by their rough angles and the edges of the leaves to any thing that comes in their way. Flowers large, white, panicled. Plant glaucous. Root creeping.

All bone or Greater Stitchwort. Fl. May. Britain. Pl. 1 to 2 feet.

25 S. Laxma'nni (Fisch. in litt. D. C. prod. 1. p. 397.) stem erect, few-flowered; leaves linear, acute, entire, almost glabrous; peduncles filiform, long; petals 2-lobed, almost double the length of the acute lanceolate sepals. ♃? H. Native of Eastern Siberia. Flowers white.

Laxmann's Stitchwort. Fl. May. Clt. 1823. Pl. ½ foot.

26 S. veluti'na (Ser. mss. in D. C. prod. 1. p. 397.) plant clothed with soft hairs; leaves oblong-linear, distant; peduncles long, filiform; petals 2-lobed, longer than the oblong sepals. ♃. H. Native of Siberia? S. móllis, Fisch. in litt. but not of Schlecht. Flowers white.

Velvety Stitchwort. Fl. June, Aug. Clt. 1824. Pl. ½ to 1 ft.

27 S. saxa'tilis (Hamilt. mss. in D. Don, fl. prod. nep. p. 215.) leaves flat, elliptical-oblong, and are as well as the erect stem tomentose; peduncles axillary, trichotomous, many-flowered; sepals acuminated, tomentose, longer than the corolla. ♃. H. Native among stones at Bheempedi in Nipaul. Flowers white.

Stone Stitchwort. Fl. April, May. Pl. 1 foot.

28 S. grami'nea (Lin. spec. 604.) leaves linear, with smooth margins; stems diffuse; flowers panicled, spreading; petals length of or longer than the calyx. ♃. H. Native nearly throughout Europe in heathy pastures, in bushy places, on a gravelly or sandy soil, and the margins of woods; also in Unalaschka, (Cham.) Smith, engl. bot. 803. Fl. dan. 414. S. arvénsis, Hoffm. germ. for 1791. p. 152. Plant green, not glaucous. Petals white. Anthers reddish.

Grassy or Lesser Stitchwort. Fl. May. Britain. Pl. 1 foot.

29 S. Friesia'na (Ser. mss. D. C. prod. 1. p. 397.) leaves linear, channelled with the margins and keels rough, and base ciliated; stem flaccid; peduncles solitary; calyx nerveless, equal in length to the petals. ♃. H. Native of Smoland at Fremsjo. S. longifòlia, Fries. in Billb. svensk. bot. ex Spreng. neue. entd. 3. p. 217. but not of Muhl. in Willd. enum.

Fries's Stitchwort. Fl. May, June. Pl. ½ foot.

30 S. glau'ca (With. bot. arrang. 1. p. 420.) plant glaucous; leaves linear-lanceolate, with smooth margins, floral ones scarious; petals twice as long as the calyx; peduncles partly scattered; stem erectish, weak. ♃. H. Native almost throughout Europe in moist meadows, bogs, and the margins of ditches and ponds, where the soil is gravelly. Plentiful in Britain. Smith, engl. bot. t. 825. S. palústris, Retz. prod. 106. S. mèdia, Sibth. 141. S. gramínea β, Lin. spec. 604. Petals white. Anther pale-red.

Glaucous Stitchwort. Fl. June, July. Britain. Pl. ¾ foot.

31 S. falca'ta (Ser. mss. in D. C. prod. 1. p. 398.) plant downy; stem firm, branched at the base; leaves linear, falcate, stiff, numerous; flowers somewhat corymbose; peduncles long, thickish; sepals lanceolate, somewhat keeled, shorter than the petals. ♃. H. Native on the eastern shore of Lake Baical, and in Dahuria. Petals white.

Sickle-leaved Stitchwort. Fl. June, July. Pl. 1 foot.

32 S. Edwa'rdsii (Rr. Br. in app. to Parry's voy. p. 13.) leaves ovate-lanceolate, quite entire, nerveless, shining; peduncles terminal, 1-flowered or trifid: petals longer than the 3-nerved calyx; anthers purple. ♃. H. Native of Melville Island, Chester Inlet. Hook. fl. bor. amer. p. 96. t. 31. There are two varieties of this plant with 1 or 3-flowered peduncles, hairy, and smooth stems.

Edwards's Stitchwort. Fl. June, July. Pl. ½ foot.

33 S. ni'tida (Hook. in Scorsby, greenl. p. 411.) leaves lanceolate, rather 3-nerved; flowers somewhat panicled; anthers yellow. ♃. H. Native of Greenland and Eschscholtz Bay.

Shining Stitchwort. Pl. ¼ to ½ foot.

34 S. stri'cta (Richard in Frankl. 2nd journ. ed. 2. append. p. 15. Hook. fl. bor. amer. p. 90.) plant erect, shining, or rather glaucous; leaves linear, awl-shaped, erect, stiff; panicle terminal; petals linear, longer than the crenate, 2-nerved sepals; anthers purple. ♃. H. Native of North America from Lake Winepeg to the Bear Lake, and from Hudson's Bay to the Rocky Mountains. S. pubéscens, Rich. in Frankl. 1st journ. ed. 1. app. no. 164. Stem pubescent, pilose.

Var. β; stem smooth. S. pubéscens β, Richard. l. c.

Var. γ; upper leaves glaucous.

Straight Stitchwort. Pl. ½ foot.

35 S. crassifòlia (Ehrh. beitr. 3. p. 60.) leaves ovate-lanceolate, thickish, entire, smooth; peduncles solitary from the forks of the stem. ♃. H. Native of Germany and Siberia in moist meadows. Plant glaucous.

Thick-leaved Stitchwort. Fl. May, June. Clt.? Pl. ½ to 1 foot.

36 S. brevifòlia (Schum. pl. zeel. p. 142.) leaves lanceolate; peduncles solitary, axillary, longer than the leaves; petals cleft beyond the middle, about the length of the sepals. ♃. H. Native of Zealand by the sea-side. Œder. fl. dan. t. 415. Flowers white.

Short-leaved Stitchwort. Fl. May, June. Pl. ½ to 1 foot.

37 S. aqua'tica (Poll. pal. no. 422. but not of Scop.) leaves elliptic-lanceolate, entire, with a callous tip; petals profoundly 2-parted, shorter than the calyx; capsules ovate-oblong, a little longer than the calyx; stems weak. ⊙. H. Native throughout Europe, and in the island of Unalaschka, also in Britain, in rivulets, springs, and watery spots. S. uliginòsa, Murr. comm. gött. 55. Smith, engl. bot. 1074. Curt. lond. fasc. 6. t. 28. S. gramínea γ, Lin. fl. suec. ed. 2. p. 150. S. hypericifòlia, Wiggers Holsat. 34. S. Dilleniàna, Leers, 107. S. lateriflòra, Krok. siles. 2. p. 52. t. 4. S. fontàna, Jacq. coll. 1. p. 327. S. Alsìne, Hoffm. fl. germ. for 1791. p. 153. t. 5. Larbrèa aquática, St. Hil. Herb smooth, somewhat glaucous. Stems square. Flowers small, white, in irregular lateral and terminal panicles. This is probably the *Larbrèa aquática* of St. Hil. but whether the stamens are perigynous in the British plant we have not materials at present to decide.

Water or Bog Stitchwort. Fl. June. Britain. Pl. ¼ foot.

38 S. undula'ta (Thunb. fl. jap. p. 185.) leaves oblong, acute, undulate, length of the spaces of stem between the leaves; flowers axillary and terminal; peduncles capillary, longer than

the leaves; calyx glabrous; stem decumbent, herbaceous. ♃ ? H. Native of Japan. Petals white. Peduncles 2-3 together.

Undulate-leaved Stitchwort. Pl. decumbent.

39 S. TETRA'GONA (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 647.) leaves lanceolate, acuminated, undulated, sessile; peduncles 1-flowered, axillary, umbellately aggregate; sepals lanceolate, acuminated, twice the length of the petals; stem herbaceous, tetragonal. ♃. S. Native of Java. Flowers white. Allied to *S. undulàta*.

Square-stemmed Stitchwort. Pl. 1 foot.

40 S. CERASTIOI'DES (Lin. spec. 604.) leaves oblong, bluntish, glabrous; stems with a hairy lateral line; peduncles downy, in pairs, 1-flowered, fruit-bearing ones deflexed; petals larger than the calyx; capsules oblong, almost twice as long as the obtuse sepals, which have a single hairy line; stems tufted, procumbent, rooting. ♃. H. Native of humid grassy places, on the Alps of Europe and the Pyrenees. In the Highlands of Scotland; on Ben Nevis, on the mountains to the north of Invercauld, and on the mountains about Killin. Smith, engl. bot. t. 911. Fl. dan. 96. Cerástium trígynum, Vill. delph. 3. p. 645. t. 96. Cerástium refráctum, All. ped. no. 1728. Cerástium stellarioìdes, Hartm. Flowers small, white. Stamens 8 or 10, when the styles are more than their proper number.

Var. β, triflòra (D. C. prod. 1. p. 398.) leaves broader, numerous, glabrous. ♃. H. Native of Carinthia on the Alps. S. cerastioìdes, Wulf. in Jacq. coll. 1. p. 254. t. 19. S. multicaúlis, Jacq. Stem erect. Peduncles 2-3 together.

Chickweed-like Stitchwort. Fl. June. Scotland. Pl. creeping.

41 S. LÆ'TA (Richards. in Frankl. 1st jour. ed. 2. app. p. 16.) stem erect, and is as well as the leaves quite smooth, glaucous; leaves linear-lanceolate, keeled, acute; peduncles subgeminate, terminal; petals a little longer than the obscurely 3-nerved, smooth, or pubescent calyx. ♃. H. Native of Arctic America from the great Bear Lake to the shores of the Arctic sea and on the Rocky Mountains. Leaves erect. Anthers white, or when dry, yellowish-brown.

Fruitful Stitchwort. Pl. decumbent.

42 S. GRA'CILIS (Richards. ex Spreng. syst. app. 1. p. 180.) stem slender, quadrangular, and are, as well as the lanceolate leaves, nerveless and very smooth; sterile branches terminated by a leafy bud; flowers solitary, nearly terminal; sepals 3-nerved, rather shorter than the calyx. ♃. H. Native of Hudson's Bay.

Slender Stitchwort. Pl. ½ foot.

43 S. HUMIFU'SA (Swartz, nov. act. holm. 1787. p. 111. t. 4. f. 1.) leaves ovate, rather leaning to one side, sessile; stems procumbent, square; peduncles solitary, short; sepals ovate, obtuse, with membranaceous margins, scarcely equalling in length the corolla; petals profoundly 2-parted. ♃. H. Native of Sweden and Norway. Vahl. fl. dan. t. 978. Petals white.

Trailing Stitchwort. Fl. My. Ju. Clt. 1816. Pl. procumbent.

44 S.? GRŒNLA'NDICA (Retz, prod. fl. scand. ed. 2. no. 552.) leaves linear, a little ciliated at the base, rather fleshy; petals emarginate; sepals very blunt; fruit globose; stems decumbent, 2-flowered. ♃. H. Native of Greenland. This plant is perhaps referable to the genus *Arenària*.

Greenland Stitchwort. Fl. June. Pl. decumbent.

45 S. MARGINA'TA (Cham. in Schlecht. Linnæa. 1. p. 50.) tufted, densely leafy, smooth; leaves ovate-lanceolate, connate at the base, with cartilaginous margins, hooked at the apex; flowers solitary, axillary; petals and capsule equal in length with the calyx. ♃. H. Native of North-west America in St. Schischmareff Bay. Petals white, equalling the calyx in length. An elegant procumbent smooth species.

Marginated-leaved Stitchwort. Pl. procumbent.

46 S. CRI'SPA (Cham. in Schlecht. Linnæa. 1. p. 51.) smooth; stem diffuse; leaves on very short petioles, ovate, acuminated with repandly waved margins; flowers solitary, axillary; petals much shorter than the calyx; capsule equalling the calyx. ♃ ? H. Native of Unalaschka. Stem tetragonal, decumbent. Flowers the size of *Arenària trinérvia*.

Curled Stitchwort. Pl. decumbent.

47 S.? ARENA'RIA (Lin. spec. 604.) leaves spatulate; stem erect, bifid, clammy, with alternate branches; petals emarginate. ⊙. H. Native of Spain. This plant is also perhaps referable to the genus *Arenària*. Petals white.

Sand Stitchwort. Fl. June, July. Clt. 1799. Pl. ½ foot.

48 S. SOAPI'GERA (Willd. spec. 2. p. 716.) stems angular, erect; leaves linear-lanceolate, much crowded, with rough margins, and ciliated at their base; peduncles elongated, filiform, 1-flowered, and disposed in something like umbels; petals deeply divided, about the length of the calyx; sepals lanceolate, 3-nerved, ciliated. ♃. H. Native of Scotland by sides of rivulets on the mountains; in Perthshire, and about Loch Nevis, Inverness-shire. Smith, engl. bot. t. 1269. Don, herb. brit. 10. Petals white.

Scape-bearing Stitchwort. Fl. June, July. Scotland. Pl. ¼ ft.

49 S. FISCHERIA'NA (Ser. mss. in D. C. prod. 1. p. 398.) leaves lanceolate, acute, distant, smoothish; peduncles in pairs, very long, capillary; petals hardly equalling the calyx in length; sepals lanceolate, 1-nerved. ♃. H. Native of Siberia. Very like *S. scapígera*, according to Fischer. Flowers white.

Fischer's Stitchwort. Fl. June. Pl. ¼ foot.

50 S. FLO'RIDA (Fisch. in litt. D. C. prod. 1. p. 399.) leaves lanceolate, acute, firm, ciliated; peduncles terminal and lateral, very long, and generally solitary, stiff; petals exceeding the calyx; sepals lanceolate, somewhat 3-nerved; capsules exceeding the calyx, with rather revolute valves. ♃ ? H. Native of Kamtschatka. Flowers white.

Florid Stitchwort. Pl. ¼ foot ?

51 S. PALLASIA'NA (Ser. mss. in D. C. prod. 1. p. 399.) leaves ovate, sessile, and are as well as the forked stems pubescent; fruit-bearing peduncles reflexed, almost double the length of the leaves. ♃ ? H. Native of Siberia. S. dichótoma, Willd. herb. ex Schlecht. berl. mag. 1816. p. 194. but not of Lin. Flowers white.

Pallas's Stitchwort. Pl. ¼ foot.

52 S. STEPHANIA'NA (Willd. herb. ex Schlecht. berl. mag. 1816. p. 194.) leaves ovate-lanceolate, acuminated, sessile, and are as well as the forked stems villous; flowers axillary, solitary, and terminal; fruit-bearing peduncles erectish, length of leaves. ♃ ? H. Native of Siberia. Very like *S. dichótoma*, but every part is much smaller. Flowers white.

Stephan's Stitchwort. Pl. ¼ foot.

53 S. SCHLECHTENDALIA'NA (Ser. mss. in D. C. prod. 1. p. 399.) leaves ovate, cordate, clasping the stem, and are as well as the forked stems villous; flowers solitary, axillary, and terminal, on short stalks; fruit-bearing peduncles reflexed. ♃ ? H. Native of Siberia. S. villòsa, Willd. herb. ex Schlecht. berl. mag. 1816. p. 194. but not of Poir.

Schlechtendahl's Stitchwort. Pl. ½ foot.

54 S. RUSCIFÒLIA (Pall. Willd. herb. ex Schlecht. berl. mag. 1816. p. 194.) leaves ovate-cordate, glabrous, acute, clasping the stem, marginated; flowers axillary, solitary, and terminal, or somewhat aggregate, on long peduncles. ♃ ? H. Native of Siberia. Flowers white.

Butcher's Broom-leaved Stitchwort. Pl. ½ foot.

55 S. DIFFU'SA (Willd. herb. ex Schlecht. berl. mag. 1816. p. 195.) leaves linear, acutish, glabrous; stems creeping, diffusely branched; panicle dichotomous, axillary, naked. ♃ ? H. Native of Siberia. Flowers white.

Diffuse-branched Stitchwort. Pl. creeping.

56 S. subula'ta (Bœber. herb. ex Schlecht. berl. mag. 1816. p. 195.) leaves linear, bluntish; flowers corymbose; petals one-half shorter than the awl-shaped sepals. ♃ ? H. Native of Siberia. Petals white.

Awl-shaped-sepalled Stitchwort. Pl. diffuse.

57 S. Dahu'rica (Willd. herb. ex Schlecht. berl. mag. 1816. p. 195.) leaves lanceolate, very entire, sessile, acute, pubescent at the base as well as the stems; flowers axillary, solitary; peduncles twice the length of the leaves. ♃ ? H. Native of Dahuria. Very like *S. diffùsa*, but the leaves are broader and the flowers solitary and larger. Petals white.

Dahurian Stitchwort. Fl. June, July. Clt. 1818. Pl. ½ ft.

58 S. Mosque'nsis (Bieb. in Willd. herb. ex Schlecht. berl. mag. 1816. p. 195.) leaves linear-awl-shaped, shorter than the spaces of the stems between the leaves; flowers in panicles. ♃ ? H. Native of Russia near Moscow. Petals white.

Moscow Stitchwort. Pl. ½ foot?

59 S. serpyllifòlia (Willd. herb. ex Schlecht. berl. mag. 1816. p. 26.) stems much branched, procumbent; leaves on short footstalks, ovate, acute, and somewhat mucronate, rounded at the base, thickish, with the margin as well as the middle nerve on the under surface ciliated; calyx pubescent; ovary containing about 25 seeds. ♃. H. Native of South America in the frigid plains of mount Antisana at the height of 6300 feet. Flowers white, generally terminal. H. B. et Kunth, nov. gen. et spec. amer. 6. p. 25.

Wild-Thyme-leaved Stitchwort. Pl. procumbent.

60 S. recurva'ta (Willd. herb. ex Schlecht. berl. mag. 1816. p. 196.) stems diffuse; leaves stalked, ovate-oblong, acute, mucronated, 1-nerved, thickish, keeled, recurved; nerve on the under surface, hairy; calyx glabrous; ovary containing about 40 seeds. ♃. H. Native of New Granada in cold places at the height of 3480 feet. H. B. et Kunth, nov. gen. et spec. amer. 6. p. 26. Flowers white.

Recurved-leaved Stitchwort. Pl. ½ foot.

61 S. ova'ta (Willd. herb. ex Schlecht. berl. mag. 1816. p. 196.) stems diffuse, rather pilose; leaves stalked, somewhat rhomboidal, ovate, acute and somewhat mucronate, membranaceous, ciliated; fruit-bearing peduncles diverging, reflexed; hairy at the base; capsules containing about 20 seeds. ♃. H. Native of South America in shady places near Caripe. H. B. et Kunth, nov. gen. et spec. amer. 6. p. 26. S. ciliàta, Willd. herb. ex Kunth, l. c. Petals white.

Ovate-leaved Stitchwort. Pl. procumbent.

62 S. elonga'ta (Nutt. gen. amer. 1. p. 289.) stem diffuse, procumbent, pubescent; leaves oblong-lanceolate, mucronulate; peduncles lateral, solitary, very long; flowers apetalous. ♃ ? H. Native of Carolina and Georgia.

Elongated-peduncled Stitchwort. Pl. procumbent.

63 S. longifo'lia (Muhlenb. in Willd. enum. p. 479. but not of Fries.) leaves linear, acute; panicle terminal; petals acute, 2-parted, shorter than the calyx. ♃ ? H. Native of Pennsylvania. Petals white.

Long-leaved Stitchwort. Fl. June, July. Clt.? Pl.?

64 S. mura'lis (Link. enum. 1. p. 459.) plant covered with glandular pubescence; leaves ovate, fleshy, tapering into the footstalk at the base; petals cut, scarcely longer than the calyx. ☉. H. Native of Crete. Arenària muràlis, Sieb. cret. exsic. Sepals acute, nervous. This is an intermediate plant between *Stellària* and *Arenària*. Petals white.

Wall Stitchwort. Fl. June, July. Clt. 1824. Pl. procumbent.

65 S. radi'cans (Lapeyr. fl. pyr. t. 93. ex abr. p. 250.) stems terete, prostrate, rooting, many-flowered; leaves elliptical, obtuse, shining, cauline ones leaning to one side; peduncles divaricating; sepals linear, obtuse, twice as long as the petals; capsules pear-shaped. ♃. H. Native of the Pyrenees. Petals white.

Rooting-stemmed Stitchwort. Pl. prostrate.

66 S. rupe'stris (Scop. fl. carn. 1. p. 317. t. 18. f. 1.) leaves flat, 3-nerved on the under surface; stems villous, few-flowered; petals ovate, acuminated, shorter than the calyx. ♃ ? H. Native of the alps of Carniola. Petals white.

Rock Stitchwort. Pl. trailing.

67 S. e'legans (Ser. mss. in D. C. prod. 1. p. 400.) stems prostrate at the base; leaves elliptical, small, glabrous; flowers dichotomously panicled; peduncles twice as long as the calyx, rather downy; sepals lanceolate, acute, smoothish, with somewhat membranaceous margins; petals twice the length of the calyx. ♃. H. Native of Siberia and the Altaian mountains. Cerástium élegans, Fisch. in litt. Petals white.

Elegant Stitchwort. Fl. May, Jul. Clt. 1820. Pl. prostrate.

68 S. lo'ngipes (Goldie. plant. canad. in edinb. phil. journ. apr. 1822.) plant very smooth; leaves linear-lanceolate; peduncles terminal, dichotomously branched, furnished with bracteas; pedicels very long; petals broad, obovate, 2-parted, hardly longer than the sepals, which are 3-nerved. ♂ ? H. Native of North America in woods near Lake Ontaria, and about Mackenzie River and Bear Lake. Petals white.

Long-pedicelled Stitchwort. Fl. June, July. Clt. 1820. Pl. ½ foot.

Cult. None of the species of *Stellària* are worth cultivating for ornament except the *S. Holóstea*, which makes a very pretty border-flower. Most of the species require to be grown in moist shady situations, several of the smaller kinds require to be grown in pots in a mixture of loam and sand, particularly *S. scapígera* and *S. cerastioìdes*, &c. The perennial herbaceous species are easily increased by dividing the plants at the root; and the annual ones only require to be sown in the open border. None of the species require any particular care. The South American kinds require shelter during winter.

XXXII. ARENA'RIA (from *arena*, sand, in which most of the species are found). Lin. gen. no. 774. Gært. fruct. 2. p. 130. f. 9. D. C. prod. 1. p. 400.

Lin. syst. *Penta-Decándria, Trigýnia.* Calyx of 5 sepals. Petals 5, entire. Stamens 10, or from abortion fewer. Styles 3. Capsules 1-celled, opening by 3 or 6 teeth at the apex, many-seeded. Small grassy or chickweed-looking alpine plants without stipulas.

§ 1. *Leaves grassy.*

1 A. graminifo'lia (Schrad. hort. gœt. t. 5. neu. journ. 1810. 2. p. 139.) stems erect, simple; leaves long, awl-shaped, filiform, scabrous on the margins from serratures; panicle trichotomous, pubescent, lax; sepals very blunt, 6 times shorter than the obovate petals. ♃. H. Native of Caucasus in fields. Bieb. fl. taur. suppl. no. 852. A. filifòlia, Bieb. fl. taur. no. 852. p. 344. but not of Vahl. Flowers white.

Var. β, glabérrima (D. C. prod. 1. p. 402.) panicle glabrous, many-flowered; flowers larger. A. graminifòlia, Willd. enum. p. 481. ex Bieb. l. c. Flowers white.

Grass-leaved Sandwort. Fl. June, July. Clt. 1817. Pl. ½ to ¾ foot.

2 A. longifo'lia (Bieb. fl. taur. 1. p. 345. suppl. 308.) leaves awl-shaped, filiform, serrulated; stems erect, simple; panicle trichotomous, glabrous, crowded; sepals ovate, obtuse, not half the length of the obovate petals. ♃. H. Native of Siberia on the Lower Volga.—Gmel. sib. 4. p. 157. no. 65. t. 63. f. 2. Very like *A. graminifòlia*, but the flowers are smaller, and more numerous, and the sepals are narrower and keeled. Flowers white.

Long-leaved Sandwort. Fl. Ju. Jul. Clt. 1823. Pl. ½ to ¾ ft.

3 A. Dahu'rica (Fisch. in litt. D. C. prod. 1. p. 402.) leaves awl-shaped, filiform, serrulated; stems erect, simple; panicle dichotomous, few-flowered; peduncles and calyxes covered with clammy down; sepals lanceolate-linear, nerved, hardly equal in length with the petals. ♃. H. Native of Dahuria. Flowers white.

Dahurian Sandwort. Fl. Ju. Jul. Clt. 1824. Pl. ½ foot.

4 A. cucubaloi'des (Smith, icon. ined. 1. p. 17. t. 17.) leaves awl-shaped, filiform, serrulated; stems erect, simple; panicle dichotomous, rather lax; sepals lanceolate, acute; petals obovate, twice the length of the calyx. ♃. H. Native of Armenia. Calyx clammy. Flowers white.

Cucubalus-like Sandwort. Fl. June, July. Pl. 1 foot

5 A. otitoi'des (Adams, ex Fisch. in litt. D. C. prod. 1. p. 402.) leaves awl-shaped, filiform, serrated; stems erect, simple; panicle dichotomous, crowded, many-flowered; sepals lanceolate, keeled, scarcely longer than the obovate petals; styles protruding a great length. ♃. H. Native of Siberia. Very like *A. graminifòlia* in the stems and leaves, but the flowers are very small, more numerous, and more densely crowded. Flowers white.

Otites-like Sandwort. Fl. June, July. Clt. 1820. Pl. ½ to ¾ foot.

6 A. Holo'stea (Bieb. fl. taur. 1. p. 345.) leaves awl-shaped, filiform, roughish on the margins; stems erect, simple; panicle few-flowered; sepals acuminated, nerveless, shorter than the obtuse petals. ♃. H. Native of Caucasus and Iberia. Flowers like those of *Stellària Holóstea*. Sepals green on the back, but with the margins white. Petals white.

Stitch-wort-like Sandwort. Fl. June, July. Pl. ½ foot.

7 A. ri'gida (Bieb. fl. taur. 1. p. 346. suppl. p. 309.) leaves linear-setaceous, ciliary-scabrous; stems erect, rigid, simple; panicle trichotomous, pressed together, glabrous; sepals acute, somewhat keeled, hardly exceeding the corolla. ♃. H. Native in the Ukraine in sandy places. Bracteas larger than in *A. graminifòlia* and *longifòlia*. Flowers white. A. Holóstea, Beaupre. in litt.

Rigid-stemmed Sandwort. Fl. Ju. Jul. Clt. 1823. Pl. ½ ft.

8 A. formòsa (Fisch. in litt. D. C. prod. 1. p. 402.) leaves linear-setaceous, ciliary-scabrous; stems erect, simple, and are as well as peduncles clothed with viscid hairs; panicle trichotomous, few-flowered; sepals thick, obtuse, inner ones very broad, and covered with glandular hairs on their back, one-half shorter than the obovate petals. ♃. H. Native of Dahuria. Plant habit and size of *Scheuchzèria palústris*. Flowers large, white.

Handsome Sandwort. Fl. June, July. Clt. 1824. Pl. ½ to 1 foot.

9 A. lychni'dea (Bieb. fl. taur. 1. p. 346. suppl. p. 309.) plant tufted; leaves awl-shaped, radical ones in bundles, linear-setaceous, ciliary-scabrous; stem erect, rather hispid; panicle di-trichotomous, few-flowered, divaricating after flowering; sepals ovate, rather acute, one-half shorter than the obovate petals. ♃. H. Native of Caucasus and Iberia. A. airæfòlia and setàcea; Fisch. in litt. Flowers in threes, white, about the size of those of *A. Austrìaca*. Pedicels villous.

Var. β, glàbra (D. C. prod. 1. p. 402.) plant glabrous. A. Laxmánni, Fisch. in litt.

Lychnis-like Sandwort. Fl. June, July. Pl. ½ foot.

10 A. Gmeli'ni (Fisch. in litt. D. C. prod. 1. p. 402.) leaves linear, obtuse; stems jointed; panicle trichotomous, somewhat corymbose; sepals lanceolate, green, with scarious margins; petals obovate, twice the length of the calyx. ♃. H. Native of the Ural mountains, especially on a mountain called Tagannai. —Gmel. sib. 4. p. 144. t. 61. f. 1. Flowers white, very like those of *Gypsóphila rèpens*.

Gmelin's Sandwort. Fl. June, July. Pl. ½ foot.

11 A. cephalòtes (Bieb. fl. taur. 1. p. 346. suppl. p. 309.) leaves awl-shaped, filiform, ciliary-scabrous; stems thick, erect, simple; head of flowers terminal, fascicled, hemispherical; sepals acuminated, almost equal in length with the corolla. ♃. H. Native of Tauria in fields. Bracteas striated. Flowers white. This is the most elegant species of the whole genus.

Headed Sandwort. Fl. June, July. Pl. ½ to ¾ foot.

12 A. dianthoi'des (Smith, icon. ined. p. 16. t. 16.) leaves awl-shaped, filiform, ciliary-scabrous; stems erect, simple; flowers in heads; bracteas ventricose, exceeding the peduncles; sepals ovate, obtuse; petals obovate, 3-times longer than the calyx. ♃. H. Native of Armenia. Flowers white.

Pink-like Sandwort. Pl. ½ to ¾ foot.

13 A. gypsophiloi'des (Schreb. act. nov. acad. N. C. no. 6. 4. p. 139. ex Willd. spec. 2. p. 723.) leaves linear, radical ones setaceous; panicle rather pubescent; sepals ovate, mucronate, hardish; petals lanceolate, thrice as long as the calyx. ♃. H. Native of the Levant. Flowers white.

Gypsophila-like Sandwort. Pl. ½ foot.

14 A. capilla'ris (Poir. dict. 6. p. 380.) lower leaves in tufts, very long, capillary; stem rather naked, terminated by a 3-flowered umbel; peduncles elongated, 1-flowered, capillary; bracteas membranaceous, glabrous; petals ovate, rather crenulated, twice as long as the calyx. ♃. H. Native of Siberia. A. Sibírica, Pers. ench. 1. p. 504. Flowers white.

Capillary-leaved Sandwort. Fl. June, July. Clt. 1820. Pl. ¼ to ½ foot.

15 A. pinifo'lia (Bieb. fl. taur. 1. p. 348.) stems distorted, ascending, few-flowered, pubescent; leaves setaceous, stiff, stem ones straight; sepals obtuse, striated, villous, shorter than the corolla. ♃. H. Native of the alps of Caucasus. Calyx green, with the stripes obliterated from short, rather clammy down. Petals white. Peduncles terminal, twin, much longer than the corolla.

Pine-leaved Sandwort. Fl. June, July. Clt. 1823. Pl. ½ to ¾ foot.

16 A. subula'ta (Ser. mss. in D. C. prod. 1. p. 403.) leaves setaceous, stiff, mucronated, striated, lower ones in bundles; stems panicled, few-flowered; sepals lanceolate, much shorter than the petals; capsules ovate, hardly longer than the calyx. ♃. H. Flowers white.

Var. α, glandulífera (D. C. prod. 1. p. 403.) stems, peduncles, and sepals clothed with glandular hairs; panicles 3-5-flowered. ♃. H. Native of Siberia in the regions about the Baical. A. púngens, Steph. ex Stev. in litt. A. viscòsa, Fisch. in litt. A. setàcea, Adams. ex Fisch.

Var. β. glabràta (D. C. l. c.) plant very smooth; flowers 1-3. ♃. H. Native of Eastern Siberia.

Awl-shaped-leaved Sandwort. Fl. June, July. Clt. 1822. Pl. ¼ to ½ foot.

17 A. pu'ngens (Clem. in Lag. gen. et spec. 15. but not of Steph.) leaves awl-shaped, and are as well as sepals mucronately pungent; petals longer than the calyx; styles 3-4. ♃. H. Native of Spain on the summits of the mountains in the province of Granada. Flowers white.

Pungent-leaved Sandwort. Fl. June, July. Pl. ½ foot.

18 A. Nardifo'lia (Led. Hook. fl. bor. amer. t. 32.) tufted; leaves awl-shaped, pungent; stem erect, 3-flowered; petals oblong, obtuse, twice the length of the obtuse sepals; capsule 3-valved. ♃. H. Native of North America on the Rocky Mountains, and on the north-west coast; also of Siberia. Flowers white.

Nardus-leaved Sandwort. Fl. June, July. Clt. 1827. Pl. ¼ to ½ foot.

§ 2. *Leaves awl-shaped or linear.*

19 A. SQUARRO'SA (Mich. fl. bor. amer. 1. p. 273.) plant tufted; lower leaves squarrosely-imbricated, channelled, glabrous; stems simple, few-leaved; flowers dichotomously panicled, erect; sepals ovate, roundish; petals obovate, thrice as long as the calyx; capsules oval, exceeding the calyx, 3-valved; valves obtuse. ♃. H. Native of New Jersey and Carolina in sandy pine-barrens. A. Caroliniàna, Walt. fl. carol. 141. Flowers white.

Squarrose-leaved Sandwort. Fl. July, Aug. Pl. ¼ foot.

20 A. IMBRICA'TA (Bieb. fl. taur. 1. p. 344. but not of Rafinisque) leaves linear-awl-shaped, ciliated, crowded; stems creeping, hairy; peduncles 1-flowered, terminal; petals longer than the calyx, which is bluntish, striated, and hairy; capsules 3-valved. ♃. H. Native of the alps of Caucasus near Kobi. Stev. in mem. soc. mosq. 3. p. 263. Leaves short, stiff, spreading, ciliated, in bundles in the axillæ of the older leaves. Flowers white, about the size of those of *A. laricifòlia*.

Imbricate-leaved Sandwort. Fl. Jul. Aug. Clt. 1820. Pl. ¼ ft.

21 A. JUNIPE'RINA (Lin. mant. 72.) leaves awl-shaped, stiff, spinose, lower ones in bundles, upper ones distant; stems erect, firm; sepals ovate, generally 1-nerved; petals obovate, almost twice as long as the calyx; capsules ovate-roundish, 3-valved, hardly exceeding the calyx. ♃. H. Native of the Levant as well as in Eastern Siberia. Smith, icon. ined. p. 35. t. 35. Poir. dict. 6. p. 378. A. aciculàris, Fisch. in litt. Flowers white.

Juniper-like Sandwort. Fl. June, July. Clt. 1800. Pl. ½ ft.

22 A. STRI'CTA (Mich, fl. bor. amer. 1. p. 274.)] plant erect, glabrous, many-stemmed; leaves awl-shaped-linear, erect, and in axillary fascicles; panicle few-flowered; sepals oval-lanceolate; petals conspicuously-striped, much longer than the calyx. ♃. H. Native of North America on rocks in New England and Canada, and on the high mountains of Carolina. Hook. fl. bor. amer. t. 33. Very like *A. striàta*, but much larger and more erect. Flowers white.

Straight Sandwort. Fl. May, June. Clt. 1812. Pl. ½ foot.

23 A. OBTU'SA (Torrey. in ann. lyc. new york, vol. 2. 1827.) tufted, many-stemmed; leaves linear-awl-shaped, bluntish, keeled, rather secund; stem simple, commonly 1-flowered; peduncles clothed with glandular hairs; sepals oblong, obtuse, 3-nerved; petals oblong, twice the length of the calyx; capsule ovate, shorter than the calyx; seeds orbicularly-kidney-shaped. ♃. H. Native of North America on the Rocky Mountains.

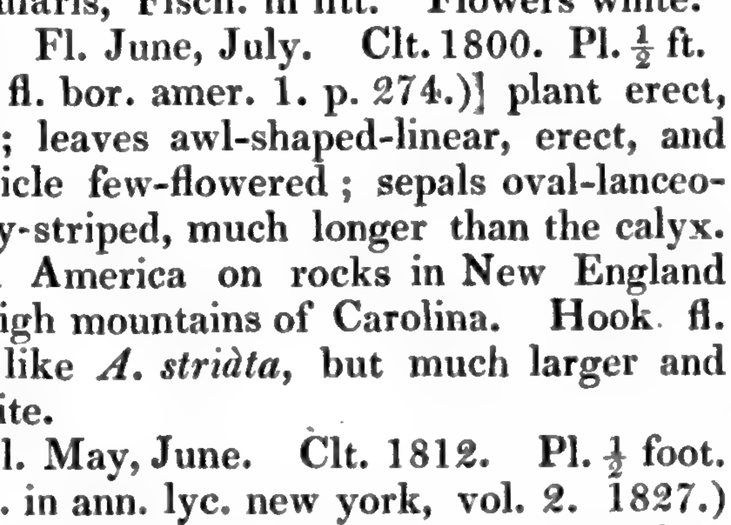
Obtuse-leaved Sandwort. Pl. ¼ foot.

24 A. PRO'CERA (Spreng. ex Horn. hort. hafn. p. 424.) stem erect, simple, few-flowered; calyxes obtuse; petals emarginate, thrice as long as sepals. ♃. H. Native? Flowers white.

Tall Sandwort. Fl. June, July. Clt. 1820. Pl. ¾ foot.

25 A. LARICIFO'LIA (Lin. spec. 607.) leaves awl-shaped, denticulately-ciliated; stems ascending, 1-3 or 6-flowered, somewhat scabrous; calyx cylindrical; sepals bluntish, triple-nerved, hairy; petals twice as long as the sepals; capsules 3-valved, exceeding the calyx. ♃. H. Native on the alps of Switzerland and France, &c. Flowers white.

FIG. 70.



Var. α, *multiflòra* (Ser. mss. in D. C. prod. 1. p. 404.) stems weak, many-flowered; younger leaves in bundles, arcuate, axillary; calyx and peduncles hairy. A. laricifòlia, Vill. dauph. 4. p. 629. t. 47. f. 5. Jacq. aust. 3. p. 39. t. 272.

Var. β, *striàta* (Ser. mss. in D. C. prod. 1. p. 404.) stems stiff, few-flowered; leaves straight, long; peduncles and calyxes clothed with clammy hairs. A. striàta, Vill. dauph. 4. p. 630. t. 47. f. 6. A. liniflòra, Jacq. coll. 2. t. 3. f. 3.

Var. γ, *Chamisòni*; leaves smooth; cauline ones ciliated at the base. Native of Eschscholtz Bay..

Larch-leaved Sandwort. Fl. Ju. Aug. Clt. 1816. Pl. ½ ft.

26 A. ROSTRA'TA (Waldst. et Kit. hung. ex Willd. enum. 481.) leaves linear-awl-shaped, recurved; flowers twin, terminal; sepals acute, 3-nerved, shorter than the corolla, pubescent; stems diffuse, pubescent. ♃. H. Native of Hungary in alpine places. A. macrocárpa, Kit. et Hort. Gœtt. Flowers white.

Beaked Sandwort. Fl. June, July. Clt. 1816. Pl. ½ foot.

27 A. LYCOPODIOI'DES (Willd. herb. ex Schlecht. berl. mag. 1816. p. 212.) plant much branched, creeping, glabrous; leaves rather imbricated, mucronate, stiff, 1-nerved; petals shorter than the calyx; capsules many-seeded. ♃. H. Native of Mexico near Moran, at the height of 3990 feet. Flowers white.

Lycopodium-like Sandwort. Pl. creeping.

28 A. A'RCTICA (Stev. in litt. in D. C. prod. 1. p. 404.) plant small, tufted; leaves linear-lanceolate, obtuse; stems 1-flowered; peduncles covered with glandular hairs; sepals oblong, obtuse, hardly nerved; petals obovate, double the length of the calyx. ♃. H. Native of Siberia, on the icy shores, also in the Bay of St. Lawrence. Hook, fl. bor. amer. t. 32. A. bryoìdes, Fisch. in litt. A. Altàica, Fisch. in litt. A. sérpens, Fisch. in litt. Plant with the habit of *Silène acaúlis* or *Cherlèria sedoìdes*. Flowers whitish.

Arctic Sandwort. Pl. ⅛ foot.

29 A. AUSTRI'ACA (Jacq. austr. 3. p. 39. t. 270.) leaves linear-awl-shaped, 3-nerved; stem tufted, rather panicled; peduncles terminal, very long, twin, puberulous; petals obtuse, emarginate; sepals 3-nerved, very acute, spreading. ♃. H. Native of Austria and Italy, on the alps. All. ped. no. 1700. t. 64. f. 2. A. elongàta, Schlecht. berl. mag. 1816. p. 200. Stellària biflòra, Jacq. coll. 1. p. 251. t. 18. A. stellarioìdes, Pers. ench. 1. p. 503. Flowers white. Capsule longer than the calyx.

Var. β, *glàbra* (D. C. fl. fr. 4. p. 787.). A. Villársii, Balb. misc. 21. exclusive of the variety *hirsùta*. A. triflòra, Vill. dauph. 4. p. 623. t. 47. A. míxta, Lapeyr. abr. 255. Plant glabrous.

Austrian Sandwort. Fl. June, Sept. Clt. 1793. Pl. ½ foot.

30 A. GLOBULÒSA (Labill. pl. syr. dec. 4. p. 6. t. 3. f. 1.) plant very much branched; leaves awl-shaped, nerved, pilose; flowers numerous, disposed in racemes; sepals unequal, longer than the petals; capsules profoundly 3-valved; seed kidney-shaped, rough around. ♃. H. Native of Syria.

Globulose Sandwort. Fl. June, Sept. Pl. ¼ to ½ foot.

31 A. CAPILLA'CEA (All. ped. no. 1705. t. 89. f. 2.) leaves setaceous, rigid, scabrous; flowers erect; petals larger than the calyx. ⊙. H. Native of Piedmont on the tops of the mountains called Tenda. Petals white. Stem hairy.

Capillary-leaved Sandwort. Fl. June, July. Clt. 1819. Pl. ¼ to ½ foot.

32 A. GRANDIFLÒRA (Lin. spec. 608.) leaves awl-shaped, broadish, flat, 3-nerved, ciliated, radical ones crowded; stems generally 1-flowered; peduncles very long, pubescent; sepals ovate, awned, 3-nerved, one-half smaller than the petals; capsules ovate, 6-valved, hardly exceeding the calyx in length. ♃. H. Native of France on the alps and mountains. All. ped. no. 1711. t. 10. f. 1. A. triflòra, Cav. icon. 3. t. 249. f. 2. A. míxta, Lapeyr. abr. p. 255. Flowers white.

Var. β, *multiflòra* (D. C. prod. 1. p. 404.) stems 3-4-flowered; peduncles very long; leaves hardly ciliated. A. junipérina, Vill. dauph. 4. p. 624.—All. ped. no. 1715. t. 26. f. 5.

Var. γ, *triflòra* (D. C. prod. 1. p. 404.) stems 2-4-flowered; leaves narrower and recurved. A. triflòra, Lin. mant. 240. D. C. fl. fr. 4. p. 788. ♃. H. Native on sandy hills near Fontainebleau.

Var. δ, *stolonífera* (D. C. prod. 1. p. 404.) stems much branched; lower leaves broadish, short, dense; upper ones very narrow, very long, and distant; sepals very narrow. ♃. H. Native of Dauphiny, and Siberia on rocks at Tschussowaja. A. stolonífera, Vill. ex herb. D. C. A. láxa, Fisch. in litt.

Great-flowered Sandwort. Fl. June, Sept. Clt. 1783. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

33 A. He'lmii (Fisch. in litt. D. C. prod. 1. p. 404.) plant clothed with glandular hairs; leaves linear, bluntish, 3-nerved, radical ones crowded; stems 1-3-flowered; peduncles very long; sepals ovate, somewhat mucronate, obsoletely 3-nerved; petals obovate, twice the length of the sepals; capsules ovate, in length exceeding the calyx. ♃. H. Native of the Ural mountains in Siberia. Flowers white.

Helme's Sandwort. Fl. June, July. Clt. 1822. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

34 A. Scandina'vica (Spreng. syst. 2. p. 399.) leaves awl-shaped; branches 2-flowered; petals entire; ovary oblong; sepals oblong, obtuse, striated. ♃. H. Native of Lapland on the alps. A. biflòra, Cham. et Schlecht. Linnæa. 1. p. 52. but not of Lin. Stellària biflòra, Lin. spec. 604. Oed. fl. dan. t. 12. Alsinélla biflòra, Swartz, et Wickstroem. A small plant, with the appearance of a species of *Sagìna*. Petals white.

Scandinavian Sandwort. Pl. $\frac{1}{8}$ foot.

35 A. liniflòra (Lin. spec. 608.) stem suffruticose, distorted; leaves filiform, strictly appressed; peduncles twin, terminal, short; sepals lanceolate, striated, shorter than the corolla. ♃. H. Native of Austria, Hungary, and Caucasus. Perhaps *A. pinifòlia*, Bieb. Flowers white.

Flax-flowered Sandwort. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

36 A. macroca'rpa (Pursh, fl. amer. sept. 1. p. 316. but not of Horn.) plant tufted; leaves crowded, awl-shaped-linear, flat, with ciliated margins; peduncles terminal, 1-flowered, leafy; sepals linear; petals ovate, twice the length of the sepals; capsules oblong, thrice the length of the calyx. ♃. H. Native of the north-west coast of America and of Chamisso's Island. Flowers white. This plant approaches near to *A. grandiflòra*, but differs in the long capsule and shape of the sepals materially. Habit of a species of *Cerástium*.

Var. β; habit of *Cherlèria sedoìdes*. Native of the island of St. Lawrence.

Long-fruited Sandwort. Fl. June, July. Clt. 1810. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

37 A. hi'rta (Wormsk. in fl. dan. t. 1646.) leaves linear-awl-shaped, obtuse, with 2 furrows, hairy; stems hairy, 1-2-3-flowered; sepals 3-nerved, acute, shorter than the capsule; petals oblong, rather shorter than the calyx. ♃. H. Native of the south of Greenland, Lapland, island of St. Paul, and Kamtschatka. A. sulcàta, Schlechtend in berl. mag. 1816. p. 212. A. villòsa, Ledeb. A small plant with reddish flowers.

Var. β, *glabràta* (Cham. in Schlecht. Linnæa. 1. p. 56.) plant smooth. Native of the island of St. Lawrence.

Hairy Alpine Sandwort. Fl. June, July. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

38 A. rube'lla (Smith, engl. fl. 4. p. 267.) plant tufted; leaves awl-shaped, obtuse, quite smooth, 3-nerved; peduncles 1-flowered, elongated, pubescent; sepals very acute, 3-nerved, longer than the elliptical petals; capsule 4-valved, sometimes 3-valved, longer than the sepals. ♃. H. Native of Melville Island; in Scotland on the summit of the Breadalbane mountains; on Craig Challeach, and on Ben Lawers. A small plant, forming a dense tuft. Calyx brownish-purple. Corolla white. Anthers red. Alsìne rubélla, Wahl. lapp. 128. t. 6. Alsinélla rubélla, Swartz. sum. veg. scand. p. 17. A. quadriválvis, R. Br. in append. to Parry's voy. p. 13.—D. Don, in eng. bot. suppl. t. 2638.

Red Alpine Sandwort. Scotland. Pl. 1 to 2 inches.

39 A. Ro'ssii (R. Br. l. c.) quite smooth; leaves triquetrous; awl-shaped, bluntish, awnless, nerveless, scarcely equalling the flower in length; peduncles 1-flowered, elongated; petals oblong, a little longer than the obsoletely 3-nerved sepals. ♃. H. Native of Melville Island. A small tufted herb. Calyx purplish. Corolla white. Ovary 1-celled. The *A. Róssii* of Richardson in Franklin's journey, p. 738. differs from this in its larger stature, and in the capsule being 3-valved. *Alsìne stricta* differs from it in its larger size and in the leaves being acute.

Ross's Sandwort. Pl. 1 to 2 inches.

40 A. ve'rna (Lin. mant. 72.) plant tufted, many-stemmed; leaves awl-shaped, bluntish; stems panicled, elongated; sepals ovate-lanceolate, acuminated, with 3 remote equal ribs, longer than the obovate petals; capsules cylindrical, of 3 valves, longer than the calyx. ♃. H. Native of the mountainous parts of Europe. In Britain about the lead-mines in Derbyshire, as well as in Yorkshire, Westmoreland, and Wales. In Scotland on Arthur's Seat, and many other hills near Edinburgh. Smith, engl. bot. t. 512. Jacq. austr. t. 404. A. saxátilis, Huds. ed. 1. p. 168. Penn. tour. in Wales, t. 2. f. 1. A. junipérina, With. p. 424. A. laricifòlia, With. p. 404. A. divaricàta, Adams, ex Fisch. in litt. A. fláccida, Schleich. Flowers small, white.

Var. β, *cæspitòsa* (D. C. prod. 1. p. 405.) stems very leafy; calyxes and peduncles smoothish. A. cæspitòsa, Ehrh. herb. 55. D. C. fl. fr. 5. p. 613.

Var. γ, *mìnor* (D. C. prod. 1. p. 405.) stem dwarf, 1-flowered. ♃. H.

Spring Sandwort. Fl. May, Aug. Brit. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

41 A. Gera'rdi (Willd. spec. 2. p. 729.) plant erect, branched; leaves linear-awl-shaped, 3-nerved; peduncles twin, terminal, 1-flowered; sepals acuminated, 3-nerved, with membranaceous margins. ♃. H. Native of the alps of Austria and France. A. liniflòra, Jacq. aust. t. 445.—Gerard. gallo-prov. 405. no. 7. t. 15. f. 1.? Flowers white. Perhaps only a variety of *A. vérna*.

Gerard's Sandwort. Fl. May, Aug. Clt. 1822. Pl. $\frac{1}{4}$ foot.

42 A. ramosi'ssima (Willd. enum. suppl. p. 24.) stems very much branched, elongated, panicled; leaves awl-shaped, bluntish, nerved, recurved; petals ovate, hardly equalling the sepals in length; sepals acuminated, striated, and are hispid as well as peduncles; capsules of 3 valves. ♂. H. Native of Hungary. Horn. hort. hafn. p. 964. Link. enum. 1. p. 431. This is very like *A. vérna*, but it is of a more loose habit.

Most-Branched Sandwort. Fl. May, Aug. Clt. 1816. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

43 A. e'legans (Cham. in Schlecht. Linnæa. 1. p. 57.) tufted, many-stemmed, smooth; leaves linear, obtuse, thickish; peduncles terminal, solitary; sepals lanceolate, awl-shaped, acuminated, rather keeled; petals exceeding the calyx; capsule 3-valved. ♃. H. Native of the Bay of St. Lawrence. Plant smooth. Like *A. vérna*.

Elegant Sandwort. Pl. $\frac{1}{4}$ foot.

44 A. hi'spida (Lin. spec. 608.) plant tufted, erect, many-stemmed, pilose, hispid; panicle dichotomous; leaves awl-shaped, and are hispid as well on the under surface of the sepals, hardly striated; corolla exceeding the calyx; capsules somewhat globose, of 3 valves, hardly longer than the calyx. ♃. H. Native about Montpelier in chalky places. Habit of *Spérgula*. Stems simple, with a few scattered hairs. Flowers white. D. C. fl. fr. 4. p. 789.

Hispid Sandwort. Fl. June, July. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

45 A. subulæfo'lia (Presl. ex Spreng. syst. 1. p. 182.) stem

tufted, simple; leaves awl-shaped, bluntish, quite smooth; panicle dichotomous; sepals acute, clothed with glandular pubescence, twice the length of the petals; capsules 3-valved, equal in length to the calyx. ♃. H. Native of Sicily. *A. Arvática*, Presl. ex Spreng.

Awl-leaved Sandwort. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ foot.

46 *A.* ECHINA'TA (Poir. dict. 6. p. 377.) plant dwarf; stems rather branched, short; leaves filiform, awl-shaped, hardly pubescent; flowers somewhat panicled; peduncles and calyxes glandular, hispid; corolla equal in length to the calyx; capsules length of calyx. ♃. H. Native of the Alps of Europe. Flowers white.

Echinated-calyxed Sandwort. Fl. June, July. Pl. $\frac{1}{8}$ foot.

47 *A.* PA'TULA (Mich. fl. bor. amer. 1. p. 273.) plant pubescent; stems filiform, panicled, many-flowered; leaves setaceous, spreading; petals somewhat emarginate, a little longer than the very acute, striped sepals. ♃. H. Native of North America on rocks near Knoxville, Kentucky. Flowers white. This plant resembles *A. tenuifòlia*.

Spreading-leaved Sandwort. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

48 *A.* SAXA'TILIS (Lin. spec. 607.) leaves awl-shaped; stems panicled; sepals ovate. ♃. H. Native of Germany, Switzerland, France, and Siberia.—Barrel. icon. t. 580. ?—Gmel. sib. 4. t. 63. f. 2.—Vaill. par. 7. t. 2. f. 3. Flowers white.

Stone Sandwort. Fl. July, Aug. Clt. 1732. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

49 *A.* PE'NDULA (Waldst. et Kit. hung. 1. p. 90. t. 87.) stems filiform, rooting, very long, diffuse; flower-bearing branches erect; leaves linear, flat, acute, somewhat fasciculate; sepals lanceolate, acute, shorter than the petals; capsules depressed, globose (6-valved?). ♃. H. Native of Hungary on chalky rocks. Flowers white. Filaments of stamens hairy at their base.

Pendulous Sandwort. Fl. Ju. Jul. Clt. 1816. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

50 *A.* TENUIFÒLIA (Lin. spec. 667.) leaves awl-shaped, setaceous; stems panicled, forked; sepals awl-shaped, striated, much longer than the petals; capsules of 3 valves, hardly exceeding the calyx in length. ⊙. H. Native of dry barren sandy fields, and on walls in many parts of Europe. In Britain in several parts of Cambridgeshire; at Oxburgh, Norfolk, Worcestershire, and Oxfordshire. Smith, engl. bot. t. 219. Fl. dan. t. 389. Alsìne tenuifòlia, Bauh. hist. 3. p. 2. 364. f. *A. viscòsa*, Schreb. Lips. 30. Petals white.

Var. α, *Vaillantiàna* (D. C. prod. 1. p. 406.) stems tufted, erect, glabrous, branching at the top.—Vaill. par. t. 3. f. 1.

Var. β, *Barrelièri* (D. C. l. c.) stems much branched, glabrous, rather procumbent. *A. Barrelièri*, Vill. dauph. 4. p. 634.—Barrel. icon. t. 580. Native of Dauphiny.

Var. γ, *simpliciúscula* (Ser. mss.) stem glabrous, erect, upper part branched; calyx glabrous; stamens 3 or 4.

Var. δ, *hýbrida* (D. C. l. c.) stem straight, glabrous; calyxes clothed with glandular viscid hairs. *A. hýbrida*, Vill. dauph. 4. p. 634. t. 47. *A. pentándra*, Duf. ann. gen. 7. p. 292. Native of Dauphiny.

Var. ε, *viscídula* (D. C. l. c.) stems erect, upper part branched, and are as well as calyxes covered with viscid hairs. *A. viscídula*, Thuil. fl. par. ed. 2. p. 219. *A. dùbia*, Sut. fl. helv. 1. p. 266. *A. viscòsa*, Pers. ench. 1. p. 504. Native of Switzerland.

Fine-leaved Sandwort. Fl. Ju. July. Brit. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

51 *A.* VILLÒSA (Ledeb. ex Steud. nom. 67. descr. ex Fisch. in litt. D. C. prod. 1. p. 406.) leaves linear, awl-shaped, 3-nerved, ciliated; stems pubescent, villous; sepals ovate-lanceolate, acuminated, striated, 3-nerved, with membranaceous margins, longer than the corolla. ♃. H. Native of Siberia. Flowers white.

Villous-stemmed Sandwort. Fl. June, July. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

52 *A.* CALYCI'NA (Poir. voy. 2. p. 167. dict. 6. p. 370.) plant very smooth; leaves grassy, short; peduncles very long, generally 1-flowered; sepals lanceolate, very acute, with membranaceous margins; petals oblong, narrow, much shorter than the calyx; capsules oval, of 5 valves, almost equal in length to the calyx. ⊙. H. Native of Barbary. Petals white.

Large-*calyxed* Sandwort. Fl. June, July. Clt. 1816. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

53 *A.*? SPINULIFLÒRA (Ser. mss. D. C. prod. 1. p. 406.) plant very smooth; leaves filiform, obtuse; flowers dichotomously-panicled, numerous, small; sepals lanceolate, membranaceous, pellucid, with long points; petals very short; stamens 5? Native of the Levant. Petals white.

Spiny-flowered Sandwort. Fl. June, July. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

54 *A.* TRIA'NDRA (Schrank. hort. monac. t. 30.) stem dichotomous, diffuse; leaves flat, linear, very narrow; corolla smaller than the calyx; flowers triandrous; capsules of 3 valves. ⊙. H. Native? Minuártia tenuifòlia, Mart. hort. erlang, p. 44. ex Schrank. l. c. Petals white. Perhaps only a variety of *A. tenuifòlia*.

Triandrous Sandwort. Fl. June, July. Clt. 1817. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

55 *A.* EMARGINA'TA (Brot. fl. lus. 2. p. 202.) stems erect; leaves linear, bluntish; sepals lanceolate; petals emarginate. shorter than the calyx. ⊙. H. Native of Portugal on dry hills beyond the Tagus, and of Algiers. Stems racemose, clammy. Leaves sessile. Petals reddish, emarginate. Schlecht. in berl. mag. 1816. p. 212.?

Emarginate-petalled Sandwort. Fl. June, July. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

56 *A.* MEDITERRA'NEA (Ledeb. ex Link. enum. 1. p. 431.) stem very much branched; leaves linear, recurved; sepals striated, with long points and membranaceous margins, much longer than the corolla; capsules longer than the calyx. ⊙. H. Native? This was sent under the name of *A. calycìna*, see Horn. hafn. and *A. calycìna*, Pers. Peduncles very long. Petals white.

Mediterranean Sandwort. Fl. Ju. Jul. Clt. 1823. Pl. ¼ to ½ ft.

57 *A.* RECU'RVA (All. ped. no. 1713. t. 89. f. 8.) leaves radical, crowded, recurved, awl-shaped, leaning rather to one side; stems tufted, simple, generally 3-flowered; sepals ovate-lanceolate, striated, covered with glandular hairs as well as the peduncles; petals ovate, a little longer than the sepals; capsules ovate, of 3 valves, shorter than the calyx; seeds somewhat kidney-shaped, hardly dotted. ♃. H. Native of the higher Alps of Europe in stony meadows, particularly in Switzerland, Italy, Austria, and Moravia. Jacq. coll. 1. p. 244. t. 16. f. 1. There is a variety of this plant with from 1-8 flowers on each stem. Flowers white.

Var. β, *hispídula* (Ser. mss. in D. C. prod. 1. p. 406.) stems, leaves, and peduncles covered with glandular hairs. ♃. H. Native of Vallais. Flowers white.

Recurved-leaved Sandwort. Fl. Ju. Jul. Clt. 1822. Pl. ¼ ft.

58 *A.* HIRSU'TA (Bieb. fl. taur. 1. p. 349.) plant hairy; leaves awl-shaped, 3-nerved, bluntish; lower leaves imbricate, recurved; stems declinate; panicle many-flowered, dichotomous; sepals acute, somewhat 5-nerved, hairy, almost equal in length to the corolla; capsule 3-valved; seeds rather disciform, with echinated margins. ♃. H. Native of Tauria on high mountains. Flowers white. Perhaps only a variety of *A. recúrva*.

Hairy Sandwort. Fl. June, July. Clt. 1820. Pl. ¼ foot.

59 *A.* CALYCULA'TA (Poir. suppl. 5. p. 7.) plant somewhat pubescent; leaves thickish, somewhat fasciculate, semicylindrical, awl-shaped, curved; sepals lanceolate, elongated, acutish, 5-nerved, with membranaceous margins; petals entire; capsules ovate, longer than the calyx. ♃. H. Native of Hungary. Flowers white.

Calyculated Sandwort. Fl. June, July. Clt. 1817. Pl. ¼ ft.

60 A. GLA'BRA (Mich. fl. bor. amer. 1. p. 274.) plant very smooth, erectish, many-stemmed; leaves linear-awl-shaped, flat, spreading; pedicels 1-flowered, elongated, divaricating; sepals oval, bluntish, smooth, shorter than the corolla. 4. H. Native of North Carolina on rocks. Stellària uniflòra, Walt. fl. carol. p. 141. Flowers white.

Glabrous Sand-wort. Fl. June, July. Pl. $\frac{1}{4}$ foot.

61 A. RUPE'STRIS (Labill. pl. syr. dec. 4. p. 8. t. 4. f. 1.) stems ascending; leaves setaceous, obtuse, somewhat curved, crowded, a little ciliated beneath; flowers panicled, from 2-4; sepals ovate, oblong, rather hairy, 3-nerved; petals oval-oblong, twice as long as the sepals; disk glandular under the ovary; capsules of 3 valves, hardly exceeding the calyx in length. 4. H. Native of Mount Lebanon. Flowers white.

Rock Sandwort. Fl. June, July. Pl. $\frac{1}{4}$ foot.

62 A. SETA'CEA (Thuil. fl. par. ed. 2. p. 220.) stem very much branched; flowers panicled, fastigiate; leaves setaceous, in bundles, ciliated at their base, all leaning to one side; sepals awl-shaped, acute, with white, membranaceous margins, almost equal in length with the petals; capsules of 3 valves, rising above the calyx. 4. H. Native among stones on dry hills about Paris and Fontainebleau. Flowers white.

Var. α, pilòsa (Ser. mss. in D. C. prod. 1. p. 407.) stems hairy at the bottom. 4. H. A. heteromálla, Pers. ench. 1. p. 504. A. saxátilis, Loisel. fl. gall. p. 261. exclusive of the synonymes of Lin. and Vahl.

Var. β, rugòsa (Ser. mss. in D. C. l. c.) stem pubescent at the bottom. 4. H. A. heteromálla, Bieb. fl. taur. 1. p. 350. Flowers white. Plant greenish-glaucous.

Setaceous-leaved Sandwort. Fl. June, July. Clt.? Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

63 A. FASCICULA'TA (Gouan. ill. 30.) leaves awl-shaped, setaceous, in bundles; stems erect, straight, almost simple; flowers fascicled; pedicels shorter than the leaves; sepals unequal, acuminated, somewhat membranaceous, with two narrow lines, almost twice the length of the obtuse petals; capsules of 3 valves, shorter than the calyx; seeds kidney-shaped, rough, with rather serrated margins. ♂. H. Native in sandy or gravelly sunny places, in many parts of Europe, particularly about Montpelier, Austria, and Carniola. In Scotland on rocks in Fifeshire and the mountains of Angus-shire. Jacq. austr. 2. t. 182. A. fastigiàta, Smith. engl. bot. t. 1744. Alsìne mucronàta, Lam. dict. 4. p. 310. Stellària rùbra, Scop. carn. 1. p. 316. t. 17. Stems often purplish. Petals white.

Fascicled-leaved Sandwort. Fl. June. Scotland. Pl. $\frac{1}{2}$ ft.

64 A. FASTIGIA'TA (Lin. syst. nat. ed. 12. vol. 3. p. 733. Smith, fl. græc. 442.) stem fastigiate, leafy, pubescent, viscid, villous; panicle leafy; sepals linear-lanceolate, very long, ciliated; petals very short; leaves linear-awl-shaped, ciliated, connate. ⊙. H. Native of Asia Minor. Flowers in racemose panicles.

Fastigiate Sandwort. Pl. $\frac{1}{8}$ foot.

65 A. FRANKLI'NI (Hook. fl. bor. amer. t. 35.) root fusiform; stems numerous; panicle fastigiate, crowded; sepals lanceolate, acuminated; petals oblong-lanceolate, obtuse, shorter than the sepals; leaves linear-awl-shaped, finely ciliated at the base and connate; capsule 6-valved at the apex. 4. H. Native of North America in the arctic regions. Flowers white.

Franklin's Sandwort. Fl. June, July. Pl. $\frac{1}{4}$ foot.

66 A. FILIFÒLIA (Forsk. descr. p. 211. Vahl. symb. 1. p. 33. t. 12.) leaves setaceous, crowded, 2-ribbed; stems suffruticose, forked; peduncles terminal, 1-2-flowered; sepals very narrow. equal in length with the corolla. 4. H. Native of Arabia on Mount Boka. Petals white.

Thread-leaved Sandwort. Fl. June, July. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

67 A. MUCRONA'TA (D. C. fl. fr. 4. p. 791.) leaves setaceous, not ciliated at the base; stems tufted, prostrate at the base; panicle rather forked; peduncles longer than the leaves; sepals acuminated, somewhat membranaceous, with 2 lateral ribs, awned, longer than either the petals or capsule; capsules of 3 valves. ⊙. H. Native about Montpelier on rocks. A. fasciculàta β, rostràta, Pers. ench. 1. p. 504. Alsìne mucronàta, Gouan. ill. 22. A. mutábilis, Lapeyr. abr. 256. Petals white. Perhaps only a variety of *A. fasciculàta*.

Mucronate-sepalled Sandwort. Fl. June, July. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ ft.

68 A. GLOMERA'TA (Bieb. fl. taur. 1. p. 350. suppl. p. 311.) plant pubescent, hoary; leaves awl-shaped, straight; flowers on very short pedicels, disposed in glomerate heads; sepals scariose, with 2-stripes, acuminated, much longer than the petals; capsule 3-valved. ⊙. H. Native of Tauria on calcareous rocks. Petals white. Allied to *A. fasciculàta*, but differs in the stem being branched from the base.

Var. β, elàtior (Ser. mss. in D. C. prod. 1. p. 407.) panicle rather looser; pedicels longer. ⊙. H. Native among rocks about Odessa.

Glomerate-flowered Sandwort. Fl. June, July. Clt. 1818. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

69 A. LARI'CINA (Cham. in Schlecht. Linnæa. 1. p. 57.) decumbent; leaves stiff, awl-shaped, ciliated, with bundles of small leaves in the axillæ; flowers few, terminal; petals twice the length of the calyx; seeds disk-formed, ciliated. 4. H. Native of Siberia. Spérgula larícina, Lin. spec. 631. Smith, icon. ined. 1. p. 18. t. 18. Lam. ill. t. 392. f. 3. Spérgula arenarioìdes, Herb. Willd.

Larch-like Sandwort. Fl. June, July. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

70 A. ULIGINÒSA (Schleich. cent. exs. 1. no. 47. D. C. fl. fr. 4. p. 786. icon. pl. gall. p. 14. t. 46.) stem erect, branched from the base; leaves linear, bluntish; branches naked; peduncles twin, 1-flowered, generally terminal, furnished with two bracteas at the base of each; sepals lanceolate, nerveless, hardly longer than the ovate petals; capsules ovate, of 3-valves, equal in length to the calyx; seeds somewhat kidney-shaped, orange-coloured. 4. H. Native of Jura, Siberia, and Lapland, in turfy bogs. Spérgula strícta, Swartz, act. holm, and in Schrad. journ. 1800. vol. 2. p. 256. Petals white.

Var. β, purpuràta (Ser. mss. in D. C. prod. 1. p. 407.) stems and calyxes purple. A. muscòrum, Adams ex Fisch. in litt.

Bog Sandwort. Fl. June, July. Clt. 1819. Pl. $\frac{1}{4}$ foot.

71 A. POLYGONOI'DES (Wulf. in Jacq. coll. 1. p. 241. t. 15.) plant procumbent; leaves linear, obtuse, ciliated; peduncles either in twos or threes, 1-flowered, furnished with two bracteas at the middle of each; sepals oblong-linear, obtuse, without nerves, hardly shorter than the corolla; capsules ovate, of 3 valves, hardly exceeding the calyx; seeds somewhat disciform, black. 4. H. Native of Switzerland in stony places. A. obtùsa, All. ped. t. 64. f. 4. Stellària ciliàta, Scop. fl. carn. ed. 2. vol. 1. p. 315. no. 536. t. 17. Stellària biflòra, Gun. fl. norv. 1. p. 45. no. 91. Petals white.

Var. β, occúlta (D. C. prod. 1. p. 408.) peduncles very long, 1-flowered. 4. H. Native of Siberia on the Altaian mountains. A. occúlta, Fisch. in litt. Petals white.

Polygonum-like Sandwort. Fl. Ju. July. Clt. 1822. Pl. $\frac{1}{4}$ ft.

72 A. BAVA'RICA (Lin. amœn. 4. p. 315.) leaves linear, semicylindrical, fleshy, obtuse, longer than the spaces of the stem between the leaves; stems branched, somewhat dichotomous, hard, jointed; peduncles terminal, generally in pairs. 4. H. Native of Bavaria and Siberia. Saxífraga Bavárica, Ray, hist. 1033. A. Pònæ, Rchb. icon. t. 138. Petals white. Seeds few.

Bavarian Sandwort. Fl. June, July. Pl. $\frac{1}{4}$ foot.

73 A. SAJANE'NSIS (Willd. herb. ex Schlecht. berl. mag. 1816. p. 200.) leaves linear, bluntish; stems procumbent; peduncles

terminal, very short, 1-flowered; sepals 1-nerved. 4 ? H. Native of the Altaian mountains at Sajan. Petals white.

Sajan Sandwort. Fl. June, July. Pl. ¼ foot.

74 A. JU'NCEA (Bieb. fl. taur. suppl. p. 309.) stems erect, simple; leaves linear, setaceous, rough, ciliated; panicle dichotomous, pubescent; sepals acute, villous, obscurely 3-nerved, almost equal in length to the corolla. ⊙ ? H. Native of Tauria. Petals white.

Rush-like Sandwort. Fl. June, July. Pl. ¼ to ½ foot.

75 A. VERTICILLA'TA (Willd. spec. 2. p. 725.) leaves awl-shaped, stiff, spinose, and are as well as the flowers disposed in whorls; peduncles 4-flowered, somewhat capitate; sepals linear, awl-shaped, pungent; petals lanceolate. ħ. H. Native of Armenia between Erzerum and Tocat. Petals white.

Whorled-leaved Sandwort. Fl. June, July. Clt. 1823. Shrub ½ foot.

76 A. FILIFO'RMIS (Labill. pl. syr. dec. 4. p. 8. t. 3. f. 2.) stem simple, filiform, naked at the top; leaves setaceous, acuminated; panicle somewhat dichotomous, few-flowered; sepals elliptical, glabrous; petals oval-oblong, tapering to the base, twice as long as the sepals; capsules of 3-valves (longer than the calyx?) seeds kidney-shaped. ⊙. H. Native of the island of Cyprus. Petals white.

Filiform-stemmed Sandwort. Fl. June, July. Pl. ¼ to ½ ft.

77 A. PHARNACEOÌDES (Ser. mss. in D. C. prod. 1. p. 408.) leaves filiform, mucronate, somewhat fasciculate; stem branched; flowers somewhat umbellate; sepals ovate, obtuse; petals twice as long as sepals. ⊙ ? H. Native of the Levant. Stems and peduncles partly clothed with glandular hairs. Flowers white.

Pharnaceum-like Sandwort. Fl. June, July. Pl. ¼ to ½ foot.

78 A. PI'CTA (Sibth. and Smith, fl. græc. t. 439.) stems leafless, dichotomous, hairy towards the top; leaves tufted, awl-shaped; petals emarginate, veiny on the under surface. ⊙. H. Native of the island of Cyprus in fields. Petals white, but veined on the under surface with red.

Painted-petalled Sandwort. Fl. June, July. Pl. ¼ foot.

79 A. MARGINA'TA (Bieb. in herb. Willd. ex Schlecht. berl. mag. 1816. p. 212. but not of D. C.) stems ciliated; leaves linear awl-shaped, smoothish; sepals acute, edged. 4. H. Native of Eastern Siberia. Plant small, almost woody, much branched. Petals white.

Edged-sepalled Sandwort. Fl. June, July. Pl. ¼ foot.

80 A. CANE'SCENS (Vahl. herb. ex Horn. hort. hafn. 1. p. 964. in add.) leaves awl-shaped, fleshy; sepals nerved, one-half shorter than the petals. 4. H. Native? A. macrocárpa, Horn. hort. hafn. 1. p. 964. but not of Pursh. Flowers white.

Canescent Sandwort. Fl. June, July. Clt. 1817. Pl. ¼ ft.

81 A. ? JURE'SSI (Willd. herb. ex Schlecht. berl. mag. 1816. p. 212.) leaves linear, awl-shaped, leaning rather to one side; sepals lanceolate. 4 ? H. Native of Portugal on mount Gerez. Petals white. Plant dwarf, tufted.

Juress's Sandwort. Fl. June, July. Pl. ¼ foot.

82 A. PU'LCHRA (Willd. herb. ex Schlecht. berl. mag. 1816. p. 212.) plant erect, glabrous; leaves linear, awl-shaped; flowers panicled; sepals membranaceous, edged, shorter than the petals. 4 ? H. Native on mount Ararat. Flowers large, white.

Fair Sandwort. Fl. June, July. Pl. ¼ foot.

83 A. ? ARMERI'NA (Bory, ann. gen. sc. ph. 3. 1820. p. 5.) stems diffuse, woody; leaves connate, linear, acute, stiff, when old recurved; flowers capitate. ħ. F. Native of Spain in hedges near Sierra Nevada. Petals white.

Sweet-William Sandwort. Fl. June, July. Shrub ½ foot.

84 A. EXTE'NSA (Duf. ann. gen. 7. p. 291.) plant regularly pubescent, diffuse, branched; stems elongated; leaves linear; flowers loosely panicled; petals length of calyx; capsules obversely conical, inclosed within the calyx. 4 ? H. Native of Spain on arid hills in the province of Valentia. Flowers rose-coloured.

Extended Sandwort. Fl. June, July. Pl. ½ foot.

85 A. ? RAFINESQUIA'NA (Ser. mss. in D. C. prod. 1. p. 409.) leaves imbricated, awl-shaped, acute; stems sparingly branched, rather erect; peduncles solitary, terminal, almost naked, 1 or 3-flowered; stamens 8 or 10. 4 ? H. Native of North America in New Jersey. A. imbricàta, Rafinesque journ. bot. 1. p. 229. suppl. 5. p. 8. but not of Bieb. Petals white.

Rafinesque's Sandwort. Fl. June, July. Pl. ¼ foot.

86 A. ? CHERLE'RIÆ (Fisch. in litt. in D. C. prod. 1. p. 409.) plant small, tufted; leaves linear, awl-shaped, curved at the points? rather imbricate; flowers terminal or somewhat corymbose; sepals oblong, bluntish, rather membranaceous, twice as long as the narrow petals. ⊙. H. Native of Siberia. A. Dahùrica, Spreng. syst. 2. p. 398. Petals white.

Var. α, uniflòra (D. C. l. c.) flowers solitary, terminal; stem almost wanting; leaves curved at the points. ⊙. H. Native of Dahuria on rocks near Grædina. Habit of *Cherlèria sedoìdes*, Petals white.

Var. β, fasciculàta (D. C. l. c.) flowers somewhat umbellate; stem elongated; leaves not curved at the points. ⊙. H. Native of Dahuria, very common in places exposed to the sun. Petals white.

Cherleria-like Sandwort. Fl. March, May. Pl. ⅛ to ¼ foot.

§ 3. *Leaves lanceolate, linear-lanceolate, oval, spatulate or roundish. The plants of this division are easily known from the rest in the leaves neither being grassy nor setaceous.*

87 A. TETRA'QUETRA (Lin. spec. 605.) leaves ovate, keeled, recurved, edged, imbricated in four rows; stems straight, pubescent; flowers somewhat capitate; sepals stiff, acute, keeled, ciliated, almost equal in length to the corolla; capsules ovate, truncate, of 6-valves, with the valves callose at the apex; seeds kidney-shaped, very rough. 4. H. Native of France and the shores of the Mediterranean on sterile mountains. Flowers white.

Var. α, laxifòlia (D. C. prod. 1. p. 409.) leaves distant; heads many-flowered; stems elongated. 4. H. Native of Piedmont, Pyrenees, and about Montpelier. All. ped. no. 1718. t. 89. f. 1.—Magn. p. 53. icon.

Var. β, densifòlia (D. C. l. c.) leaves densely imbricated; heads few-flowered; stems short. A. imbricàta, Lag. in litt. Gypsóphila aggregàta, Lin. spec. 581. 4. H. Native of the shores of the Mediterranean.

Square-stemmed Sandwort. Fl. Aug. Clt. 1731. Pl. ¼ to ½ ft.

88 A. AMA'BILIS (Bory. ann. gen. sc. phys. 3. 1820. p. 5.) leaves triangular, concave, acute, revolute; stems branched, level topped, tufted, naked at the bottom; peduncles almost wanting, leafy; sepals rigid. 4. H. Native of Spain at Sierra Nevada. Petals white. Perhaps A. imbricàta, Lag. ann. 5. p. 278?

Lovely Sandwort. Fl. Aug. Pl. ¼ foot.

89 A. GIESE'KII (Horn. fl. dan. t. 1518.) plant glandular, hispid; leaves linear-lanceolate, stiff, 3-nerved; peduncles very long, almost naked, 1-flowered; sepals lanceolate, acute, 3-nerved, longer than the corolla; capsules of 3, rarely of 6-valves, almost twice as long as the calyx; seeds kidney-shaped, roughish. 4. H. Native of Greenland. Petals white.

Gieseke's Sandwort. Pl. ¼ foot.

90 A. RUBICU'NDA (Spreng. syst. 2. p. 399.) stem erect, branched, pubescent; leaves lanceolate-linear, pubescent; peduncles solitary, 1-flowered, elongated; sepals acuminated, hairy, shorter than the corolla. 4. H. Native of Siberia. A. purpùrea, Willd. herb. Flowers purplish.

Reddish-flowered Sandwort. Pl. ¼ foot.

91 A. MUSCÒRUM (Fisch. in litt. but not of Adams, D. C.

prod. 1. p. 409.) plant tufted; leaves oblong, obtuse, striated, ciliated; stems short, puberulous, 1-flowered; sepals ovate, obtuse, somewhat striated, much smaller than the corolla. ♃. H. Native of Kamtschatka. Petals white.

Moss-like Sandwort. Pl. $\frac{1}{8}$ foot.

92 A. mode'sta (Duf. ann. gen. 7. p. 291.) plant viscid, pubescent, erect, slender, somewhat dichotomous; leaves oblong-linear, lower ones elliptical-ovate; peduncles filiform, at length divaricating; sepals lanceolate, acute, nerveless; petals ovate-oblong, hardly the length of the sepals; capsules ovate, of 6 valves, about the length of the calyx. ⊙. H. Native of Spain about Valentia. Flowers white.

Modest Sandwort. Fl. June, July. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

93 A. nemoròsa (H. B. et Kunth, gen. et spec. amer. 6. p. 35.) plant branched, procumbent, puberulous; leaves stalked, oblong, acute, mucronate, veiny, membranaceous; petals shorter than the sepals; capsules containing few seeds; seeds even, shining. ♃. F. Native of South America. A. alsinoìdes, Willd. herb. ex Schlecht. berl. mag. 1816. p. 201. Stellària pubéscens, Willd. herb. ex Kunth, l. c. Petals white. Seeds lenticular, kidney-shaped.

Var. α, Quiténsis (D. C. prod. 1. p. 409.) spaces of stem between the leaves longer than in var. β. Stems and branches terete. ♃. F. Native of Quito in groves. Petals white.

Var. β, Novogranaténsis (D. C. prod. 1. p. 409.) leaves oblong, half an inch long, or lanceolate, an inch long; stems and branches terete. ♃. F. Native of the Andes in New Granada in temperate places, at the height of 3000 feet. Petals white.

Grove Sandwort. Fl. June, July. Pl. $\frac{1}{4}$ foot.

94 A. galioi'des (Ser. mss. in D. C. prod. 1. p. 410.) stems slender, pilosely-hispid; leaves lanceolate-linear, acute, thin, ciliated, disposed somewhat in whorled bundles; flowers in dichotomous panicles; peduncles capillary, elongated; sepals lanceolate, acute, nerveless, pilosely hispid, with the edges somewhat membranaceous, hardly longer than the corolla. ♃ ? H. Native of? Habit of *Gálium Anglicum*, but more slender. Flowers white.

Lady's-Bed-Straw-like Sandwort. Fl. June, July. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

95 A. lanceola'ta (All. ped. no. 1715. t. 26. f. 5.) plant tufted, rather villous; branches ascending; leaves lanceolate, narrow, acute, stiff, nerved; pedicels twice as long as the leaves; sepals lanceolate, acute, nerved, hardly longer than the corolla; capsules of 3-valves, length of calyx, with the valves callose at the apex. ♃. H. Native of the Alps of Piedmont in stony pastures. Flowers white.

Var. β, cherlerioìdes (D. C. fl. fr. 4. p. 785.) plant small; stems creeping and tufted; leaves imbricated.—A. cherlerioìdes, Vill. dauph. 4. p. 626. t. 47. f. 1. ♃. H. Native of Dauphiny. Flowers white.

Lanceolate-leaved Sandwort. Fl. July, Aug. Clt. 1820. Pl. $\frac{1}{4}$ foot.

96 A. de'nsa (Kit. ex Schlecht. berl. mag. 1816. p. 200.) leaves oblong-lanceolate, scabrous; stems tufted, branched, ascending; sterile branches short, floral ones generally bearing 3 flowers; sepals ovate, rather scarious; petals twice as long as the calyx. ♃. H. Native of Croatia. Petals white.

Dense Sandwort. Fl. June, July. Clt. 1824. Pl. $\frac{1}{4}$ foot.

97 A. purpura'scens (Ram. pyr. ined. D. C. fl. fr. 4. p. 785. and 5. p. 611. icon. pl. rar. gall. p. 14. t. 45.) plant tufted, decumbent; branches erect, 2 or 3-flowered; leaves ovate-lanceolate, acuminated, glabrous; pedicels tomentose, scarcely exceeding the leaves; sepals lanceolate, smooth, with scarious margins, longer than the corolla; capsules ovately-cylindrical, semi-6-valved, hardly protruding beyond the calyx; valves acute; seeds kidney-shaped. ♃. H. Native on the higher Pyrenees. A. cerastioìdes, Pers. ench. 1. p. 502. Lapey. pyr. abr. p. 252. but not of Poir. Flowers purplish.

Purplish-flowered Sandwort. Pl. $\frac{1}{8}$ foot.

98 A. viola'cea (Ledeb. ex Fisch. in litt. D. C. prod. 1. p. 410.) leaves lanceolate, smoothish; flowers somewhat panicled, erect, terminal; peduncles covered with clammy hairs, equal in length to the calyx; sepals oblong, beset with clammy hairs; petals narrow, obovate, twice as long as the sepals. ♃ ? H. Native of Siberia towards Ochotsk. A. purpùrea, Willd. Flowers violaceous or purple.

Violaceous-flowered Sandwort. Fl. June, July. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ ft.

99 A. abieti'na (Presl. ex Spreng. syst. app. 181.) stem tufted, ascending, few-flowered, rather villous; leaves linear-lanceolate, awned, stiff, smooth, ciliated at the base; petals obovate, emarginate, longer than the acuminated sepals. ♃. H. Native of Sicily. This is certainly a species of *Stellària*. Perhaps *A. grandiflòra*, Lin.

Fir-like Sandwort. Pl. $\frac{1}{4}$ foot.

100 A. monta'na (Lin. amœn. 4. p. 272.) plant pubescent; leaves lanceolate-linear; sterile stems very long, procumbent; peduncles terminal, very long, 1-flowered, fruit-bearing ones nodding; sepals lanceolate, acuminated, much shorter than the corolla; capsules ovate-globose, of 6-valves, equal in length to the calyx; valves bluntish; seeds kidney-shaped, rough. ♃. H. Native of the west of France and Spain, on sterile mountains. D. C. fl. fr. 4. p. 784. Vent. cels. t. 34. Sims, bot. mag. 1118. A. linearifòlia, Poir. dict. 6. p. 366. Habit of *Cerástium*. Root creeping? Flowers large, white. Fruit nodding.

Var. β, intricàta (D. C. prod. 1. p. 410.) leaves almost linear. A. intricàta, Duf. in litt. ♃. H. Native of Spain about Valentia.

Mountain Sandwort. Fl. April, July. Clt. 1800. Pl. $\frac{1}{2}$ foot.

101 A. ruscifòlia (Poir. dict. 6. p. 365.) leaves coriaceous, ovate, spinose, edged, approximate; flowers in dichotomous panicles; sepals ovate, pungent, striped, almost one-half shorter than the petals; capsules ovate, of 6 valves exceeding the calyx in length; valves narrow, acute. ♃ ? H. Native? Flowers white.

Butcher's-Broom-leaved Sandwort. Pl. $\frac{1}{2}$ foot.

102 A. re'pens (Ser. mss. in D. C. prod. 1. p. 410.) plant hairy; leaves ovate, almost sessile; stems creeping; flowers solitary, axillary; peduncles shorter than the leaves; sepals lanceolate, acutish, hardly longer than the corolla, with membranaceous margins; capsules ovate, of 6 valves, equal in length to the calyx; seeds kidney-shaped, shining, black. ♃. H. Native? Alsìne rèpens, herb. Deless. Flowers white.

Creeping-stemmed Sandwort. Fl. May, July. Pl. creeping.

103 A. Wallichia'na (Ser. mss. in D. C. prod. 1. p. 411.) plant very smooth; leaves ovate-lanceolate; stems much branched, very numerous; sepals lanceolate, acute, rather pellucid, 1-nerved, longer than the corolla; capsules ovate, profoundly 6-valved, equal in length to the calyx; seeds somewhat pear-shaped, rough. ⊙. H. Native of Nipaul at Narainhetty. A. serpyllifòlia, D. Don, prod. fl. nep. p. 215. Very like *A. serpyllifòlia*, but distinct. Petals white.

Wallich's Sandwort. Fl. June, Aug. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

104 A. Urale'nsis (Spreng. syst. 2. p. 396.) stem much branched, scabrous; leaves ovate, acute, sessile, nerved, rather pilose; peduncles aggregate, beset with glandular pili; sepals acuminated, exceeding the corolla. ⊙ ? H. Native of Siberia on the Ural mountains.

Ural Sandwort. Pl. $\frac{1}{4}$ foot.

105 A. buxifòlia (Poir. dict. 6. p. 362.) plant pubescent; leaves ovate-oblong, sessile; stems creeping; peduncles dichotomous, generally 2-flowered; sepals linear, short, obtuse, with

membranaceous margins; petals hardly longer than the calyx; capsules ovate, obtuse (of 5 valves?) equal in length to the calyx. ⊙. H. Native of Canada. Petals white.

Box-leaved Sandwort. Pl. creeping.

106 A. SERPYLLIFÒLIA (Lin. spec. 606.) leaves ovate, acute, sessile, rough, ciliated, and smooth; stems panicled; sepals hairy, lanceolate, acute, 3-nerved, 3 outermost 5-nerved, green, opaque, almost double the size of the corolla; capsules ovate, 6-valved at apex, equal in length to the calyx; seeds exactly kidney-shaped, wrinkled. ⊙. H. Native throughout the whole of Europe, on walls and dry sandy ground, common, as well as in North America in cultivated ground, and on road sides from New York to Carolina. Smith, engl. bot. t. 923. Curt. lond. fasc. 4. t. 32. Fl. dan. 977. Stellària serpyllifòlia, Scop. carn. no. 544. Flowers white, solitary.

Var. β, víscida (Ser. mss. D. C. prod. 1. p. 411.) stems dwarf; leaves and calyxes full of nerves and clammy.

Wild-Thyme-leaved Sandwort. Fl. July. Britain. Pl. ¼ ft.

107 A. PURSHIA'NA (Ser. mss. in D. C. prod. 1. p. 414.) stem dichotomous, diffuse; leaves oval, acutish; peduncles alternate, axillary, solitary, elongated; sepals acute, length of petals. ⊙. H. Native of Labrador on the sea-shore. A. thymifòlia, Pursh. fl. amer. sept. 1. p. 317. but not of Sibth and Smith. Petals white.

Pursh's Sandwort. Fl. June, July. Pl. ⅛ to ¼ foot.

108 A. THYMIFÒLIA (Smith, fl. græc. t. 441.) stems numerous, slender, panicled; leaves narrow-spatulate, smooth, 3-nerved; petals unguiculate, ovate, longer than the 3-nerved sepals. ⊙. H. Native of Candia. Flowers small, white; anthers brownish. Like *A. serpyllifòlia*.

Thyme-leaved Sandwort. Pl. ⅛ to ¼ foot.

109 A. COIMBRICE'NSIS (Brot. fl. lus. 2. p. 200. phyt. lus. p. 179. t. 73.) leaves fleshy, lanceolate, nerveless, glabrous on the under surface, but pubescent on the upper surface; stem panicled, dichotomous, erect; petals twice as long as the sepals; capsules 6-valved at the apex; sepals bluntish, nerveless, shorter than the corolla. ⊙. H. Native of Portugal in sandy ground near Coimbra and elsewhere. Petals white.

Coimbra Sandwort. Fl. June, July. Clt. 1819. Pl. ¼ foot.

110 A. PUBE'SCENS (D'Urv. enum. pl. arch. p. 50.) plant pubescent; leaves ovate, acute, on short footstalks; stems spreading, branched, elongated; sepals acute, shorter than the corolla. ♃. H. Native of the island of Cos on the summits of the mountains at the height of 1200 feet above the level of the sea. Flowers white. Very like *A. ciliàta*, but differing in all parts of the plant being densely clothed with down; the leaves are narrower, and the sepals are not striped.

Pubescent Sandwort. Fl. May, July. Clt. 1820. Pl. ¼ foot.

111 A. CINE'REA (D. C. fl. fr. 5. p. 811.) plant grey, hairy; leaves ovate-lanceolate, acute, ciliated, upper ones distant, lanceolate, acute; flowers in dichotomous panicles, on long peduncles; sepals lanceolate, acute, somewhat keeled, almost one-half smaller than the corolla; capsules ovate, equal in length with the calyx, of 6 valves; valves callose at the apex. ♃. H. Native of the south of France. Flowers white.

Cinereous Sandwort. Fl. April, Aug. Pl. ¼ foot.

112 A. BREVICAU'LIS (Sternb. in Spreng. pl. min. cog. 1. p. 31.) leaves oblong, acutish, 3-nerved, ciliated, somewhat imbricate; stems prostrate; sepals lanceolate, acuminated, striped, exceeding the petals in length, with membranaceous margins. ♄? H. Native of the Alps of Rhætia. Petals white. Very like *A. ciliàta*, but differing in the stems being erect, leaves blunt, 1-nerved; sepals smaller, and petals 1-nerved.

Short-stemmed Sandwort. Fl. May, July. Clt. 1823. Pl. ¼ ft.

113 A. SCA'BRA (Poir. dict. 6. p. 377.) leaves lanceolate, acute, spreading, scabrous; stem simple, very short; peduncles panicled, dichotomous; sepals ovate, acuminated, striped, rough, with membranaceous margins, shorter than the corolla. ♃? H. Native of the Alps of Europe. Flowers white.

Scabrous-leaved Sandwort. Fl. May, Jul. Clt. 1822. Pl. ⅛ ft.

114 A. REDO'WSKII (Cham. in Schlecht. Linnæa, 1. p. 58.) leaves elliptical, acute at both ends, mucronate, membranous, ciliated at the base; stems procumbent, tufted; sepals ovate, acuminated, shorter than the corolla; petals longer than the calyx. ♃. H. Native of Siberia. Like *A. ciliàta*.

Redowski's Sandwort. Pl. procumbent.

115 A. CRE'TICA (Spreng. syst. 2. p. 396.) stem tufted; leaves crowded, oblong, acute, stiffish, smooth; peduncles terminal, usually 1-flowered, clammy-pubescent; sepals keeled, acutish, shorter than the corolla. ♃. H. Native of Candia. A. hìrta, Sieb.

Cretan Sandwort. Pl. ¼ foot.

116 A. CILIA'TA (Lin. spec. 608.) leaves ovate or obovate, roughish, with a few hairs, 1-nerved, and ciliated; stems procumbent; flowers usually solitary; sepals ovate, acute, 5-7-ribbed; petals obovate, twice as long as the sepals; capsules ovate, of 6-valves, equal in length to the calyx. ♃. H. Native of Europe on high mountains. In Ireland upon the limestone cliffs of a high mountain adjoining to Ben Bulben, in the county of Sligo. Smith, engl. bot. t. 1745. Fl. dan. t. 346. Wulf. in Jacq. coll. 1. p. 245. t. 16. f. 1. Fl. dan. t. 346. A thick, tufted, spreading, procumbent plant. Flowers white.

Var. β, multicaúlis (D. C. fl. fr. 4. p. 783.) leaves pulpy and somewhat leathery, and with the sepals scarcely nerved. A. multicaúlis, Wulf. in Jacq. coll. 1. p. 248. t. 17. f. 1. Flowers white.

Ciliated-leaved Sandwort. Fl. July, Sep. Ireland. Pl. procumbent.

117 A. SCOPULÒRUM (H. B. et Kunth, gen. et spec. amer. 6. p. 31.) stems elongated, much branched, procumbent; leaves lanceolate-linear, acute, 1-nerved, membranaceous, with the margins and the back ciliated; calyx glabrous, shorter than the petals; capsules containing only 2 or 3 seeds; seeds smooth, shining. ♃. F. Native of the Andes of Peru at the height of 5100 feet. A. dígyna, Willd. herb. ex Schlecht. berl. mag. 1816. p. 201. Flowers white.

Rocky Sandwort. Pl. procumbent.

118 A. DECUSSA'TA (Willd. herb. ex Schlecht. in berl. mag. 1816. p. 35.) plant very much branched, creeping; branches hairy; leaves lanceolate-linear, acute, mucronate, with thickened margins, 1-nerved, stiff, ciliated; petals longer than the sepals; ovary containing 4 or 5 seeds. ♃. F. Native of Mexico near Moran at the height of 3990 feet above the level of the sea. H. B. and Kunth, gen. et spec. 6. p. 34. Petals white.

Decussate-leaved Sandwort. Fl. June, July. Pl. ¼ to ½ foot.

119 A. SE'RPENS (H. B. et Kunth, gen. et spec. amer. 6. p. 32.) plant much branched, creeping, glabrous; leaves oblong, somewhat spatulate, obtuse, rather fleshy, veinless, ciliated at the base; petals hardly longer than the sepals; capsules containing generally about 15 seeds; seeds smooth, shining. ♃. F. Native of Peru at the bottom of mount Chimborazo, at the height of 4920 feet. Flowers white.

Serpent Sandwort. Pl. creeping.

120 A. RADDIA'NA (Ser. mss. in D. C. prod. 1. p. 412.) leaves ovate-lanceolate, tapering to the base, ciliated; stems very long, branched, prostrate, glabrous, quadrangular; peduncles axillary, 1 to 3-flowered; flowers apetalous. ⊙? F. Native of Madeira. Sepals lanceolate, pellucid, with three green nerves. Bracteas two, somewhat similar to the sepals. A. alsinoìdes, Raddi brev. osserv. p. 13. but not of Willd.

Raddi's Sandwort. Pl. prostrate.

121 A. NORVE'GICA (Gunn. fl. norv. 2. no. 1100. t. 9. f. 7-9.

ex Horn. fl. dan. t. 1269.) plant glabrous; stems terete, procumbent, 1-2-flowered; leaves spatulate, glabrous; flowers terminal, rather globose; sepals ovate, obtuse, hardly nerved, with the margins rather membranaceous, equal in length with the corolla; capsule ovate-globose, of 6 valves at the apex, hardly exceeding the calyx. ♃. H. Native of Norway. Petals white.

Norwegian Sandwort. Fl. June, July. Pl. $\frac{1}{4}$ foot.

122 A. TRINE'RVIA (Lin. spec. 605.) stem slender, branched; leaves ovate, acute, 3-nerved, stalked, ciliated; peduncles long, becoming deflexed after flowering; sepals lanceolate, acute, obscurely 3-nerved, with a rough keel and membranaceous margins, much longer than the corolla; capsules ovate, of 6 valves, equal in length to the calyx; seeds kidney-shaped, black, and smooth. ⊙. H. Native of most parts of Europe in shady bushy places, where the soil is rather moist. Smith, engl. bot. t. 1483. Curt. lond. fasc. 4. t. 31. Fl. dan. t. 429. Petals white. Habit of *Alsìne mèdia*.

Three-nerved-leaved Sandwort. Fl. May, June. Britain. Pl. $\frac{1}{2}$ to 1 foot.

123 A. MURA'LIS (Sieb. ex Spreng. syst. 2. p. 397.) plant clothed with glandular pubescence; leaves spatulate, acutish, rather fleshy; stem much branched; flowers racemose; petals emarginate, equal with the acute sepals. ⊙? H. Native of Candia. Petals white.

Wall Sandwort. Pl. $\frac{1}{8}$ foot.

124 A. OXYPE'TALA (Smith, fl. græc. t. 437.) hairy; stem slender, erect, branched; leaves ovate, acute, stalked, 1-nerved; peduncles terminal, panicled, dichotomous; calyx hairy, obsoletely 5-nerved; petals acuminated. ⊙. H. Native of Greece. Plant very like common *Chickweed*, but erect. Flowers white.

Sharp-petalled Sandwort. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

125 A. UMBELLA'TA (Sol. in Russ. allepo, ed. 2. p. 252.) stems ascending, leafy, jointed, smooth; leaves obovate, ciliated; flowers umbellate; petals rather torn. ⊙. H. Native of Asia Minor. Smith, fl. græc. t. 439. Plant glaucous. Habit of *Holósteum umbellàtum*. Flowers white.

Umbellate-flowered Sandwort. Pl. 2 to 3 inches.

126 A. LATERIFLÒRA (Lin. spec. 605.) stem slender, branched; leaves broad-ovate, obtuse, ciliated, nerved; peduncles lateral, long, 1-2-flowered; sepals ovate, obtuse; petals twice as long as the sepals; capsules ovate, obtuse, twice as long as the calyx (of 3-6 valves?) valves obtuse. ♃? H. Native of the islands of Kamtschatka and St. Lawrence. Hook, fl. bor. amer. t. 34. Similar to *A. trinérvia*, but very distinct. Petals white.

Lateral-flowered Sandwort. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

127 A. CERASTIIFÒLIA (Ram. in D. C. fl. fr. 4. p. 783.) plant tufted, rather woody, branched; leaves ovate-lanceolate, 3-nerved, pubescent; peduncles terminal, 1-flowered, clothed with glandular hairs; sepals lanceolate, bluntish, nerved, shorter than the corolla; capsules ovate, of 3-valves, hardly exceeding the calyx in length; valves callose at the apex. ♃. H. Native of the Pyrenees in the chinks of rocks. A. Ramóndi, Poir. suppl. 5. p. 3. Flowers white.

Chickweed-like Sandwort. Pl. ¼ foot.

128 A. MACROPHY'LLA (Hook, fl. bor. amer. t. 37.) smooth; leaves lanceolate, or ovate-lanceolate, tapering to both ends; peduncles lateral, 2-3-flowered; sepals ovate-lanceolate, acuminated; petals oblong, obtuse, much shorter than the sepals; capsule 6-valved at the apex; valves obtuse; stem erect, terete. ♃. H. Native of North America on the western coast. Flowers white.

Long-leaved Sandwort. Pl. $\frac{1}{2}$ foot.

129 A. CALYCA'NTHA (Ledeb. ex Fisch. in litt. and D. C. prod. 1. p. 412.) leaves oblong, acute, sessile, hardly ciliated at the base; flowers nodding; sepals oblong, acute, with membranaceous margins; petals perhaps always wanting; stamens longer than the calyx. ⊙. H. Native of Eastern Siberia.

Calyx-flowered Sandwort. Pl. $\frac{1}{4}$ foot.

130 A. ROTUNDIFÒLIA (Bieb. fl. taur. 1. p. 343.) leaves orbicular, hardly ciliated at the base; stems filiform, procumbent; peduncles lateral, 2-leaved, somewhat dichotomous; sepals lanceolate, acute, with membranaceous margins; petals obovate, length of calyx. ♃. H. Native on the Alps of Caucasus.

Round-leaved Sandwort. Fl. March, Aug. Pl. $\frac{1}{4}$ foot.

131 A. BALEA'RICA (Lin. syst. nat. ed. 12. app. 230.) plant tufted, creeping; leaves ovate, shining, rather fleshy, ciliated; peduncles elongated, 1-flowered; flowers drooping; sepals ovate, bluntish, nerveless, much shorter than the corolla; capsules ovate, of 6 valves, hardly exceeding the calyx in length. ♃. H. Native of Corsica and the Balearic islands. Lher. stirp. 1. t. 15. A. muscòsa, Medic. act. pal. 3. p. 202. t. 12. A pretty little tufted plant, with white flowers.

Balearic Sandwort. Fl. March, Aug. Clt. 1787. Pl. $\frac{1}{8}$ to $\frac{1}{4}$ ft.

132 A. BIFLÒRA (Lin. mant. 71.) leaves ovate-roundish, glabrous, rather imbricated; stems procumbent, very much branched; peduncles lateral, 2-flowered; flower-buds roundish; sepals ovate, obtuse, shorter than the corolla; capsules ovate, of 3 valves, length of calyx; valves callose at the apex. ♃. H. Native of the south of Europe on the highest Alps, near the limits of perpetual snow. All. ped. no. 1699. t. 44. f. 1. et t. 64. f. 3. good. Jacq icon. rar. t. 83. Flowers white.

Var. β, apétala (D. C. fl. fr. 4. p. 782.) leaves imbricate, ciliated; flowers apetalous. A. apétala, Vill. dauph. p. 622. t. 48.

Two-flowered Sandwort. Pl. $\frac{1}{4}$ foot.

133 A.? MUSCOI'DES (H. B. et Kunth, gen. et spec. amer. 6. p. 32.) plant creeping, glabrous; leaves small, rather imbricate, linear-lanceolate, nerveless, acutish, rather fleshy; petals hardly the length of the sepals; capsules containing few-seeds; seeds smoothish. ♃. F. Native of South America on the summit of mount Antisana, at the height of 6900 feet. A. nàna, Willd. herb. ex Schlecht. berl. mag. 1816. p. 201. Seeds very minute, rather lenticular. Petals white.

Moss-like Sandwort. Pl. creeping.

134 A. TETRA'GYNA (Willd. herb. ex Schlecht. berl. mag. 1816. p. 201.) plant much branched, creeping, glabrous; leaves approximate, oblong-lanceolate, acutish, obsoletely 1-nerved, rather fleshy, and ciliated towards the base; corolla exceeding the calyx in length; styles for the most part 4; capsules of 4 valves, containing 8 or 10 seeds; seed tubercled. ⊙. H. Native of South America on Mount Antisana, at the height of 6300 to 6600 feet. H. B. et Kunth, gen. et spec. amer. 6. p. 30. Flowers white.

Four-styled Sandwort. Pl. creeping.

135 A. BRYOI'DES (Willd. herb. ex Schlecht. berl. mag. 1816. p. 201.) plant tufted, glabrous; leaves small, imbricate, in 4 rows, ovate, obtuse, concave, nerveless, thick, ciliated; petals shorter than the sepals; capsules containing only 1 or 2 seeds. ♃. F. Native of America in very cold places on Mount Tolucca in Mexico, at the height of 5700 feet. H. B. et Kunth, gen. et spec. amer. 6. p. 33. Petals white.

Bryum-like Sandwort. Pl. $\frac{1}{8}$ foot.

136 A. DICRANOI'DES (H. B. et Kunth, nov. gen. et spec. amer. 6. p. 34.) plant tufted, glabrous; leaves imbricated in 4 rows, ovate-lanceolate, acute, concave, 1-nerved, ciliated; flowers terminal, solitary, sessile, with 2 styles. ♃. F. Native of South America on Mount Antisana, at the height of 6300 feet. Lobèlia bryoìdes, Willd. herb. mss. ex Schlecht. in Rœm. et Schult. syst. 5. p. 41. Fruit unknown. Flowers white.

Dicranum-like Sandwort. Pl. $\frac{1}{8}$ foot.

137 A. Salzma'nni (Presl. ex Spreng. syst. app. 181.) stem much branched, flaccid, villous; leaves oblong-lanceolate, acute, hispidly-ciliated; panicle dichotomous; sepals 3-nerved, with scarious margins, shorter than the corolla, but longer than the sub-globose capsule. ♃. H. Native of Sicily.

Salzmann's Sandwort. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

138 A. spatula'ta (Desf. atl. 1. p. 358.) plant pubescent; leaves spatulate, ciliated at the base; stem erect, filiform, branched; flowers panicled, dichotomous; sepals oblong, pubescent, with membranaceous margins, much shorter than the corolla; capsules ovate, equal in length to the calyx (of 5 valves?) valves callose at the apex. ⊙. H. Native of Barbary in sand near Algiers. A. cerastioides, Poir. dict. 6. p. 363. but not of D. C. nor Lapeyr. Anthers blue. Petals white, slightly emarginate, obovate.

Spatulate-leaved Sandwort. Pl. $\frac{1}{4}$ foot.

139 A. procu'mbens (Vahl. symb. 1. p. 50. t. 33.) plant pubescent; leaves linear-lanceolate and elliptic; stems prostrate; peduncles elongated, panicled; sepals lanceolate, bluntish, with membranaceous margins, a little longer than the corolla; capsule (of 5 valves?) equal in length with the calyx; seeds very small. ♃. H. Native of Tunis, Egypt, and Naples among rubbish. A. herniariæfolia, Desf. atl. 1. p. 358. A. geniculàta, Poir. dict. 6. p. 365. A. ròsea, Presl. ex Spreng. Petals red and white.

Procumbent Sandwort. Fl. July, Aug. Clt. 1801. Pl. $\frac{1}{8}$ ft.

140 A. Jussie'æ (St. Hil. fl. bras. 2. p. 174.) leaves lanceolate, acute, scabrous; flowers solitary, on long peduncles; sepals keeled, acute with membranous margins, scabrous; petals a little shorter than the capsule, but a little longer than the calyx. ♃. F. Native of Brazil. Plant decumbent, 2 feet long. Capsule 3-valved.

Jussieu's Sand-wort. Fl. March. Pl. decumbent.

† *Species not sufficiently known, but evidently all belonging to the last division of the genus.*

141 A. Rosa'ni (Ten. prod. p. 26. and cat. 1819. p. 43.) leaves linear-lanceolate, mucronate, hairy, striated; stem erect, hairy, generally 3-flowered; petals obovate, twice the length of the striped calyx. ♃. H. Native of Lucania. Petals white.

Rosani's Sandwort. Pl. $1\frac{1}{2}$ inch.

142 A. Bartolo'tti (Tineo. pl. rar. sic. pug. 1. p. 10.) leaves lanceolate, almost glabrous; stem decumbent, panicled, dichotomous, 2-edged; panicle pubescent; petals ovate, almost equal in length with the calyx; sepals ovate-lanceolate, with membranaceous margins. ♃? H. Native of Sicily by the sea-side near Gela. Petals white?

Bartolotti's Sandwort. Pl. $\frac{1}{4}$ foot.

143 A. molluginifo'lia (Pour. ex Schlecht. berl. mag. 1816. p. 201.) leaves obovate, acute; peduncles bifid, drooping. ♃? H. Native of Spain.

Mollugo-leaved Sandwort. Pl. $\frac{1}{4}$ foot.

144 A. seri'cea (Ser. mss. in D. C. prod. 1. p. 414.) leaves silky, lanceolate, ciliated; stem erect; branches 1-flowered; corolla shorter than the calyx. ♃? H. Native of Siberia. A. purpùrea, Willd. herb. ex Schlecht. berl. mag. 1816. p. 211. Petals purple?

Silky-leaved Sandwort. Pl. $\frac{1}{4}$?

145 A. clandesti'na (Portenschlag. pl. dalm. t. 1. ined.) leaves linear-lanceolate, acute; stem simple, 1-flowered; flower large, nodding; peduncles short; sepals oblong, obtuse, 5-times shorter than the corolla; petals very long and very narrow, linear, acute; stamens or 5 small egg-shaped little bodies seated between the ovary and the petals; ovary oblong; styles 3; stigmas forked. ♃? ⊙. H. Native of Dalmatia. Perhaps a proper genus. Perhaps the same as *A. calycìna*.

Clandestine Sandwort. Pl. $\frac{1}{4}$ foot.

146 A.? stellarioi'des (Willd. herb. ex Schlecht. berl. mag. 1816. p. 209.) leaves ciliary-serrulated; stems pubescent, somewhat panicled; sepals lanceolate, longer than the corolla. Native of Caucasus.

Stitchwort-like Sandwort. Pl. $\frac{1}{4}$ foot.

147 A. affi'nis (Willd. herb. ex Schlecht. berl. mag. 1816. p. 198.) leaves oblong, acute, stalked; upper ones sessile; corolla shorter than the calyx. Native of Siberia.

Allied Sandwort. Pl. $\frac{1}{4}$ foot.

Cult. *Arenària* is a genus of dwarf herbaceous plants, for the most part perennial, the most of which are well adapted for ornamenting rock-work, but some of the rarer species should be grown in small pots well drained with potsherds, in a mixture of sand, loam, and peat, and placed among other alpine plants. Those species marked frame only require to be sheltered during frost. The perennial species may be either increased by dividing the plants at the root, by seeds, or cuttings planted under a hand-glass will root freely. The annual kinds are not so shewy as the perennials, therefore they are not worth cultivating, except in botanical gardens; they may be either sown on the rock-work or in the annual arrangement.

XXXIII. ME'RCKIA (in honour of Dr. Merk, who travelled in Eastern Asia). Cham. in Schlecht. Linnæa. vol. 2.

Lin. syst. *Pentándria, Trigýnia.* Calyx 5-parted. Petals 5, unguiculate, entire. Stamens 5, alternating with the sepals; filaments filiform; anthers fixed by the middle, somewhat globose. Styles 3. Capsule sessile, inflated, depressedly-globose, furrowed, imperfectly 3-celled, 3-valved, with the dissepiments 2-parted, bearing the seeds. Seeds numerous, or few, pear-shaped. Embryo hooked with the radical towards the hilum. Herbs with creeping roots, and fleshy, opposite leaves on short footstalks. Flowers stalked, terminal, and lateral, solitary.

1 M. physo'des (Fisch. in litt. ex Cham. l. c.) tufted; leaves ovate, acute, ciliated, distant, thin; peduncles long; sepals lanceolate, acutish, equal in length to the corolla; seeds small, pear-shaped. ♃. H. Native of Kamtschatka and in Eschscholtz Bay in the sea-sand. Arenària physòdes, D. C. prod. 1. p. 413. Flowers white. Seeds numerous.

Bladdery-capsuled Merkia. Pl. creeping.

2 M. peploi'des; leaves ovate, acute, fleshy, approximate, ciliated at the base; peduncles short; sepals oblong, acutish, equal in length to the corolla; seeds few, large, pear-shaped. ♃. H. Native throughout northern Europe in the sea-sand; plentiful in Britain. Arenària peploides, Lin. spec. 605. Smith, engl. bot. t. 189. Fl. dan. 189. Honkénya peploìdes, Erhr. beit. 2. p. 181. Flowers red. Capsule roundish, equalling the calyx. The plant is fermented and used by the Icelanders for food.

Peplis-like Merckia. Fl. June, Aug. Brit. Pl. creeping.

Cult. These plants will grow in any common garden-soil, and are easily increased by dividing the plants at the root.

XXXIV. CERA'STIUM (from κερας κερατος, *keras keratos*, a horn; because many of the species have capsules exactly of the form of an ox's horn). Lin. gen. no. 797. Gært. fruct. 2. p. 231. t. 130. f. 6. D. C. prod. 1. p. 414.

Lin. syst. *Decándria, Pentagýnia.* Calyx 5-parted. Petals 5, bifid. Stamens 10. Styles 5. Capsules 1-celled, cylindrical or globose, opening at the apex by 10 circinnate or ascending teeth. Flowers of all white.

Sect. 1. Stre'phodon (στρεφω, *strepho*, to turn, and οδους οδοντος, *odous odontos*, a tooth; in allusion to the revolute teeth

of the capsule). Ser. mss. in D. C. prod. 1. p. 414. Capsules cylindrical, with circinnate or revolute teeth.

1 C. pauciflo'rum (Stev. in litt. D. C. prod. 1. p. 414.) plant pilose; leaves lanceolate, acute; flowers few, on long dichotomous peduncles, nodding, with a solitary flower rising from the fork; petals and capsules much longer than the calyx. ⊙. H. Native of Siberia.

Few-flowered Mouse-ear Chickweed. Fl. June, July. Clt. 1816. Pl. ½ foot.

2 C. nemora'le (Bieb. fl. taur. suppl. p. 317.) plant hairy, clammy; stem erect, upper part forked; cauline leaves lanceolate, acute; flowers axillary, solitary, spreading, on long peduncles; petals length of calyx; capsules hardly longer than the calyx. ⊙. H. Native of Caucasus in groves.

Grove Mouse-ear Chickweed. Fl. May, June. Clt. 1818. Pl. 1 foot.

3 C. perfolia'tum (Lin. spec. 627.) plant glabrous and glaucous; stem erect, branched, or simple; leaves lanceolate, connate, bluntish; flowers in umbels; petals much shorter than the calyx. ⊙. H. Native of Greece, Barbary, and Siberia in sandy places.—Dill. elth. 295. t. 217. f. 284. good.

Perfoliate-leaved Mouse-ear Chickweed. Fl. June, July. Clt. 1725. Pl. 2 feet.

4 C. Cauca'sicum (Fisch. in litt. D. C. prod. 1. p. 414.) stem erect, dichotomous; branches elongated; cauline leaves lanceolate, glabrous, but with scabrous margins; petals length of the glabrous sepals; capsules shorter than the pubescent pedicels. ⊙. H. Native of Caucasus. C. elongàtum, Bieb. fl. taur. suppl. p. 316. but not of Pursh. Flowers about the size of those of *Stellària Holóstea*. Capsules somewhat cylindrical, broad, a little longer than the calyx.

Caucasian Mouse-ear Chickweed. Fl. Ju. Jul. Pl. 1 foot.

5 C. fri'gidum (Bieb. fl. taur. p. 362. suppl. p. 320.) plant villous; stems branched at the base, ascending, dichotomously umbellate; leaves lanceolate, acute, hairy; sepals lanceolate, acute; petals much longer than the calyx; capsules oblong. ♃. H. Native of the alps of Caucasus. C. purpuráscens, Adams, ap. Web. et Mohr. cat. 1. p. 60. Flowers blue.

Frigid Mouse-ear Chickweed. Fl. May. Pl. ⅛ to ¼ foot.

6 C. Dahu'ricum (Fisch. in Spreng. pl. min. cog. 2. p. 65. Schrank. hort. monac. t. 75. good.) plant smoothish, glaucous; stem dichotomous; leaves cordate-ovate, clasping the stem; fruit-bearing peduncles very long and deflexed; sepals lanceolate, with scarious margins; petals semibifid, longer than the calyx. ♃. H. Native of all parts of Siberia amongst rubbish. C. connàtum? Willd. ex Steud. nom. C. amplexicaúle, Sims, bot. mag. t. 1789. good.—Gmel. sib. 4. p. 148. no. 49. t. 62. f. 1.

Var. β, Holósteum (D. C. prod. 1. p. 415.) leaves linear-lanceolate, clasping the stem and rather ciliated; stems and peduncles rather hairy. Fisch. in litt. C. nìtens, Stev. in litt.

Dahurian Mouse-ear Chickweed. Fl. May, Sept. Clt. 1815. Pl. 1 to 3 feet.

7 C. ma'ximum (Lin. spec. 629.) plant puberulous; stems diffuse; leaves linear-lanceolate, acuminated, tapering to both ends; flowers large, in dichotomous umbels; petals crenated and 2-lobed; capsules ovate, about the length of the calyx. ♃. H. Native of Siberia.—Gmel. sib. 4. p. 150. no. 51. t. 62. f. 2. Stems more or less hairy. Roots creeping.

Largest-flowered Mouse-ear Chickweed. Fl. May, Sept. Clt. 1792. Pl. ½ to 1 foot.

8 C. stellarioi'des (Moc. pl. nutk. icon. ined. D. C. prod. 1. p. 415.) stem erect, dichotomous, branched, generally 3-flowered, and are as well as leaves glabrous; leaves oblong, acuminated; pedicels 1-flowered, terminal; sepals lanceolate; petals semibifid, twice the length of the calyx. ⊙. H. Native of North America, about Nutka.

Stitchwort-like Mouse-ear Chickweed. Fl. June. July. Clt. 1810. Pl. ½ foot.

9 C. molli'ssimum (Poir. suppl. 2. p. 164.) leaves clasping the stem, lanceolate, acute, covered with soft down; panicle diffuse, somewhat umbellate, ⊙? H. Native of Peru. Very like *C. perfoliàtum*.

Softest Mouse-ear Chickweed. Pl. 1 foot.

Sect. II. O'rthodon (from *ορθος, orthos*, straight, and *οδους οδοντος, odous odontos*, a tooth; in allusion to the teeth of the calyx being straight). Ser. mss. in D. C. prod. 1. p. 415. Capsules cylindrical or ovate, with the margins of the teeth revolute.

§ 1. *Petals equal in length to the calyx or smaller.*

* *Capsules cylindrical, longer than the calyx.*

10 C. dicho'tomum (Lin. spec. 628.) plant pilose, clammy; stem branched at the top, dichotomous, with a solitary flower in each fork; peduncles and petals almost equal in length to the calyx; segments of calyx lanceolate, acute; capsules very long, erect; leaves lanceolate. ⊙. H. Native of Spain and Algiers among corn. C. inflàtum and C. glandulòsum, Hort. berl. appear to be only varieties. Myosòtis dichótomum, Mœnch. meth. 225. Alsìne corniculàta, Cluss. hist. 2. p. 184.

Forked-stemmed Mouse-ear Chickweed. Fl. June, Jul. Clt. 1725. Pl. ½ foot.

11 C. rudera'le (Bieb. fl. taur. 1. p. 357. suppl. p. 318.) plant hairy; stem erect, dichotomous; leaves oblong-lanceolate, bluntish; flowers somewhat umbellate; peduncles much longer than the calyx; segments of calyx lanceolate, acute, equal in length to the petals; capsules pendulous, twice the length of calyx. ⊙. H. Native of Caucasus near Kisljar.

Rubbish Mouse-ear Chickweed. Fl. June, July. Clt. 1817. Pl. ½ foot.

12 C. Tau'ricum (Spreng. ex herb. Balb. D. C. prod. 1. p. 415.) plant hairy; stem erect, much branched; leaves ovate, lower ones tapering to the base, upper ones sessile; flowers dichotomously-panicled, equal in length with the peduncles; petals length of calyx; capsules oblong, rather tapering, twice the length of calyx. ⊙. H. Native of Tauria. Very like *C. vulgàtum*, but the stems are more branched, leaves more numerous, and the flowers much smaller.

Taurian Mouse-ear Chickweed. Fl. May, July. Clt. 1820. Pl. ½ foot.

13 C. Illy'ricum (Arduin. spec. D. C. prod. 1. p. 420.) flowers generally pentandrous; petals emarginate; stems very spreading and very hairy; calyx externally hairy. ⊙. H. Native of the Morea and the Island of Cyprus on mountains. C. pilòsum, Sibth. and Smith, fl. græc. t. 454. but not of Horn. Flowers pentandrous, but according to Arduin decandrous. A spreading plant like *C. vulgàtum*.

Illyrian Mouse-ear Chickweed. Fl. June, July. Pl. ¼ foot.

14 C. vulga'tum (Lin. spec. 627.) plant hairy, rather clammy, pale-green; stems erect; leaves elliptic, very blunt; flowers dichotomous, somewhat umbellate, longer than the peduncles; petals equalling the calyx in length; capsules oblong, tapering, twice as long as the calyx. ⊙. H. Native throughout the whole of Europe in fields, waste ground, as well as on walls and dry banks, common. Plentiful in Britain. Smith, engl. bot. t. 789. C. viscòsum, Huds. ang. 200. Curt. lond. fasc. 2. t. 35. Bieb. fl. taur. and suppl. no. 884.—Vaill. par. 1. t. 30. f. 3. C. barbulàtum, Wahl. fl. carp. no. 446. C. rotundifòlium, Sternb. et Hopp. in mem. soc. ratisb. 1818. p. 113. ex Bieb. l. c.

Var. β, glomeràtum (D. C. fl. fr. 4. p. 776.) leaves very

blunt; flowers umbellately glomerate. C. ovàle, Pers. ench. 1. p. 521.

Var. γ, *Americànum* (Ser. mss. in D. C. prod. 1. p. 416.) stem very short, few-flowered; leaves imbricate. C. pùmilum, Rafin. in litt. but not of Curt. lond. C. semidecándrum of American authors. ⊙. H. Native of North America on dry, barren, and sunny hills; frequent in Pennsylvania and Virginia.

Var. δ, *tenéllum* (Ser. mss. in D. C. prod. 1. p. 416.) plant very minute, filiform; stems 1-2-flowered. ⊙. H. Native about Geneva in sandy places. C. tenéllum, Gaud. fl. helv. mss.

Common Mouse-ear Chickweed. Fl. April, July. Britain. Pl. $\frac{1}{8}$ to $\frac{1}{2}$ foot.

15 C. VISCÒSUM (Lin. spec. 627.) plant hairy and clammy, dark-green; stems recumbent; leaves lanceolate-oblong; flowers dichotomously-umbellate; peduncles and petals equal in length with the calyx; capsules rather pendulous, terete, twice the length of the calyx. 4. H. Native of most parts of Europe in meadows, pastures, waste ground and on walls; very common also in North America from Canada to Carolina (Pursh). Plentiful in Britain. Smith, engl. bot. t. 790. C. vulgàtum, Huds. 200. Bieb. fl. taur. and suppl. no. 883. Curt. lond. fasc. 2. t. 34. C. sylváticum, Schleich. exsic. C. obscùrum, Chaub. in St. Amans. fl. agen. p. 180. bouq. t. 4. f. 1.

Clammy Mouse-ear Chickweed. Fl. May, Sept. Britain. Pl. recumbent.

16 C. HOLOSTEOI'DES (Fries, nov. fl. succ. III.) stem pubescent on one side; peduncles pilose; leaves oblong, glabrous; petals shorter than the calyx; margins of calyx scariose. 4. H. Native of Sweden. Horn. hort. hafn. suppl. p. 138.

Holosteum-like House-ear Chickweed. Fl. May, July. Clt. 1818. Pl. $\frac{1}{2}$ foot.

17 C. STRIGO'SUM (Fries, nov. fl. succ. III.) stem erect; leaves oblong, obtuse, strigose; flowers somewhat capitate; sepals lanceolate, hispid, greatly exceeding the petals in length. 4? H. Native of Sweden.

Strigose Mouse-ear Chickweed. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

18 C. PELLU'CIDUM (Chaubard, in St. Amans. fl. agen. p. 181.) bouq. t. 4. f. 2.) plant villous and clammy; stems erect; leaves ovate-roundish; peduncles 3 or 4 times longer than the calyx; bracteas of the universal forks rather membranaceous, pellucid; petals longer than the calyx. ⊙. H. Native of sandy places towards Agen. Perhaps only a variety of *C. semidecándrum*. Flowers pentandrous.

Pellucid-leaved Mouse-ear Chickweed. Fl. April, May. Pl. $\frac{1}{4}$ foot.

19 C. SEMIDECA'NDRUM (Lin. spec. 627.) plant hairy, viscid; stems erect; leaves ovate-lanceolate; flowers pentandrous, dichotomously-umbellate; peduncles longer than the calyx; petals slightly cloven; capsules terete, deflexed after flowering, twice the length of the calyx. ⊙. H. Native of most parts of Europe in waste and sandy ground; also on walls in the outskirts of towns or villages, very frequent. Plentiful in Britain. Smith, engl. bot. t. 1630. Curt. lond. fasc. 2. t. 33.—Vaill. bot. par. t. 30. f. 2.

Var. β, *pùmilum* (Curt. lond. fasc. 6. t. 30.) petals cloven a third of their length. ⊙. H. On dry banks near Croydon, Surrey.

Var. γ, *alsinoìdes* (D. C. fl. fr. 4. p. 776.) calycine lobes scariose on the margins and apices. C. alsinoìdes, Pers. ench. 1. p. 521. ⊙. H. Native about Montpelier.

Semidecandrous Mouse-ear Chickweed. Fl. March, April. Britain. Pl. $\frac{1}{4}$ foot.

20 C. PENTA'NDRUM (Lin. spec. 627.) plant procumbent, and rather clammy; radical leaves spatulate; cauline ones oval-orbicular; segments of calyx acuminated, longer than the slightly cloven petals; capsules shorter than the pedicels. ⊙. H. Native of Spain and Tauria among rubbish. Bieb. fl. taur. 1. p. 359. suppl. p. 319. Perhaps a mere variety of the last.

Pentandrous Mouse-ear Chickweed. Fl. April, May. Clt. 1821. Pl. $\frac{1}{4}$ foot.

21 C. ANDRO'SACEUM (Ser. mss. in D. C. prod. 1. p. 416.) plant very small, and very hairy; leaves ovate; stem dichotomous; flowers rather capitate in threes on stalks, involucrate at the base; segments of calyx narrow, very acute. ⊙. H. Native about Constantinople. C. pilòsum, Castagne in litt. but not of Horn. nor Ledeb. Habit of *Andrósace villòsa*.

Androsace-like Mouse-ear Chickweed. Fl. April, May. Pl. $\frac{1}{8}$ foot.

22 C. GRA'CILE (Duf. in ann. gen. sc. ph. 7. p. 304.) plant erect, slender, dichotomous, clothed with clammy pubescence; lower leaves ovate, stalked, upper ones ovate-lanceolate, sessile; flowers solitary, distant; peduncles hardly longer than the flowers, fruit-bearing ones deflexed; corolla length of calyx; capsules protruding, oblong; stamens either 5 or 10. ⊙. H. Native of Spain on rocks at a place called La Sierra de Vernisa, near St. Philip. Very like *C. pentándrum* or *C. semidecándrum*.

Slender Mouse-ear Chickweed. Fl. May, July. Clt. 1818. Pl. $\frac{1}{4}$ foot.

23 C. BRACHYPE'TALUM (Desp. in Pers. ench. 1. p. 520.) stem erect, tomentose, dichotomous; leaves ovate; flowers panicled; peduncles longer than the flowers; calyx villous, longer than the petals; capsules hardly exceeding the length of the calyx. ⊙. H. Native of Europe among rubbish. D. C. fl. fr. 4. p. 777. icon. pl. gall. t. 44. C. canéscens, Horn. ex Spreng. in herb. Balb. Stems and leaves very hairy.

Short-petalled Mouse-ear Chickweed. Fl. April, May. Clt. 1816. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

24 C. SPATULA'TUM (Pers. ench. 1. p. 520.) stem simple, rather villous; leaves hairy, lower ones obovately-spatulate, stalked, cauline ones somewhat ovate, sessile; flowers glomerate. ⊙. H. Native of Jamaica. Capsules a little longer than the calyx.

Spatulate-leaved Mouse-ear Chickweed. Fl. June, July. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

25 C. FU'LVUM (Rafin. prec. p. 36. journ. bot. 1814. p. 269.) plant clothed with fulvous hairs; stem erect, angular; leaves obtuse; flowers dichotomous; sepals lanceolate, acute; petals equal in length to the calyx; capsules nodding, arched. ⊙. H. Native of Pennsylvania and Virginia.

Fulvous-haired Mouse-ear Chickweed. Fl. May, June. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

26 C. MURA'LE (Desp. in D. C. fl. fr. 5. p. 609.) plant hairy, erectish, stiff; leaves ovate-oblong, acute, numerous; flowers length of pedicels, disposed in bundles; petals emarginate, equal in length to the calyx; capsules oblong, scarcely exceeding the calyx in length. 4? H. Native of France.

Wall Mouse-ear Chickweed. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

27 C. DIFFU'SUM (Pers. ench. 1. p. 520.) stem much branched, villous, opaque, diffuse; leaves ovate-lanceolate, rather hispid; flowers dichotomously panicled, numerous; pedicels length of flowers; petals emarginate, shorter than the calyx; capsules obovate, about equal in length to the calyx. 4. H. Native? Habit of *Stellària arenària*.

Diffuse Mouse-ear Chickweed. Fl. April, Sept. Clt. 1820. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

** *Capsules egg-shaped, equalling the calyx in length, or shorter.*

28 C. SERPYLLIFÒLIUM (Willd. enum. suppl. p. 26? Link. enum. 1. p. 433.) stem decumbent at the base, hairy, rather clammy; leaves lanceolate, tapering to the base, distant; flowers dichotomous, on short pedicels, with a solitary flower in each

fork, on a long pedicel; capsules ovate, shorter than the calyx. 4. H. Native of Siberia. C. serpillifòlium, Bieb. ex Stev. in litt. 1817.

Wild-thyme-leaved Mouse-ear Chickweed. Fl. June, July. Clt. 1817. Pl. decumbent.

29 C. longifo'lium (Willd. spec. 2. p. 814. but not of Poir.) stem erect, dichotomous, hairy, clammy; leaves linear-lanceolate; sepals with membranaceous margins; petals shorter than the calyx; fruit-bearing peduncles horizontal; capsules length of calyx. ⊙. H. Native of Armenia.

Long-leaved Mouse-ear Chickweed. Pl. ¼ to ½ foot.

30 C. Commersonia'num (Ser. mss. in D. C. prod. 1. p. 417.) stem dichotomous, viscid, angular; leaves linear, very long, sessile, rather viscid; flowers dichotomously-umbellate; sepals lanceolate, acute, hardly membranaceous at the margins; corolla and capsule length of calyx. ⊙. 4? H. Native of Monte Video. C. longifòlium, Juss. ex Poir. suppl. 2. p. 164. but not of Willd.

Commerson's Mouse-ear Chickweed. Pl. ½ foot.

31 C. aqua'ticum (Lin. spec. 629.) plant rather hairy; root creeping; stem weak, straggling, round, forked; leaves heart-shaped, sessile; peduncles lateral, solitary, 1-flowered, viscid; sepals ovate, slightly marginate; capsule ovate, length of calyx or longer, opening by 5 cloven teeth. 4. H. B. Native of many parts of Europe in watery places and on the margins of rivers and ditches; plentiful in Britain. Smith, eng. bot. t. 538. Curt. fl. lond. fasc. 1. t. 34. The general appearance of this plant much resembles *Stellària némorum*. Petals white, equal with the calyx. This plant is said by M. Sering to be the *Larbrèa aquática* of St. Hilaire, but that is a truly distinct plant with perigynous stamens belonging to *Paronychièæ*.

Water Mouse-ear Chickweed. Fl. July. Britain. Pl. decumbent.

32 S. te'nue (Viv. app. fl. cors. in Schlecht. Linnæa. 1. p. 501.) smooth, erect; leaves linear-lanceolate; peduncles elongated; sepals 3-nerved, with membranous margins, nearly twice the length of the corolla; capsule oblong. ⊙. H. Native of Corsica.

Low Mouse-ear Chickweed. Fl. June, July. Pl. ½ foot.

33 S. heterophy'llum (Viv. app. fl. cors. in Schlecht. Linnæa. 1. p. 501.) leaves smoothish, lower ones ovate, upper ones linear; calyx hairy, equalling the corolla in length; capsule round. ⊙. H. Native of Corsica.

Variable-leaved Mouse-ear Chickweed. Fl. Ju. Jul. Pl. ¼ ft.

§ 2. *Petals exceeding the calyx in length.*

* *Capsules equal in length with the calyx, or shorter.*

34 C. Ma'nticum (Lin. spec. 629.) plant very smooth; leaves lanceolate-linear; stem straight, dichotomous; peduncles very long; sepals and bracteas lanceolate, acute, with membranaceous margins, shorter than the corolla; capsules ovate, almost equal in length to the calyx. ⊙. H. Native of Italy and Hungary on the mountains. Walds. and Kit. hung. 1. p. 96. t. 96. Stellària Mántica, D. C. fl. fr. 4. p. 794.

Mantic Mouse-ear Chickweed. Fl. June, July. Clt. 1801. Pl. ½ to 1 foot.

35 C. rupe'stre (Fisch. in litt. D. C. prod. 1. p. 417.) plant rather pilose; stems prostrate, branched; leaves ovate-linear; flowers dichotomous, with a solitary flower in each fork on a long peduncle; sepals ovate, obtuse, with membranaceous margins; petals cloven, much longer than the calyx; capsules egg-shaped, almost equal in length to the calyx. 4. H. Native of the alps of Siberia in bogs overflowed by the melting of the snow above a place called Tschala.

Rock Mouse-ear Chickweed. Fl. May, July. Clt. 1820. Pl. prostrate.

36 C. fonta'num (Baumg. fl. trans. ex Spreng. syst. 2. p. 416.) stem creeping, somewhat tetragonal, hairy; leaves pilose, radical ones spatulate, cauline ones ovate; flowers panicled; petals shorter than the calyx; capsule ovate-globose. 4. H. Native of Transylvania.

Fountain Mouse-ear Chickweed. Pl. creeping.

37 C. cilia'tum (Kit. ex Spreng. syst. 2. p. 417.) stem straight; leaves linear, in fascicles, scabrous above, but revolute and smooth beneath; peduncles terminal, elongated, corymbose; petals bifid, much longer than the obtuse sepals. 4. H. Native of Croatia on the Matra mountains. C. Matrénse, Kit. in Spreng. pl. min. cogn. 1. p. 33. Panicle terminal, leafy.

Ciliated Mouse-ear Chickweed. Fl. Ju. Jul. Clt. 1817. Pl. ½ ft.

38 C. elonga'tum (Pursh, fl. amer. sept. 1. p. 321. but not of Bieb.) plant hairy; leaves linear, longer than the internodes, divaricating; peduncles terminal, elongated, di-trichotomous; bracteas ovate; petals emarginate, twice the length of the acute sepals; capsules somewhat globose. 4. H. Native of North America on the plains of the Columbia river.

Elongated-peduncled Mouse-ear Chickweed. Fl. Apr. May.

39 C. defle'xum (Ser. mss. in D. C. prod. 1. p. 417.) plant downy; stem tall, dichotomous, panicled; leaves ovate-lanceolate, waved; flowers erect, small; petals exceeding the calyx; capsule-bearing peduncles deflexed; capsules hardly equalling the calyx in length. 4? H. Native of the north of Persia.

Deflexed-peduncled Mouse-ear Chickweed. Fl. May, July. Pl. 1 foot.

40 C. tenuifòlium (Pursh, fl. amer. sept. 1. p. 321.) plant tufted, clothed with very fine pubescence; leaves narrow, linear, longer than the internodes; flowers on long peduncles; petals obovate, emarginate, almost three times the length of the acute sepals. 4. H. Native of North America on the banks of the Schuylkill and Delaware, Pennsylvania. Very like *C. arvénse*.

Fine-leaved Mouse-ear Chickweed. Fl. May, Ju. Pl. ¼ foot.

41 C. furca'tum (Cham. in Schlecht. Linnæa. 1. p. 61.) pubescent, glandular above; stem nearly simple; leaves broad, lanceolate, acute, hairy; flowers dichotomously-panicled; sepals obtuse; petals twice the length of the sepals; capsule shorter than the calyx. ⊙. H. Native of Siberia.

Forked-stemmed Mouse-ear Chickweed. Fl. June, July. Pl. ½ to 1 foot.

42 C. campanula'tum (Viv. annal. bot. 1. p. 2. p. 171. t. 1.) plant ascending, diffuse, villous; radical leaves spatulate; cauline ones oblong; panicle dichotomous; corollas campanulate; petals semibifid, twice as long as the calyx; capsules ovoid, equal in length with the calyx. ⊙. H. Native about Rome. Sebas. rom. pl. fasc. 2. p. 12. t. 3. f. 1. C. Ligústicum, Viv. cat. hort. Dinegro. C. præ'cox, Ten. fl. neap. 1. p. 27.

Campanulate-flowered Mouse-ear Chickweed. Fl. April, May. Clt. 1824. Pl. ½ foot.

43 C. inca'num (Ledeb. mem. acad. scienc. potz. 5. p. 514.) plant erect, hoary, pubescent; leaves oblong-linear, acute, clothed with very short, appressed hairs; peduncles trichotomous; sepals with membranaceous margins; petals spatulate, semibifid at the apex, twice the length of the calyx; capsules globose, inclosed in the calyx. 4. H. Native of the south of Siberia.

Hoary Mouse-ear Chickweed. Fl. June, July. Pl. ¼ to ½ ft.

44 C. grandiflo'rum (Waldst. et Kit. pl. hung. 2. t. 168.) stems creeping; leaves linear, acute, with somewhat revolute margins, hoary, tomentose; flowers dichotomous; sepals oblong, scarcely hoary, with scarious margins; petals twice the length of calyx; capsules oblong. 4. H. Native of Hungary and Iberia on dry hills. West. in flora, 1820. p. 357. C. argén-

teum, Bieb. fl. taur. 1. p. 361. suppl. 320. C. incànum, Hoffm. hort. mosc. ann. 1808. ex Bieb. l. c. Very like *C. tomentòsum*, but differs in being less hoary, and the leaves narrower and more acute, hardly revolute at the margins.

Great-flowered Mouse-ear Chickweed. Fl. June, July. Clt. 1818. Pl. ½ foot.

** *Capsules exceeding the calyx in length.*

45 C. TOMENTO'SUM (Lin. spec. 629. var. β.) root creeping; stem diffuse, hoary-tomentose as well as the leaves, which are oblong-spatulate, upper ones lanceolate; panicle erect, dichotomous; sepals elliptic, lanceolate, hoary-tomentose, with scarious margins; capsules sub-cylindrical, longer than or equal with the calyx. ♃. H. Native of the south of Europe on mountains in Provence, Greece, &c. In the gardens of France it is called *Oreille de souris*. Smith, fl. græc. 455. Col. phytob. ed. 1744. p. 115. t. 31. C. Colúmnæ, Tenor. prod. p. 27. cat. app. p. 44. C. tomentòsum, Lam. dict. 1. p. 680. Flowers large.

Tomentose Mouse-ear Chickweed. Fl. June, July. Clt. 1648. Pl. ½ foot.

46 C. WILLDENO'WII (H. B. et Kunth, nov. gen. et spec. amer. 6. p. 29.) stems erect, forked at the apex, and are woolly as well as the leaves, which are ovate-lanceolate and acute; calyx pubescent; capsules oblong-cylindrical, many-seeded, rather arched, hardly exceeding the calyx in length; seeds brown, small. ♃. H. Native of Quito in South America. Stellària móllis, Willd. herb. ex Schlecht. berl. mag. 1816. p. 196. Flowers about the size of those of *C. arvénse*.

Willdenow's Mouse-ear Chickweed. Fl. June, Jul. Pl. ½ ft.

47 C. NIPAULE'NSE; hairy; lower leaves spatulate, upper ones lanceolate, acute; flowers terminal, glomerate; sepals acute, and are as well as the pistils shorter than the corolla; stem decumbent, branched. ♃. H. Native of Nipaul at Narainhetty. C. grandiflòrum, D. Don, prod. fl. nep. 216. Stems decumbent, much branched. Flowers large, white.

Nipaul Mouse-ear Chickweed. Pl. ½ foot.

48 C. BIEBERSTEI'NII (D. C. in mem. soc. phys. gen. vol. 1.) root creeping; stem diffuse, woolly-tomentose as well as the leaves, which are ovate-lanceolate; peduncles erect, dichotomous; sepals oblong, tomentose, with scarious margins; capsules ovate, subcylindrical, longer than the calyx. ♃. H. Native of Tauria on the higher mountains. Hook, bot. mag. t. 2702. C. tomentòsum, var. α, Lin. spec. 629.? C. rèpens, Bieb. fl. taur. 1. p. 360. suppl. 320. but not of Lin.—Moris, oxon. 2. sect. 5. t. 22. f. 44.? Differing from *C. tomentòsum* in the leaves being much broader and the flowers and fruit larger.

Bieberstein's Mouse-ear Chickweed. Fl. June, July. Clt. 1820. Pl. ½ foot.

49 S. BEERINGIA'NUM (Cham. in Schlecht. Linnæa. 1. p. 62.) plant hairy and clammy above; stems tufted, leafy at the base, erect, elongated above and few-leaved; leaves oblong-acutish; flowers at length drooping; sepals elliptical, acute; petals and capsules one-half longer than the calyx. ♃. G. Native of the Cape of Good Hope.

Beering's Mouse-ear Chickweed. Pl. ¼ to ½ foot.

50 C. PUSI'LLUM (Ser. mss. in D. C. prod. 1. p. 418.) stems erect, generally 2-flowered; leaves ovate, finely tomentose, sessile; sepals lanceolate, acute, hairy; capsules cylindrical, 3-times longer than the calyx, with small teeth. ⊙. H. Native of Siberia.

Small Mouse-ear Chickweed. Fl. Ju. Clt. 1824. Pl. ⅛ ft.

51 C. LANA'TUM (Lam. dict. 1. p. 680.) stems prostrate, tufted; leaves densely woolly, lower ones roundish, upper ones ovate; flowers dichotomous; sepals lanceolate, with scariose margins; capsules ovate-cylindrical, almost double the length of the calyx. ♃. H. Native of the Alps of Europe. Myosòtis lanàta, Mœnch. suppl. p. 308. C. villòsum, Baumg.

Var. β, *Thomasiànum* (Ser. mss. in D. C. prod. 1. p. 418.) stems, leaves, and calyxes glabrous. ♃. H. Native of the Pyrenees, in a valley called Eynes.

Woolly Mouse-ear Chickweed. Fl. June, July. Clt. 1819. Pl. prostrate.

52 C. IMBRICA'TUM (H. B. et Kunth, nov. gen. et spec. amer. 6. p. 28.) plant much branched, creeping; leaves rather membranaceous, imbricated in four rows, rather spatulate-oblong, obtuse, clothed with soft hairs on both surfaces; capsules oblong-cylindrical, longer than the hairy calyx; seeds roundish, brown, emarginate at the base. ♃. F. Native of South America on the summits of the mountains of Cotopaxi and Antisana, at the height of 5700 to 6600 feet. Flowers about the size of those of *C. vulgàtum*.

Imbricated-leaved Mouse-ear Chickweed. Pl. ½ foot.

53 C. FISCHERIA'NUM (Ser. mss. in D. C. prod. 1. p. 419.) plant hairy, rather clammy; stems prostrate; leaves ovate, sessile, distant; flowers dichotomously umbellate, on short peduncles, with a solitary flower in each fork on a long peduncle; sepals lanceolate, bluntish, with scariose margins; petals twice as long as the calyx. ♃. H. Native of Kamtschatka, Unalaschka, and Behring's Straits. C. hirsùtum, Fisch. in litt. but not of Tenore. C. pilòsum, Ledeb.? Very like *C. viscòsum*, and *alpìnum*.

Fischer's Mouse-ear Chickweed. Fl. June, July. Pl. prostrate.

54 C. ALPI'NUM (Lin. spec. 628.) root creeping; stems prostrate; leaves elliptical, subglabrous, or clothed with white hairs; panicle dichotomous; flowers few, on long peduncles; sepals oblong, recurved, bluntish, with scarious, membranaceous margins; petals twice as long as the calyx; capsules oblong, recurved, almost double the length of the calyx. ♃. H. Native of the Pyrenees. On the mountains of Scotland and Wales by the sides of alpine rills, plentifully. Smith, engl. bot. t. 472. Fl. dan. t. 6. C. latifòlium, Lighf. scot. p. 242. t. 10. C. glabràtum, Hartm. There is a more hoary variety which has been often taken for *C. latifòlium* of Lin. It is a very polymorphous plant, sometimes green, sometimes hoary. The three following varieties are enumerated by Mr. Brown.

Var. α; leaves oblong or rarely short-oval; peduncles dichotomous, rarely 1-flowered; hairs on the stems tipped with glands; capsule oblong, nearly twice the length of the calyx. In Melville Island.

Var. β; leaves broad, ovate; peduncles dichotomous; hairs for the most part acute; inner leaflets of the calyx smoothish. In Melville Island.

Var. γ; hairy; leaves elliptical or lanceolate; peduncles divided and solitary; hairs for the most part acute; capsule a little longer than the calyx. In Melville Island.

Alpine Mouse-ear Chickweed. Fl. June, July. Britain. Pl. ¼ foot, prostrate.

55 C. LITHOSPERMIFÒLIUM (Fisch. mem. soc. mosc. 3. p. 81.) stem branched, spreading; leaves lanceolate, acute, pubescent; flowers solitary; petals emarginate, twice as long as the calyx; sepals elliptical; ovary globose. ♃. H. Native of Siberia.

Lithospermum-leaved Mouse-ear Chickweed. Fl. June, July. Pl. ¼ to ½ foot.

56 C. OVA'TUM (Hoppe in Willd. enum. p. 493.) root creeping; plant rather hairy; stems prostrate; leaves ovate, acute, glabrous, a little ciliated; flowers terminal, somewhat corymbose; petals thrice as long as the calyx; capsules roundish. ♃. H. Native of the Alps of Carinthia. C. Carinthìacum,

West.? C. alpìnum, Hoppe, herb. Viv. Common peduncles dichotomous.

Var. β, filifórme (Schleich. pl. exsic.) stems 1-flowered; peduncles elongated, deflexed. C. pedunculàtum, Gaud. in litt. 1814. Perhaps a proper species.

Ovate-leaved Mouse-ear Chickweed. Fl. June, July. Clt. 1816. Pl. $\frac{1}{4}$ foot.

57 C. latifòlium (Lin. spec. 629.) plant hairy, rather viscid; stems prostrate, 1, rarely 3-flowered; flowers terminal; peduncles longer than the flowers; leaves ovate; sepals ovate, with scarious margins; petals twice the length of the calyx; capsules ovate, turgid, protruding beyond the calyx. ♃. H. Native of the Alps of Switzerland, France, and Austria. On the Welsh and Scottish mountains. Smith, engl. bot. t. 473. Jacq. coll. 1. p. 256. t. 20. C. tomentòsum, Huds. ed. 1. p. 176. The whole plant is clothed with tawny rigid hairs.

Broad-leaved Mouse-ear Chickweed. Fl. June, July. Britain. Pl. procumbent.

58 C. glacia`le (Gaud. in litt. 1814. D. C. prod. 1. p. 419.) plant clothed with very clammy hairs; stems tufted, dense, 1-flowered; peduncles length of the flowers; leaves elliptical or ovate; sepals ovate, with rather scarious margins; petals twice as long as the calyx. ♃. H. Native of Switzerland on the highest Alps near the limits of perpetual snow. C. uniflòrum, Thom. dried plants. Perhaps only a variety of *C. latifòlium*.

Icy Mouse-ear Chickweed. Fl. Ju. Jul. Clt. 1819. Pl. $\frac{1}{4}$ ft.

59 C. sylva'ticum (Walds. et Kit. pl. hung. 1. p. 100. t. 97.) plant diffuse, creeping; stems dichotomously panicled; lower leaves ovate, the rest oblong-lanceolate; flowers erect on long peduncles; petals semibifid, twice the length of the ovate-lanceolate sepals; capsules much longer than the calyx. ♃. H. Native of Hungary and Naples in woody valleys, and probably in Siberia. C. Sibíricum, Stev. in litt. The Hungarian plant is said to be a perennial while the Neapolitan one is annual.

Wood Mouse-ear Chickweed. Fl. Ju. Jul. Clt. 1820. Pl. $\frac{1}{4}$ ft.

60 C. litigiòsum (Lois. not. ajout. 1 vol. 8vo.) hairy, very clammy, dark-green; stem ascending, much branched; leaves small, ovate, acute; flowers loosely-panicled; peduncles longer than the calyx; petals bifid, exceeding the calyx; stamens 10; styles 5, long; capsule exserted; seed hardly tuberculated. ♃? H. Native of France in the Bois de Bologne in arid dry places. Flowers white.

Litigious Mouse-ear Chickweed. Fl. May, June. Pl. $\frac{1}{4}$ foot.

61 C. arve'nse (Lin. spec. 628.) stem declinate; leaves linear-lanceolate, bluntish, rather pilose at the base; flowers dichotomously-panicled; peduncles clothed with deflexed pubescence; petals twice the length of the obtuse sepals; capsules oblong-cylindrical, shorter than the calyx. ♃. H. Native throughout Europe in fields, and on banks and hillocks on a gravelly or chalky soil, as well as on dry hills and rocks in Pennsylvania, according to Pursh. Smith, engl. bot. t. 93. Curt. lond. fasc. 6. t. 29. Fl. dan. t. 629.—Vaill. bot. par. t. 30. f. 4, 5. C. rèpens, Lin. spec. 628? Roots creeping.

Corn-field Chickweed. Fl. May, Aug. Britain. Pl. $\frac{1}{4}$ to 1 ft.

62 C. stri'ctum (Lin. spec. 629? D. C. fl. fr. 5. p. 610.) stems declinate; leaves almost linear, acuminated, glabrous or rather hairy; peduncles clothed with glandular hairs; petals twice the length of the calyx; capsules oblong. ♃. H. Native of Europe on the Alps. Perhaps only a variety of *C. arvénse*. Root creeping.

Var. α, suffruticòsum (D. C. prod. 1. p. 419.) leaves very narrow, smoothish. C. suffruticòsum, Lin. spec. 629. C. laricifòlium, Vill. delph. 4. p. 644.

Var. β, mólle (D. C. l. c.) leaves very narrow, hairy. C. mólle, Vill. delph. 3. p. 644.

Var. γ, lineàre (D. C. l. c.) leaves linear-lanceolate, elongated, acuminated, glabrous. C. lineàre, All. ped. 2. p. 365. t. 88. f. 4.

Var. δ, commùne (D. C. l. c.) leaves linear, bluntish. C. stríctum, Lin. spec. 629? Centúnculus angustifòlius, Scop. carn. 1. t. 19. C. ambíguum, Fisch. in litt.

Straight Mouse-ear Chickweed. Fl. May, Aug. Clt. 1793. Pl. $\frac{1}{2}$ foot.

63 C. dioi'cum (Ait. hort. kew. ed. 1. vol. 2. p. 120. ed. 2. vol. 3. p. 137.) plant hairy and viscid; leaves lanceolate; flowers dioecious; petals 3 times longer than the calyx. ♃. H. Native of Spain.

Dioecious-flowered Mouse-ear Chickweed. Fl. May, July. Clt. 1766. Pl. $\frac{1}{2}$ to 1 foot.

64 C. Pennsylva'nicum (Horn. hort. hafn. p. 435.) stems prostrate, and are as well as linear-lanceolate leaves pubescent; corolla twice the length of the calyx; panicle dichotomous; flowers on very long peduncles. ♃. H. Native of Pennsylvania on dry hills and rocks. Roots creeping. C. arvénse, Pursh. fl. amer. sept. 1. p. 321? Very like *C. arvénse*, but differing in the petals being narrower and the capsules globose. Perhaps only a variety of *C. stríctum*.

Pennsylvanian Chickweed. Fl. Ju. July. Clt. 1810. Pl. 1$\frac{1}{2}$ ft.

65 C. Colsma'nni (Lehm. ex Spreng. syst. 2. p. 418.) stem straight; leaves in fascicled whorls, reflexed, oblong-linear, smoothish; peduncles terminal, subcorymbose; petals entire, thrice the length of the bluntish sepals. ♃. H. Native of the Straits of Magellan. Perhaps a species of *Spergulària*.

Colsmann's Mouse-ear Chickweed. Fl. June, July. Clt. 1827. Pl. $\frac{1}{2}$ foot.

66 C. nu`tans (Rafin. prec. p. 36.) stem erect, clothed with clammy pubescence; leaves linear-oblong, acute; flowers rather umbellate, on long peduncles; petals exceeding the calyx in length; capsules nodding, twice the length of the calyx. ⊙. H. Native of Pennsylvania. C. longipedunculàtum, Muhl. cat. 1813. C. glutinòsum, Nutt. gen. amer. 1. p. 291. but not of H. B. et Kunth. Radical leaves spatulate, upper ones stem-clasping.

Nodding-capsuled Mouse-ear Chickweed. Fl. June, July. Pl. 1 foot.

67 C. Ledebouria'num (Ser. mss. in D. C. prod. 1. p. 420.) stem erect, pilose; leaves oblong, obtuse, under surface glaucous; flowers 2-3, erect, nodding after flowering; petals 3-times longer than the calyx; sepals obtuse, with membranaceous margins; capsules oblong, longer than the calyx. ♃. H. Native of Siberia. C. pilòsum, Ledeb. acad. scienc. petersb. 5. p. 514. no. 26. but not of Horn.

Ledebour's Mouse-ear Chickweed. Fl. June, July. Pl. $\frac{1}{2}$ ft.

68 C. filifòrme (Vest. in fl. 1820. p. 353.) stems tufted; leaves filiform, trigonal, fleshy; sepals lanceolate; petals twice the length of the calyx; capsules oblong, exceeding the calyx in length. ♃. H. Native of Upper Styria. Panicle dichotomous. Pedicels about equal in length to the calyx.

Filiform-leaved Chickweed. Fl. June, July. Pl. $\frac{1}{2}$ foot.

69 C. ri'gidum (Ledeb. mem. acad. petersb. 5. p. 514. no. 25.) plant hairy; stem erect, very simple at the base, but forked at the apex; leaves oblong, acute; peduncles elongated; sepals lanceolate, acute; petals bifid, longer than the calyx; capsules oblong, shining, twice as long as the calyx. ♃. H. Native of Siberia. The whole plant is clothed with stiff spreading hairs. Stems straight, stiff, tall.

Var. β, Chamissòni (See Cham. in Schlecht. Linnæa 1. p. 61.) leaves narrower and acute. All parts of the plant smaller. ♃. H. Native of the island of Unalaschka.

Stiff-stemmed Mouse-ear Chickweed. Fl. June, July. Pl. 2 feet.

70 C. glutinòsum (H. B. et Kunth, gen. et spec. amer. 6. p. 29.) plant villous, clammy, tawny; stems ascending, dichotomously branched at the apex; leaves lanceolate, narrow, acute; capsules cylindrical, rather arched, twice the length of the calyx; seeds rough, brown. 4. H. Native of New Granada. Petals 2-lobed.

Clammy Mouse-ear Chickweed. Fl. June, July. Pl. ½ foot.

71 C. rivula're (St. Hil. fl. bras. 2. p. 166.) puberulous; stem trailing; leaves obovate-oblong, tapering at the base, mucronulate; flowers loosely cymose, on long pedicels; petals 3-times longer than the calyx. ⊙. H. Native of Brazil in the province of Cis-platine in rivulets. Plant 1 foot long. Capsule sub-cylindrical, twice the length of the calyx.

Rivulet Mouse-ear Chickweed. Pl. trailing.

72 C. humifu'sum (St. Hil. fl. bras. 2. p. 166.) smoothish; stem trailing, creeping; leaves oblong, narrowed at both ends; flowers solitary, on long peduncles; petals twice the length of the sepals. ⊙. H. Native of Brazil in the northern part of the province of Rio Grande, in humid places.

Trailing Mouse-ear Chickweed. Pl. trailing.

† *Species not enough known.*

73 C. bractea'tum (Rafin. prec. p. 36.) plant pubescent; stem weak; leaves oblong, almost mucronate; flowers erect, dichotomous, bracteate; bracteas ovate, acute; petals length of calyx; capsules nerveless, erect. 4 ? H. Native of Pennsylvania.

Bracteate Mouse-ear Chickweed. Fl. June, July. Pl. ½ ft.

74 C. pube'scens (Gold. pl. canad. in edinb. phil. journ. april, 1822.) plant pubescent, hairy; stem deflexed, pilose; leaves linear-lanceolate, longer than the internodes; panicle terminal, generally 4-flowered. 4 ? H. Native of Canada.

Pubescent Mouse-ear Chickweed. Fl. June, July. Clt. 1821. Pl. ¼ foot.

75 C. pilòsum (Horn. hort. hafn. p. 965.) leaves linear-lanceolate, obtuse, woolly, with reflexed margins; petals larger than the calyx. 4. H. Native of? Sent by Schrader under the name of *C. lanàtum* of Pers. Link. enum. 1. p. 434. Like *C. viscòsum*.

Pilose Mouse-ear Chickweed. Fl. June, July. Clt. 1820. Pl. ¼ foot.

76 C. Palla'ssii (Vest. in flora, 1820. p. 356.) leaves lanceolate, pubescent, stiff, acute, lower ones equal in length to the internodes, upper ones longer; stem generally 1-flowered; petals semibifid. 4 ? H. Native of? Flower large.

Pallas's Mouse-ear Chickweed. Fl. June, July. Pl. ¼ foot.

77 C. Sprenge'lii (Ser. mss. in D. C. prod. 1. p. 421.) leaves linear, very long, and are as well as stems pubescent; peduncles terminal, umbellate. ♂. H. Native of? C. tenuifòlium, Spreng. in Horn. hafn. suppl. p. 138. but not of Pursh.

Sprengel's Mouse-ear Chickweed. Fl. May, June. Clt. 1819. Pl. ½ foot.

78 C. fimbria'tum (Ledeb. mem. acad. scienc. petersb. 5. p. 516. no. 27.) plant diffuse; stems angular, pilose; leaves lanceolate, acuminate, glabrous, ciliated; sepals oblong; petals multifid; capsules globose. 4. H. Native of Siberia.

Fringed-petalled Chickweed. Fl. June, July. Pl. ½ foot.

79 C. Tenorea'num (Ser. mss. in D. C. prod. 1. p. 421.) plant diffuse, hairy; leaves elliptical, obtuse; hairy-ciliated, as well as the calyx, which is longer than the corolla; flowers panicled; capsules oblong. ⊙. H. Native of Naples on the mountains. C. pilòsum, Tenore, cat. 1819. p. 44. but not of Horn.

Tenore's Mouse-ear Chickweed. Fl. May, July. Clt. 1822. Pl. ¼ foot.

80 C. Scara'ni (Tenore, prod. p. 27. cat. 1819. p. 44.) plant diffuse; leaves lanceolate-oblong, acute, clothed with green tomentum on both surfaces; petals twice as long as the calyx; capsules ovate; fruiting peduncles horizontal. 4. H. Native of Naples on the mountains.

Scarani's Mouse-ear Chickweed. Fl. June, July. Clt. Pl. ½ ft.

81 C. Samnia'num (Ser. mss. in D. C. prod. 1. p. 421.) plant diffuse; branches divaricating; leaves lanceolate, linear, tomentose, green, woolly; panicle dichotomous; petals twice the length of the calyx; capsules oblong. 4. H. Native of Italy on the mountains of Samnium. C. longifòlium, Tenore, prod. p. 27. Cat. 1819. p. 451. but not of Willd. Juss. not Poir.

Samnium Mouse-ear Chickweed. Fl. June, July. Pl. ¼ to ½ foot.

82 C. hirsu'tum (Tenore, prod. p. 27. cat. 1819. p. 45.) plant diffuse, hairy, viscid; stems creeping; leaves oblong, obtuse, tapering to the base, hairy, canescent; flowers panicled; petals twice the length of the calyx; capsules oblong, rather incurved. 4. H. Native of Italy on the mountains of Samnium.

Hairy Mouse-ear Chickweed. Fl. June, July. Clt. 1822. Pl. ¼ foot.

Cult. *C. tomentòsum*, *grandiflòrum*, and *Dahúricum*, are the only species of this genus worth cultivating as border flowers. *C. latifòlium*, *C. alpìnum*, and *C. glaciàle*, are well adapted for rock-work, or to be grown in small pots, in a mixture of loam, sand, and peat; the rest are only worth preserving in general collections. They only require the treatment of other hardy plants. The perennial species are increased by dividing the plants at the roots. The annual and biennial species by seeds, which should be sown in the open ground in the spring.

XXXV. BRACHYSTE'MMA (from βραχυς, *brachys*, short, and στεμμα, *stemma*, a crown; in allusion to short minute petals.) D. Don, prod. fl. nep. p. 216.

Lin. syst. *Pentándria*, *Digýnia*. Calyx 5-parted. Petals 5, minute, elliptical, acute. Stamens 5, much shorter than the petals. Styles 2, distinct. Capsules spherical, 1-celled, with 4 valves opening even to the base, 1-seeded. A diffuse branched, smoothish herb. Stems pentagonal, rather pilose at the top. Leaves opposite, elliptical, oblong, mucronate, stalked, with cartilaginous rather serrulated margins. Flowers paniculately corymbose, terminal or axillary. Peduncles many-flowered, and are as well as pedicels glandular, furnished with linear bracteas at the base, which are ciliated on the margins with glandular hairs. Calyx large, coloured, shining. Corolla white.

1 B. calyci'num (D. Don, l. c.) 4. H. Native of Nipaul. Arenària Nepaulénsis, Spreng. syst. append. p. 181.

Large-calyxed Brachystemma. Pl. diffuse, 1 foot.

Cult. Not worth cultivating except in a botanic garden. Only requiring to be planted in the open border. It may be either increased by dividing the plant at the root or by seed.

XXXVI. CHERLE'RIA (in honour of John Henry Cherler, who assisted John Bauhin in his general history of plants.) Hall. itin. helv. 1. Lin. gen. no. 775. Lam. ill. t. 379. D. C. prod. 1. p. 421.

Lin. syst. *Decándria*, *Trigýnia*. Calyx 5-sepalled (f. 81. *b*.) Petals 5, small, emarginate. Stamens 10 (f. 81. *b*.). Styles 3 (f. 81. *g*.). Capsules 3-celled, 3-valved. Cells 2-seeded.—Smooth, tufted, small, moss-like herbs, with small awl-shaped densely-crowded leaves, and small solitary white or rose-coloured flowers. Nos. 5 and 6 differ from the rest in the petals being much longer than the sepals. Perhaps they belong to *Arenària*.

1 C. sedoi'des (Lin. spec. 608.) plant small, tufted; leaves triquetrous, bluntish, slightly toothed on the margin, spreading; valves of capsule bluntish, callose at the apex, longer than the calyx. ♃. H. Native of the Alps of Europe in moist spots near the limits of perpetual snow. On the loftiest mountains of Scotland in moist spots near their summits, not unfrequent. Smith, engl. bot. t. 1212. Jacq. austr. t. 284. Ch. cæspitòsa, Lam. fl. fr. 3. p. 46. Flowers yellowish-green.

FIG. 81.

Stone-crop-like Mossy-Cyphel or Dwarf Cherleria. Fl. July. Scotland. Pl. ⅛ foot.

2 C. stella'ta (Clark. ex Spreng. syst. 2. p. 416.) leaves trigonal, obtuse, stellately spreading at the top; flowers terminal, stalked; peduncles hispid. ♃. F. Native of Mount Parnassus.

Starry-leaved Cherleria. Pl. 2 inches.

3 C.? imbrica'ta (Ser. mss. in D. C. prod. 1. p. 421.) plant tufted, small; leaves flattish, concave, and 3-nerved beneath, blunt, imbricated; flowers sessile, octandrous? ♃? H. Native of the Alps of Carinthia and of upper Austria, as well as of Siberia. Cherlerioìdes, Hoppe.? pl. sel. 2. C. octándra, Sieb. Flowers greenish-yellow.

Imbricated-leaved Cherleria. Fl. July. Pl. ⅛ foot.

4 C. dicranoi'des (Cham. in Schlecht. Linnæa 1. p. 63.) densely tufted, small; leaves spatulately-oblong, kèeled, rather imbricated, nerveless. ♃. H. Native of St. Laurence Bay, in North-west America. Plant like *Dícranum glaúcum*.

Dicranum-like Cherleria. Pl. 1 foot.

5 C. grandiflòra (D. Don, prod. fl. nep. p. 214.) leaves lanceolate, stiff, mucronate, pungent, keeled underneath, with scarious margins, which are dilated and ciliated, concave above; segments of calyx cuneated, rounded, very broad; petals obovate, retuse, exceeding the calyx in length. ♃. H. Native of Nipaul at Gosaingsthan. Flowers about the size of those of *Arenària grandiflòra*, rose-coloured, with purple filaments and yellow anthers. Arenària globiflòra, Wall. mss.

Great-flowered Cherleria. Pl. 1 to 2 inches.

6 C. junipe'rina (D. Don, prod. fl. nep. p. 214.) leaves crowded in 6 rows, lanceolate, mucronate, stiff, deflexed, with smooth margins; flowers axillary, solitary, shorter than the leaves; segments of calyx obtuse; petals oval, oblong, twice the length of the calyx. ♃. H. Native of Nipaul at Gosaingsthan. Arenària densíssima, Wall. in litt. Plant forming a large compact tuft. Flowers white.

Juniper-like Cherleria. Pl. 1 to 2 inches.

Cult. *Cherlèria* is a genus of very pretty alpine plants, having the appearance of some species of *Arenària*. They should be grown in small pots, well drained with potsherds, in a mixture of sand, loam, and peat, and placed among other alpine plants. They are increased by dividing the plants at the root, or sometimes by seed.

XXXVII. SPERGULA'STRUM (from *spergula*, spurry, and *astrum*, an affixed signification, like.) Michx. fl. bor. amer. 1. p. 275. D. C. prod. 1. p. 421. Micropétalum, Pers. ench. 1. p. 509.

Lin. syst. *Decándria, Tri-Tetragýnia.* Calyx 5-sepalled. Petals 5, very minute, entire or wanting. Stamens 10, perigynous. Stigmas 4, sessile, ligulately-setaceous. Capsules ovate, longer than the calyx of 4-valves.—North American herbs, with the habit of *Stellària* or *Spérgula*. This genus ought more properly to have been placed in *Paronỳchieæ*, from the perigynous insertion of the stamens.

1 S. lanuginòsum (Michx. fl. bor. amer. 1. p. 275.) plant densely pubescent; leaves lanceolate, tapering into the footstalk; peduncles almost solitary, long, at length reflexed; flowers apetalous. ♃. H. Native of North America on the mountains of Virginia and Carolina. Micropétalum lanuginòsum, Pers. ench. 1. p. 509. Stems densely clothed with very fine wool.

Woolly Spergulastrum. Fl. June, July. Clt. 1821. Pl. ½ ft.

2 S. lanceola'tum (Mich. fl. bor. amer. 1. p. 275.) plant glabrous; leaves lanceolate, tapering at both ends; flowers panicled; petals ovate, very short. ♃. H. Native of North America on moist rocks from Canada to Carolina. Micropétalum lanceolàtum, Pers. ench. 1. p. 509. Spérgula boreàlis, Bigel. fl. bost. 2. p. 433. Hook. fl. bor. amer. p. 86. Sometimes there are only 3 stigmas. Petals white.

Lanceolate-leaved Spergulastrum. Fl. July. Pl. ½ foot.

3 S. gramí'neum (Michx. fl. bor. amer. 1. p. 276.) plant very smooth; leaves linear, erect; panicle loose; petals lanceolate, length of sepals. ♃. H. Native of North America near springs and on shady rocks, from New York to Virginia, Canada, &c. Spérgula longifòlia, Hook. fl. bor. amer. p. 86. Spérgula gramínea, Bigel. l. c. Like *Stellària gramínea*.

Grassy Spergulastrum. Fl. June, July. Pl. ½ foot.

Cult. A genus of weed-looking plants, not worth cultivating except in general collections. They should be grown in pots in a mixture of peat and sand. They may be either increased by dividing the plants at the roots or by seed.

XXXVIII.? HYDROPI'TYON (from *υδωρ, hydor*, water, and *πιτυς, pitys*, a pine-tree or fir; water plants resembling the pine tree in the fine whorled leaves.) Gært. fruct. 3. p. 19. t. 183. f. 2. D. C. prod. 1. p. 422.

Lin. syst. *Decándria, Monogýnia.* Calyx of 5 sepals. Petals 5, ovate-roundish. Stamens 10; filaments thick and pilose; anthers cordate. Ovary oblong. Style 1. Stigma orbicular. Capsule 1-seeded. Seed naked.—East Indian water herbs, with whorled pinnate leaves, and small axillary flowers. This genus most probably ought to be removed from this order.

1 H. Zeyla'nicum (Gært. l. c.) leaves pinnate, in whorls; stems arched; flowers axillary, sessile. ♃? S. W. Native of the East Indies. Flowers red.

Ceylon Water-fir. Pl. floating.

2 H. peduncula'tum (D. C. prod. 1. p. 422.) leaves in whorls, pinnate; stems straight; flowers axillary on long peduncles. ♃? S. W. Native of the East Indies and Malabar. H. calycìnum, Gært. Hottònia I'ndica, Lin. spec. 208.—Burm. zeyl. p. 121. t. 55.—Rheed. hort. mal. 12. p. 71. t. 36. Petals 4, greenish-red. The whole plant has a somewhat grateful odour. The flowers mixed with ginger and cardamon in milk-whey are used in Malabar as an anti-dysenterical medicine.

Stalked-flowered Water-fir. Pl. ½ foot.

Cult. As neither of the species of *Hydropítyon* has ever been introduced into Europe in a living state, it is difficult to say what mode of cultivation they require. We think from the nature of the plant that it will be impossible ever to cultivate it in this country.

XXXIX. ACO'SMIA (*a, priv. κοσμος, kosmos*, beauty; a plant without beauty). Benth. mss. in Lin. soc. herb.

Lin. syst. *Decándria, Dygýnia.* This is the *Gypsóphila cerastoìdes*, p. 383. no. 36. of this work, but what the character

is which separates it from *Gypsóphila*, we are not at present acquainted with, unless that the capsule may be 4-valved.

XL. ODONTOSTE'MMA (from *οδους οδοντος*, *odous odontos*, a tooth, *στεμμα*, *stemma*, a crown; in allusion to the toothed petals). Benth. mss. in Lin. soc. herb.

LIN. SYST. *Decándria*, *Digýnia*. Calyx 5-leaved. Petals 5, cuneiform, toothed at the apex. Stamens 10. Styles 2, recurved. Capsule 1-celled, 4-valved, many-seeded. Herb with the habit of *Cerástium*. Leaves elliptic, oblong, sessile, obtuse, hairy on both sides; in fact the whole plant is clothed with glandular hairs. Panicle trichotomous. Flowers white.

1 O. GLANDULÒSA (Benth. l. c.). ♃. F. Native of Kamoon.

Glandular Odontostemma. Pl. 1 foot.

Cult. This plant will grow in any common garden-soil. It requires to be protected during winter. Not worth cultivating, unless in general collections.

XLI. LEUCOSTE'MMA (from *λευκος*, *leucos*, white, and *στεμμα*, *stemma*, a crown; flowers white). Benth. mss. in Lin. soc. herb.

LIN. SYST. *Decándria*, *Digýnia*. Calyx 5-leaved. Petals 5, bipartite or emarginate, with long claws. Stamens 10. Styles 2. Capsule 1-celled, 4-valved, many-seeded. Plants resembling *Stellària* in habit, with white flowers.

1 L. WEBBIA'NA (Benth. l. c.) plant spreading, smooth; leaves linear-lanceolate, acuminated; peduncles 1-flowered, axillary; sepals acuminated; petals deeply bipartite. ♃. F. Native of Kamoon.

Webb's Leucostemma. Pl. $\frac{1}{4}$ to $\frac{1}{2}$ foot.

2 L. LATIFÒLIA (Benth. l. c.) diffuse, smooth; leaves ovate, mucronate, upper ones nearly lanceolate; sepals acuminated; peduncles terminal, solitary, 1-flowered; petals emarginate. ♃. F. Native of Kamoon.

Broad-leaved Leucostemma. Pl. creeping.

Cult. The species of *Leucostémma* will thrive in any common soil, and are easily increased by dividing the plants or by seed.

Post no. 53. p. 492 SILE'NE CISPLATE'NSIS (St. Hil. fl. bras. 2. p. 163. t. 108.) hairy stem, branched; leaves lanceolate, lower ones obtuse, upper ones smaller, acutish; flowers laxly racemose, erect; calyx silky-hairy, cylindrical when in flower, but at length becoming clavate; teeth short, acute; petals obcordate, crowned in the throat. ⊙. H. Native about Monte Video in sandy places, and to the south of the river Plate. Flowers bluish-violet.

Cisplatine Catchfly. Fl. June, July. Pl. 1 foot.

ORDER XXVIII. ELATI'NEÆ (plants agreeing with *Elátine* in important characters.) Cambess. in St. Hil. fl. bras. 2. p. 159.

A small family of plants, nearly allied to the *Caryophýlleæ*, from which they differ essentially in the organization of their stigmas, of their capsules, and of their seeds. The stigmas are capitate. The valves of the capsules are bent inwards at the margins, so much as to form dissepiments. The seeds are without albumen. They differ from *Hypericíneæ*, with which they agree in certain analogies, by the existence of a true central placenta, and by their stamens being definite in number, &c. M. Cambessedes agrees with M. Bartling, who has united the *Chenopòdeæ*, *Amaranthàceæ*, *Paronychièæ*, and the *Caryophýlleæ* in one natural class, in spite of the difference of the insertion of their stamina, as they agree in most other respects. This order contains only three genera, the *Merímea*, Camb., *Elátine*, Lin. and *Bérgia*, Lin. The two last genera with their species will be found in *Caryophýlleæ*, therefore we shall only give amended characters of the genera here, and refer to the preceding Order for the species.

Synopsis of the genera.

1 MERI'MEA. Calyx 5-parted. Petals 5. Stamens 10. Styles 5. Capsule 5-valved, 5-celled, many-seeded; valves separating, bent in at the margins so as to constitute dissepiments.

2 ELA'TINE. Calyx 3-4-parted. Petals 3-4. Stamens 3-8. Styles 3-4, crowned by capitate stigmas. Capsule 3-4-valved, 3-4-celled, many-seeded; valves separating, bent in at the margins, constituting dissepiments.

3 BE'RGIA. Calyx 5-parted. Petals 5. Styles 5, approximate. Capsule 5-valved, 5-celled, from the edges of the valves being bent inwards.

I. MERI'MEA (in memory of Prospero Merimee, an ancient botanist, whose name is now almost forgot.) Cambess. in St. Hil. fl. bras. 2. p. 160.

LIN. SYST. *Decándria*, *Pentagýnia*. Calyx 5-parted. Petals 5. Stamens 10. Styles 5, connate at the base. Capsule 5-valved, 5-celled, separating at the valves; valves bent inwards at the margins, so much as to constitute dissepiments. Seeds fixed to a 5-lobed central placenta, they are elliptical-oblong. Embryo straight. A small plant with oblong-lanceolate, sessile, serrated, pilose leaves, and axillary, solitary, stalked small white flowers.

1 M. ARENARIOI'DES (Camb. l. c.) ♃. G. Native of Brazil in the province of Minas Geraes.

Sand-wort-like Merimea. Pl. creeping.

Cult. An insignificant plant, only worth cultivating in botanical gardens or those of the curious. An equal mixture of sand and loam will suit it well, and it may be propagated by seed or dividing the plant.

II. ELA'TINE (*ελατη*, *elate*, a fir; resemblance in leaves). Lin. gen. no. 685. Gært. fruct. 2. p. 142. t. 102. f. 1.

For the generic character of this genus as well as the specific character of the species, see p. 420. genus 21. of this work, under Order *Caryophýlleæ*, from which it has been removed to the present order by M. Cambessedes.

III. BE'RGIA (in honour of Peter Jonas Bergius, a professor of natural history at Stockholm, who wrote several botanical works between 1757 and 1780, particularly on mosses, and plants of the Cape of Good Hope). Lin. gen. 791. D. C. prod. 1. p. 390.

For the generic and specific characters of this genus see p. 420. genus no. 22. under *Caryophýlleæ*, from which it has been removed to the present order by M. Cambessedes.

ORDER XXIX. LI'NEÆ (plant agreeing with *Línum* in important characters). D. C. theor. ed. 1. p. 217. prod. 1. p. 423.

Calyx of 3-4, but usually of 5 sepals (f. 82. *a*.) hardly connected at the base, continuous with the peduncle, permanent, imbricate in æstivation. Petals equal in number to the sepals, and alternating with them (f. 82. *b*.), hypogynous, unguiculate at the base, connected with the ring of the stamens, as well as sometimes being connected together at the base, twisted in æstivation. Stamens equal in number with the petals,

slightly monadelphous at the base, alternating with the petals, with a tooth or abortive filament between each (f. 82. *e.*); anthers ovate, inserted by the base, 2-celled, birimose. Ovary sub-globose (f. 82. *c.*) with as many cells as there are sepals, rarely fewer. Styles equal in number to the cells of the ovary (f. 82. *d.*), capitate, or simple at the apex. Capsule globose, usually acuminate (f. 82. *c.*), crowned by the permanent bases of the styles (f. 82. *d.*), constantly composed of carpels having induplicate margins, each opening by 2 valves at the apex, with an incomplete dissepiment rising from the centre of each, therefore each carpel is divided into two incomplete cells, containing two seeds, one in each cell. Seeds ovate, compressed, shining, inverted. Albumen sparing, but usually wanting, but instead there is always a fleshy tumid endopleura. Embryo straight, flat, with the radical turned towards the hilum, and with elliptical cotyledons. This order differs from *Caryophýlleæ* by the capsule being formed by the cohesion of several, half 2-celled, 2-seeded carpels. It is composed of herbs or subshrubs bearing yellow, blue, or white fugacious petals, and with entire exstipulate leaves. Flowers always disposed in racemose corymbs or panicles. The plants are of immense importance to the world, on account of the tenacity of their fibres, when made into flax. The seeds are oily. The leaves of *Lìnum cathárticum* and *L. selaginoìdes* are purgative.

Synopsis of the genera.

1 LI'NUM. Sepals 5, entire (f. 82. *a.*). Petals 5 (f. 82. *b.*) Stamens 5 (f. 82. *e.*). Styles 5 (f. 82. *d.*), rarely 1 or 3.

2 RADI'OLA. Sepals 4, joined almost to the middle, trifid at the apex. Petals 4. Stamens 4. Styles 4.

I. LI'NUM (from *Llin*, a thread, in Celtic, whence λινον in Greek, and *linum* in Latin). Bauh. Vaill. Lin. Rœm. et Schult. syst. 6. p. 736. D. C. prod. 1. p. 423.

LIN. SYST. *Pentándria, Pentagýnia.* Flowers with a quinary proportion of parts. Sepals entire. Styles very rarely 3, but generally 5 (f. 82. *d.*) as well as sepals (f. 82. *a.*), petals (f. 82. *b.*), and stamens (f. 82. *e.*).

§ 1. *Flowers yellow.*

1 L. GA'LLICUM (Lin. spec. 401.) plant glabrous, usually of many stems; leaves alternate, linear-lanceolate; flowers in loose forked panicles; pedicels length of calyx; sepals ciliated at the base, awl-shaped at the top; petals blunt, twice as long as the calyx. ⊙. H. Native on hills from France to Iberia. Smith, fl. græc. t. 303.—Ger. gallo-prov. t. 16. f. 1.

Var. β, mèdium (D. C. prod. 1. p. 423.) branches rather angular; leaves serrulately-scabrous on the margins. ⊙. H. Native of Portugal on calcareous hills and heathy mountains about Coimbra and elsewhere.

French Flax. Fl. July, Aug. Clt. 1777. Pl. ½ to 1 foot.

2 L. AU'REUM (Walds. et Kit. pl. hung. 2. t. 177.) plant glabrous, erect; leaves alternate, linear-lanceolate; flowers in lax, panicled corymbs; pedicels 2 or 3-times longer than the calyx; sepals rather ciliated at the base, awl-shaped at the apex; petals emarginate, twice as long as the calyx; styles distinct. ⊙. H. Native of Hungary and Croatia in grassy places. L. Libúrnicum, Scop. carn. ed. 2. no. 385. Styles 3.

Golden Flax. Fl. July. Clt. 1820. Pl. ½ foot.

3 L. SETA'CEUM (Brot. phyt. no. 22. t. 6.) plant puberulous, erect; leaves alternate, crowded, linear-awl-shaped, somewhat serrately scabrous; flowers in panicled corymbs; pedicels length of the calyx; sepals awl-shaped, ciliated at the base; petals twice as long as sepals; styles distinct. ⊙. H. Native of Portugal on calcareous hills near Coimbra, also of Mauritania. L. Brotèri, Willd. mss. in Schult. syst. 6. p. 758. L. tenuifòlium, Schousb.

Var. β, bicolor; flowers yellow, with a blue base and striped with purple. Native of the north of Africa near Tangiers. L. bícolor, Schousb. maroc. 135. L. tenuifòlium δ, Willd. spec. 1. p. 1536. L. tenuifòlium β, bícolor, Pers. ench. 1. p. 335.

Awl-shaped-leaved Flax. Fl. June, July. Pl. ½ to 1 foot.

4 L. ERIGEROI'DES (St. Hil. fl. bras. 1. p. 132.) smooth, simple, erect; leaves alternate, crowded, linear, very acute, with 2 glands at the base; panicle somewhat corymbose; sepals hardly crenulated; petals twice the length of the calyx; style free; stigmas small. ♄. G. Native of Brazil in the province of Cisplatine.

Erigeron-like Flax. Shrub 1 foot.

5 L. LITTORA'LE (St. Hil. fl. bras. 1. p. 133.) smooth; stems numerous, erect; leaves linear, erect, smooth, upper ones alternate; flowers panicled; sepals acute, hardly crenate, much shorter than the sepals. ♃. S. Native of Brazil. Styles free; stigmas small. Petals 3 times longer than the sepals.

Shore Flax. Shrub 1 foot.

6 L. JU'NCEUM (St. Hil. fl. bras. 1. p. 134. t. 24.) smooth; stems erect, twiggy; leaves remote, short, appressed, linear, acute; flowers panicled; sepals acute. ♄. S. Native of Brazil. Flowers subglomerate; petals twice the length of the calyx.

Rushy Flax. Shrub 2 inches.

7 L. TE'NUE (Desf. atl. 1. p. 280. t. 81.) plant glabrous, erectish; leaves alternate, linear, acute; flowers in lax, panicled racemes; pedicels hardly the length of the calyx; sepals mucronate; petals rather retuse, 4-times longer than the calyx. ⊙. H. Native of Algiers on uncultivated hills. L. virgàtum, Schousb. mar. 1. p. 136. L. meliánthum, Brot. fl. lus. 1. p. 484. ex Link. Flowers about the size of those of common flax. Branches of panicle dichotomous.

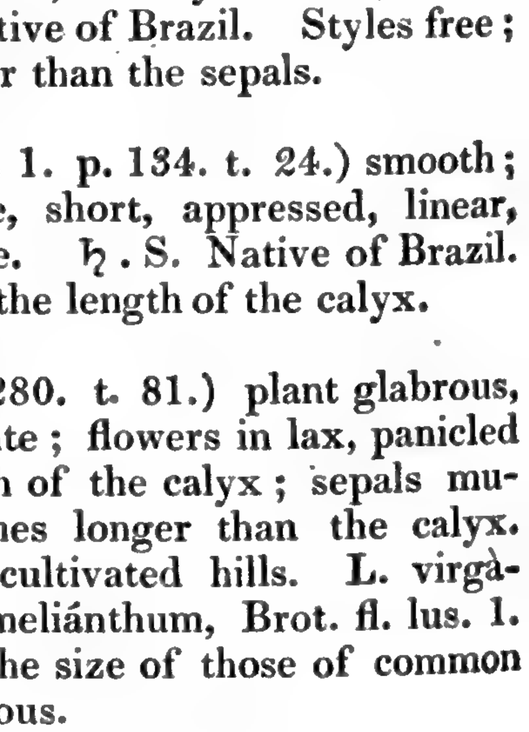
Slender Flax. Fl. June, July. Pl. ½ to ¾ foot.

8 L. LUTE'OLUM (Bieb. fl. taur. 1. p. 256.) plant glabrous, erect; stem angular; leaves alternate and opposite the flowers, linear, acute, and are as well as the sepals serrulated; branches of panicle dichotomous; pedicels very short; petals twice as long as the calyx; styles distinct; stigmas not capitate. ⊙. H. Native of Tauria and Iberia in sunny fields.—Buxb. cent. 5. t. 59. Leaves with 2-glands at the base.

Yellowish-flowered Flax. Fl. June, July. Clt. 1820. Pl. ½ ft.

9 L. NODIFLO'RUM (Lin. spec. 401.) plant glabrous; leaves lanceolate, smooth, furnished with 2 glands at the base of each, lower ones alternate, floral ones opposite; branches of panicle dichotomous; pedicels very short; calyx length of leaves; styles distinct; stigmas not capitate. ♄. H. Native of Italy and the islands of the Archipelago.—Moris, oxon. sect. 5. t. 26. f. 11. Sibth. and Smith, fl. græc. t. 307. (f. 82.).

FIG. 82.



Knotted-flowered Flax. Fl. July, Aug. Clt. 1759. Pl. ½ to ¾ ft.

10 L. STRI'CTUM (Lin. spec. 400.) plant glabrous, erect; leaves linear-lanceolate, straight, and are as well as the much-pointed sepals roughly ciliated; panicle corymbose, crowded; pedicels very short; petals length of calyx; styles distinct. ⊙. H. Native of the south of Europe and the north of Africa in sandy fields.

—Lob. icon. t. 411. f. 2. L. sessiliflòrum, Lam. dict. 3. p. 523. L. alterniflòrum, Delile.

Var. β, altérnum (Pers. ench. 1. p. 336.) stems evidently corymbose at the apex. ⊙. H. Native of Corsica.

Var. γ, spicàtum (Lam. dict. 3. p. 523.) stem rather spiked at the apex. Smith, fl. græc. 304. Leaves not ciliated.

Straight Flax. Fl. May, July. Clt. 1759. Pl. ½ foot.

11 L. RI'GIDUM (Pursh, fl. amer. sept. 1. p. 210.) leaves stiffly erect, linear, short; stem angular, furrowed; sepals ovate, acuminate, 3-nerved, glandularly-ciliated; petals oblong, very narrow; styles connate to the middle. ⊙. H. Native of North America on the banks of the river Missouri. Flowers sulphur-coloured.

Stiff-leaved Flax. Fl. July. Clt. 1807. Pl. 1 foot.

12 L. SELAGINOI'DES (Lam. dict. 3. p. 525.) leaves filiform, mucronate, alternate, crowded; stems suffruticose, branched at the apex; flowers terminal, almost sessile; ovary 10-celled. ♄. G. Native of Monte Video on rocks, also of Chili. Flowers white or brownish. Petals shorter than the calyx.

Selago-like Flax. Shrub procumbent or ¼ foot erect.

13 L. PROSTRA'TUM (Lam. dict. 3. p. 525.) plant glabrous; leaves alternate, oval-oblong; stems prostrate, very much branched; flowers lateral, solitary, on very short peduncles; sepals bluntish. ♃? ♄. G. Native of Peru on dry hills near Lima. Leaves like those of *Polýgala vulgàris*. Flowers like those of *L. Gállicum*.

Prostrate Flax. Pl. prostrate.

14 L. VIRGINIA'NUM (Lin. spec. 398.) plant glabrous, erect; leaves linear-lanceolate, alternate, radical ones ovate; panicle loose, corymbose; sepals acute; styles connate at the base; capsules awnless. ⊙. H. Native of North America on dry sunny hills and in fields, from New York to Virginia. L. Virgínicum, Pursh, fl. amer. sept. 1. p. 210. Flowers small, remote.

Virginian Flax. Fl. July, Aug. Clt. 1807. Pl. 1 foot.

15 L. MEXICA'NUM (H. B. et Kunth, nov. spec. amer. 6. p. 39.) plant glabrous, erect; leaves alternate; lower ones somewhat opposite, oblong, or ovate-oblong, acute, rounded at the base; branches panicled; sepals ovate; stigmas globose, acute, ciliated; styles connate to the middle; capsules acutely mucronate. ♃. F. Native of Mexico in woods near Santa Rosa. Benth. bot. reg. 1326.

Mexican Flax. Fl. June, July. Clt. 1828. Pl. 1 foot.

16 L. MYSORE'NSE (Heyne, mss. ex Wall. cat. herb. ind. no. 1507. Benth. bot. reg. no. 1326.) glabrous, erect; leaves alternate, oblong, obtuse, tapering to the base; flowers paniculately-corymbose; sepals ovate, acutish, with rather ciliated margins; petals hardly exceeding the sepals; styles connate at the base; stigmas globose; capsule acutely-mucronate. ⊙. S. Native of Mysore. Flowers about the size of those of *L. Virginiànum*.

Mysore Flax. Pl. ½ foot.

17 L. SCHIEDEA'NUM (Schlecht. et Cham. in Linnæa. 5. p. 234.) smooth, ascending, woody at the base, slender; leaves in something like whorls, 4 or nearly opposite, but mostly all alternate, obovate-lanceolate and linear-lanceolate, tapering to the base, sessile, rough on the margins; flowers disposed in dichotomous cymes; the branches axillary and alternate; bracteas linear, glandular, and fringed; sepals ovate-lanceolate, acute, with glandular serratures or fringed; fruit shorter than the calyx. ♄. G. Native of Mexico in woods near Jalapa. Flowers small, yellow.

Schiede's Flax. Shrub 1 foot.

18 L. AQUILI'NUM (Mol. chil. ed germ. 126.) plant glabrous, erect; leaves alternate, lanceolate, acute; peduncles bifid; pedicels longer than the calyx. ♃. F. Native of Chili on the mountains.—Feuill. Per. 3. p. 32. t. 22. f. 2.

Eagle Flax. Pl. 1 foot.

19 L. TENE'LLUM (Schlecht. et Cham. in Linnæa. 5. p. 235.) villous; root woody, descending, branched, white; stem densely leafy; peduncles twice or thrice dichotomous; flowers pedicellate, solitary, alternate; floral leaves minute, almost opposite; leaves on the lower part of the stem almost in whorls, 4 or nearly opposite, elliptic, and lanceolate, acute at the base, and acutish at the top, rarely roundish and obtuse, villous or villously-ciliated, with rough margins, with a few stipitate glands in front; sepals ovate, lanceolate, keeled, acute, mucronate, with glandular fringed margins. ♃. F. Native of Mexico near Jalapa. Flowers yellow, larger than those of *L. cathárticum*.

Tender Flax. Pl. ½ foot.

20 L. CORYMBI'FERUM (Desf. atl. 1. p. 279. t. 80.) plant glabrous, erect; leaves lanceolate, erect, alternate, 3-nerved, rough; panicle loose, somewhat corymbose; sepals awl-shaped, mucronate at the apex; petals four times longer than the calyx; styles distinct; stigmas not capitate. ⊙. H. Native on Mount Atlas near Mayane. Flowers the size of those of *L. usitatíssimum*.

Corymb-bearing Flax. Fl. June, July. Pl. 1 to 1½ foot.

21 L. DAHU'RICUM (Schult. syst. 6. p. 752.) plant glabrous, erect; lower leaves lanceolate-spatulate, crowded; cauline ones linear-lanceolate, remote, with rather roughish revolute margins; panicle lax, corymbose; pedicels very short; sepals ovate, lanceolate; petals thrice as long as the calyx. ♃. H. Native of Dahuria.

Dahurian Flax. Fl. June, July. Clt. 1816. Pl. 1 foot.

22 L. MARI'TIMUM (Lin. spec. 400.) plant glabrous, erect; leaves lanceolate, 3-nerved, alternate, lower ones opposite, obtuse; panicle lax, rather corymbose; sepals ovate, with short points; petals 3-times longer than the calyx; styles distinct. ♃. H. Native of the south of Europe in grassy boggy places by the sea-side. Jacq. hort. t. 154. L. heterophýllum, Mœnch. suppl. 99.—Lob. icon. t. 412. f. 2.—Tratt. tab. t. 579.

Sea-side Flax. Fl. July, Aug. Clt. 1596. Pl. 2 feet.

23 L. MULLE'RI (Mor. elench. ex bull. phil. March, 1829. p. 428.) This species comes very near to *L. marítimum*, and *L. setàceum*, Brot. but differs from both in the leaves being alternate, elliptical, and ciliated. ♄. H. Native of Sardinia on the mountains.

Muller's Flax. Pl. 1 foot.

24 L. ARBO'REUM (Lin. spec. 400.) shrubby, glabrous, glaucous; leaves cuneiform, obtuse, alternate, recurved; flowers few, somewhat capitate; sepals oval-lanceolate, acuminated; petals thrice as long as the calyx; style free; stigmas oblong. ♄. H. Native of Candia and Italy on the mountains. Sibth. et Smith, fl. græc. t. 305. Curt. bot. mag. t. 234. L. campanulàtum, D. C. fl. fr. ed. 3. vol. 4. p. 797.—Alp. exot. p. 19. t. 13.

Tree Flax. Fl. May, June. Clt. 1788. Shrub 1 foot.

25 L. CAMPANULA'TUM (Lin. spec. 400.) plant scabrous at the base, glaucous; leaves alternate, lower ones rounded at the apex; middle ones furnished with a small point, upper ones obversely lanceolate, acuminate, each furnished at the base with two glands; sepals linear-lanceolate; petals 3-times longer than the calyx; flowers corymbose. ♃. H. Native of the south of Europe, especially in arid places of France.—Tab. icon. p. 414. There is a variety of this plant in Tauria, with the leaves and branches pubescent.

Campanulate-flowered Flax. Fl. Ju. Aug. Clt. 1795. Pl. 1 ft.

26 L. TAU'RICUM (Willd. enum. p. 339.) plant shrubby at the base, greenish; leaves alternate, glaucous, furnished with two glands at the base of each, lower ones rather spatulate, upper ones lanceolate; panicle dichotomous; sepals acuminated, serrulated; petals 3-times longer than the calyx. ♄. H. Native of Tauria L. campanulàtum, Bieb. fl. taur. 1. p. 255.

Taurian Flax. Fl. June, Aug. Clt. 1818. Shrub ½ foot.

27 L. Chamissònis (Schiede in Schlecht, Linnæa. 1. p. 68.) stems ascending, woody at the base; branches alternate; leaves lanceolate, glandless at the base, lower ones opposite, upper ones alternate; flowers opposite the leaves and terminal; petals yellow; styles free to the base; stigmas capitate; capsules acutish, with the valves flat on the back. ♄. G. Native of Chili.

Chamisso's Flax. Shrub 1 foot.

28 L. capita'tum (Kit. in Rœm. et Schult. syst. 6. p. 751.) stem shrubby at the base; leaves furnished with a gland on each side at the base, alternate, lower ones spatulate, with smooth margins, upper ones lanceolate, acute, acuminated, with scabrous margins; flowers capitate, sessile; sepals acuminated, subserrated? ♃. H. Native on the Alps of Croatia.

Capitate-flowered Flax. Fl. June, Aug. Clt. 1816. Pl. ½ to ¾ foot.

29 L. fla'vum (Lin. spec. 399.) plant woody at the base, greenish; leaves furnished with two glands at the base of each, alternate, narrow, lanceolate, acute, sessile, with smooth margins; branches of panicle dichotomous; sepals acuminated, serrulated; petals very blunt, 3-times longer than the calyx. ♃. H. Native of Austria, Hungary, Carniola, and Caucasus, in dry meadows. Jacq. aust. t. 214. Curt. bot. mag. t. 312. L. campanulàtum β, D. C. fl. fr. 4. p. 797. L. monopétalum, Steph. enum. mosq. no. 214. Corolla monopetalous, 5-cleft. Steph. l. c.

Yellow Flax. Fl. June, Aug. Clt. 1793. Pl. 1 to 1½ foot.

30 L. tetra'gynum (Colebr. mss. ex Wall. cat. herb. ined. no. 1506. ex Benth. bot. reg. no. 1326.) glabrous, shrubby, branched; leaves elliptical, oblong, acuminated, serrated, tapering to the base, stalked; flowers in capitate-corymbs; peduncles bracteate; sepals ovate, with short points and sub-ciliated margins; petals twice the length of the calyx; styles 4, free; stigmas globose; capsule obtuse. ♄. G. Native of Nipaul and Silhet. Flowers smaller than those of *L. trígynum*.

Four-styled Flax. Shrub 2 feet?

31 L. cæspitòsum (Sibth. et Smith, fl. græc. t. 305. prod. p. 216.) plant glabrous, glaucous, tufted, shrubby at the base; leaves obovate, acute; sepals ovate, obtuse. ♄. H. Native of Crete on the higher mountains. L. globulariæfòlium, Poir. suppl. 3. p. 445. A small much-branched shrub. Capsules globose. Flowers cymose. Styles distinct.

Tufted Flax. Shrub ½ foot.

32 L. tri'gynum (Roxb. ex asiat. resear. 6. p. 357.) shrubby, glabrous; leaves alternate, elliptical, entire, pointed at both ends, feather-nerved; flowers large, bracteate; styles 3, distinct; capsule obtuse; sepals lanceolate; petals obovate, emarginate. ♄. G. Native of the East Indies at Sirinagur. Sims, bot. mag. t. 1100. Andr. bot. rep. t. 449. Delaun. herb. amat. t. 290. Capsules 6-celled. Stigmas not capitate.

Three-styled Flax. Fl. Jan. Oct. Clt. 1799. Sh. 2 to 4 ft.

33 L. Cicanòbum (D. Don, prod. fl. nep. 217.) shrubby, glabrous; leaves alternate, membranaceous, elliptical-oblong, acuminated, stalked, and acute at the base, serrate? flowers in terminal umbels; styles 3, connected to the middle; sepals oblong, acute; capsule obtuse. ♄. G. Native of Nipaul at Narainhetty. L. Cicanòbu, Hamilt. mss. Leaves 6 inches long. Flowers large. In the language of the Nawaris, this plant is called *Cicanobu Swa*. Mr. Bentham is disposed to consider this a mere variety of *L. rèpens*.

Cicanobu Flax. Fl. Decem. Shrub 1 to 2 feet.

34 L. re'pens (D. Don, prod. fl. nep. p. 217.) stem shrubby; leaves alternate, ovate-cuneated, mucronulate, glabrous, crenulated, feather-nerved; flowers solitary, stalked; sepals lanceolate, mucronate, with denticulated margins; capsule obtuse; styles 3, connate to about the middle. ♄. G. Native of Nipaul at Narainhetty. L. rèpens and semitrígynum, Hamilt. mss. L. trígynum, Smith, exot. bot. t. 17. Flowers large, campanulate. Root creeping.

Creeping Flax. Fl. Nov. Shrub 3 foot.

35 L. Macræ'i (Benth. in bot. reg. no. 1326.) glabrous; stems shrubby at the base; branches erect; leaves opposite or alternate, lanceolate, acuminated, stiff; sepals ovate, acuminated; petals twice the length of the calyx; style equal to the corolla, slightly quinquefid at the apex; stigmas globose; capsules acutely mucronate. ♄. G. Native of Chili at Valparaiso. Flowers about the size of those of *L. marítimum*.

Mac Rae's Flax. Shrub 1 foot.

36 L. mono'gynum (Forst. prod. no. 145.) stem suffruticose; leaves alternate, lanceolate, 3-nerved. ♄. G. Native of New Zealand. Flowers yellow. Styles connate at the base. According to Mr. Bentham this is the same as *L. Africànum*.

One-styled Flax. Fl. June, July. Shrub 1 foot.

37 L. Africa'num (Lin. mant. p. 360.) plant glabrous, erect, shrubby at the base; leaves linear-lanceolate, acute, alternate, or irregularly opposite, or in whorls; panicle corymbose, erect; flowers disposed along the branches, almost sessile; sepals rather serrately ciliated; styles connate at the base. ♄. G. Native of the Cape of Good Hope. Jacq. coll. 3. p. 218. t. 353. Curt. bot. mag. 403.

African Flax. Fl. June, July. Clt. 1771. Shrub 1 to 2 ft.

38 L. Æthiòpicum (Thunb. fl. cap. 2. p. 143.) plant glabrous, shrubby at the base, erectly-spreading; leaves ovate, mucronate, opposite; flowers terminal, rather umbellate; styles connate at the base. ♄. G. Native of the Cape of Good Hope. L. Africànum, Rchb. icon. exot. t. 46.

Æthiopian Flax. Fl. June, July. Clt. 1771. Shrub 1 foot.

39 L. quadrifòlium (Lin. spec. 402.) plant glabrous, erect; leaves ovate, somewhat mucronate, 4 in a whorl, upper ones sometimes opposite; styles distinct. ♃. G. Native of the Cape of Good Hope. Curt. bot. mag. t. 431. Houtt. pfl. syst. 4. p. 263. t. 46. f. 1. Perhaps L. quadrifòlium of Thunb. fl. cap. 2. p. 244. and L. tetraphýllum of Habenstr. in herb. Panzer, are different from this.

Four-leaved Flax. Fl. May, June. Clt. 1787. Pl. 1 to 1½ ft.

§ 2. *Flowers blue or rose-coloured, rarely varying to white.*

40 L. verticilla'tum (Lin. spec. 402.) leaves in whorls, linear-lanceolate, upper ones as well as calyxes villous. ⊙. H. Native of Italy about Rome. Petals grey.

Whorled-leaved Flax. Fl. June, July. Pl. 1 foot.

41 L. stria'tum (Walt. fl. carol. p. 118.) leaves opposite, ovate, or oblong, with the margins and nerves somewhat decurrent; flowers panicled, terminal. ⊙. H. Native of Carolina. Habit of *Campánulata hýbrida*. Stems somewhat tetragonal, simple. Sepals ovate, acute, a little smaller than the petals. Flowers blue and striated.

Striated Flax. Fl. June, July. Clt. 1817. Pl. 1 to 1½ foot.

42 L. viscòsum (Lin. spec. 398.) leaves lanceolate, 3-5-nerved, alternate, and somewhat opposite, and are as well as stems hairy, middle and upper ones, as well as sepals, bearing glandular hairs; styles shorter than the stamens or nearly equal with them. ♃. H. Native of the southern parts of Germany and Italy in sunny places. Flowers pale wine-coloured, rarely blue. Capsules of 10 cells.—Bertol. am. itin. p. 139.

Var. β, *sylvéstre* (Scop. carn. no. 383. t. 11.) leaves all ciliated with glandular hairs, and as if they were serrated. ♃. H. Native of Carniola.

Var. γ, *Nestlèri* (D. C. prod. 1. p. 246.) lower leaves smoothish, somewhat ovate. ♃. H. Native of Austria in gravelly or sandy fields.

Var. δ, *hypericifòlium* (Sal. parad. t. 79.) leaves ovate-oblong, distinctly 5-nerved. Sims, bot. mag. t. 1048.—L. venùstum,

Andr. bot. rep. 477. Flowers large, almost the size of those of a *Mallow*. Perhaps a distinct species.

Clammy Flax. Fl. June, Aug. Clt. 1807. Pl. 1 to 2 feet.

43 L. PILI'GERUM (Presl. ex Spreng. syst. p. 127.) stem simple, hairy; leaves oblong-lanceolate, 3-nerved; sepals linear, pilose; styles equal in length with the stamens. ♃. H. Native of Sicily and Crete.

Hair-bearing Flax. Pl. 1 to 2 feet.

44 L. HIRSU'TUM (Lin. spec. 398.) leaves lanceolate, 3-5-nerved, alternate, and somewhat opposite, and are as well as the stems hairy, upper ones as well as sepals ciliated, with glandular hairs; stamens connate to the middle. ♃. H. Native of Italy, south of France, Tauria, Caucasus, and Hungary, in elevated places exposed to the sun. Flowers bluish, rarely rose-coloured. Jacq. aust. t. 31. Smith, fl. græc. t. 302.—Moris. hist. 2. p. 573. sect. 5. t. 26. f. 5. Panicle corymbose.

Var. β, elàtius (Rœm. ined. Schult. syst. 6. p. 740.) leaves evidently 3-nerved. ♃. H. Native of Caucasus.

Hairy Flax. Fl. July, Aug. Clt. 1759. Pl. 1 foot.

45 L. ASCYRIFÒLIUM (Sims, bot. mag. t. 1087.) leaves alternate, 3-nerved, ovate, cordate, pubescent, upper ones somewhat opposite; flowers somewhat spiked; sepals acuminated, hairy. ♃. H. Native of Portugal near Coimbra. Flowers white, streaked with bluish-purple veins, with a yellow bottom. Petals crenulated.

Ascyrum-leaved Flax. Fl. July, Aug. Clt. 1800. Pl. 1 ft.

46 L. NERVÒSUM (Walds. et Kit. pl. hung. 2. t. 105.) stem hairy at the base; leaves lanceolate, pointed, 3-5-nerved, glabrous; panicle loose; sepals awl-shaped, pointed, serrated at the base. ♃. H. Native of Hungary, the Ukraine, and Tauria, on hills. Flowers large, blue. Petals emarginated or pointed, crenated at the apex. Styles white. Capsules with 10 prominent sutures.—Barrel. icon. p. 1009.

Var. β, glabràtum (D. C. prod. 1. p. 426.) stem glabrous at the base. ♃. H. Native of Russia on the banks of the Don.

Nerved-leaved Flax. Fl. June, July. Clt. 1822. Pl. 1 to 1½ foot.

47 L. NARBONE'NSE (Lin. spec. 398.) plant glabrous, erect, rather glaucous; leaves alternate, distant, lanceolate-linear, very acute, and rather stiff; panicle sub-corymbose; sepals acuminated, with the margins scariose at the base. ♃. H. Native of Spain, south of France, and Italy, in elevated sunny places. Flowers large, beautiful, blue, very rarely white. Hook. bot. mag. icon.—Barrel. icon. p. 1007.

Narbonne Flax. Fl. May, July. Clt. 1759. Pl. 2 feet.

48 L. PUNCTA'TUM (Presl. ex Spreng. syst. 1. p. 962.) stem diffuse, usually 3-flowered; leaves imbricate, lanceolate, acute, rather scabrous, full of pellucid dots; sepals ovate. ♃. H. Native of Sicily.

Dotted-leaved Flax. Pl. diffuse.

49 L. USITATI'SSIMUM (Lin. spec. 397.) plant erect, glabrous; leaves lanceolate or linear acute; panicle corymbose; sepals ovate, acute, or mucronate, with scarious or membranaceous margins; petals rather crenated, 3-times larger than the calyx. ☉. H. Native of many parts of Europe, as well as in Nipaul and North America, in corn-fields, said to be originally from Egypt. Tratt. tab. t. 744. Smith, engl. bot. t. 1357. Curt. fl. lond. fasc. 5. t. 22. Mart. fl. rust. t. 133. L. satìvum, Black. herb. t. 160. Plench. t. 243. L. arvénse, Neck. gallob. 159. Flowers blue. Sepals 3-nerved.

Var. β, hùmile (Mill. dict. no. 2.) petals emarginate; stem dwarf-branched.

Flax has been cultivated from the earliest ages and for an unknown length of time in Britain, of which it is now considered a naturalized inhabitant. It is cultivated both for its fibre for making thread, and its seed for being crushed for oil, but never has been grown in sufficient quantity for either purpose. The legislature of the country, as Brown observes, has paid more attention to framing laws regarding the husbandry of flax than to any other branch of rural economy; but it need not excite surprise that these laws, even though accompanied by premiums, have failed to induce men to act in a manner contrary to their own interest. The fact is, the culture of flax is found on the whole less profitable than the culture of corn. It is one of the most severe crops when allowed to ripen its seed; but by no means so when pulled green. Loud. encycl. agri. p. 846.

The varieties of the common *Flax* are few, and hardly deserving notice. Marshall mentions the *Blue* or *Lead-coloured Flax*, as being cultivated in Yorkshire, and Professor Thaer mentions a finer and coarser variety; he also as well as some other agriculturists has tried the *Lìnum perénne*, but though it affords a strong fibre, it is coarser, and difficult to separate from the woody matter.

The soil most proper for *flax*, besides the alluvial kinds, are deep and friable loams, and such as contain a large proportion of vegetable matter. Strong clays do not answer well, nor soils of a gravelly or dry sandy nature. But whatever be the kinds of soil, it ought neither to be too poor nor in too rich a condition; because in the latter case the *flax* is apt to grow too luxuriant, and to produce a coarse sort; and, in the former case, the plant from growing weakly affords only a small produce. (*Treat. on Rural Affairs.*) If there be water at a small depth below the surface of the ground, it is thought by some still better, as is the case in Zealand, which is remarkable for the fineness of its *flax*, and where the soil is deep and rather stiff, with water almost every where at the depth of a foot and a half or two feet underneath it. It is said to be owing to the want of this advantage, that the other provinces of Holland do not succeed equally well in the culture of this useful plant; not that but fine *flax* is also raised on light lands, if they have been well tilled and manured, and if the seasons are not very dry. It is remarked in the letters of the Dublin Agricultural Society, that most stiff soils yield much larger quantities of *flax* and far better seed than can be obtained from light lands, and that the seeds reared from the former may with proper care be rendered full as good as any that can be imported from Riga or Zealand. M. Du Hamel, however, thinks that strong land can hardly yield such fine *flax* as that which grows on lighter ground. The place of *flax* in a rotation of crops is various, but in general it is considered as a corn or exhausting crop, when the seed is allowed to ripen, and as a green pea or bean crop, when the plant is pulled green. *Flax*, Donaldson observes, is sown after all sorts of crops, but is found to succeed better on lands lately broken up from grass. In Scotland, the most skilful cultivators of *flax* generally prefer lands from which one crop of grain only has been taken, after having been several years in pasture. When such lands have been limed or marled, immediately before being laid down to grass, the crop of *flax* seldom or never misgives, unless the season proves remarkably adverse. In the north of Ireland flax is generally sown by the small farmers after potatoes. In Belgium it is supposed not to do well after peas or beans, nor to succeed if sown oftener on the same soil than twice. (*Von Thaer.*)

The preparation of the soil when grass land is intended for *Flax* consists in breaking it up as early in the season as possible, so that the soil may be duly mellowed by the winter frosts, and in good order for being reduced by the harrows when the seed process is attempted. If *flax* is to succeed a corn crop, the like preparation is required to procure the aid of frost, without which the surface cannot be rendered fine enough for receiving the seed. Less frost, however, will do in the last than in the first case, therefore the grass land ought always to be earliest

ploughed. At seed time harrow the land well before the seed is distributed, then cover the seed to a sufficient depth by giving a close double tine of the harrows. Water-furrow the land, and remove any stones or roots that may remain on the surface, which finishes the process.

The ordinary season of sowing *flax-seed* is from the middle of March to the end of April, but the last week of March and the first 10 days of April is esteemed the best time, and accordingly within these periods the greatest quantity of *flax-seed* is sown in this country. In France and Italy it is often sown in the autumn, by which a larger crop is produced, especially when seed is desired.

The quantity of seed depends upon the intention of the crop. When a crop of seed is intended to be taken, thin sowing is preferable, in order that the plants may have room to throw out lateral shoots, and to obtain air in the blossoming and filling season. But it is a mistake to sow thin when *flax* is intended to be taken, for the crop then becomes coarse, and often unproductive. From eight to ten pecks per acre is the proper quantity when *flax* is intended, but when seed is the object six pecks is sufficient, for seed from thick sown crops is never so good, nor so abundant. (*Donaldson.*) In the choice of seed, that which is of a bright, brownish colour, oily to the feel, and at the same time weighty, is considered the best. Linseed imported from various countries is employed. That brought from Holland is in the highest estimation, as it not only ripens sooner than any other that is imported, but also produces greater crops, and *flax* of that quality which best suits the chief manufactures of the country. American seed produces in common fine *flax*, but neither the quantity of *flax*, nor capsules, nor are they so large as the produce of Dutch linseed. Riga seed yields a very coarse sort of flax, but greater in quantity of seed than any other. It is common in some parts of Scotland to sow seed saved from the crops of the preceding year, especially when that crop was raised from seed imported from Holland. The success of this practice is found to depend greatly on changing the seed from one sort of soil to another of an opposite nature. But the saving in the expense of purchasing that sort of seed in place of what is newly imported from Holland is so inconsiderable, and the risk of the crop misgiving so much greater in the one case than in the other, that those only who are ignorant of the consequences, or who are compelled from necessity, are chargeable with this act of ill-judged parsimony. *Flax-seed* is by some farmers changed every three years in succession without perceiving any degeneracy. When any degeneracy takes place the seed of *flax* grown on a different soil, as moss, moor, sand, &c. without any view to the produce in fibre, will, it is said, answer as well as foreign seed.

The manner of sowing *flax* is almost always the same, but when seed is the main object drilling may be adopted, by which seed may be saved in sowing, cleaning conducted at less expense, and the plants rendered more vigorous and branchy, by the stirring of the soil, and the admission of air between the rows. The fibres of *flax* grown in this way will be shorter, and less equal in thickness throughout their length, than *flax* grown by the broadcast mode and tolerably thick.

The after culture consists chiefly in weeding, but sometimes it commences with rolling the surface, which is a very proper operation when the soil is very dry, the season advanced, or the earth very porous. By this process the earth is pressed firmly to the seeds, and they are thereby stimulated to vegetate sooner, and the drought is kept out. On some soils, and in wet and stormy seasons, *flax* is apt to be laid, to guard against which some cultivators run across their flax-field slender poles, fixed to stakes; but a better method is to run small ropes across the field both lengthwise and breadthwise, so as to form a sort of net-work, fastened to stakes at due distances, which is proof against almost every accident that can happen from tempestuous weather. In Scotland a crop of *flax* is sometimes weeded by turning a flock of sheep at large into the field. They will not take the young *flax* plants, but they carefully search for the weeds, which they devour.

The crop of *flax* is taken in by pulling, on which there is considerable differences of opinion. None, however, think of pulling it before it comes into flower, when fibre is the sole object, or before the seed in the capsules acquires a brownish colour, when fibre and seed jointly or fibre alone is the object. Some argue for pulling while it is green, in order that its fibres may be softer and finer; others, with the same view, pull it up before its seeds are quite formed, and others again think that it should not be pulled till some of the capsules have begun to open, being of opinion that the fibres of green *flax* are too tender, and that they fall into tow. On the other hand it is certain that the fibres of *flax* which has stood till it is very ripe are always stiff and harsh, that they are not easily separated from the woody part, and that they do not bleach so well, therefore both extremes should be avoided, and it seems most reasonable to think that the properest time for pulling *flax* is, when its stalks begin to turn from a green to a yellow colour, when its leaves begin to fall, and when its seeds begin to be brown. Donaldson observes that a crop of *flax* frequently grows and runs out a great number of seed-bearing branches. When that is the case the seeds, not the *flax*, ought to be the farmer's chief object, and the crop should be allowed to stand till the seeds are perfected. But that when the crop thrives and is likely to become more valuable for the *flax* than the seeds, it should be pulled soon after the bloom drops off, and before the pods turn hard and sharp in the points. When *flax* is grown for its fibre, Brown considers it the safest course to take it in a little early, as any thing wanted in quantity being in this way made up by the superiority of the quality. The operation of pulling *flax* differs according to the intention of the crop. When it is grown for the fibre it is pulled and tied immediately in sheaves like corn, being carried off immediately to be watered. But when seed is the object of the crop, it is pulled up and laid in handfuls across each other, the reason of which is, the business of rippling is facilitated, as the ripplers, in place of having to separate each handful from the bundle, find it by this simple precaution already done to their hand. In most fields there are varieties of soils, of course some parts of a field will produce fine *flax*, others coarse, some long and some short; in a word, crops of different lengths and qualities. It cannot be supposed that all these different kinds of *flax* will undergo an equal degree of watering, grassing, breaking, and heckling without sustaining much injury. Although it is of much importance yet it very seldom happens that much attention is bestowed to separate the different sorts of *flax* from each other, in pulling the crop. Some instead of laying the *flax* in loose handfuls, tie them up loosely at the top, and then spread out their roots and set several of them together in an upright position upon their roots. In either case the *flax* is left twelve or fourteen days in the field to dry it. This drying is certainly not necessary for the rippling, because the ripple will separate the capsules from the *flax* as effectually before it has been dried as it will afterwards, and if it is done with a view to ripen the seed, it should be considered that the *flax* will be more hurt by the longer time of steeping, which will become necessary in consequence of this drying, than the seed can be benefited, because the more the membrane which connects the fibres to the reed is dried, the greater must be the degree of putrefaction necessary to loosen and destroy the cohesion of this connecting membrane; the finer parts of the *flax* itself must necessarily be destroyed by the degree of

putrefaction necessary to separate the membrane from the fibre. The practice adopted in some parts of Brittany seems, therefore, much more rational, which is to ripple the *flax* after it has lain in the air two or three days, but even one day will be sufficient if the weather is dry.

The process of rippling is the next operation. A large cloth should be spread on a convenient spot of ground, with a ripple placed in the middle of it. In performing this operation, the capsules are separated from the stalks by means of an iron comb called a ripple, fixed on a beam of wood, on the ends of which two persons sit, who, by pulling the seed ends of the *flax* repeatedly through this comb, execute the operation in a very complete manner. In Scotland the pods are generally separated by the ripple, even when there is no intention of saving them for seed, as it is found when the *flax* is put into water without taking off the capsules, the water soon becomes putrid, in consequence of which the *flax* is greatly injured.

The management of the capsules and separating of the seed is the next operation. The capsules should be spread in the sun to dry, and those seeds which separate from the capsules of their own accord, being the fullest and ripest, should be set apart for sowing, in case the precaution of raising some *flax* purposely for seed has not been attended to. The capsules are then broken, either by treading or by threshing, in order to get out the remaining seeds, the whole of which, as well as the former, should be carefully sifted, winnowed, and cleaned. When the seed is laid up, it must be frequently stirred or ventilated to prevent its heating. Even this second seed affords a considerable profit by the oil which it yields, and also by being used when broken for fattening of cattle.

To facilitate the separation of the fibre from the bark, it is necessary to accelerate the process of decay or putrefaction. This may be done in different ways, but the chief are those of bleaching alone, or of steeping and bleaching. Bleaching is a tedious and laborious operation, when it is intended as a substitute for steeping, but it is the most certain for not injuring the fibre, and may be adopted on a small scale when steeping places are not at hand. In Dorsetshire and some other places, *flax*, instead of being steeped, is what is called dew-retted; that is, the stalks are allowed to lie on the grass until they arrive at that state in which the harl or woody part separate easily from the boon, reed, or fibre, by the action and influence of the dew. This is nothing more than exposing the *flax* to the influence of the weather for a longer period than is necessary, when the operation of watering has been previously performed, as in grassing. Steeping, however, is the most universal practice both in Britain and on the Continent. Of late an invention has been made by Mr. Lee of Middlesex, by which, with the aid of soft soap and machinery, the fibre is more completely separated than by steeping, and uninjured by that process. When *flax* is to be separated by this new process, the cultivator has only to pull it in handfulls, dry it, bind it into sheaves, and put it up in stacks like corn, till wanted by the manufacturer.

Steeping or watering, however, is and will be the general practice, till flax-dressing machines come into general practice. In performing this operation, the *flax*, whether it has been dried and rippled or pulled green, is loosely tied into small bundles, the smaller the better, because it is then most equally watered. These sheaves ought to be built in the pool in a reclining upright position, so that the weight placed above may keep the whole firm down. The weights made use of are commonly stones placed on planks or directly on the *flax*. The Flemish mode of steeping *flax*, as described by Radcliff, is said to improve the quality of the *flax* and greatly increase its whiteness. The mode differs from the common practice in placing the bundles in the steep vertically instead of horizontally, in immersing the *flax* by means of transverse sticks, with that degree of weight annexed, which shall not push it down to the bottom, but leave it to descend spontaneously towards the conclusion of the steepage; and in leaving at first a space of half a foot between the bottom and the roots of the *flax*. The spontaneous descent of the *flax* is an indication of its being sufficiently steeped, and the strength and quality of the fibre are said to be much better preserved by this mode, in which the temperature of the atmosphere acts with most force on the upper part of the plant, which needs it most.

The water most proper for steeping flax should be clear, soft, and in standing pools. Compared with running water, pools occasion the *flax* to have a better colour, to be sooner ready for the grass, and even to be of superior quality in every respect. Where soft, clear, stagnating water cannot be obtained without art, a pit or canal is commonly formed, adjoining a river or stream, whence water can be easily brought. This pit or canal is filled with water for some time (a week or two) before it be proposed to pull the *flax*, by this means the water acquires a greater degree of warmth than river water possesses, and which contributes greatly to facilitate the object farmers have in view in immersing green *flax* in water, namely, to make the flaxing substance part easily and completely from the boon reed or harl.

The period that flax ought to remain in the water depends on various circumstances, as the state of ripeness in which it is pulled, the quality and temperature of the water, &c. The most certain rule to judge when *flax* is sufficiently watered is, when the boon becomes brittle and the harl separates easily from it. In warm weather ten days of the watering process is sufficient; but it is proper to examine the pools regularly after the seventh day, lest the *flax* should putrefy or rot, which sometimes happens in very warm weather. Twelve days will answer in any sort of weather, though it may be remarked that it is better to give too little of the water than too much, as any deficiency may be easily made up by suffering it to be longer on the grass, whereas an excess of water admits of no remedy (*Brown*).

Grassing or bleaching flax is the next operation, the intention of which is to rectify any defect in the watering process, and to carry on the putrefying process to that point when the fibre will separate from the bark, boon, reed, or harl with the greatest ease. In performing this operation the *flax* is spread very thin on the ground, and in regular rows, the one being made to overlap the other a few inches, with a view of preventing, as much as possible, its being torn up and scattered by gales of wind. Old grass-ground, where the herbage does not grow to any great height, is the best for the purpose, as when the grass or weeds spring up so as to cover the flax, it is frequently rotted, or at least greatly injured thereby. The time allowed for grassing is regulated by the state of the *flax*, and seldom exceeds ten or twelve days. During this time it is repeatedly examined, and when it is found that the boon has become very brittle, so that on being broken and rubbed between the hands, it easily and freely parts from the harl, it is then taken up, a dry day being chosen for the purpose, and being bound in sheaves is either sent directly to the mill, which is the usual practice in the northern districts, or broken and scutched by a machine or implement for that purpose.

Steeping of flax in hot water and soft soap, said to be the invention of Lee, and for which he was granted by parliament a secret or unenrolled patent, is said to separate the fibre from the woody matter better than steeping in water, and this in the short space of two or three hours, and either with green flax or such as has been dried or stacked for months or years.

The dressing of flax consists of various operations, such as scutching, hacking, or breaking, by which the woody part is broken, and heckling or combing, by which the fibre is separ-

ated from the woody part, and sorted into lengths. These operations are often all performed by the cottager or small farmer, who grows *flax* for the purpose of spinning the fibre in his own family. But there are also public *flax* mills, impelled by water or other powers, by which *flax* is scutched, and it is then heckled by professed hecklers. A method of preparing *flax* in such a manner as to resemble cotton in whiteness and softness, as well as in coherence, is given in the Swedish Transactions for the year 1747. For this purpose a little sea-water is to be put into an iron pot, or an untinned copper kettle, and a mixture of equal parts of birch-ashes and quicklime to be strewed upon it; a small bundle of *flax* is to be opened and spread upon the surface, and covered with more of the mixture, and the stratification continued till the vessel is sufficiently filled. The whole is then boiled with sea-water for ten hours, fresh quantities of water being then supplied according to the evaporation, that the matter may never become dry. The boiled *flax* is to be immediately washed in the sea by a little at a time in a basket with a smooth stick, at first when hot, and when grown cold enough to be borne by the hands, it must be well rubbed, washed with soap, laid to bleach, and turned and watered every day. Repetitions of the washing with soap expedite the bleaching, after which the flax is to be beat, and again well washed; when dry it is to be worked and carded in the same manner as common cotton, and pressed betwixt two boards for 48 hours. It is now fully prepared and fit for use. It loses in this process nearly one-half of its weight, which however is abundantly compensated by the improvement made in its quality.

Lee's method of breaking flax and hemp without dew-retting was invented in 1810, and was the first step towards a great improvement, brought nearer to perfection by the new patent machines of Messrs. Hill and Bunby, which are portable, and may be worked in barns or any kind of out-house; they are also well calculated for parish workhouses and charitable institutions; a great part of the work being so light, that it may be done by children and infirm persons, and such is the construction and simplicity of the machines, that no previous instruction or practice in required. The woody part is removed by a very simple machine, and by passing through the second machine, equally simple, the flax may be brought to any degree of fineness equal to the best used in France and the Netherlands, for the finest lace and cambric. The original length of the fibre, as well as the strength remains unimpaired, and the difference of the produce is immense, being nearly two-thirds, one ton of flax being produced from four tons of stalks. The expense of working each ton obtained by this method is only five pounds. The glutinous matter may be removed by soap and water only, which will bring the flax to such perfect whiteness, that no further bleaching is necessary, even after the linen is woven; and the whole process of preparing flax may be completed in six days.

The produce of flax in seed is generally from six to eight, sometimes as high as ten or twelve bushels per acre, and the price depends in a great measure on that of foreign seed imported; as when sold to oil makers it is generally about one-half of Dutch seed, sold for the purpose of sowing. The seed is separated into three qualities, the best for sowing, the second best for crushing for oil, and the inferior for boiling or steaming for cattle.

The produce of flax in fibre varies exceedingly. Before being sorted, the gross product of fibre varies from three cwt. to half a ton per acre.

The use of flax in the linen manufacture is well known. The seed is crushed for oil, which is that in common use by painters; the cake or husk, which remains after the expression of the oil, is sold for fattening cattle, and in some places as a manure; and the inferior seed, not fit for crushing, is boiled and made into flax-seed jelly, esteemed an excellent nutriment for stock, the process of making which we shall here describe. The proportion of water to seed is about seven to one. Having been steeped in water eight and forty hours previous to boiling, the remainder is added cold, and the whole boiled gently about two hours, keeping it in motion during the operation, to prevent its burning to the boiler, thus reducing the whole to a jelly-like, or rather a gluey or ropy consistence. After being cooled in tubs it is given with the mixture of barley-meal, bran, and cut chaff; a bullock being allowed about two quarts of the jelly per day, or somewhat more than a quart of seed in four days; that is about one-sixteenth of the medium allowed of oil-cake.

The diseases of flax are few, and chiefly the fly, which sometimes attacks the plant when young, and the mildew and rust.

Medical qualities. Linseed contains about one-fifth of mucilage and one-sixth of fixed oil. The mucilage resides entirely in the skin, and is separated by infusion or decoction, the oil by expression. It is one of the cheapest fixed oils, but is generally rancid and nauseous, and unfit for internal use. Linseed is emollient and demulcent. The entire seeds are used in cataplasms. The infusion is much employed as a pectoral drink, and in ardor-urinæ, nephritic pains, and during the exhibition of corrosive sublimate.

Very useful or Common Flax. Fl. June, July. Britain. Pl. 1 to 3 feet.

50 L. MARGINA'TUM (Poir. suppl. 3. p. 443.) plant glabrous, erect; leaves linear-lanceolate, reflexed; sepals with white margins, and are as well as the capsules mucronated; petals crenated. ♃. H. Native of? L. angustifòlium, Willd. enum. 338. but not of Huds. L. affìne, Panz. mss. Very like *L. usitatíssimum*, but the flowers are smaller.

Marginated-sepalled Flax. Fl. Ju. Jul. Clt. 1810. Pl. 2 ft.

51 L. REFLE'XUM (Ait. hort. kew. 1. p. 307.) leaves ovate-lanceolate, acuminated, reflexed, smooth; sepals acuminated; filaments connate. ♃. H. Native of the south of Europe. Flowers blue.

Reflexed-leaved Flax. Fl. July. Clt. 1777. Pl. 1½ foot.

52 L. RU'BRUM (Rafin. carl. p. 74.) plant glabrous; stem straight, branched, angular at the top; leaves linear acute, 1-nerved; peduncles rather corymbose, striated; sepals ovate, acuminated, 3-nerved, with scarious margins. ♃. H. Native of Sicily near Agrigentum. Flowers rose-coloured. Allied to *L. usitatíssimum.*

Red-flowered Flax. Fl. June, July. Pl. 1½ to 2 feet.

53 L. OLIGOPHY'LLUM (Willd. mss. in Schult. syst. 6. p. 758.) stem branched; leaves linear, scale-formed; flowers solitary; sepals ovate, acuminated. ♃. F. Native of Buenos Ayres.

Var. α, glandulòsum (Schiede in Schlecht. Linnæa. 1. p. 68.) branched; leaves spreading, furnished with as tipular gland at the base.

Var. β, eglandulòsum (Schiede, l. c.) leaves spreading, destitute of the stipular gland.

Var. γ, squamifòlium (Schiede, l. c.) stem simple; leaves scale-formed, without the stipular gland.

Few-leaved Flax. Pl. 1 foot?

54 L. SQUAMULÒSUM (Rud. in Willd. enum. p. 338.) plant glabrous, erect; leaves linear-awl-shaped, erect, lower ones smaller, and crowded; sepals ovate, acute, 5-nerved, with membranaceous margins; petals hardly thrice the size of calyx. ♃. H. Native of Tauria and on the banks of the Don. Flowers blue, but sometimes apetalous, according to Rudolph. L. Austrìacum, Bieb. fl. taur. 1. p. 245. but not of Lin.

Scaly-leaved Flax. Fl. July, Aug. Clt. 1818. Pl. 1 to 2 ft.

55 L. DIFFU'SUM (Schult. obs. 63.) plant glabrous, diffuse, ascending; stems branched; branches spreading; leaves linear-lanceolate, acute, 1-nerved; petals twice the size of the calyx.

4. H. Native of? Flowers pale blue. L. Austrìacum, Lam. dict. 3. p. 521. Branches spreading horizontally.

Diffuse Flax. Fl. June, July. Clt. 1823. Pl. ½ to 1 foot.

56 L. ANGUSTIFÒLIUM (Huds. angl. 134.) plant glabrous, many-stemmed, rather erect; leaves linear-lanceolate, acute, 3-nerved; sepals elliptical, 3-nerved, acutish; petals hardly twice the size of the calyx. 4. H. Native of France, and Italy, also of Asia and New Holland. In England in sandy or chalky pastures, especially towards the sea. About St. Ives and Truro, Cornwall, plentifully; in Sussex and Kent; near Walsingham, and in Gunton fields, Norfolk; at Darsham, Suffolk; in a field by Allerton Hall, near Liverpool. Smith, engl. bot. t. 381. Petals pale-purple, with a slight notch.

Narrow-leaved Flax. Fl. July. England. Pl. 1 foot.

57 L. SI'CULUM (Presl. ex Spreng. syst. app. p. 127.) stem simple; leaves linear-lanceolate, acute, 3-nerved; flowers in corymbose panicles; sepals acuminated, 3-nerved, with glandular margins; petals emarginate. 4? H. Native of Sicily.

Sicilian Flax. Pl. 1 foot.

58 L. AGRE'STE (Brot. fl. lus. 481.) stems rather tufted, oblique, and are as well as lanceolate, 3-nerved; acuminated leaves glabrous; sepals lanceolate, 3-nerved, acuminated; petals cuneated; capsules mucronate, woolly at the dissepiments. ⊙. H. Native of Portugal. Petals white, with purple lines and 5 blue nerves at the claws, or from purplish-white to ash-coloured.

Wild Flax. Fl. June, July. Pl. 1 to 2 feet.

59 L. SIBI'RICUM (D. C. prod. 1. p. 427.) plant glabrous, erect, tall; leaves linear, acute, spreading, without dots; sepals oval, 5-nerved at the base, outer ones acutish, inner ones very blunt, all with membranaceous margins; petals entire, three or four times larger than the calyx. 4. H. Native of Siberia. L. perénne, var. Sibírica, Lin. spec. 379. Mill. fig. t. 166. f. 2. good. L. Austrìacum, Sims. bot. mag. t. 1086. Flowers large, beautiful blue.

Siberian Flax. Fl. June, July. Clt. 1775. Pl. 3 to 4 feet.

60 L. LEWI'SII (Pursh, fl. amer. sept. 1. p. 210.) stems tall, numerous, glabrous; leaves scattered, lanceolate-linear, mucronate, glabrous; sepals ovate, acuminated, 3-nerved; petals rounded at the apex. 4. H. Native of North America in the valleys of the Rocky Mountains, and on the banks of the Missouri. L. Sibíricum, var. Lewísii, Lindl. bot. reg. 1163. Flowers large, pale blue. Plant glaucous.

Lewis's Flax. Fl. July. Clt. 1826. Pl. 1 to 2 feet.

61 L. A'NGLICUM (Mill. dict. no. 5.) plant glabrous, ascending; leaves linear, acute, erect; sepals obovate, obscurely 5-nerved, outer ones hardly mucronate, inner ones obtuse, with membranaceous margins; petals emarginate, two or three times longer than the calyx. 4. H. Native of England on chalky hills in Cambridgeshire, Northamptonshire, and Westmoreland, and at Marsham, Norfolk. L. perénne, var. A'nglica, Lin. L. perénne, Smith, fl. brit. 343. engl. bot. 1. t. 40. Mart. fl. rust. t. 134. Roots woody. Flowers pale-blue.

Var. β, procúmbens (Rai. angl. 3. p. 362.) stems procumbent. 4. H.

English Flax. Fl. June, July. England. Pl. 1 to 1½ foot.

62 L. AUSTRI'ACUM (Lin. mant. 359.) plant glabrous, erect; leaves linear or rather lanceolate, acute, erectish, full of pellucid dots; branches racemose; fructiferous pedicels deflexed; sepals oval, obtuse, 3 or 5-nerved at the base; petals retuse, three or four times longer than the calyx. 4. H. Native of Austria on hills. Jacq. fl. austr. t. 418. Petals pale, blueish-purple.

Austrian Flax. Fl. Ju. Jul. Clt. 1775. Pl. 1 to 2 feet.

63 L. MONTA'NUM (Schleich. cat. pl. helv. D. C. prod. 1. p. 427.) plant glabrous, erectish, many-stemmed; leaves linear or lanceolate, acute, erectish; flowers in panicled corymbs; fructiferous pedicels erect; sepals oval, 3-nerved at the base, with membranaceous margins, outer ones acute, inner ones obtuse, thrice as large as the calyx. 4. H. Native of France, Switzerland, Italy, and Hungary, on grassy mountains. L. Austrìacum, D. C. suppl. 615. L. alpìnum, D. C. fl. fr. 4. p. 615. L. perénne, Lam. fl. fr. 3. p. 66. Bert. amœn. it. 352. L. læ've, Scop. carn. ed. 2. no. 387. t. 11. L. Narbonénse, Sut. helv. 184. L. alpìnum β, elàtius, Wahl. carp. 299. Flowers blue.

Mountain Flax. Fl. June, July. Clt. 1817. Pl. 1 foot.

64 L. ALPI'NUM (Lin. spec. 1672.) plant glabrous, decumbent, many-stemmed; leaves linear, awl-shaped, spreading, full of pellucid dots; flowers few, rather corymbose; fructiferous pedicels erect; sepals oval, 3-nerved at the base, with membranaceous margins, outer ones acutish, inner ones obtuse, thrice as large as the calyx. 4. H. Native of the south of France, north of Italy, and Austria, on dry mountains. Jacq. aust. t. 321. Sweet, fl. gard. t. 17. Linum perénne γ, alpìnum Schiède in Schlecht. Linnæa. 1. p. 70. Flowers large, blue.

Alpine Flax. Fl. July, Aug. Clt. 1739. Pl. ½ foot.

65 L. DECU'MBENS (Desf. atl. 1. p. 278. t. 79.) plant glabrous, many-stemmed, decumbent; leaves linear-awl-shaped, acute, erect; flowers few, somewhat corymbose; fructiferous pedicels erect; sepals ovate, membranaceous, pointed at the apex; petals retuse, twice as long as the calyx. 4. H. Native of the north of Africa in fields, in the kingdom of Tunis. Flowers rose-coloured.

Decumbent Flax. Fl. June, July. Clt. 1817. Pl. ½ foot.

66 L. GRANDIFLÒRUM (Desf. atl. 1. p. 277. t. 78.) plant glabrous, erectish, branched at the base; leaves linear-lanceolate, acute, erectish; flowers loosely panicled; sepals lanceolate, acute, ciliary-serrated, rather longer than the capsules. 4. F. Native of the north of Africa in fields near Mascar. Flowers large, rose-coloured. Leaves rough on the margins.

Great-flowered Flax. Fl. June, Jul. Clt. 1820. Pl. ½ to 1 ft.

67 L. TENUIFÒLIUM (Lin. spec. 398.) stems branching from the base, erect, glabrous; leaves linear-setaceous, smoothish; sepals lanceolate, acuminated, fringed with glandular hairs in the middle, exceeding the capsule in length; petals three times longer than the calyx. 4. H. Native of many parts of Europe on arid hills, particularly in France, Switzerland, and Germany. Jacq. fl. austr. t. 215.—Clus. hist. 1. p. 318. f. 2.—Flowers of a dirty whitish flesh-colour. Leaves spinulose on the margins.

Slender-leaved Flax. Fl. June, July. Clt. 1759. Pl. 1½ ft.

68 L. SALSOLOI'DES (Lam. dict. 3. p. 521.) stems shrubby at the base, branched and a little twisted; branches ascending, sterile ones short; leaves linear-setaceous, smoothish; sepals ovate, acuminated, fringed with glandular hairs in the middle, rather shorter than the capsules; petals 3-times longer than the calyx. ħ. H. Native of France, Provence, and Vascony, in arid places. L. suffruticòsum, D. C. fl. fr. 5. p. 616. but not of Cav.—Barrel. icon. t. 795. Flowers small, of a dirty whitish flesh-colour.

Salsola-like Flax. Fl. June, July. Clt. 1810. Pl. 1 foot.

69 L. SUFFRUTICÒSUM (Lin. spec. 400.) stems shrubby at the base, branched, and are as well as linear, acute leaves, scabrous in all parts; sepals acuminated, fringed with glandular hairs in the middle; petals 5-times longer than the calyx. ħ. F. Native of Spain in arid fields. Cav. icon. 2. t. 108. L. tenuifòlium, Asso. syn. arr. 41. Linum, Bory. ann. gen. 3. p. 10. —Barrel. icon. t. 1231. Differing from *L. salsoloìdes* in being canescent and having oblong petals. Flowers large, pale-flesh-coloured, or white with purple claws.

Suffruticose Flax. Fl. Aug. Clt. 1759. Shrub 1½ foot.

70 L. CA'RNEUM (St. Hil. fl. bras. 1. p. 132.) leaves linear-lanceolate, very acute, glaucescent, lower ones opposite, upper

ones rather imbricate; panicle coarctate; sepals acute, serrulated, shorter than the petals. ♄. S. Native of Brazil. Plant shrubby at the base. Flowers flesh-coloured.

Flesh-coloured-flowered Flax. Pl. ½ to 1 foot.

† *Species not sufficiently known, but most of which evidently belong to the last section, with blue flowers.*

71 L. Hispa'nicum (Mill. dict. no. 7.) stem panicled, procumbent; leaves scattered, linear-lanceolate; sepals acute. ♃. H. Native of Spain. Flowers like those of *L. usitatíssimum.*

Spanish Flax. Fl. June, July. Clt.? Pl. procumbent.

72 L. bie'nne (Mill. dict. no. 8.) stems branched; leaves alternate, linear; sepals spreading, acuminated. ♂. H. Native of Istria. Flowers like those of *L. usitatíssimum.*

Biennial Flax. Fl. June, July. Clt.? Pl. 3 foot.

73 L. pallasia'num (Schult. syst. 6. p. 758.) plant pubescent; leaves linear, acute, hoary; sepals smoothish, acute, with white, lacerated margins. ♃. H. Native of Russia about Cherson. L. pubéscens, Willd. mss. Corolla blue, 3-times longer than the calyx.

Pallas's Flax. Pl. 1 to 2 feet.

74 L. pube'scens (Russ. allep. ex Schult. syst. 6. p. 758.) stem round; floral leaves opposite, lanceolate, pilose; flowers almost sessile; sepals ciliated, length of leaves. ♃? H. Native of Syria about Aleppo. Flowers unknown.

Pubescent Flax. Pl. 1 foot.

75 L. trine'rvium (Roth. nov. spec. 187.) plant glabrous; leaves alternate, linear, 3-nerved; sepals oblong, 3-ribbed. Native of the East Indies. Flowers perhaps yellow.

Three-nerved-leaved Flax. Pl. 1 foot?

76 L. Brote'ri (Hoffmansegg.) sepals awl-shaped, larger than the calyx; flowers rather panicled; leaves filiform, glandularly ciliated. Native of Spain. Flowers white.

Brotero's Flax. Pl.?

§ 3. *Flowers white. Leaves opposite.*

77 L. catha'rticum (Lin. spec. 401.) plant erect, glabrous; leaves opposite, obovate-lanceolate; stem forked at the top. ⊙. H. Native throughout Europe, both in dry and moist meadows; plentiful in Britain. Smith, engl. bot. 6. t. 382. Curt. lond. fasc. 3. t. 19. Mart. rust. t. 135. Schkuhr. handb. 1. t. 87. Black herb. t. 368. Petals white, acute. Flowers pendulous before expansion. This plant is bitter, and powerfully, but as it seems, not dangerously cathartic. Dr. Withering found 2 drachms or more, in a dose, of the dried herb, useful in obstinate rheumatisms.

Cathartic or Purging Flax or Mill Mountains. Fl. June, July. Britain. Pl. ½ to 1 foot.

Cult. Most of the species of this genus are very ornamental. The green-house and frame species grow freely in a mixture of loam and peat, and cuttings strike root readily in the same kind of soil under a hand-glass. The hardy shrubby species will grow in any light soil, and cuttings will root freely under a hand-glass. The hardy perennial species are well adapted for ornamenting flower-borders, but the dwarf kinds succeed best on rock-work, or to be grown in pots, that they may be protected by a frame in severe weather, or from too much wet; they may be increased by dividing the plants at the root, by cuttings planted under a hand-glass, or by seeds, which in most of the species ripen in abundance. The annual species only require to be sown in the open ground in April.

II. RADI'OLA (from *radiolus*, a little ray, in allusion to the rayed capsules). Gmel. syst. 1. p. 289. D. C. prod. 1. p. 428.

Lin. syst. *Tetrándria, Tetragýnia.* Sepals of calyx 4, joined to the middle, each of which is deeply and acutely 3-cleft. Petals 4, obovate, undivided, length of calyx. Anthers 2-lobed. Ovary 4-lobed. Styles 4, short. Stigmas capitate. Capsules roundish, somewhat pointed, with 8 furrows and 8 valves, with inflexed edges; 8 cells; seeds solitary in the cells, oval, compressed, polished.

1 R. linoìdes (Gmel. syst. 1. p. 289.). ⊙. H. Native in wet sandy ground throughout Europe; plentiful in Britain. R. millegràna, Smith. fl. brit. 202. engl. bot. 13. t. 893. Lìnum radìola, Lin. spec. 402. Fl. dan. t. 178.—Vaill. par. 33. t. 4. f. 6. Stem repeatedly forked, leafy, many-flowered, moderately spreading and somewhat corymbose. Leaves sessile, small, ovate, 3-ribbed. Flower-stalks solitary from the forks of the stem as well as its ultimate branches, white, very minute. Capsules light brown, rather depressed.

Flax-like Radiola or Flax-seed. Britain. Pl. 1 to 2 inches.

Cult. The seeds of this very small plant should be sown in a moist sandy situation, where it may afterwards be allowed to scatter itself.

Order XXX. MALVA'CEÆ (plants agreeing with *Málva* in important characters). Brown. congo. p. 8. Kunth, diss. 1822. p. 1. D. C. prod. 1. p. 429.—Malvàceæ § 1, 2, 3. Juss. gen. 271.

Calyx usually of 5 sepals (f. 84. *b.* f. 85. *b.*), rarely 3-4, more or less connected at the base, valvate in æstivation, usually bearing bracteas at the base (f. 83. *a.* f. 84. *a.*), these constitute an outer calyx or involucrum. Petals equal in number to the sepals (f. 83. *b.* f. 84. *c.* f. 85. *c.*) and alternating with them, hypogynous, equal, twisted in æstivation (f. 84. *b.*), sometimes distinct, but usually adnate to the tube of the stamens at the base. Stamens numerous, definite, but usually indefinite (f. 84. *d.*); filaments connected into a column (f. 84. *d.*), unequal, outer ones shortest; anthers 1-celled, kidney-shaped, bursting by a transverse chink. Ovary usually of many carpels (f. 83. *e.* f. 84. *h.*) disposed in a whorl around the axis, almost always connected. Styles equal in number with the ovaries, sometimes distinct, sometimes joined in one, with an equal number of stigmas (f. 84. *g.*) which are more or less distinct. Carpels sometimes 1-2-seeded, opening by a chink on the inside, sometimes many-seeded, opening by valves and with a dissepiment in the middle of each valve, bearing the seeds, sometimes nearly free, sometimes connected into a many-celled capsule (f. 83. *f.* f. 84. *h.*) sometimes connate, into an anomalous kind of berry (f. 85. *h. i.*). Seeds ovate or somewhat triquetrous, covered by a smooth or villous epidermis (f. 83. *g.* f. 84. *i.*). Albumen none. Embryo straight, dicotyledonous, with a terete radicle, and yellow twisted cotyledons.—Herbs, shrubs, or trees. Leaves alternate, usually stalked, toothed, or lobed. Villi usually stellately branched. Stipulas 2, at the sides of the leaves. Peduncles axillary, 1 or many-flowered, sometimes disposed in terminal racemose spikes in consequence of the upper leaves being absent. This order, before it was dismembered from *Bombàceæ* and *Byttneriàceæ*, contained most of the grandest flowers in nature. Even now the splendour of various species of *Althæ'a*, *Hibíscus*, &c. renders it a very remarkable group of plants, the greater part of which are

objects worthy of the gardener's care, particularly those which are hardy. In stoves and green-houses the species are particularly liable to the attacks of the red spider, mealy bug, and scale, a circumstance which makes them less generally esteemed than the beauty of many of them merits. The greater part of the plants contained in this Order are clothed with stellate pubescence, and a kidney-shaped, 1-celled anther is a character common to the whole. These two peculiarities, together with the alternate stipulate leaves, distinguish them from all the rest of *Thalamiflòræ*. All the species abound in a nutritive mucilage; a quality which renders the young heads of the *Okro* or *Hibíscus esculéntus*, an object of great value within the tropics as an ingredient in soups. In Brazil the *Abùliton esculéntum* serves the same purposes. The emollient properties of *Althæ'a officinàlis* are well known to physicians. A decoction of the leaves of *Sphærálcea Cisplatìna* is used for similar objects in Brazil. A species of *Pavònia* is employed in the same country as a diuretic in the form of a decoction. The straight shoots of *Sìda macrántha* are employed as rocket-sticks at Rio Janeiro. The chewed leaves of *Sìda carpinifòlia* allay the inflammation occasioned by the stings of wasps. The tough fibres of many *Malvàceæ* are manufactured into cordage. Their petals are astringent, whence those of *Hibíscus ròsa-Sinénsis* are used in China to blacken the eye-lashes, and the leather of shoes. The fibrous threads, in which the seeds of *Gossýpium* are enveloped, furnish the valuable cotton, an article of immense importance to the world; these threads, when examined by the microscope, will be seen to be finely toothed, which explains the cause of their adhering together with greater facility than those of *Bómbax* and several *Apocýneæ*, which are destitute of teeth, and which cannot be spun into thread without the admixture of cotton.

Synopsis of the genera.

Division I. *Calyx double, or girded by an involucrum.*

1 Ma'lope. Calyx girded by a 3-leaved involucrum; leaflets cordate. Carpels numerous, 1-seeded, disposed into a head.

2 Ma'lva. Calyx girded by a 3-leaved involucrum, rarely by a 5-6-leaved one; leaflets oblong or setaceous. Carpels capsular, 1-seeded, verticillate, disposed in an orbicular head.

3 Sphæra'lcea. Calyx girded by a 3-leaved involucel. Carpels, 2-3-seeded, verticillate, collected into a round head.

4 Modi'ola. Calyx girded by a 3-leaved involucel. Carpels bicuspidate, 2-seeded, disposed in a whorl.

5 Kitaibe'lia. Calyx girded by a 7-9-cleft involucel. Carpels capsular, 1-seeded, disposed into a 5-lobed head.

6 Althæ'a. Calyx girded by a 6-9-cleft involucel. Carpels capsular, 1-seeded, disposed into a globular head.

7 Lavate'ra. Calyx girded by a 3-5-cleft involucel; leaflets usually connected together to the middle. Carpels capsular, 1-seeded, disposed into an orb around the axis.

8 Mala'chra. General involucrum 3-5-leaved, girding a head of flowers. Calyx girded by a proper 8-12-leaved involucel; leaflets linear, or bristle-formed. Carpels 5, capsular, 1-seeded, disposed into a globular head.

9 Ure'na. Calyx girded by a 5-cleft involucel, especially with the leaflets connected to the middle. Anthers on the top of the staminiferous tube. Carpels 5, capsular, connivent, 1-seeded, usually echinated on the outside, with prickles, which are rayed at the apex.

10 Pavònia. Calyx girded by a 5-15-leaved involucel. Stigmas 10. Carpels 5, capsular, 2-valved, 1-seeded.

11 Malvavi'scus. Calyx girded by a many-leaved involucel. Petals erect, convolute. Stigmas 10. Carpels 5, baccate, 1-seeded, sometimes nearly distinct, but usually connate into a 5-celled fruit.

12 Lebretònia. Calyx 5-parted, girded by a shorter 5-parted involucel. Petals 5, exserted in part, twisted in æstivation, with a spreading limb. Styles 10. Carpels 5 or only 4 from abortion, 1-seeded, indehiscent.

13 Hibíscus. Calyx girded by a many-leaved, rarely with few-leaved involucel, distinct or connected with each other at the base. Petals not auricled. Stigmas 5. Carpels joined into a 5-celled capsule, with the valves bearing a dissepiment on the inside; cells many, rarely 1-seeded. Seeds woolly or smooth.

14 Pari'tium. Calyx girded by a 7-10-12-toothed or lobed involucel. Style 5-cleft. Capsule 5-celled, 5-valved, with a dissepiment in the middle of each valve, many-seeded. Seed smooth.

15 Laguna'ria. Calyx girded by an involucel, which is almost reduced to a prominent, entire or toothed margin. Capsule 5-celled, with a dissepiment in the middle of each valve. Cells many-seeded. Seeds smooth.

16 Thespe'sia. Calyx truncate, girded by a 3-leaved deciduous involucel. Capsule 5-celled; cells semi-partite, bearing 4 seeds at the base, with an incomplete dissepiment. Albumen sparing.

17 Gossy'pium. Calyx cup-shaped, bluntly 5-toothed, girded by a 3-leaved involucel (f. 83. *a*.) leaflets connected at the base, cordate, jagged. Stigmas 3-5. Capsule 3-5-celled (f. 83. *f*.), many-seeded. Seeds enveloped in cotton (f. 83. *g*.).

18 Redoute'a. Calyx 5-parted (f. 84. *b*.), girded by a 10-12-leaved involucel (f. 84. *a*.), shorter than the calyx. Stigmas 3 (f. 84. *g*.). Capsule 3-celled, 3-valved (f. 84. *h*.) many-seeded. Placentas 3, alternating with the valves, bearing woolly seeds (f. 84. *i*.) on all sides. Anthers in bundles (f. 84. *d*.).

19 Fugo'sia. Calyx 5-cleft (f. 85. *a*.), girded by a very short 12-leaved setaceous involucel. Anthers few, disposed as it were in a whorl on the middle of the staminiferous tube (f. 85. *d*.). Stigmas 1-3-4 (f. 85. *e*.). Capsule 3-celled, globose; cells 3-5-seeded (f. 85. *h*. *i*.). Seeds covered with short wool.

20 Se'rra. Calyx 5-toothed, small, girded by a 3-leaved involucel; leaflets cordate, entire. Anthers about 10, stipitate, on the top and sides of the tube, with a 4-5-crenate membrane under the ovary. Stigmas 5. Capsule 2-celled? 10-seeded.

21 Lopi'mia. Involucel 20-leaved, longer than the calyx; leaflets setaceous, connivent. Corolla flat. Column of stamens somewhat deflexed. Stigmas 10. Anthers 30-40. Capsule of 5 carpels; carpels 1-seeded, close, covered with viscid mucilage.

22 Polychlæ'na. Calyx 5-cleft, girded by a many-leaved, setaceous involucel. Capsule 5-celled, cells 1-seeded.

Division II. *Calyx without an involucel.*

23 PALA'VIA. Calyx naked, 5-cleft. Carpels capsular, numerous, 1-seeded, disposed into a head without any order.

24 CRISTA'RIA. Calyx naked, 5-cleft. Fruit orbiculately-depressed, covered with a thin pellicle, composed of numerous 1-seeded carpels, bearing 2 wings in the centre.

25 A'NODA. Calyx naked, 5-cleft; lobes acuminated, spreading when in fruit. Capsule somewhat hemispherical beneath, depressed above and star-formed, many-celled, especially with 1-celled, 1-seeded, connate carpels.

26 PERI'PTERA. Calyx naked, 5-cleft. Petals erect, spirally twisted into a tube, at length free. Capsule stellately many-celled; cells 1-seeded.

27 SI'DA. Calyx naked, 5-cleft, usually angular. Styles multifid at the top. Carpels capsular, 5-40, 1-seeded, seldom bladdery, disposed in a whorl around the axis, more or less connected with each other, or wholly connected into a many-celled capsule.

28 ABU'TILON. Calyx naked, 5-cleft, usually angular. Styles multifid at the apex. Carpels capsular, 5-30, many-seeded, usually bladdery, disposed in a whorl around the axis, so closely connected with each other as to form a many-celled capsule.

29 NUTTA'LLIA. Calyx naked, 5-cleft. Anthers numerous. Stigmas numerous, filiform. Carpels numerous, disposed into a ring or whorl, 1-seeded, not opening spontaneously.

30 LAGUNE'A. Calyx naked, 5-cleft. Anthers on the top and sides of the tube. Stigmas 5. Capsule 5-celled, 5-valved; valves with a dissepiment in the middle, separable, standing above the filiform central axis.

31 INGENHOU'ZIA. Calyx naked, 3-parted; lobes ovate, lanceolate, acuminated. Petals 5. Urceolus campanulate, situated within the petals. Stamens numerous, monadelphous. Style 1.

32 EURYA'NTHE. Calyx naked, 5-cleft. Petals 5. Stamens indefinite, hardly connected at the base. Style 1. Capsule 3-celled, 3-valved, many-seeded; valves with a dissepiment in the middle of each.

Division I. *Calyx double, or girded by an involucrum.*

I. MA'LOPE (from μαλος, tender; soft leaves). Lin. gen. no. 843. Lam. ill. t. 583. D. C. prod. 1. p. 429.

LIN. SYST. *Monadélphia, Polyándria.* Calyx 5-cleft, girded by a 3-leaved involucrum; leaflets cordate. Carpels many, 1-seeded, collected into a head. Herbs resembling *Málva*, with large purplish or small white flowers.

1 M. MALACOI'DES (Lin. spec. 974.) leaves ovate, crenated; stipulas oblong-linear; peduncles axillary, 1-flowered. ⊙. H. Native of Italy, Provence, Spain, Mauritania, and the island of Scio, in meadows. Sweet, fl. gard. icon. Cav. diss. t. 37. f. 1.—Sabb. hort. 1. t. 50.—Moris, hist. 2. p. 522, sect. 3. t. 17. f. 11.—Bocc. sicil. 15. t. 8. f. 2. Barrel. icon. t. 1189. Flowers purplish.

Var. β, *sinuàta* (D. C. prod. 1. p. 429.) leaves some obtusely trifid, others sinuated or pinnatifid. ⊙. H. Native of Mauritania. —Cav. diss. t. 27. letter X. Intermediate between *M. malacoìdes* and *M. stipulàcea*. Flowers large, purplish-violet, like those of a species of *Mallow*.

Mallow-like Malope. Fl. July, Aug. Clt. 1710. Pl. 1½ ft.

2 M. STIPULA'CEA (Cav. ann. cienc. nat. 3. p. 74.) leaves ovate, crenated; stipulas cordate, ovate, acute; peduncles axillary, 1-flowered. ⊙. H. Native about Mogodor. Flowers large, purple, like those of a common *Mallow*.

Large-stipuled Malope. Fl. July, Sept. Pl. 1 foot.

3 M. TRI'FIDA (Cav. diss. 2. p. 85. t. 27. f. 2.) leaves 3-nerved, trifid, toothed, glabrous; lobes acuminated; peduncles axillary, 1-flowered. ⊙. H. Native of Portugal, Spain, and Mauritania, in meadows. Flowers large, purple.

Trifid-leaved Malope. Fl. July, Sept. Clt. 1808. Pl. 1 to 2 feet.

4 M. MULTIFLÒRA (Trig. in Cav. diss. 2. p. 85.) leaves roundish, crenated, villous; flowers 3-4, axillary. ⊙. H. Native of Portugal and Spain. Flowers small, white.

Many-flowered Malope. Pl. ½ foot.

Cult. The seeds of these beautiful plants only require to be sown in the open border about the beginning or middle of April.

II. MA'LVA (altered by the Latins from the Greek word μαλαχη, *malache*, soft, which comes from μαλασσω, to soften; in allusion to the soft mucilaginous qualities of the species). Lin. gen. no. 841. Lam. ill. t. 582. D. C. prod. 1. p. 430.

LIN. SYST. *Monadélphia, Polyándria.* Calyx 5-cleft, girded by a 3-leaved involucrum, or rarely with a 5 or 6-leaved involucrum; leaflets oblong or setaceous. Carpels capsular, many, disposed in a round head. Many of the species are shewy. *Málva* was an excellent vegetable among the Romans, but what species is uncertain, and the Chinese use some sort of *Mallow* as food.

SECT. I. MALVA'RTRUM (a name altered from *Málva*). D. C. prod. 1. p. 430. Carpels 1-celled, 1-seeded.

§ 1. *Chrysánthæ* (from χρυσος, *chrysos*, gold, and ανθος, *anthos*, a flower; because all the species contained in this section have yellow flowers). *D. C. prod.* 1. *p.* 430. *Leaves undivided. Flowers small, yellow, almost sessile in the axils of the upper leaves, and sometimes apparently in spikes, in consequence of the upper leaves being wanting.*

1 M. TRICUSPIDA'TA (Ait. hort. kew. ed. 2. vol. 4. p. 210.) leaves oblong or ovate, acute, serrated; flowers axillary, glomerate; carpels tricuspidate. ♂. S. Native of Jamaica. M. Americàna, Cav. diss. 2. t. 22. f. 2. M. carpinifòlia, Desr. in Lam. dict. enc. 3. p. 754. M. Coromandeliàna, Willd. Swartz, Sìda Jamaicénsis, Mill.

Var. β, *subtríloba* (D. C. prod. 1. p. 430.) leaves somewhat 3-lobed. M. Antillàrum, Zucc. obs. no. 79.

Tricuspidate-carpelled Mallow. Fl. July, Aug. Clt. 1726. Pl. 1 foot.

2 M. AMERICA'NA (Lin. spec. 968.) leaves ovate, acute, crenately serrated, rather pilose; flowers axillary, generally solitary, or in terminal capitate spikes; carpels awnless. ⊙. H. Native of St. Domingo. M. ulmifòlia, Balb. herb. M. Curassávica, Desrous, in Lam. dict. enc. 3. p. 754.

American Mallow. Fl. July. Clt. 1756. Pl. 1 foot.

3 M. SCA'BRA (Cav. diss. 5. t. 138. f. 1.) leaves ovate-lanceolate, coarsely toothed, obsoletely 3-lobed, under surface as well as branches scabrous with stellate hairs; peduncles axillary, generally 2-flowered. ♄. G. Native of Peru in arid places. M. scopària, Jacq. icon. rar. t. 139. M. corchorifòlia, Desrous in Lam. dict. enc. 3. p. 743. M. Lagàscæ, Cat. hort. taur. 1821. p. 36? There is a variety with sessile flowers.

Scabrous Mallow. Fl. June, July. Clt. 1798. Shrub 4 ft.

4 M. SCOPA'RIA (Lher. stirp. t. 27.) leaves ovate, crenately-serrated, under surface as well as branches somewhat velvety from stellate down; flowers axillary, crowded. ♄. G. Native of Peru. Cav. diss. 2. p. 65. t. 21. f. 4. Racemes axillary.

Broom Mallow. Fl. Aug. Sep. Clt. 1782. Shrub 6 feet.

5 M. BORBO'NICA (Willd. enum. 728.) leaves ovate, acute, grossly and unequally toothed, clothed with starry pubescence, upper leaves cuneated at the base; flowers axillary and in spikes at the tops of the branches. ♄. S. Native of Mauritius and Bourbon.

Bourbon Mallow. Fl. July, Aug. Clt. 1816. Shrub 5 ft.

6 M. POLYSTA'CHYA (Cav. diss. 5. t. 138. f. 3.) leaves ovate-acuminated, serrated, scabrous; flowers axillary, and in spikes at the tops of the branches; capsules 12, glabrous, awnless. ♄. G. Native of Peru. M. vetulìna, Desrous. in Lam. dict. enc. 3. p. 754.

Many-spiked Mallow. Fl. July, Aug. Shrub 4 feet.

7 M. TIMORIE'NSIS (D. C. prod. 1. p. 430.) leaves ovate, rather cordate, toothed, and are as well as branches clothed with starry rough hairs; flowers disposed in long cylindrical spikes; capsules 8-12, bearded at the apex, awnless. ♄. S. Native of the islands of Timor and Java.

Timor Mallow. Shrub 6 feet.

8 M. RUDERA'LIS (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 647.) leaves ovate, or ovate-lanceolate, acute, grossly serrated, rather pilose above and strigose beneath, as well as the branches; flowers axillary and glomerate at the tops of the branches; carpels pointed at the apex, but bicuspidate at the base. ♄. S. Native of Java.

Rubbish Mallow. Shrub 6 feet.

9 M. SPICA'TA (Lin. spec. 967.) leaves roundish, somewhat cordate, upper surface scabrous with stellate down, under surface tomentose; flowers disposed in terminal spikes; capsules 14, glabrous, awnless. ♄. S. Native of Jamaica. Cav. diss. 2. t. 20. f. 4. M. sublobàta, Desr. in Lam. dict. ency.—Sloane, hist. 1. p. 219. Lower flowers axillary, solitary.

Spiked-flowered Mallow. Fl. Sept. Oct. Clt. 1726. Shrub 2 to 3 feet.

10 M. OVA'TA (Cav. diss. 2. p. 80. t. 20. f. 2.) shrubby; leaves dentately serrated, cuneate-lanceolate, pubescent on both surfaces: flowers disposed in oblong, terminal spikes; carpels 10, awnless. ♄. S. Native of Brazil near Rio Janeiro.

Ovate-spiked Mallow. Shrub 3 to 6 feet.

11 M. SUBHASTA'TA (Cav. diss. 2. p. 72. t. 21. f. 3.) leaves ovate, acuminate, somewhat hastate, obsoletely 3-lobed, grossly toothed, and are as well as branches hairy; peduncles solitary, axillary, length of footstalks. ♄. S. Native of Brazil and Peru.

Subhastate-leaved Mallow. Shrub 2 to 4 feet.

12 M. TOMENTO'SA (Lin. spec. 967.) leaves cordate, crenated, obtuse, and are as well as branches tomentose; flowers lateral, crowded. ♄. S. Native of the East Indies.—Pluk. amalt. t. 356. f. 1.?

Tomentose Mallow. Fl. Sept. Oct. Clt. 1820. Sh. 3 feet.

13 M. WALTHERIFO'LIA (Link. enum. 2. p. 209.) leaves somewhat cordate, acute, toothed, under surface tomentose; flowers sessile; lobes of calyx ovate; leaflets of involucrum very narrow. ♃. S. Native of Java. Leaves hoary on the under surface. Corolla larger than the calyx.

Waltheria-leaved Mallow. Clt. 1824. Pl. 1½ foot.

14 M. TRACHELIIFO'LIA (Link. enum. 2. p. 209.) leaves cordate, acuminated, serrated, scabrous, lower ones lobed; peduncles axillary; flowers capitate. ⊙. H. Native of? Leaves on long footstalks. Calyx hairy. Corolla larger than the calyx.

Throat-wort-leaved Mallow. Fl. July, Aug. Clt. 1821. Pl. 1½ foot.

15 M. GANGE'TICA (Lin. spec. 967.) leaves cordate, obtuse, glabrous; flowers sessile, glomerate; carpels 10, awnless, crenulated. ⊙. H. Native of the East Indies.—Pluk. phyt. t. 74. f. 6. Allied to *M. tricuspidàta*.

Gangetic Mallow. Fl. July, Aug. Clt. 1823. Pl. 1 to 2 ft.

16 M. DOMINGE'NSIS (Spreng. in herb. Balb. D. C. prod. 1. p. 431.) plant dwarf; leaves ovate, toothed, adult ones smoothish, younger ones, footstalks, and branchlets pilose; flowers axillary, solitary, on short pedicels; carpels hispid, tricuspidate. ♃. S. Native of St. Domingo.

St. Domingo Mallow. Fl. July, Aug. Clt. 1824. Pl. 1 foot.

17 M. SUBTRI'LOBA (Lag. nov. gen. et spec. 21.) leaves cordate, angularly-subhastate, crenated; peduncles axillary, very short, 3 or many-flowered; carpels 8 or 9, very smooth, awnless. ♄. G. Native of New Spain. Allied to *M. spicàta* and *M. scopària*.

Sub-three-lobed-leaved Mallow. Shrub 3 to 4 feet.

§ 2. *Cymbalàriæ* (from κυμβη, *kymbe*, a boat; in allusion to the round concave leaves.) *D. C. prod.* 1. *p.* 431. *Flowers purple or white. Pedicels axillary, 1-flowered, solitary. Outer calyx 3-leaved. Leaves roundish. Stems herbaceous.*

18 M. LEPRÒSA (Ort. dec. 8. p. 95.) leaves kidney-shaped, broadly crenated, and are as well as branches leprously white; stems prostrate; peduncles longer than the footstalks. ♃. S. Native of Cuba. Flowers purple.

Leprous Mallow. Fl. May, July. Clt. 1815. Pl. prostrate.

19 M. SHERARDIA'NA (Lin. spec. 1675.) leaves orbicular, cordate, velvety-tomentose, crenated; stems prostrate; pedicels arched, longer than the footstalks. ♃. H. Native of Bithynia. Cav. diss. 2. t. 26. f. 4.—Till. pis. 108. t. 35. f. 2.—Buxb. cent. app. 46. f. 32. Flowers small, red.

Sherard's Mallow. Fl. May, July. Clt. 1818. Pl. prostrate.

20 M. CYMBALARIÆFÒLIA (Desrous. in Lam. dict. enc. 3. p. 753.) leaves cordate, roundish, obsoletely 5-lobed, crenated, rather glabrous; stem decumbent? rather villous; pedicels longer than the footstalks.—Native of? Flowers white or red.

Boat-leaved Mallow. Pl. decumbent.

21 M. CRE'TICA (Cav. diss. 5. t. 138. f. 2.) leaves cordate, roundish, 5-angled, crenated, villous; pedicels longer than the footstalks; stem erect. ⊙. H. Native of Crete. Flowers purple and white. The whole plant is villous.

Cretan Mallow. Fl. June, Aug. Clt. 1825. Pl. 1 foot.

§ 3. *Bibracteolàtæ* (from *bis*, twice, and *bractea*, a bractea; in allusion to 2-leaved involucrum,) *D. C. prod.* 1. *p.* 431. *Flowers purple or white. Outer calyx of two leaves. Pedicels axillary, 1-flowered. Stems herbaceous.*

22 M. HISPA'NICA (Lin. spec. 970.) leaves semi-orbicular, crenated, upper ones somewhat rhomboidal; stems erect, hairy. ⊙. H. Native of Spain and Mauritania. Desf. atl. 2. t. 170. Corolla large, flesh-coloured. The whole plant is hairy.

Var. β, spithàmea (Cav. diss. 2. t. 18. f. 3.) leaves small, roundish, crenulated.

Spanish Mallow. Fl. July. Clt. 1710. Pl. 1 foot.

23 M. STIPULA'CEA (Cav. diss. 2. t. 15. f. 2.) lower leaves 3-lobed, very entire, upper ones multifid; segments trifid, and toothed at the apex; stipulas lanceolate, longer than the footstalks. ⊙. H. Native of Spain.—Asso, arrag. t. 5. f. 1. Flowers purple. Stems declinate.

Large *stipuled* Mallow. Fl. Ju. Aug. Clt. 1815. Pl. 1½ ft.

24 M. CUNEIFÒLIA (Cav. diss. 2. t. 20. f. 1.) leaves obovately-cuneiform, repand, truncate at the apex, villous; pedicels longer than the footstalks. ⊙? H. Native of? Flowers purple.

Wedge-leaved Mallow. Pl. 1 foot.

25 M. PAPA'VER (Cav. diss. 2. t. 15. f. 3.) leaves 3 or 5-parted; segments entire, linear, ciliated. ⊙? H. Native of Portugal. Flowers almost like those of *Papàver Rhœ's*.

Poppy-flowered Mallow. Pl. 1 foot.

26 M. ÆGY'PTIA (Lin. spec. 971.) leaves 3-parted; segments

quinquifid, toothed at the apex; stems erect; corolla a little smaller than the calyx. ⊙. H. Native of Egypt, Mauritania, and Spain. Cav. diss. 2. t. 17. f. 1. M. diphýlla, Mœnch. Flowers pale-blue or purple.

Egyptian Mallow. Fl. June, July. Clt. 1739. Pl. 1 foot.

27 M. TRI'FIDA (Cav. diss. 5. t. 137. f. 2.) leaves 3-parted; segments trifid, linear, obtuse; stems erect; corolla longer than the ciliated calyx. ⊙. H. Native of Spain. Flowers purple.

Trifid-leaved Mallow. Fl. Ju. July. Clt. 1815. Pl. ½ to 1 ft.

§ 4. *Bismálvæ* (meaning unknown). Medik. *D C. prod.* 1. *p.* 432. *Flowers purple or white. Pedicels axillary, solitary,* 1-*flowered. Involucrum* 3-*leaved. Leaves many-parted. Stems herbaceous.*

28 M. TOURNEFORTIA'NA (Lin. spec. 971.) leaves many-parted; lobes trifid, linear; stems decumbent; hairs almost wanting or in starry fascicles. ⊙. H. Native of Provence and Spain by the sea-side. Cav. diss. 2. t. 17. f. 3. M. marítima, Lam. fl. fr. 3. p. 140. Stems prostrate, and much branched at the base. Flowers purple.

Var. β, ciliàta (Dufour, in litt.) stem erect, rather dwarf. ⊙. H. Native of Spain.

Tournefort's Mallow. Fl. July, Aug. Clt. 1759. Pl. ½ ft.

29 M. ALCE'A (Lin. spec. 971.) lower leaves angular, upper ones 5-parted, cut; stems and calyxes roughish-velvety from stellate down. ♃. H. Native of many parts of Europe, particularly France and Germany. Cav. diss. 2. t. 17. f. 2. Sims, bot. mag. t. 2197.—Blackw. t. 309. Flowers pale purple.

Alcea or Vervain Mallow. Fl. July, Oct. Clt. 1797. Pl. 4 feet.

30 M. MORE'NI (Poll. veron. 1816.) lower leaves 5-lobed, upper ones palmately 5-cleft, with the lobes toothed; stems and calyxes roughish-velvety, with stellate hairs. ♃. H. . Native of Italy. M. alceoìdes, Ten. cat. 1819. p. 55. Hook, bot. mag. 2793. Flowers red, disposed in terminal corymbs.

Moreni's Mallow. Fl. July, Oct. Clt. 1820. Pl. 2-3 feet.

31 M. ITA'LICA (Poll. pl. veron. 1816.) stems erect, hairy; lower leaves somewhat kidney-shaped, 5-lobed, upper ones 5-parted, all toothed and roughish. ♃. H. Native of Italy. Flowers purple.

Italian Mallow. Fl. July, Sept. Clt. 1829. Pl. 3 feet.

32 M. MOSCHA'TA (Lin. spec. 971.) lower leaves kidney-shaped, cut, cauline ones with 5-deeply pinnatifid, jagged segments; stems and calyxes scabrous from simple hairs. ♃. H. Native of many parts of Europe. In Britain in grassy borders of fields, and by way sides on a gravelly soil. Smith, eng. bot. 754. Curt. lond. 4. t. 50. Fl. dan. 907. Cav. diss. 2. t. 18. f. 1. Flowers rose-coloured.

Var. β, laciniàta (Desrous. in dict. enc. 3. p. 750.) lower leaves as well as upper ones deeply divided into 5 pinnatifid, jagged segments.—Moris. ox. sect. 5. t. 18. f. 4. M. tenuifòlia, Sav. cent. p. 122. M. moschàta β, undulàta, Sims, bot. mag. 2298. Flowers white. The musky scent of these two plants undoubtedly proceeds from the herbage, not from the flowers.

Musk-scented Mallow. Fl. July, Aug. Britain. Pl. 1 to 1½ ft.

33 M. PURPURA'TA (Lindl. bot. reg. 1362.) plant pubescent, ascending; lower leaves 5-cleft, upper ones trifid; segments usually trifid, lobes forked, obtuse; peduncles solitary, axillary, longer than the petioles. ♃. F. Native of Chili in the Cumbre, a pass in the Andes. Petals purplish. An elegant ascending plant with fine leaves.

Purplish-flowered Mallow. Fl. June, July. Clt. 1825. Pl. prostrate.

34 M. ALTHÆOI'DES (Cav. diss. 2. t. 135.) leaves palmate; lobes lanceolate, toothed; hairs simple; pedicels longer than the leaves; sepals acuminated. ⊙. H. Native of Spain. Stems prostrate, hairy. Flowers large, whitish-rose-coloured.

Var. β, hirsùta (Ten. prod. 40.) lower leaves roundish-cordate, 7-lobed, the rest 5-parted. ⊙. H. Native of Sicily. Stems prostrate. Flowers large, rose-coloured.

Althæa-like Mallow. Fl. July, Aug. Clt. 1822. Pl. trailing.

35 M. FASTIGIA'TA (Cav. diss. 2. t. 23. f. 2.) leaves cordate, 5-lobed, acuminated, unequally toothed, with the middle lobe longer, and are as well as the erect stem tomentose from stellate tomentum; pedicels axillary, approximating into a terminal corymb. ⊙. H. Native of the mountains of Auvergne. Flowers large, rose-coloured. D. C. fl. fr. no. 4510.

Var. β, lobàta (Cav. diss. 2. t. 18. f. 4.) leaves somewhat cordate, crenated; flowers somewhat spiked. ⊙. H. Native of Spain. Petals large, purplish. Leaves 5-lobed.

Var. γ, Albulénsis (Cav. diss. 2. t. 34. f. 3.) upper leaves cuneiform at the base. ⊙. H. Native of Spain.

Fastigiate-flowered Mallow. Fl. June, July. Clt. 1818. Pl. 1 to 2 feet.

36 M. RIBIFÒLIA (Viv. fl. cors. app. in Schlecht. Linnæa. 1. p. 506.) stems erect, rough from simple and stellate hairs; lower leaves cordate, 5-lobed, upper ones 5-cleft, and palmately lobed, beset with stellate pubescence beneath; peduncles solitary, longer than the leaves; petals 3 times higher than the calyx. ♃. H. Native of Corsica.

Gooseberry-leaved Mallow. Pl. 1 to 2 feet.

37 M. CIRCINA'TA (Viv. fl. cors. app. in Schlecht. Linnæa. 1. p. 506.) stem erect, with a few scattered hairs; leaves cordate, crenulated, lower ones kidney-shaped, upper ones circinate, 6-lobed; petioles hispid above; peduncles solitary, 1-flowered, not half so long as the petioles; outer leaflets of the calyx oblong, inner ones ovate, acute, 4 times shorter than the corolla. ⊙. H. Native of Corsica. Like *M. Nicæénsis.*

Circinate-leaved Mallow. Pl. 1 foot.

§ 5. *Fasciculàtæ, D. C. prod.* 1. *p.* 432. *Flowers purple or white. Leaves angular, cordate,* 5-*nerved. Pedicels axillary, numerous,* 1-*flowered. Outer calyx* 3-*leaved. Stems herbaceous.*

38 M. TOMENTE'LLA (Presl. ex Spreng. syst. append. p. 257.) plant covered with stellate tomentum; stem prostrate; leaves orbicular, cordate, obtuse, 5-angled, toothed; peduncles shorter than the petioles. ⊙? H. Native of Sicily. Flowers red.

Sub-tomentose Mallow. Fl. June, July. Pl. prostrate.

39 M. MAURITIA'NA (Lin. spec. 970.) stem erect; leaves 5-lobed, obtuse; pedicels and footstalks smoothish. ⊙. H. Native of Italy, Spain, and Portugal. Cav. diss. 2. t. 25. f. 2. M. obtùsa, Mœnch. Flowers deep purple.

Var. β, Sinénsis (Cav. diss. 2. t. 25. f. 4.) stem reclinate, very smooth. M. glàbra, Desrous. in dict. enc. 3. p. 752. Flowers purple.

Mauritanian Mallow. Fl. Ju. July. Clt. 1768. Pl. 4 to 6 ft.

40 M. SYLVE'STRIS (Lin. spec. 969.) stem erect; leaves 5-7-lobed, acute; pedicels as well as footstalks pilose. ♂. H. Native of most parts of Europe about hedges, road sides, and in cultivated as well as in waste ground. Common in Britain. Smith, engl. bot. t. 671. Curt. fl. lond. fasc. 2. t. 51. Woodv. t. 54. Fl. dan. t. 1223. Cav. diss. 2. t. 26. f. 2. M. vulgàris, Ten. prod. fl. neap. Flowers purple, veiny. The whole plant, but especially the root, yields in decoction a plentiful, tasteless, colourless mucilage, very salutary in cases of internal irritation. Decoctions of the leaves are sometimes employed in dysenteries, heat, and sharpness of urine, and in general for obstructing acrimonious humours; but their principal use is in emollient glysters, cataplasms, and fomentations.

Var. β. albiflòra (D. C. prod. 1. p. 432.) lobes of leaves blunter; flowers white. M. venàta, Hortul.

Wild or Common Mallow. Fl. May, Aug. Britain. Pl. 1 to 4 feet.

41 M. RODI'GII (Presl. ex Spreng. syst. 3. p. 89.) stem diffuse, smooth and suffruticose at the base; leaves semi-orbicular, 5-lobed, crenate, smooth; peduncles tern, axillary; sepals ciliated; capsules tomentose. ♃? H. Native of Saxony. Flowers purplish.

Rodige's Mallow. Pl. 1 to 2 feet?

42 M. HENNI'NGII (Goldb. in act. mosc. 5. p. 133.) stem diffuse; leaves somewhat kidney-shaped, very bluntly 7-lobed; pedicels and petioles smoothish; petals not exceeding the calyx; carpels wrinkled. ♃. H. Native about Moscow, frequent. Petals white, tipped with red.

Henninge's Mallow. Fl. June, Aug. Clt. 1820. Pl. 1 foot.

43 M. ROTUNDIFÒLIA (Lin. spec. 969.) stems prostrate; leaves cordate, orbicular, very bluntly 5-7-lobed; fructiferous pedicels bent downwards, and are pubescent as well as footstalks; corolla twice the size of the calyx. ⊙. H. Native of most parts of Europe in waste ground, and by way sides in towns or villages, frequent; common in Britain. Smith, engl. bot. t. 1092. Curt. lond. fasc. 3. t. 43. Fl. dan. t. 721. Cav. diss. 2. t. 26. f. 3. Flowers pale lilac-coloured; but that said to be a native in cultivated grounds from Pennsylvania to Carolina has white flowers.

Var. β. pusílla (Smith, engl. bot. t. 241.) petals hardly larger than the calyx. M. parviflòra, Huds. angl. 307. but not of Lin. Flowers paler than in var. α. Native of England, near Hythe in Kent. M. boreàlis, Liljeb.

Var. γ, crenàta (Kit. in litt.) petals hardly larger than the calyx; leaves undivided, crenate-serrated. ⊙. H. Native of Hungary in ground impregnated with salt. Flowers lilac. Perhaps a proper species.

Round-leaved Mallow. Fl. June, Sept. Britain. Pl. prostrate.

44 M. NODÒSA (Wahl. in isis. 1828. vol. 21. p. 971.) pilose; stem prostrate; leaves 5-7-lobed, acutish, toothed; peduncles solitary or twin; carpels knotted, and are as well as the column hairy. ⊙. H. Native of Turkey about Constantinople. Flowers like those of *M. rotundifòlia*, but the fruit is double the size, with very prominent knots in the middle.

Knotted-carpelled Mallow. Fl. June, July. Pl. prostrate.

45 M. ARVE'NSIS (Presl. ex Spreng. syst. 3. p. 90.) stem prostrate; leaves cordately-orbicular, angularly-lobed; peduncles axillary, aggregate; corolla twice the length of the ciliated calyx; capsules wrinkled, pubescent. ⊙. H. Native of Sicily.

Corn-field Mallow. Pl. prostrate.

46 M. BRASILIE'NSIS (Desrous. in dict. enc. 3. p. 744.) stems diffuse; leaves orbicular, cordate, 7-lobed, soft, villous; lobes acutish; flowers aggregate, stalked; leaflets of involucel setaceous. ⊙. H. Native of Brazil near Rio Janeiro. Flowers purplish.

Brazilian Mallow. Fl. June, Aug. Clt. 1824. Pl. ¾ foot.

47 M. NICÆE'NSIS (All. ped. no. 1416.) stems prostrate; leaves angular, 5-lobed, acute; pedicels 3-4, erect, 4 times shorter than the footstalks; calyxes pilose, shorter than the corolla. ⊙. H. Native by road sides about Nice and in Spain. Cav. diss. 2. t. 25. f. 1. Flowers white, purplish at the top.

Var. β, montàna (Forsk. descr. 124.) leaves soft, villous. ⊙. H. Native of Egypt.

Nice Mallow. Fl. July, Aug. Clt. 1810. Pl. prostrate.

48 M. MICROCA'RPA (Desf. cat. hort. par.) stem erect; leaves cordate, roundish, somewhat 5-lobed, crenated, glabrous; pedicels generally in pairs, shorter than the footstalks; corolla exceeding the calyx a little. ⊙. H. Native of Egypt. Pers. ench. 2. p. 251. A small plant, with purplish flowers.

Small-fruited Mallow. Fl. Ju. Sept. Clt. 1823. Pl. ½ to 1 ft.

49 M. HIRSU'TA (Presl. ex Spreng. syst. append. p. 257.) stem erect, branched, very hairy; leaves orbicularly-cordate, denticulated, tomentose on both surfaces, lower ones somewhat angular, upper ones 5-lobed, obtuse; peduncles 4 together, hairy, erectly-spreading, 3-times shorter than the petioles; capsules wrinkled, tomentose. ⊙. H. Native of Sicily.

Hairy Mallow. Fl. June, July. Pl. 1 to 2 feet.

50 M. BIVONIA'NA (Presl. ex Spreng. syst. p. 257.) plant covered with stellate pubescence; stem erect; leaves cordately-orbicular, bluntly angled; peduncles aggregate, very short, pubescent, bent; capsules tomentose. ⊙? H. Native of Sicily.

Bivoni's Mallow. Fl. June, July. Pl. 1 foot.

51 M. PARVIFLÒRA (Lin. amœn. 3. p. 416.) stem spreading; leaves roundish, bluntly angular, crenated, smoothish; flowers axillary, almost sessile, glomerate; corolla hardly longer than the calyx. ⊙. H. Native of the south of France and Mauritania. Jacq. hort. vind. t. 39. Cav. diss. 2. p. 68. t. 26. f. 1.—Pluk. phyt. 44. f. 2. Flowers small, reddish. Carpels wrinkled above, with toothed margins.

Small-flowered Mallow. Fl. June, July. Clt. 1779. Pl. decumbent, 2 feet long.

52 M. VERTICILLA'TA (Lin. spec. 970.) stem erect; leaves cordate, rather orbicular, bluntly angular; flowers axillary, glomerate, sessile; calyxes scabrous, rather inflated; carpels smoothish. ⊙. H. Native of China. Jacq. hort. vind. t. 40. Cav. diss. 2. t. 25. f. 3. M. glomeràta, Hortul. Flowers small, white, but purplish at the tip, almost sessile.

Whorled-flowered Mallow. Fl. June, July. Clt. 1683. Pl. 1 to 2 feet.

53 M. CHINE'NSIS (Mill. dict. no. 5.) stem erect, herbaceous; leaves somewhat orbicular, obsoletely 5-lobed; flowers crowded, sessile. ⊙. H. Native of China. Perhaps *M. verticillàta*. Flowers reddish or white, tipped with red.

Chinese Mallow. Fl. June, Aug. Clt.? Pl. 1 to 2 feet.

54 M. MAREO'TICA (Delil. ined. D. C. prod. 1. p. 433.) stem erect; leaves half round, 5-nerved, crenated, upper ones slightly lobed; flowers somewhat aggregated into a terminal head, almost sessile; calyxes inflated, 5-cleft; lobes broadish, mucronate, entire; carpels reticulated, pubescent. ⊙. H. Native of Egypt. Flowers purplish?

Mareotic Mallow. Fl. July, Aug. Clt. 1822. Pl. 1 to 2 ft.

55 M. TRIONOI'DES (D. C. prod. 1. p. 433.) stem erect; leaves half-round, 5-nerved, crenate-toothed, upper ones slightly lobed; flowers almost sessile, approximating into a terminal head; calyxes inflated, 5-cleft; lobes lanceolate, acuminate, ciliary-serrated; carpels very hairy. ⊙. H. Native? Leaflets of involucel setaceous.

Trionum-like Mallow. Pl. ½ to 1 foot.

56 M. CRI'SPA (Lin. spec. 970.) stem erect; leaves angular, toothed, curled, glabrous; flowers axillary, sessile. ⊙. H. Native of Syria. Cav. diss. 2. t. 23. f. 1. Flowers white, but pale-purple at the tip, almost sessile.

Curled-leaved Mallow. Fl. June, Aug. Clt. 1573. Pl. 2 to 6 feet.

57 M. FLEXUÒSA (Horn. hort. hafn. 2. p. 655.) stems prostrate, flexuous; leaves cordate, orbicular, 7-lobed, crenated; flowers axillary, sessile, few. ⊙. H. Native of? Flowers white, purple at the tip, almost sessile.

Flexuous-stemmed Mallow. Fl. June, Aug. Clt. 1820. Pl. prostrate.

58 M. GERANIOI'DES (Schlecht, et Cham. in Linnæa. 5. p. 226.) herbaceous; stems diffuse, canescently-tomentose from fascicles of long hairs; leaves triangular, trifid, beset with simple hairs above, middle-lobe 3-5-lobed, lateral ones 2-lobed; calyx closed; clusters of flowers stalked. ⊙. H. Native of Mexico.

Geranium-like Mallow. Fl. June, July. Pl. diffuse.

59 M. TENE'LLA (Cav. icon. 5. t. 422. f. 3.) stem trailing; leaves 3-lobed, crenated; flowers axillary, sessile, aggregate; corolla hardly larger than the calyx. ⊙. H. Native of Chili on the Cordilleras. Flowers pale-blue. A small plant.

Weak Mallow. Fl. June, Aug. Pl. trailing.

60 M. BONARIE'NSIS (Cav. diss. 2. t. 22. f. 1.) stem erect, tomentose, branched; leaves 3-lobed; lobes unequally crenate-toothed; flowers glomerate, axillary, nearly sessile, small. ⊙. H. Native of Buenos Ayres in the fields. Flowers white or red.

Buenos Ayrean Mallow. Fl. July, Aug. Clt. 1820. Pl. 1 ft.

§ 6. *Capénses, D. C. prod.* 1. *p.* 433. *Flowers purplish or white. Leaves angularly lobed. Stems shrubby. Outer calyx or involucel* 3*-leaved. Pedicels solitary,* 1*-flowered, rarely in twos or threes, or* 2*-*3*-flowered.—N. B. Many of the species of this section are probably varieties or hybrids originated by culture. All natives of the Cape of Good Hope.*

61 M. AMŒ'NA (Sims, bot. mag. t. 1998.) pedicels 1-flowered, aggregate, shorter than the leaves; leaflets of outer calyx ovate, acuminated; leaves 5-lobed, pilose, wrinkled. ♄. G. Flowers purple. This is an elegant plant.

Pleasing Mallow. Fl. April, May. Clt. 1796. Shrub 2 to 4 feet.

62 M. VIRGA'TA (Cav. diss. 2. p. 70. t. 18. f. 2.) pedicels 1-flowered, solitary or in pairs, longer than the footstalks; leaflets of outer calyx linear; leaves 3-lobed, crenated, glabrous, rigid. ♄. G. Murr. in comm. gœt. 1779. p. 20. t. 6. M. Capénsis, Lin. spec. 968. Flowers purple, with darker stripes.

Twiggy Mallow. Fl. May, July. Clt. 1727. Sh. 2 to 3 ft.

63 M. CAPE'NSIS (Cav. diss. p. 71. t. 24. f. 3.) pedicels 1-flowered, solitary or in pairs, longer than the footstalks; leaflets of outer calyx ovate-lanceolate; leaves 5-lobed and 3-lobed, crenate-toothed, clammy. ♄. G. Ker, bot. reg. 295. M. biflòra, Desrous. in dict. enc. 3. p. 747. Flowers red and white. No. 3429 of Burch. cat. is perhaps different from this.

Cape Mallow. Fl. year. Clt. 1713. Shrub 4 to 6 feet.

64 M. BALSA'MICA (Jacq. icon. rar. 1. t. 140.) pedicels 1-flowered, solitary, longer than the footstalks; leaflets of outer calyx oblong-linear; leaves ovate, slightly 3-lobed, acute, unequally toothed. ♄. G. Flowers pink.

Balsamic Mallow. Fl. May, Sept. Clt. 1800. Shrub 4 ft.

65 M. OXYCANTHOI'DES (Horn. hafn. 2. p. 654.) pedicels solitary, longer than the petioles; leaves glabrous, cuneiform, profoundly 3-lobed, deeply serrated, intermediate lobe largish. ♄. G. Flowers white or red.

Hawthorn-like Mallow. Fl. May, Aug. Clt. 1818. Sh. 4 ft.

66 M. RUGÒSA (Desrous. in dict. enc. 3. p. 747.) pedicels 1-flowered, solitary, longer than the petioles; leaflets of outer calyx ovate, acute; leaves somewhat cordate, pinnatifidly-sinuated, wrinkled. ♄. G. Flowers purple.

Wrinkled Mallow. Fl. May, Sep. Shrub 4 feet.

67 M. TRIDACTYLI'TES (Cav. diss. 2. p. 73. t. 21. f. 2.) pedicels solitary, 1-flowered, length of leaves; leaves almost sessile, cuneiform, trifid, entire. ♄. G. M. refléxa, Andr. rep. t. 135. Leaflets of outer calyx linear. Flowers pink.

Three-fingered-leaved Mallow. Fl. June, Aug. Clt. 1791. Shrub 3 feet.

68 M. DIVARICA'TA (Andr. bot. rep. t. 182.) pedicels solitary, longer than the petioles; leaves lobed, plaited, toothed, scabrous; branches and branchlets divaricating, flexuous. ♄. G. Flowers white, lined with red at the base. Involucel linear.

Divaricate-branched Mallow. Fl. June, Sep. Clt. 1792. Shrub 3 feet.

69 M. RETU'SA (Cav. diss. 2. t. 21. f. 1.) pedicels solitary, longer than the petioles; leaflets of outer calyx lanceolate; leaves oblong, very blunt, 3-lobed, toothed, villous. ♄. G. M. tríloba, Thunb. prod. 118. Flowers yellow or pink.

Retuse-leaved Mallow. Fl. March, May. Clt. 1803. Shrub 4 feet.

70 M. CALYCI'NA (Cav. diss. 2. p. 81. t. 22. f. 4.) pedicels solitary, 1-flowered, twice as long as the leaves; leaflets of outer calyx ovate, acute, large; leaves cordate, crenated, clothed with rough hairs. ♄. G. Ker. bot. reg. 297. Flowers pale red.

Large-calyxed Mallow. Fl. May, Aug. Clt. 1812. Sh. 4 ft.

71 M. FRA'GRANS (Jacq. hort. vind. 3. t. 35.) pedicels 1-flowered, solitary, length of petioles; leaflets of outer calyx lanceolate; leaves cordate, 5-lobed, toothed; branches red, clammy. ♄. G. Cav. diss. 2. p. 72. t. 23. f. 3. Ker. bot. reg. 296. M. scabròsa, Lin. amœn. acad. 4. p. 343. Flowers red.

Fragrant Mallow. Fl. May, July. Clt. 1759. Shrub 6 ft.

72 M. STRI'CTA (Jacq. hort. schoenbr. 3. p. 294.) pedicels solitary, 1-flowered, length of petioles; leaflets of outer calyx rather linear; leaves ovate, slightly 3-lobed, toothed, hairy. ♄. G. Corolla white, veined with red at the base.

Straight Mallow. Fl. May, Aug. Clt. 1805. Shrub 6 feet.

73 M. BRYONIFÒLIA (Lin. spec. 968.) pedicels solitary, 1 or 2-flowered, shorter than the petioles; leaves cordate, slightly 5-lobed, blunt, clothed with very rough starry hairs. ♄. G. M. refléxa, Wendl. hort. herrenh. 1. t. 4. M. stellàta, Thunb. prod. 119.? Flowers purple or red?

Bryony-leaved Mallow. Fl. July, Aug. Clt. 1731. Sh. 4 ft.

74 M. GROSSULARIÆFO'LIA (Cav. diss. 2. p. 71. t. 24. f. 2.) pedicels solitary, 1 or 3-flowered, longer than the petioles; leaflets of outer calyx oblong-linear; leaves sinuately-lobed, serrated, rough, and are as well as branches hairy. ♄. G. Ker. bot. reg. 561.—Dill. elth. 209. t. 169. f. 207. Flowers red, with darker veins and white claws.

Gooseberry-leaved Mallow. Fl. May, Sept. Clt. 1732. Shrub 3 to 6 feet.

75 M. ASPE'RRIMA (Jacq. hort. Schoenbr. 2. t. 139.) pedicels 1 or 2-flowered, solitary, rather longer than the petioles; leaflets of outer calyx linear; leaves 5-lobed, obtuse-toothed, very rough; terminal lobe elongated. ♄. G. Flowers white with a red base. The whole plant is rough from stellate hairs.

Very rough Mallow. Fl. Ju. Sept. Clt. 1796. Shrub 5 ft.

§ 7. *Multiflòræ. D. C. prod.* 1. *p.* 434. *Flowers purple or white. Peduncles axillary, many-flowered. Outer calyx* 3*-leaved. Leaves angular.*

76 M. LA'CTEA (Ait. hort. kew. 2. p. 448.) shrubby; leaves angular, acute, cordate, villous; petals obcordate, rather shorter than the calyx; peduncles panicled. ♄. G. Native of Mexico. M. vitifòlia, Cav. icon. 1. t. 30. Flowers milk-white.

Milky-flowered Mallow. Fl. Jan. Feb. Clt. 1780. Sh. 4 ft.

77 M. CAPITA'TA (Cav. diss. 5. t. 137. f. 1.) shrubby; leaves 5-lobed; lobes pinnatifidly-jagged, toothed, intermediate one elongated; peduncles capitate, corymbose. ♄. G. Native of Peru. Flowers pale violet-coloured with white claws.

Capitate-flowered Mallow. Shrub 6 feet.

78 M. MINIA'TA (Cav. icon. 3. t. 278.) stems fruticulose, erect; leaves ovate, 3-lobed, toothed, tomentose; peduncles axillary, racemose, few-flowered, but sometimes only 1-flowered. ♄. G. Native of? Flowers vermilion.

Vermilion-flowered Mallow. Fl. May, July. Clt. 1798. Pl. 1 foot.

79 M. MUNROA'NA (Dougl. in bot. reg. 1306.) plant clothed with white tomentum; stems ascending; leaves roundish, cordate, somewhat 5-lobed, crenate; involucel setaceous; peduncles axillary and terminal, panicled, 3-5-flowered. ♃. H. Native of North America on the barren plains of the Columbia. Flowers elegant, of a vermilion colour.

Munro's Mallow. Fl. May, Oct. Clt. 1827. Pl. 1 to 2 ft.

80 M.? opercula'ta (Cav. diss. 2. t. 35. f. 1.) shrubby, tomentose; leaves angular, 5-lobed; intermediate lobe largest; peduncles axillary, racemose; flowers leaning to one side; carpsule operculate. ♄. G. Native of Peru in sandy places. Flowers pale purple.

Lidded-capsuled Mallow. Fl. July, Aug. Clt. 1795. Sh. 3 ft.

81 M. Peruvia'na (Lin. spec. 968.) plant herbaceous, erect; leaves palmatifid; spikes axillary; flowers leaning to one side; carpels denticulated. ⊙. H. Native of Peru. Jacq. hort. vind. t. 156. Cav. diss. 2. p. 68. t. 19. f. 1. M. exasperàta, Mœnch. Corolla small, violet.

Peruvian Mallow. Fl. June, Aug. Clt. 1759. Pl. 4 feet.

82 M. Lime'nsis (Lin. spec. 968.) plant herbaceous, erect; leaves 7-lobed, wrinkled; spikes axillary; flowers leaning to one side; carpels smooth. ⊙. H. Native of Peru at Lima. Jacq. hort. vind. t. 141. Cav. diss. 2. p. 69. t. 19. f. 2. M. læ'vis, Mœnch. Corolla blue.

Lima Mallow. Fl. July. Clt. 1768. Pl. 1 to 4 feet.

83 M. acau'lis (Cav. diss. 2. p. 82. t. 35. f. 2.) plant herbaceous, stemless; leaves all radical, angular, toothed; teeth with two bristles; peduncles rising from the root, many-flowered. ♃. G. Native of Peru on the Andes. Flowers yellowish.

Stemless Mallow. Pl. ½ foot.

Sect. II. Mala'chia (μαλαχη, *malache*, a mallow). D. C. prod. 1. p. 435. Involucel or outer calyx 5 or 6-leaved; leaflets linear. Carpels 5, 1-seeded, distinct, indehiscent.

84 M. hibiscifòlia (Desrous. in dict. enc. 3. p. 748.) leaves ovate, acuminated, somewhat angular, serrated, soft, villous; pedicels a little shorter than the petioles; involucel 5-leaved. ♄. S. Native of Bourbon. Flowers red.

Hibiscus-leaved Mallow. Shrub 6 feet?

85 M. Borya'na (D. C. prod. 1. p. 435.) leaves 5-angled, toothed, acute, pubescent; pedicels very short; involucel 6-leaved. ♄? S. Native of Bourbon. Lobes of calyx 3-nerved at the base. Flowers not seen, but they are probably red.

Bory's Mallow. Shrub.

† *Species not sufficiently known.*

86 M. orienta'lis (Mill. dict. no. 3.) stem erect, herbaceous; leaves lobed, obtuse, crenated. ⊙. H. Native of the Levant. Flowers large, beautiful red.

Eastern Mallow. Fl. Jul. Sept. Clt.? Pl. 1 to 2 feet.

Cult. The stove species of *Mallow* will succeed in any kind of rich soil, and cuttings of them will strike root freely if planted in light soil with a hand-glass placed over them. The greenhouse species will grow in the same kind of soil as the stove species, and are propagated in the same manner; most of them are worth cultivating for ornament, but particularly those belonging to the section *Capénses*. The hardy perennial species should be planted in the open border, and they may either be encreased by dividing the plants at the root or by seed. The most ornamental species are *M. moschàta*, *Morènii alcèa*, *Munroàna*, and *purpuràta*. The annual species only require to be sown in the open ground, but none of them are worth cultivating, unless in general collections, except *M. Mauritánica*, *triméstris*, and *Liménsis*.

III. SPHÆRA'LCEA (from σφαιρα, *sphaira*, a globe, and *Alcea*, Marsh-Mallow; in allusion to the disposition of the carpels.) St. Hil. fl. bras. 1. p. 209. Málva, sect. iii. Sphæròma, D. C. prod. 1. p. 435.

Lin. syst. *Monadélphia*, *Polyándria*. Calyx 5-cleft, girded by a shorter deciduous 3-leaved involucel. Carpels many, separable, verticillate, 2-3-seeded, opening by 2 little valves on the back, disposed into a globular head. Seeds kidney-shaped. Trees or shrubs, with toothed or 3-5-lobed leaves. Peduncles axillary at the tops of the branches, 1-flowered or umbellately, or racemosely 2-many-flowered. Flowers reddish or flesh-coloured. This genus has lately been divided from *Málva* by M. Auguste St. Hilaire; we shall therefore retain the authorities for the species under that genus.

1 S. Cisplati'na (St. Hil. fl. bras. 1. p. 210.) stem shrubby, slender; leaves ovate, somewhat 3-lobed, toothed or crenate, tomentose beneath; flowers axillary, racemose, secund; leaflets of involucel setaceous. ♄. S. Native of Brazil in the province of Cisplatine, where the plant is called *Malvalisco*. It is employed in fomentations in diseases of the chest.

Var. β, *quercifòlia* (St. Hil. l. c.) stems looser; leaves longer, blunter, cuneate at the base, and obsoletely crenated.

Cisplatine Globe-Mallow. Fl. Dec. Jan. Shrub 6 feet.

2 S. umbella'ta (Cav. icon. 1. t. 95.) leaves sub-peltate, 5-lobed, obtuse; peduncles axillary, umbelliferous; leaflets of involucel obovate, somewhat stipitate, deciduous. ♄. S. Native of New Spain on the declivities of mountains. Flowers large, of fiery violet-colour. Lod. bot. cab. 222.

Umbellate-flowered Globe-Mallow. Fl. Jan. April. Clt. 1814. Shrub 10 feet.

3 S. ròsea (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 435.) leaves sub-peltate, 5-lobed, acute; peduncles axillary, 1-3-flowered; leaflets of involucel ovate, sessile. ♄. G. Native of Mexico. Flowers rose-coloured. Leaflets of involucel 3-nerved. Very like *M. umbellàta*.

Rose-coloured-flowered Globe-Mallow. Shrub 4 feet.

4 S. abutiloìdes (Lin. spec. 971.) leaves 5-angled, tomentose; peduncles axillary, bifid, few-flowered; leaflets of involucel oblong-linear, small; fruit globose. ♄. G. Native of the Bahama islands, and on the sea-coast of Carolina. Jacq. hort. Schoenbr. 3. t. 293. Sims, bot. mag. 2544. Flowers large, purple. Leaves cordate, 5-7-lobed.

Abutilon-like Globe-Mallow. Fl. June, Sept. Clt. 1725. Shrub 20 feet.

5 S. obtusi'loba; plant clothed with stellate tomentum; leaves cordate, somewhat 5-lobed, crenated; lobes very blunt; peduncles axillary and terminal, corymbosely-racemose, many-flowered; flowers crowded; involucel of 3 linear leaflets; segments of calyx ovate. ♄. G. Native of Chili in the vicinity of Valparaiso. Málva obtusíloba, Hook. bot. mag. t. 2787. Petals obcordate, purple, with darkish claws.

Obtuse-lobed-leaved Globe Mallow. Fl. July. Clt. 1827. Shrub 3 to 4 feet.

6 S. e'legans (Cav. diss. 2. t. 16. f. 1.) leaves 3-parted, canescent, jagged, intermediate lobe trifid; pedicels axillary, 1-flowered, a little shorter than the petioles; fruit globose. ♄. G. Native of the Cape of Good Hope. Jacq. coll. 4. t. 6. f. 1. Flowers pink or yellowish-red. Carpels 3-seeded.

Elegant Globe-Mallow. Fl. June, July. Shrub 4 feet.

7 S. angustifòlia (Cav. diss. 2. p. 64. t. 20. f. 1.) leaves lanceolate, toothed, powdery; peduncles axillary, solitary, or in pairs, 1 or few-flowered; leaflets of involucel setaceous, deciduous. ♄. G. Native of Mexico. Cav. icon. 1. p. 48. t. 68. Sweet, fl. gard. icon. Flowers pink.

Narrow-leaved Globe Mallow. Fl. Aug. Sept. Clt. 1780. Shrub 3 or 4 foot.

Cult. The species of *Sphærálcea* will thrive in any light soil, and ripened cuttings will strike root if planted in the same kind of soil, under a hand-glass. All the species bear elegant flowers.

IV. MODI'OLA (from *modiolus*, the nathe of a wheel, in allusion to the whorled position of the carpels). Mœnch, meth.

620. St. Hil. fl. bras. 1. p. 210. Málva, sect. 4. Modìola, D. C. prod. 1. p. 435.

Lin. syst. *Monadélphia, Polyándria.* Calyx 5-cleft, girded by a 3-leaved involucel. Petals entire. Tube of stamens divided into fascicles at the apex. Styles connected at the base. Capsule girded by the permanent calyx. Carpels many, separable, bicuspidate, verticillate, 2-valved, opening internally. Seeds 2 in each cell. Creeping or trailing herbs. Leaves 3-9, but usually 5-lobed, deeply serrate. Stipulas petiolar, twin. Peduncles axillary, solitary, rarely twin, 1-flowered, slender. Corolla violaceous or red. This genus has been lately separated by M. Auguste St. Hilaire from the genus *Málva*, we shall, therefore, retain the authorities for the species under that genus.

1 M. re'ptans (St. Hil. fl. bras. 1. p. 212. t. 43.) stem creeping; leaves 5-angled, profoundly 5-7-parted, cut; peduncles axillary, solitary, 1-flowered, longer than the leaves; ovary very hairy, 14-16-celled. ⊙. H. Native of Brazil in the provinces of Cisplatine and Rio Grande do Sul, on rocks. Flowers red.

Creeping Modiola. Pl. creeping.

2 M. Carolinia'na (Lin. spec. 969.) leaves many-lobed, deeply toothed; pedicels solitary, shorter than the petioles; fruit crested. ⊙. H. Native of North America in fields from Virginia to Carolina. Cav. diss. 2. t. 15.—Dill. elth. t. 4. f. 4. Schurhr. handb. 1. Flowers dark red or vermilion. Stem prostrate, rooting. Lower leaves undivided.

Carolina Modiola. Fl. Jul. Sept. Clt. 1723. Pl. prostrate.

3 M. urticifòlia (H. B. et Kunth, nov. gen. amer. 5. p. 276.) leaves roundish-ovate, acute, obsoletely cordate, deeply serrated, somewhat 9-lobed, rather pilose; pedicel solitary, shorter than the petioles; flowers decandrous; capsule of 15-hispid carpels. ♃. G. Native of South America near Santa Fe de Bogota. Flowers violet, very like those of *M. Caroliniàna.*

Nettle-leaved Modiola. Fl. July, Sept. Pl. prostrate.

4 M. prostra'ta (Cav. diss. 2. t. 16. f. 3.) leaves palmately 5-7-lobed, deeply toothed; pedicels solitary, rather longer than the leaves; fruit glabrous; petals entire. ⊙. H. Native of Brazil at Monte Video by way sides. Sims, bot. mag. 2515. Flowers red. Ovary 14-16-celled.

Prostrate Modiola. Fl. June, Aug. Clt. 1806. Pl. prostrate.

5 M. erioca'rpa (D. C. prod. 1. p. 436.) leaves palmately 5-lobed, deeply toothed; pedicels in pairs, length of petioles; fruit villous. ♃. G. Native about Buenos Ayres in the fields called the Pampas. Flowers red.

Woolly-fruited Modiola. Pl. prostrate.

6 M. decu'mbens (Willd. enum. 731.) leaves ovate, deeply toothed, somewhat lobed; pedicels longer than the petioles; fruit villous; petals entire. ♃. G. Native of South America. Flowers red.

Decumbent Modiola. Fl. Ju. Sept. Clt. 1815. Pl. decumbent.

Cult. These plants will grow in any common garden-soil. They are all increased by seeds, which may be sown in the open border in April. The perennial kinds will require to be sheltered during severe weather.

V. KITAIBE'LIA (in honour of Paul Kitaibel, formerly professor of botany at Pest in Hungary, who travelled through that country in search of plants; author of Plantæ Rariores Hungariæ, 3 vol. fol. Pest, in conjunction with Waldstein.) Willd. nov. act. soc. n. Scrut. berl. 2. p. 107. t. 4. f. 4. D. C. prod. 1. p. 436. Waldst. et Kit. hung. 1. p. 29. t. 31.

Lin. syst. *Monadélphia, Polyándria.* Calyx 5-cleft, girded by a 7 or 9-cleft involucel. Carpels capsular, 1-seeded, collected into a 5-lobed head. A large strong herb, with white flowers.

1 K. vitifòlia (Willd. l. c.) ♃. H. Native of Hungary. Leaves 5-lobed, acute, toothed. Flowers axillary.

Vine-leaved Kitaibelia. Fl. July, Sep. Clt. 1801. Pl. 5 to 8 ft.

Cult. This plant only requires to be planted in the open border, and is increased by dividing at the root.

VI. ALTHÆ'A (from αλθω, *altho*, to cure; in allusion to the well known salutary effects of *Althæ'a officinàlis.*) Cav. diss. 2. p. 91. D. C. prod. 1. p. 436.

Lin. syst. *Monadélphia, Polyándria.* Calyx 5-cleft, girded by a 6 or 9-cleft involucel. Carpels capsular, 1-seeded, disposed into an orbicular head. Strong coarse plants, with the appearance of *Mallow.*

Sect. I. Althæa'strum (an alteration from *Althæ'a.*) D. C. prod. 1. p. 436. Althæ'a, Lin. gen. no. 839. Lam. ill. t. 581. Carpels emarginate, destitute of membranaceous margins. Involucel usually 8 or 9-cleft.

1 A. officina'lis (Lin. spec. 966.) leaves clothed with soft white tomentum on both surfaces, cordate or ovate, toothed, undivided or somewhat 5-lobed; peduncles axillary, many-flowered, much shorter than the leaves. ♃. H. Native of marshes, especially towards the sea-coast, in many parts of Europe. In Britain abundantly. Smith, engl. bot. t. 147. Woodv. t. 53. Fl. dan. 530. Cav. diss. 2. p. 93. t. 30. f. 2. Flowers of a delicate uniform blush-colour.

The whole plant, but especially the roots, abounds with mucilage. The roots are about the thickness of a finger, long and fibrous. When peeled and dried, they are perfectly white; and certain districts of France are celebrated for producing them in fine quality. They contain much mucilage, with saccharine principle. Dr. Duncan found that the decoction of the root reddens turnsole, and gelatinizes silicized potass. It is used as an emollient and demulcent in diseases attended with irritation and pain, as in various pulmonary complaints, and in affections of the alimentary canal and urinary organs; and it is applied externally in emollient fomentations, gargles, and clysters; and a favourite lozenge is named from it, *Pate de Guimauve.* In France the plant is called *Guimauve, mauve-qui,* that is to say, *Clammy Mallow.* It was anciently called *Malva-visca,* on account of the abundant mucilage in the roots.

Officinal Marsh-Mallow. Fl. July, Sep. Britain. Pl. 3 to 4 feet.

2 A. Taurine'nsis (D. C. prod. 1. p. 436.) leaves clothed on both surfaces with soft white starry tomentum, trifid or rather 3-parted; peduncles axillary, many-flowered, rather longer than the leaves, straight. ♃. H. Native on hills about Turin. A. officinàlis β, Willd. spec. 3. p. 771. Flowers blush-coloured. An intermediate species between *A. officinàlis* and *A. Narbonénsis.*

Taurin Marsh-Mallow. Fl. Jul. Sept. Clt. 1817. Pl. 3 to 4 ft.

3 A. Narbone'nsis (Pourr. in Cav. diss. 2. p. 94. t. 29. f. 2.) leaves pubescent, somewhat tomentose, lower ones 5 or 7-lobed, upper ones 3-lobed; peduncles many-flowered, lax, longer than the leaves. ♃. H. Native of France about Narbonne, and of Spain. Jacq. icon. rar. 1. t. 138. Asso, introd. in Oryct. arrag. 175. t. 5. f. 1. Flowers of a pale red colour.

Narbonne Marsh-Mallow. Fl. Aug. Sept. Clt. 1780. Pl. 3 to 6 feet.

4 A. canna'bina (Lin. spec. 966.) leaves pubescent, and somewhat hoary on the under surface, lower ones palmately-parted, upper ones 3-parted; lobes narrow, and grossly toothed; peduncles axillary, many-flowered, lax, longer than the leaves. ♃. H. Native of the south of France, Italy, and Hungary, on the margins of woods. Jacq. hort. vind. t. 124. aust. t. 101. Cav. diss. 2. p. 94. t. 30. f. 1. Flowers rose-coloured.

Hemp-like Marsh-Mallow. Fl. June, July. Clt. 1597. Pl. 5 or 6 feet.

5 A. hirsu'ta (Lin. spec. 965.) leaves cordate, clothed with rough hairs, but glabrous on the upper surface, lower ones lobed, upper ones 3-5-lobed; stem hispid; peduncles 1-flowered, longer than the leaves. ⊙. H. Native of many parts of Europe, particularly France, Italy, Spain, and Austria, in hedges. In England in hedges and cultivated fields near Cobham Hall in Kent. Cav. diss. 2. p. 95. t. 28. f. 1. Jacq. hort. vind. t. 125. austr. t. 170. Flowers very pale blush-coloured.

Hairy Marsh-Mallow. Fl. Ju, July. England. Pl. 1 to 2 ft.

6 A. Ludwi'gii (Lin. mant. 98.) leaves glabrous, cordate-roundish, lobed, and toothed; pedicels axillary, crowded, 1-flowered; calyxes villous. ⊙. H. Native of Sicily and Egypt. Cav. diss. 2. p. 96. t. 30. f. 3. icon. 2. t. 29. f. 1. Flowers white or blush-coloured, smaller than those of *A. hirsùta*.

Ludwig's Marsh-Mallow. Fl. June, July. Clt. 1791. Pl. 1 ft.

Sect. II. Alce'a (from αλκη, *alke*, remedy; the *Alcèa* of the ancients was a kind of *Mallow*. The present plants have the appearance, taste, and emollient effects of the *Marsh-Mallow*.) Lin. gen. no. 840. Lam. ill. t. 581. D. C. prod. 1. p. 437. Carpels surrounded by a membranaceous furrowed margin. Involucel 6 or 7-cleft.

7 A. acau'lis (Cav. diss. 2. t. 27. f. 3.) plant almost stemless; leaves roundish-cordate, somewhat 5-angled, crenated; pedicels 1-flowered, much shorter than the petioles; petals emarginate, bearded at the base. ⊙. H. Native of Syria. Flowers pale-yellow.

Stemless Hollyhock. Fl. June, July. Clt. 1680. Pl. ¼ ft.

8 A. Caribæ'a (Sims, bot. mag. t. 1916.) stem straight, hispid; leaves cordate, roundish, lobed, crenate-serrated; flowers solitary, almost sessile; petals somewhat obcordate, with bearded claws; stigmas diffuse. ♂. H. Native of the Caribbee Islands. Flowers rose-coloured, with a yellow base.

Caribbean Hollyhock. Fl. March, April. Clt. 1816. Pl. 3 ft.

9 A. stria'ta (D. C. prod. 1. p. 437.) stem puberulous, and somewhat scabrous; leaves cordate, bluntly 3-lobed, crenated; flowers solitary, on short pedicels; involucel one-half shorter than the inner calyx; lobes of calyx with 7-stripes; petals obcordate, 2-lobed. ♂. H. Native? Flowers pale, 2½ inches in diameter.

Striped-calyxed Hollyhock. Fl. July, Aug. Clt.? Pl. 5 ft.

10 A. pa'llida (Walds. et Kit. in Willd. spec. 3. p. 773.) stem erect, hispid; leaves roundish, cordate; involucel equal in length to the calyx; petals 2-lobed. ♂. H. Native of Hungary. Flowers whitish-purple.

Pale-flowered Hollyhock. Fl. July, Aug. Clt. 1805. Pl. 4 to 6 feet.

11 A. leuca'ntha (Fisch. in litt.) leaves roundish-cordate, 5-angled or 3-lobed, crenate, roughly pilose; stem, petioles, and peduncles hispid; racemes bractless, naked; flowers twin; petals cuneate, emarginate. ♂. H. Native of the Altaian Mountains. A. nudiflòra, Lindl. in hort. trans. 7. p. 251. Leaves large. Involucre 6-7-cleft, half as long as the calyx. Flowers white, with a greenish-yellow base.

White-flowered Hollyhock. Fl. July, Aug. Clt. 1824. Pl. 6 feet.

12 A. Frolovia'na (Fisch. mss.). ♂. H. Native of the Russian empire. This plant was introduced to the gardens in 1824, but has never flowered.

Frolove's Hollyhock. Pl. 6 feet?

13 A. ròsea (Cav. diss. 2. t. 29. f. 3.) stem straight, hairy; leaves cordate, with 5 or 7 angles, crenated, rough; flowers axillary, sessile, somewhat spiked at the top; petals a little crenated, with villous claws. ♂. H. Native of the Levant. Alcèa ròsea, Lin. spec. 966. Mill. fig. Ludw. ect. t. 42. Knor. del. 1. t. R. 15. Flowers rose-coloured, large. All the varieties of Hollyhock have originated from this plant. The flowers are either single or double, white, red, scarlet, yellow, buff-coloured, blackish-red, seldom variegated. Although the double varieties of Hollyhock are not constant, yet where the seeds are carefully saved from the most double flowers, the greatest number of the plants will arise nearly the same as the plants from which they were taken, provided no plant with single or bad-coloured flowers are permitted to grow near them. Therefore if any such appear, they should be removed from the good ones, that their pollen may not spread into the other flowers, which would cause them to degenerate.

Var. β ? bíloba (D. C. prod. 1. p. 437.) petals bluntly 2-lobed. ♂. H. This plant sometimes occurs in gardens under the name of *A. grandiflòra*, although the flowers are much smaller than in var. *α*.

Rose or Common Hollyhock. Fl. July, Sep. Clt. 1573. Pl. 8 feet.

14 A. Sine'nsis (Cav. diss. 2. t. 29. f. 3.) stem straight, glabrous, branched at the bottom; leaves cordate, scabrous, crenated, angular; flowers axillary, sessile, spiked at the apex of the branches; petals somewhat crenated, with villous claws. ⊙. H. Native of China. Differing from *A. ròsea* in the plant being annual, dwarfer, and the flowers a little larger. Flowers rose-coloured.

China Hollyhock. Fl. July. Clt. 1818. Pl. 3 or 4 feet.

15 A. Africa'na (Lour. fl. coch. p. 421. under Alcèa.) stem shrubby, hispid; leaves 3-lobed, crenated; flowers solitary, axillary, stalked; involucel and calyx 6-parted. ♄. G. Native of the Eastern coast of Africa. Flowers scarlet. Carpels 5.

African Hollyhock. Shrub 4 feet.

16 A. Coromandelia'na (Cav. diss. 2. p. 93.) tomentose; stem erect; leaves somewhat triangular, crenated, obtuse, 5-nerved, somewhat 3-lobed; flowers solitary, almost sessile, axillary; petals broad-oblong.—Native of Pondicheri. Flowers flesh-coloured.

Coromandel Hollyhock. Pl. 2 to 3 feet.

17 A. flexuòsa (Sims, bot. mag. t. 892.) stem somewhat flexuous, hispid; leaves cordate, somewhat 7-lobed, obtuse, on long footstalks; flowers axillary, solitary, stalked; petals obcordate. ♃. S. Native of the East Indies. Flowers scarlet.

Flexuous-stemmed Hollyhock. Fl. June, Aug. Clt. 1803. Pl. 2 to 3 feet.

18 A. ficifòlia (Cav. diss. 2. p. 92. t. 28. f. 2.) stem erect, pilose; leaves divided beyond the middle into 7 lobes; lobes oblong, obtuse, irregularly toothed; involucel almost one-half shorter than the calyx. ♂. H. Native of Siberia at the Don. Alcèa ficifòlia, Lin. spec. 697.—Knor. del. 2. t. A.—Blackw. herb. t. 54. Flowers large, single or double, generally yellow or orange-coloured, in terminal spikes.

Fig-leaved or Antwerp Hollyhock. Fl. June, Sep. Clt. 1597. Pl. 6 feet.

19 A. Lavateræfòlia (D. C. prod. 1. p. 437.) stem erect, pilose; leaves tomentose on both surfaces, palmately-lobed beyond the middle; lobes oblong, obtuse, irregularly toothed; involucels nerved, nearly equal in length with the calyx. ♂? H. Native at the bottom of mount Libanon near Seyde. Flowers yellow?

Lavatera-leaved Hollyhock. Pl. 2 to 6 feet.

Sect. III. Alphæ'a (meaning unknown.) D. C. prod. 1. p. 437. Carpels wrinkled from small nerves, not marginated. Involucel 5-cleft.

20 A. Burche'llii (D. C. prod. 1. p. 438.) stem erect, pilose; leaves cordate, somewhat 5-lobed, grossly toothed, velvety; pedicels axillary, 1-flowered, pilose, hardly shorter than

the petioles; involucel and calyx 5-cleft.—Native of the Cape of Good Hope. Urèna pilòsa, Burch. cat. no. 2557.

Burchell's Hollyhock. Pl. ?

21 A. Borbónica (D. C. prod. 1. p. 438.) stem erect, villous at the bottom, upper part as well as leaves velvety; leaves cordate, some of them somewhat 5-lobed, grossly toothed; pedicels axillary, 1-flowered, twice as long as the petioles; involucel ciliated at the base. ♄? ♃? S. Native of the island of Bourbon at the river St. Dionysius. A species nearly allied to *A. Burchéllii*.

Bourbon Hollyhock. Pl. ?

† *A species not sufficiently known.*

22 A. Cre'tica (Weinm. in syll. pl. nov.). This species is said to come very near to *A. acaúlis*, but we know nothing further of it.

Cretan Althæa. Pl. ½ foot.

Cult. Most of the species are worth cultivating for ornament, particularly those belonging to the section *Alcèa* or *Hollyhock*. They will all thrive in any kind of common garden soil. The herbaceous perennial kinds may be either increased by dividing the plants at the root or by seeds. The biennial and annual species only require to be sown in the open border in spring, and the plants should be transplanted separately when of sufficient size. The stove species are propagated in the same manner as the hardy species.

VII. LAVATE'RA (named by Tournefort in honour of the two Lavaters, physicians of Zurich, and naturalists.) Lin. gen. no. 842. Lam. ill. t. 582. D. C. prod. 1. p. 438.

Lin. syst. *Monadélphia, Polyándria*. Calyx 5-cleft, girded by a 3 or 5-cleft involucel; leaflets joined, especially to the middle. Carpels capsular, 1-seeded, disposed into an orb around the axis, which is variously dilated above the fruit.

Sect. I. Ste'gia (from στεγος, *stegos*, a covering, in allusion to the expanded receptacle concealing the ovaries.) D. C. fl. fr. 4. p. 835. prod. 1. p. 438. Receptacle or axis of fruit expanded at the apex into a disk, which conceals the ovaries.

1 L. trime'stris (Lin. spec. 974.) stem herbaceous, scabrous; leaves smoothish, roundish-cordate, upper ones lobed; pedicels solitary; orb of receptacle perfectly concealing the carpels. ☉. H. Native of Syria and Spain. Jacq. hort. t. 72.—Cav. diss. 2. p. 90. t. 3. f. 1. Curt. bot. mag. 109. Stègia Lavatèra, D. C. fl. fr. no. 4525. Flowers rose-coloured. A tall spreading elegant plant.

Var. β, albiflòra; flowers white.

Three-monthly Lavatera. Fl. July, Sep. Clt. 1633. Pl. 3 to 6 feet.

2 L. Pseu'do-O'lbia (Poir. suppl. 3. p. 309.) stem shrubby; leaves tomentose, lower ones 5-lobed; pedicels aggregate; orb of receptacle half concealing the carpels. ♄. F. Native? L. undulàta, Desf. arbr. 1. p. 471. not of Mill. Flowers pale purple. Habit almost of the following section.

False-Olbia Lavatera. Fl. June, July. Clt. 1817. Sh. 5 ft.

Sect. II. O'lbia (*L. O'lbia* grows in the environs of d'Hieres in Provence; in Latin called *O'lbia*.) Medik. malv. p. 41. D. C. prod. 1. p. 438. Receptacle of fruit central, conical, protruding.

3 L. phœni'cea (Vent. malm. t. 120.) stem arboreous; leaves acutely 5-lobed, toothed, smoothish; peduncles solitary, 3-5-flowered; involucel caducous. ♄. G. Native of Madeira and of Africa. Cultivated in the gardens of the Canary Islands, whence it has been introduced into Europe. L. coccínea, Dietr. Flowers large, scarlet.

Scarlet Lavatera. Fl. June, July. Clt. 1816. Tree 10 feet.

4 L. acerifòlia (Cav. el. hort. madr. p. 20.) stem shrubby; leaves acutely 5-lobed, rather toothed, smoothish; pedicels solitary, 1-flowered. ♄. G. Native of Teneriffe. D. C. cat. hort. monsp. p. 121. Lois. herb. amat. p. 322. Flowers pale-lilac.

Maple-leaved Lavatera. Fl. June, July. Clt. 1820. Sh. 6 ft.

5 L. Ju'lii (Burch. cat. no. 2664.) stem shrubby; leaves 3-5-lobed, hoary-tomentose beneath, with obtuse lobes; terminal lobe longest; peduncles somewhat racemose; involucel 3-parted. ♄. G. Native of the Cape of Good Hope. This plant should perhaps have been enumerated amongst *Málva*. Flowers red?

Julius's Lavatera. Shrub 5 feet.

6 L. hi'spida (Desf. atl. 2. p. 118. t. 171.) stem shrubby, rough from fascicles of hairs; leaves canescent, 5-lobed, upper ones 3-lobed or undivided; flowers almost sessile; involucel 3-parted, large, and very hairy. ♄. F. Native of Algiers in hedges. Flowers rose-coloured, solitary.

Hispid Lavatera. Fl. June, July. Clt. 1804. Shrub 8 feet.

7 L. Africa'na (Cav. diss. 5. p. 282. t. 139. f. 1.) stem shrubby, rather tomentose from flocky down; leaves canescent, all bluntly 5-lobed; pedicels twin, equal in length to the petioles; involucel 3-parted, tomentose. ♄. F. Native of Spain and the north of Africa. According to Willdenow this is a variety of *L. híspida*. Flowers pale-purple.

African Lavatera. Fl. June, July. Clt. 1820. Sh. 4 to 6 ft.

8 L. O'lbia (Lin. spec. 972.) stem shrubby, rather scabrous from distant fascicles of hairs; leaves soft, woolly, 5-lobed, upper ones 3-lobed, with the middle lobe elongated; uppermost leaves oblong, almost undivided; flowers solitary, sessile. ♄. F. Native of Provence in hedges about d'Hieres.—Lob. icon. t. 653. f. 2. Flowers reddish-purple on short pedicels.

Olbia Lavatera. Fl. June, Oct. Clt. 1570. Shrub 6 feet.

9 L. unguicula'ta (Desf. arbr. 1. p. 471.) stem shrubby, tomentose from starry down; leaves tomentose on both surfaces, acutely 5-lobed, upper ones 3-lobed; flowers solitary, on short pedicels. ♄. F. Native of the island of Samos. Very like *L. Olbia*, and is often found in gardens under that name. Flowers lilac.

Clawed-petalled Lavatera. Fl. Jul. Sept. Clt. 1807. Sh. 6 ft.

10 L. moscha'ta (Mor. elench. sard. p. 9.) plant clothed with stellate tomentum; stem shrubby; leaves waved, curled, with 5 obsolete, rounded lobes; upper leaves 3-lobed; stipulas leafy; peduncles axillary, aggregate, 1-flowered, shorter than the petioles; involucel 3-parted. ♄. F. Native of Sardinia. Corolla purplish. Receptacle conical, exserted. The whole plant smells strongly of musk.

Musky-scented Lavatera. Fl. May. Shrub 4 to 6 feet.

11 L. mìcans (Lin. spec. 972.) stem shrubby; leaves 7-angled, acute, crenated, plaited, tomentose; racemes terminal. ♄. F. Native of Spain and Portugal.—Moris, oxon. sect. 5. t. 17. f. 9. L. bryonifòlia, Mill. dict. no. 11. Leaves on the upper surface at the margins furnished with sulphur-coloured micæ, which glitter in the sun. Flowers purplish.

Glittering-leaved Lavatera. Fl. June, July. Clt. 1796. Shrub 4 feet.

12 L. Lusita'nica (Lin. spec. 973.) stem shrubby; leaves 7-angled, tomentose, plaited; racemes terminal. ♄. F. Native of Portugal. L. undulàta, Mill. dict. no. 10. Flowers purple.

Portuguese Lavatera. Fl. Aug. Sept. Clt. 1748. Sh. 4 ft.

13 L. fla'va (Desf. atl. 2. p. 119. t. 172.) stem herbaceous, downy; leaves rather tomentose, roundish, obsoletely 3-lobed; pedicels axillary, aggregate. ☉. H. Native of the north of Africa near Mascar in cultivated fields, and of Sicily. L. Agregentìna, Tineo. pl. sic. 1. p. 13. L. Empédoclis, Rœuch. Flowers yellow, about the size of those of *L. O'lbia*.

Yellow-flowered Lavatera. Fl. June, July. Clt. 1818. Pl. 3 or 4 feet.

14 L. plebe'ia (Sims. bot. mag. t. 2269.) stem herbaceous, scabrous; leaves 5-lobed, pubescent beneath; peduncles axillary, aggregate (or solitary?); petals wedge-shaped, emarginate, acute. ♃. G. Native of New Holland. Flower lilac.

Vulgar Lavatera. Fl. Sept. Clt. 1820. Pl. 2 feet.

15 L. Thuringi'aca (Lin. spec. 973.) stem herbaceous, downy; leaves rather downy, lower ones angular, upper ones 3-5-lobed, with the middle lobe longest; pedicels solitary, 1-flowered, longer than the petioles; petals 2-lobed. ♃. H. Native of Thuringia, Tartary, Sweden, Germany, &c. in hedges; also on hills about Odessa. Jacq. fl. austr. t. 311. Curt. bot. mag. 517.—Cam. hort. 1. t. 6.—Dill. elth. 9. t. 8. f. 8. Flowers large, purplish, or violet.

Thuringian Lavatera. Fl. July, Sept. Clt. 1731. Pl. 5 ft.

16 L. bie'nnis (Bieb. fl. taur. 2. p. 143.) stem herbaceous, and is as well as the leaves downy, lower leaves roundish, lobed, floral ones 3-lobed, with the middle lobe lanceolate; pedicels solitary, 1-flowered, longer than the petioles; petals somewhat emarginate. ♂. H. Native of Eastern Caucasus in fields. Flowers purplish. Like *L. Thuringìaca*.

Biennial Lavatera. Fl. Jul. Aug. Clt. 1819. Pl. 3 to 4 ft.

17 L. puncta'ta (All. auct. p. 26.) stem herbaceous, somewhat scabrous from starry down; leaves rather downy, lower ones cordate, orbicular, upper ones 3-lobed; pedicels solitary, 1-flowered, longer than the leaves. ⊙. H. Native of Provence, Nice, and Italy, in cultivated fields. O'lbia defléxa, Mœnch. suppl. p. 200. Flowers pale violet.

Spotted-stemmed Lavatera. Fl. Jul. Sept. Clt. 1800. Pl. 2 ft.

18 L. lanceola'ta (Willd. enum. 733.) stem herbaceous, with scabrous dots; leaves oblong-lanceolate, serrated, clothed with starry pubescence; upper leaves very entire; peduncles solitary, longer than the leaves. ⊙. H. Native of? Perhaps a variety of *L. punctàta*. Flower pale purple.

Lanceolate-leaved Lavatera. Fl. July, Sept. Clt. 1817. Pl. 3 feet.

Sect. III. Axo'lopha (from *αξων, axon*, an axle-tree, also a pole, and *λοφος, lophos*, a crest; alluding to the receptacle or axis of fruit being expanded into a crest at the apex.) D. C. prod. 1. p. 439. Receptacle or axis of fruit truncate at the apex, and expanded into a crest.

19 L. mari'tima (Gouan. ill. p. 46. t. 11. f. 2.) stem shrubby, downy; leaves downy, roundish, bluntly angular, 5-lobed, crenated; pedicels axillary, solitary. ♄. F. Native of the south of France and Spain, on rocks by the sea-side. Cav. diss. 2. t. 32. f. 3. L. Hispánica, Mill. dict. no. 9. L. rotundifòlia, Lam. Flowers white, with purple claws.

Sea-side Lavatera. Fl. Apr. June. Clt. 1596. Sh. 2 to 3 ft.

20 L. tri'loba (Lin. spec. 972.) stem shrubby, downy; leaves downy, rather cordate, and somewhat 3-lobed, round, crenated; pedicels aggregate; sepals acuminated. ♄. F. Native of Spain. Cav. diss. 2. t. 31. f. 1. Sims, bot. mag. 2226. L. calycìna, Poir. suppl. 3. p. 310. Flowers large. pale purple.

Three-lobed-leaved Lavatera. Fl. June, July. Clt. 1759. Shrub 4 feet.

21 L. subova'ta (D. C. prod. 1. p. 439.) stem suffruticose; leaves rather downy, ovate, notched, somewhat 3-lobed, with the middle lobe longest; pedicels 1 or 2, axillary, length of petioles; lobes of calyx acuminated. ♄. F. Native of fields about Mogador. Flowers pale purple.

Subovate-leaved Lavatera. Fl. July. Sh. 2 to 4 feet.

Sect. IV. Anthe'ma (from *ανθεμον*, a flower; on account of the axillary bundles of flowers). Med. malv. p. 42. D. C. prod. 1. p. 439. Receptacle or axis of fruit small, foveolate, not protruding, nor expanded into a crest.

22 L. arbòrea (Lin. spec. 972.) stem arboreous; leaves 7-angled, plaited, downy; pedicels aggregate, axillary, 1-flowered, aggregate, much shorter than the petiole. ♂. H. Native of Italy, Spain, Portugal, north of Africa and Canary Islands, on rocks by the sea-side. In Britain at Hurst Castle, over against the Isle of Wight; on Portland Island; on Caldy Island, in Carmarthen Bay; and on the Basse Rock, Inch-Garvy, and Mykrie-inch in the Frith of Forth, Scotland. In Cornwall and Devonshire. Smith, engl. bot. t. 1841. Cav. diss. 2. t. 139. f. 2. Flowers pale purple.

Tree Mallow. Fl. July, Oct. Britain. Pl. 6 to 10 feet.

23 L. Neapolita'na (Ten. cat. 1819. n. 125.) stem herbaceous, scabrous, erect; leaves roundish, with 7 nerves, and 7 very blunt crenated lobes; pedicels axillary, aggregate; involucel shorter than the calyx; lobes of calyx acuminated. ♃. H. Native of Naples by the sea-side. Flowers blue, with obcordate petals.

Neapolitan Lavatera. Fl. Jul. Sept. Clt. 1818. Pl. 4 to 6 ft.

24 L. Cre'tica (Lin. spec. 973.) stem herbaceous, scabrous; leaves with 5-7 acute lobes; pedicels axillary, 1-flowered, aggregate, much shorter than the petioles. ⊙. H. Native of Crete. Cav. diss. 2. t. 32. f. 1. Jacq. hort. vind. t. 41. Flowers pale red, with emarginate petals.

Cretan Lavatera. Fl. July, Sept. Clt. 1723. Pl. 5 feet.

25 L. sylve'stris (Brot. fl. lus. 2. p. 277.) stem herbaceous, scabrous from starry hairs; leaves roundish, with 5-7 blunt angles, upper ones somewhat 5-lobed, acute; pedicels aggregate, 1-flowered, shorter than the petioles; involucel 3-parted. ⊙. H. Native of Portugal by road-sides about Coimbra and elsewhere. Flowers pale-purple, with deeper coloured veins.

Wild Lavatera. Fl. June, Jul. Clt. 1817. Pl. 2 to 4 feet.

26 L. ambi'gua (D. C. prod. 1. p. 440.) stem herbaceous, hispid; lower leaves with 5 angular lobes, upper ones with 3 lanceolate, acute, toothed lobes; middle lobe longish; pedicels solitary, shorter than the leaves; carpels naked. ⊙? H. Native of fields about Naples. L. sylvéstris, Ten. prod. p. 40. but not of Brot. Flowers purple.

Ambiguous Lavatera. Fl. Jul. Sep. Clt. 1824. Pl. 2 to 3 ft.

† *Species not sufficiently known.*

27 L.? tripartì'ta (D. C. prod. 1. p. 440.) stem suffruticose; branches and leaves hoary from starry down; leaves 3-parted, with cuneated lobes, which are grossly notched at the apex; pedicels solitary, 1-flowered; involucel adhering to the tube of the calyx. ♄. F. Native of? Flowers purplish? Differing from all the other *Malvaceous* plants in the adhesion of the involucel to the calyx.

Three-parted-leaved Lavatera. Shrub 4 feet.

28 L. austra'lis (Weinm. ex steud. nom.). ⊙. H. Native of Europe.

Southern Lavatera. Fl. July, Sep. Clt. 1820. Pl. 2 feet.

Cult. The greenhouse and frame species will thrive well in a mixture of loam and peat, or any light soil, and cuttings from ripe wood planted in the same kind of soil under a hand-glass will root readily, or they may be raised from seeds, which generally ripen in abundance; they may be planted out against a south wall during summer, where many of them will survive the winter, if not severe, by being sheltered by a mat in frosty weather. The perennial herbaceous species will grow in any kind of soil, and may either be increased by dividing the plants at the root or by seeds. The annual and biennial kinds only require to be sown in the open border in the spring. All the species are hardy, and well adapted for shrubberies. The species worth cultivating for ornament are *L. O'lbia, unguiculàta, flàva, Neapolitàna, Lusitánica, triméstris, Thuringìaca* and *Crética*.

VIII. MALA'CHRA (a name under which Pliny speaks of a Persian tree which produces a gum. The modern plant has

nothing to do with the tree of Pliny; but the name is preserved to designate plants analogous to *mallow* from the similitude of the word *malachra* with that of *malache*, which signifies a *mallow*). Lin. gen. ed. Schreb. no. 1131. Lam. ill. t. 580. D. C. prod. 1. p. 440.

Lin. syst. *Monadélphia, Polyándria.* General involucre 3 or 5-leaved, compassing the head of flowers. The proper involucel with 8 or 12 linear or bristle-shaped leaflets. Carpels 5, capsular, 1-seeded, disposed into a round head. Stigmas 10.

1 M. u'rens (Poit. in Schrad. journ. 2. p. 293.) leaves ovate, 5-nerved; heads of flowers almost sessile; leaflets of involucre notched at the base. ⊙. S. Native of St. Domingo.

Stinging Malachra. Pl. 2 to 3 feet.

2 M. rotundifòlia (Schrank. hort. monac. t. 56.) leaves orbicular, crenated; heads of flowers stalked, 3-leaved and 5-flowered; leaflets of involucrum kidney-shaped. ⊙. S. Native of Brazil. Flowers yellow?

Round-leaved Malachra. Fl. Aug. Sept. Clt. 1821. Pl. 1 ft.

3 M. plumòsa (Desrous. in dict. encycl. 2. p. 686.) leaves elliptical, toothed; heads of flowers stalked, with many leaves and many flowers; interior leaflets of involucrum feather-fringed. ⊙? S. Native of Brazil. Sìda plumòsa, Cav. diss. 1. t. 12. f. 4. Flowers yellowish.

Feathered-involucred Malachra. Pl. 1 foot.

4 M. cilia'ta (Poir. suppl. 3. p. 578.) leaves broad-ovate, unequally crenated, smooth; heads of flowers almost sessile; involucel and bracteas ciliated; stem pubescent. ⊙? S. Native of Porto-Rico. Flowers white.

Ciliated-bracted Malachra. Pl. 1-3 feet.

5 M. corda'ta (Poir. suppl. 3. p. 578.) leaves cordate, twice serrated, smoothish; heads of flowers rather loose, hardly involucrated; bracteas elongated, filiform, very hairy. ⊙. S. Native of Porto-Rico. Flowers pale-yellow.

Cordate-leaved Malachra. Pl. 1 to 3 feet.

6 M. capita'ta (Lin. syst. 518.) leaves roundish-cordate, bluntly angular and toothletted; heads stalked, 3-leaved, 7-flowered; stem scabrous. ⊙. S. Native of the Caribbee islands in marshes, and tropical Africa. Sìda capitàta, Lin. act. ups. 1743. p. 137. t. 2. Flowers yellow.

Headed-flowered Malachra. Fl. Aug. Sep. Clt. 1759. Pl. 2 feet.

7 M. fascia'ta (Jacq. icon. rar. 3. t. 548.) pilose; leaves roundish, obsoletely lobed; heads of flowers on short stalks, 3-leaved, and usually 5-flowered; stem very villous. ⊙. S. Native of Caraccas. Flowers rose-coloured.

Fasciated Malachra. Fl. Aug. Sept. Clt. 1819. Pl. 3-6 feet.

8 M. Berte'rii (Spreng. syst. 3. p. 94.) shrubby; stem rough, tomentose; leaves oblong, doubly toothed, beset with starry down above, but tomentose beneath and reticulated with veins; racemes axillary; leaflets of involucel coloured, nerved. ♄. S. Native of South America on the banks of the river Magdalena.

Bertero's Malachra. Shrub 3 to 4 feet.

9 M. tri'loba (Desf. hort. par. D. C. prod. 1. p. 440.) leaves roundish, bluntly 3-lobed, crenulated; heads of flowers on long stalks, many-flowered, 3-leaved; stem scabrous. ⊙. S. Native of? Flowers small, white. Poir. suppl. 3. p. 578.

Three-lobed-leaved Malachra. Fl. July, Aug. Clt. 1817. Pl. 3 feet.

10 M. radia'ta (Lin. syst. p. 518.) leaves palmately-lobed; heads of flowers stalked, 5-6-leaved, many-flowered; leaves of involucre acuminated; calyx and stems very hairy; flowers bractless. ♂. S. Native of St. Domingo and Cayenne. Cav. diss. 2. t. 33. f. 3. Sìda radiàta, Lin. spec. 965. Flowers purple.

Rayed Malachra. Fl. July, Sept. Clt. 1794. Pl. 6 feet.

11 M. bractea'ta (Cav. diss. 2. p. 34. f. 2.) leaves palmate-lobed; heads of flowers on long stalks, 5-leaved, many-flowered; leaflets of involucre ovate, acute; flowers bracteate; stem very hairy. ⊙. S. Native of South America. Flowers white with a red centre. Perhaps a species of *Pavònia*.

Bracteated Malachra. Fl. Aug. Clt. 1823. Pl. 3 foot.

12 M. alceæfòlia (Jacq. icon. rar. 3. t. 549.) leaves cordate, 5-lobed; heads of flowers stalked, 5-leaved, usually 10-flowered; stem beset with scattered bristles. ⊙. S. Native of Caraccas. Flowers yellow. Leaves of involucre 3-lobed, hastate.

Alcæa-leaved Malachra. Fl. Aug. Sept. Clt. 1805. Pl. 5 ft.

13 M. Gaudichaudia'na (St. Hil. fl. bras. 1. p. 218.) leaves entire at the base, not cordate, palmately 5-lobed, middle lobe longest; heads of flowers terminal, on short peduncles, 6-leaved, 12-15-flowered; stem hispid; segments of the calyx oblong-triangular. ⊙. S. Native of Brazil about Rio Janeiro. Flowers reddish.

Gaudichaud's Malachra. Fl. Dec. Pl. 1 foot.

14 M. heptaphy'lla (Fisch. in Horn. suppl. 78.) leaves cordate, palmately 5-lobed, curled, with the middle lobe elongated; heads of flowers somewhat stalked, usually 5-leaved, many-flowered. ⊙. S. Native of Brazil. M. fasciàta, Ker. bot. reg. t. 467. Flowers yellow. Very like *M. Alceæfòlia*.

Seven-leaved Malachra. Fl. Aug. Sept. Clt. 1818. Pl. 2 ft.

15 M. palma'ta (Mœnch. meth. 615.) leaves palmate, 3-5-lobed, middle lobe longest, broadest at the apex; stem erect, scabrous, with two villous decurrent lines running the whole length. ⊙. S. Native of? Flowers yellow. Perhaps *M. alceæfòlia* or a variety of *M. heptaphýlla?*

Palmate-leaved Malachra. Fl. Aug. Sept. Pl. 3 foot.

16 M. Ure'na (D. C. prod. 1. p. 441.) leaves angular, unequally crenated, hairy on both surfaces; stem suffruticose; carpels muricated. ♄. G. Native of China about Canton. Urèna polyflòra, Lour. coch. p. 417. Flowers copper-coloured. Involucre containing many-flowers, as in the rest of the species.

Urena-like Malachra. Shrub 3 feet.

Cult. Malàchra is a genus of plants destitute of beauty, therefore not worth cultivating, except in botanic gardens. They only require to be sown in the spring in pots filled with loam and sand, and placed in a hot-bed, where they may remain until they have ripened their seed, or they may be removed to a stove when of sufficient size. They should be planted separately.

IX. URE'NA (a name latinized from *Uren*, the Malabar name of one of the species.) Lin. gen. no. 844. Lam. ill. t. 583. Gært. fruct. 2. p. 252. t. 135. f. 2. D. C. prod. 1. p. 441.

Lin. syst. *Monadélphia, Polyándria.* Calyx 5-cleft, girded by a 5-cleft involucel, which is joined to the middle. Anthers on the top of the tube. Stigmas 10. Carpels 5, capsular, 1-seeded, connivent, generally echinated from prickles, which are rayed at the apex. Leaves usually furnished with glands on the nerves on the under surface. Flowers red, usually in the axillæ of the leaves.

§ 2. *Leaves undivided or slightly 3-5-lobed.*

1 U. speciòsa (Wall. pl. asiat. rar. p. 23. t. 26.) leaves 3-nerved, denticulated, hoary-tomentose beneath, with a gland on each nerve beneath, lower leaves roundish, acutely somewhat 3-lobed, on long petioles, middle leaves oblong-cordate, acuminated, uppermost ones lanceolate, nearly sessile; corolla large, funnel-shaped, much longer than the calyx and 5-cleft involucel; carpels smooth, reticulated; style 10-parted. ♄. S. Native of the East Indies near Ava, on the lower part of mount Taong Dong. This is a very elegant plant, with large pink flowers, which are disposed in a kind of terminal racemose panicle. It

differs so much in habit from all the other species of this genus that we doubt its being a genuine species of *Urèna*.

Shewy Urena. Fl. Sep. Dec. Shrub 2 to 4 feet.

2 U. LOBA'TA (Lin. spec. 974.) leaves roundish, obtusely sub-3-lobed, soft and velvety on both surfaces, 7-nerved, 3-glanded; calyxes oblong-lanceolate. ⊙. G. Native of China.—Dill. elth. t. 319. f. 412.

Lobed-leaved Urena. Fl. June, July. Clt. 1731. Pl. 1 to 3 ft.

3 U. SCABRIU'SCULA (D. C. prod. 1. p. 441.) leaves roundish, acutely 3 or 5-lobed, scabrous above, but tomentose beneath, 7-nerved, 1 to 3-glanded; calyxes linear. ⊙. S. Native of the East Indies, Nipaul, and Brazil. U. lobàta, Cav. diss. 6. t. 185. f. 1.—Breyn. cent. t. 35.?

Roughish-leaved Urena. Fl. Jul. Aug. Clt. 1817. Pl. 1 to 4ft.

4 U. REPA'NDA (Smith in Rees' cycl. 37. no. 6?) leaves roundish, serrated, repandly-toothed, or somewhat lobed, puberulous, pale, and netted beneath, with 1-gland; upper leaves undivided; involucels awl-shaped, longer than the calyx; carpels smooth. ⊙? S. Native of the East Indies. Pavònia repánda, Spreng. syst. 3. p. 98.

Repand-leaved Urena. Fl. July, Aug. Clt. 1820. Pl. 2 feet.

5 U. LAPPA'GO (Smith in Rees' cycl. 37. no. 11.?) leaves bluntly and repandly sinuated, somewhat cordate, hoary-pubescent beneath, with 1 gland; involucel of 5-lanceolate lobes, which are equal in length with the calyx. ♄. S. Native of Amboyna.—Rumph. amb. 6. t. 25.

Burdock Urena. Fl. July, Aug. Clt.? Shrub 3 feet.

6 U. TOMENTÒSA (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 148.) leaves broad-ovate, angular, serrated, tomentose and canescent beneath, with 1 gland, upper ones undivided, ovate or lanceolate; lobes of the involucel lanceolate, about equal in length to the calyx. ♄. S. Native of Java.

Tomentose Urena. Shrub 2 feet.

7 U. MULTI'FIDA (Cav. diss. 6. p. 336. t. 184. f. 2.) villous; leaves cordate-ovate, deeply-5-lobed, with narrow recesses, and acute grossly notched lobes, pubescent above, pale and villous beneath, with 1 gland, and 7 or 8 nerves. ♄. S. Native of Bourbon and the Mauritius. Flowers yellow, racemose.

Multifid-leaved Urena. Fl. Jan. Oct. Clt. 1817. Sh. 2 ft.

8 U. SIEBE'RI (Coll. hort. rip. p. 142. t. 39.) leaves orbicular, sinuately 7-lobed, and deeply-toothed, hairy beneath, and 1-glanded; involucel 10-cleft. ♄. S. Native of the isle of France. U. Mauritiàna, Sieb. Peduncles axillary, solitary, very short. Flowers violaceous.

Sieber's Urena. Fl. June, July. Clt.? Shrub 2 feet.

9 U. PROCU'MBENS (Lin. spec. 975.) leaves hastate, cordate, serrated; stem shrubby, procumbent. ♄. G. Native of China on mountains.

Procumbent Urena. Shrub trailing.

10 U. TRICU'SPIS (Cav. diss. 6. p. 334. t. 183. f. 1.) leaves ovate, angular, 1-glanded, tomentosely villous, 3-lobed, with acuminated lobes; lobes of involucel striated; stem hairy. ♆. S. Native of the isles of France and Bourbon. Flowers yellow.

Three-pointed-leaved Urena. Fl. July, Aug. Clt. 1820. Pl. 2 feet.

11 U. RETICULA'TA (Cav. diss. 6. p. 335. t. 183. f. 2.) lower leaves 3-lobed, upper ones lanceolate, somewhat fiddle-shaped, hoary and reticulated beneath, with 1 gland; involucel exceeding the calyx. ♄. S. Native of Cayenne and St. Domingo. U. Americàna, Lin. fil. suppl. 308. but not of Smith.

Netted-leaved Urena. Fl. Ju. Aug. Clt. 1819. Shrub 2 feet.

12 U. SUBTRI'LOBA (Schrank. hort. mon. t. 79.) leaves with 1 gland beneath, soft, somewhat orbicular, 7-nerved, unequally crenated, lower ones acuminated, middle ones 3-lobed, upper ones deeply cleft; lobes of all acuminated. ⊙. S. Native of Brazil. Flowers red.

Subtrilobed-leaved Urena. Fl. July, Oct. Clt. 1823. Pl. 2 ft.

13 U. GRANDIFLÒRA (Moc. et Sesse, fl. mex. ined. D. C. prod. 1. p. 442.) leaves ovate, somewhat cordate, irregularly 3-lobed, grossly and unequally notched; petals glandular at the base. ♄. S. Native of Mexico. Flowers red, half an inch in diameter.

Great-flowered Urena. Shrub 3 feet.

14 U. VIMI'NEA (Cav. diss. 6. p. 335. t. 184. f. 1.) leaves somewhat rhomboid, toothed, netted and hoary beneath, with 1 gland, 5-7-nerved; pedicels 2-4 together, axillary; involucel exceeding the calyx. ♄. S. Native of Brazil and Porto-Rico.

Twiggy Urena. Shrub 3 feet.

15 U. MICROCA'RPA (D. C. prod. 1. p. 442.) leaves ovate, rhomboidal, somewhat 3-lobed, smoothish above, hoary beneath, glandless, 3-nerved; fruit beset with hooked prickles. ♄. S. Native of the Caribbee Islands.

Small-fruited Urena. Fl. July. Shrub 2 feet.

16 U.? MONOPE'TALA (Lour. coch. 2. p. 508.) leaves ovate-lanceolate, serrated, downy; involucel shorter than the calyx; corolla monopetalous. ♄. G. Native of Cochin-China.

Monopetalous Urena. Shrub 2 feet.

17 U. RIBE'SIA (Smith in Rees' cycl. 37. no. 5.) leaves acutely 3-lobed, rounded and cordate at the base, villous beneath, with 1 gland; lobes of involucel spatulate, blunt. ♄? S. Native of Surinam and the island of Barbadoes.—Sloane, jam. 1. t. 11. f. 2.

Current-like Urena. Shrub 2 feet.

§ 2. *Leaves profoundly 3 or 5-lobed, with wide recesses and scolloped lobed lobes.*

18 U. SWA'RTZII (D. C. prod. 1. p. 442.) leaves 3-lobed, puberulous, pale beneath, with 1 gland; fruit beset with prickly bristles. ♄. S. Native of the Caribbee islands and Surinam. U. sinuàta, Swartz, obs. 264. U. Americàna, Smith in Rees' cycl. 37. no. 4. but not of Lin. Flowers red or white. Very like the following species.

Swartz's Urena. Fl. July. Clt. 1816. Shrub 2 feet.

19 U. SINUA'TA (Lin. spec. 974.) leaves 5-lobed, puberulous, pale beneath, with 3 glands; lobes 3-lobed, toothletted, obtuse. ♄. S. Native of the East Indies. Cav. diss. 6. t. 185. f. 2.—Rheed. mal. 10. t. 52. U. aculeàta, Mill. dict. no. 2.

Scolloped-leaved Urena. Fl. July, Aug. Clt. 1759. Shrub 2 feet.

20 U. PARADÓXA (H. B. et Kunth, nov. gen. amer. 5. p. 278.) leaves profoundly trifid, with 3 glands at the base, puberulous above, hoary-tomentose beneath, with sharply-serrulated segments, middle segment rhomboidal, profoundly scolloped, 3-lobed, lateral ones smaller, 2 or 3-lobed, with the others usually obliterated. ♄. S. Native on the banks of the river Orinoco near Ature. Flowers axillary, solitary, rose-coloured. Capsules echinated. Resembling *U. sinuàta*.

Paradoxical Urena. Shrub 4 feet.

21 U. MORIFÒLIA (D. C. prod. 1. p. 442.) leaves 5-lobed, somewhat puberulous above, pale-velvety beneath, with 1 gland; recesses serrated, very wide; fruit downy and bristly. ♄. S. Native of the Friendly islands. Young leaves densely tomentose.

Mulberry-leaved Urena. Shrub 3 feet.

22 U. MURICA'TA (D. C. prod. 1. p. 442.) leaves 5-lobed, hairy, pale beneath, with 1 gland, with narrow toothletted recesses; fruit muricated from small tubercles. ♄? S. Native of Bengal.

Muricated-fruited Urena. Fl. July, Aug. Clt. 1816. Shrub 2 feet.

23 U. HETEROPHY'LLA (Smith in Rees' cycl. 37. no. 8.) leaves profoundly 5-lobed, hoary underneath, 1-glanded, with

broad recesses, middle lobe 3-lobed; lobes obtuse, serrated; upper leaves elongated, and contracted at the base; involucel hardly equal in length to the calyx; stem rather pilose. ♄. S. Native of the East Indies.—Burm. zeyl. 150. t. 59. f. 2.—Pluk. alm. t. 74. f. 1.

Various-leaved Urena. Fl. June, July. Clt. 1818. Shrub 2 ft.

Cult. None of the species of *Urèna* are worth cultivating unless in botanic gardens, except *U. speciòsa*. They are plants of easy culture, will thrive best in a mixture of loam and peat, and cuttings will root readily if planted in the same kind of soil, under a hand-glass, but this in most cases will be unnecessary, as most of the species ripen seed in plenty.

X. PAVO'NIA (in honour of Don Joseph Pavon, M.D. of Madrid, a traveller in Peru, and one of the authors of Flora Peruviana, 5 vols. fol.) Cav. diss. 3. p. 132. Lam. ill. 585. D. C. prod. 1. p. 442.

LIN. SYST. *Monadélphia, Polyándria.* Calyx 5-cleft, girded by a 5 to 15-leaved involucel. Stigmas 10. Carpels 5, capsular, 2-valved, 1-seeded.

SECT. I. TYPHA'LEA (from τυφως, *typhos*, having an hundred heads; heads of flowers.) D. C. prod. 1. p. 442. Carpels echinated with stiff spines, each carpel usually furnished with 3 awns, these are covered with retrograde bristles or hairs.

1 P. SPI'NIFEX (Willd. spec. 3. p. 854.) leaves ovate, acuminated, somewhat cordate, unequally toothed; pedicels axillary, solitary, 1-flowered. ♄. S. Native of South America. Hibíscus spínifex, Lin. spec. 978. Jacq. hort. vind. t. 103. Flowers large, yellow. Involucel 6-7-leaved, equal in length with the calyx.

Var. a, ovalifòlia (D. C. prod. 1. p. 443.) leaves ovate; corolla twice or thrice the length of the calyx. P. spínifex, Cav. diss. 3. p. 133. t. 45. f. 2.

Var. β, aristàta (Cav. diss. 3. p. 133. t. 45. f. 3.) leaves somewhat cordate; corolla hardly longer than the calyx.

Var. γ, oblongifòlia (Moc. et Sesse, fl. mex. icon. ined.) leaves oblong; corolla length of calyx.

Var. δ, grandiflòra (Moc. et Sesse, fl. mex. icon. ined.) leaves cordate; corolla twice or thrice the length of the calyx.

Prickly-fruited Pavonia. Fl. July, Aug. Clt. 1778. Shrub 2 to 4 feet.

2 P. INTERME'DIA (St. Hil. fl. bras. 1. p. 223.) leaves ovate-lanceolate, denticulately-serrated, hairy; flowers sub-glomerate, terminal; involucel 8-10-leaved; leaflets connate at the base, rather longer than the calyx. ♄. S. Native of Brazil in the province of Mìnas Geraes. Flowers whitish.

Intermediate Pavonia. Fl. Jan. Shrub 4 to 5 feet.

3 U. STELLA'TA (Spreng. syst. 3. p. 97.) leaves oblong-lanceolate, elongated, unequally denticulated, rough from stellate down, canescent beneath; peduncles terminal, capitate; fruit 1-awned, awn covered with retrograde hairs. ♄. S. Native of Brazil. Urèna stellàta, Spreng. neu entd. 2. p. 163.

Starry-haired Pavonia. Shrub 2 feet.

4 P. TYPHA'LEA (Cav. diss. 2. p. 134 and 150. t. 197,) leaves oblong-lanceolate, toothed; peduncles axillary and somewhat terminal, many-flowered; flowers disposed in capitate bundles. ♄. S. Native of Jamaica and Guiana, in shady moist places, as well as of Brazil. Urèna Typhàlea, Lin. mant. 258. Swartz, obs. 294. Flowers small, white or pale-red. Involucel 8-leaved.

Typhalea Pavonia. Fl. June, Aug. Clt. 1824. Sh. 1 to 2 ft.

5 P. TYPHALÆOI'DES (H. B. et Kunth, nov. gen. amer. 5. p. 279.) leaves lanceolate-oblong, acute, obtuse and crenated at the base; flowers terminal, crowded into small heads; involucel 5-leaved; carpels with 3 long awns. ♄. S. Native of New Granada between St. Anna and Mariquita, also of Trinidad. Very like *P. Typhàlea*, but the leaves are much smaller. Flowers reddish.

Typhalea-like Pavonia. Fl. June, Aug. Clt. 1824. Shrub 1 to 2 feet.

6 P. U'RENS (Cav. diss. 3. t. 49. f. 1 and 5. p. 283.) leaves 7-angled, acuminated, toothed, hairy; flowers axillary, almost sessile, glomerated. ♄. S. Native of the islands of the Mauritius and Bourbon, in cold grassy places. Jacq. icon. rar. 3. t. 552. Flowers flesh-coloured. The whole plant is villous, and smells like *cucumber*. Involucel 7-9-leaved, equal with the calyx.

Stinging Pavonia. Fl. Jan. Dec. Clt. 1801. Shrub 10 ft.

7 P. COMMU'NIS (St. Hil. fl. bras. 1. p. 224.) leaves cordate, acuminated, unequally toothed, tomentose beneath, full of pellucid dots, on short petioles; flowers solitary, racemosely disposed at the tops of the branches; involucel 6-leaved, longer than the calyx. ♄. S. Native of Brazil in the provinces of Minas Geraes and St. Paul. Flowers golden-yellow.

Common Pavonia. Shrub 3 to 4 feet.

8 P. SE'PIUM (St. Hil. fl. bras. 1. p. 225.) leaves ovate-oblong, acuminated, unequally toothed, pilose beneath, full of pellucid dots; flowers solitary, axillary; involucel 5-leaved, about equal in length with the calyx. ♄. S. Native of Brazil near Rio Janeiro. Flowers golden-yellow.

Hedge Pavonia. Fl. May. Shrub 2 to 6 feet.

9 P.? LEPTOCA'RPA (Cav. diss. 6. p. 351.) leaves lanceolate, serrated; flowers sessile, glomerated; involucel 5-leaved; styles 5. ♄. S. Native of Surinam. Urèna leptocárpa, Lin. fil. suppl. 508. Perhaps a species of *Hibíscus*, from having 5 styles. Flowers the size of those of *Ranúnculus àcris*, yellow.

Slender-fruited Pavonia. Fl. Ju. Aug. Clt. 1818. Sh. 10 ft.

SECT. II. MA'LACHE (from μαλαχη, *malache*, the Greek name of *Mallow*; in allusion to the resemblance of plants.) Trew. ehr. 50. D. C. prod. 1. p. 443. Carpels unarmed, but sometimes tuberculated. Involucel generally shorter than the calyx of 5 to 15 leaves.

10 P. HASTA'TA (Cav. diss. 3. p. 138. t. 47. f. 2.) leaves lanceolate, halbert-shaped, toothed; pedicels axillary, 1-flowered; involucel 5-leaved. ♄. S. Native of Brazil on the banks of the river Uruguay. Flowers red, with deeper veins.

Halbert-shaped-leaved Pavonia. Fl. Jan. Shrub 1 to 4 feet.

11 P. MURICA'TA (St. Hil. fl. bras. 1. p. 225. t. 44.) leaves ovate, sub-cordate or lanceolate, pubescent above, but tomentose beneath; flowers terminal, aggregate; involucel 5-leaved, about equal in length to the calyx; carpels muricated on the back and top. ♄. S. Native of Brazil in the provinces of Minas Geraes and St. Paul, in woods. Flowers red, rarely flesh-coloured. There are two varieties of this plant; one with large red flowers, and the other with smaller flesh-coloured flowers.

Muricated-carpelled Pavonia. Shrub 2 to 6 feet.

12 P. LAXIFLÒRA (St. Hil. fl. bras. 1. p. 226.) leaves cordate, acuminated, unequally toothed, villous on both surfaces, full of pellucid dots; flowers solitary, axillary, or terminal, sub-corymbose; involucel 6-leaved, a little longer than the calyx; carpels unarmed, tuberculately puberulous. ♄. S. Native of Brazil in the province of Minas Geraes, in woods. Flowers yellow.

Lax-flowered Pavonia. Fl. March. Shrub 1 to 2 feet.

13 P. COCCI'NEA (Cav. diss. 3. p. 140. t. 47. f. 1.) leaves cordate, 3-lobed, serrated; pedicels 1-flowered, axillary, ascending; involucel 5-leaved; leaflets narrow. ♄. S. Native of St. Domingo.—Plum. ed. Burm. t. 169. f. 2. Flowers scarlet, 2 inches in diameter.

Scarlet-flowered Pavonia. Clt. 1816. Sh. 4 feet.

14 P. COLUME'LLA (Cav. diss. 3. p. 138. t. 48. f. 3.) leaves 5-angled, with toothed, acuminated lobes; pedicels axillary, 1-

flowered, much shorter than the petioles; involucel 5-leaved. ♄. S. Native of Bourbon. Columélla Malvínda, Comm. mss. Flowers purplish.

Columella's Pavonia. Fl. July. Clt. 1807. Shrub 3-6 ft.

15 P. PARVIFLÒRA (Desf. hort. par. Poir. suppl. 4. p. 335.) leaves rather hairy, 5-angled, with ovate or lanceolate lobes; pedicels axillary, 1-flowered, length of petioles, and are as well as petioles very hairy; involucel 5-leaved ♄. S. Native of? Flowers yellowish-white.

Small-flowered Pavonia. Fl. July, Aug. Clt. 1818. Sh. 2 ft.

16 P. GLECHOMOI'DES (St. Hil. fl. bras. 1. p. 227. t. 45.) leaves orbicular, cordate, crenate, pilose on both surfaces, full of pellucid dots; flowers solitary, axillary; involucel 5-6-leaved, about equal in length to the calyx; carpels unarmed, obovate, girded by elevated margins. ♄. S. Native of Brazil in the province of Cis-platine, Monte Video, &c. Flowers white and flesh-coloured.

Ground-ivy-like Pavonia. Fl. Nov. Shrub 1 to 2 feet.

17 P. AFFI'NIS (St. Hil. fl. bras. 1. p. 229.) leaves hastate, lanceolate, obsoletely toothed, tomentose beneath, full of pellucid dots; flowers axillary, solitary; involucel 5-leaved; leaflets broad, shorter than the calyx; carpels unarmed, obovate, girded by prominent margins. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers pale red.

Allied Pavonia. Fl. May. Shrub 5-6 feet.

18 P. SAGITTA'TA (St. Hil. fl. bras. 1. p. 229.) leaves sagittate-lanceolate, toothed, tomentose beneath, full of pellucid dots; peduncles axillary, solitary, 1-2-flowered; involucel 5-7-leaved, a little shorter than the calyx; carpels unarmed, obovate, girded by a prominent margin. ♄. S. Native of Brazil in the province of Minas Geraes, in fields. Flowers rose-coloured.

Var. β, sessiliflòra (St. Hil. l. c.) flowers sessile.

Arrow-leaved Pavonia. Fl. Feb. Shrub 3 to 4 feet.

19 P. SIDÆFÒLIA (H. B. et Kunth, nov. gen. amer. 5. p. 283.) leaves ovate, acutish, cordate, crenately-serrated, hairy above, hoary-tomentose beneath; flowers stalked, axillary, and terminal; involucel of 5 or 7 lanceolate leaves. ♃. S. Native of South America between Angustura and Trapiche de Ferreras. Branches hairy. Flowers yellow, dark purple at the base.

Sida-leaved Pavonia. Pl. 2 feet.

20 P. RACEMÒSA (Swartz, fl. ind. occ. 2. p. 1215.) leaves ovate, cordate, acuminate, serrated; raceme terminal, naked; pedicels longish; involucel 8-10-leaved. ♄. S. Native of Jamaica and Guadaloupe, in marshes. Roots rising above the earth and often arched as in *Rhizophòra* or *Mangrove*. P. spicàta, Cav. diss. 3. t. 46. f. 1.—Sloan. jam. 1. p. 121. t. 139. f. 2. Flowers brownish-yellow. Leaves scabrous above.

Racemose-flowered Pavonia. Fl. June, July. Clt. 1817. Shrub 5-10 feet.

21 P. GRANDIFLÒRA (St. Hil. fl. bras. 1. p. 232.) leaves cordate, acuminated, unequally toothed, velvety-tomentose on both surfaces; flowers axillary, solitary; involucel 12-leaved, about equal in length to the calyx; carpels smooth. ♄. S. Native of Brazil in the province of Goyaz. Flowers flesh-coloured.

Great-flowered Pavonia. Shrub 1 to 2 feet.

22 P. VELUTÌNA (St. Hil. fl. bras. 1. p. 233.) leaves cordate, acuminated, crenulated, or 3-lobed, denticulately-serrated, velvety-tomentose on both surfaces; flowers solitary, axillary, or terminal, panicled; involucel many-leaved, much shorter than the calyx; carpels unarmed, ovate, clammy. ♄. S. Native of Brazil in the province of Minas Geraes. Lopímia malacophýlla, Mart. in act. bot. vol. xi. p. 97? Flowers red.

Velvety Pavonia. Fl. May, Oct. Shrub 3 to 7 feet.

23 P. SPECIO'SA (H. B. et Kunth, nov. gen. amer. 5. p. 281. t. 477.) leaves ovate-elliptical, acute, cordate, toothletted, densely hairy, canescent beneath; flowers axillary, and somewhat terminal, on short peduncles; involucel of 7 or 9 lanceolate spatulate leaflets. ♃. S. Native of South America near Angustura. Petals violet, with purple claws 1½ inch long.

Shewy Pavonia. Pl. 2 feet.

24 P. PAPILIONA'CEA (Cav. diss. 3. p. 140. t. 49. f. 2.) leaves roundish-cordate, acute, toothed; pedicels axillary, 1-flowered, about the length of the petioles; style ascending; involucel of 10 leaflets. ♄. S. Native of the island of Taheity. Flowers yellow. Stem tomentose.

Butterfly Pavonia. Shrub 3 feet.

25 P. PELLI'TA (H. B. et Kunth, nov. gen. amer. 5. p. 282.) leaves ovate, acute, obsoletely cordate, crenulated, soft, hairy, brownish-canescent beneath; flowers axillary and terminal, on short peduncles; leaflets of involucel 11, linear-filiform, one-half shorter than the calyx. ♄. S. Native of South America near Maypure on the river Orinoco. Petals red, violet at the base. Resembling *P. speciòsa*.

Clad Pavonia. Shrub 2 to 3 feet.

26 P. NUDICAU'LIS (St. Hil. fl. bras. 1. p. 231.) leaves distant, ovate, or ovate-lanceolate, toothed, tomentose beneath; flowers terminal, crowded; involucel 10-leaved, dilated at the top, about equal in length with the calyx. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers flesh-coloured.

Naked-stemmed Pavonia. Shrub 1 to 2 feet.

27 P. POLYMÓRPHA (St. Hil. fl. bras. 1. p. 232.) leaves roundish or ovate, somewhat cordate at the base, denticulately-serrated; flowers solitary, or crowded terminal; involucel 8-10-leaved, dilated at the top, shorter than the calyx; carpels smooth. ♄. S. Native of Brazil in the province of Minas Geraes, in dry fields. Flowers flesh-coloured.

Var. β, cucurbitàcea (St. Hil. l. c.) leaves ovate, cordate, 3 inches long, hardly toothed, full of pellucid dots; peduncles axillary, short, 1-flowered.

Polymorphous Pavonia. Shrub 2 to 3 feet.

28 P. SESSILIFLÒRA (H. B. et Kunth, nov. gen. amer. 5. p. 281.) leaves ovate, acute, somewhat cordate, serrated, hairy above, clothed with long, soft, canescent hairs beneath; flowers axillary, almost sessile or terminal, aggregate; leaflets of involucel 10, hooked backwards at the top, a little shorter than the calyx. ♄. S. Native of New Granada near St. Anna, and Brazil. Flowers copper-coloured or yellow. Carpels 5, smooth.

Sessile-flowered Pavonia. Shrub 3 to 4 feet.

29 P. HI'SPIDA (Spreng. syst. 3. p. 99.) herbaceous; leaves cordate, 3-5-lobed, hairy; lobes sinuated, bluntly toothed; leaflets of involucel 7, awl-shaped; peduncles 1-flowered, shorter than the petioles. ♄. S. Native of? Flowers white with a yellow base. Hibíscus hísipdus, Spreng. pug. 2. p. 73.

Hispid Pavonia. Shrub 2 to 3 feet.

30 P. PRÆMO'RSA (Willd. spec. 3. p. 833.) leaves broadly-obovate, truncate, and crenated at the apex; pedicels axillary, 1-flowered, longer than the leaves; involucel of 14 bristle-like leaves. ♄. G. Native of the Cape of Good Hope. Curt. bot. mag. 436. P. cuneifòlia, Cav. diss. 3. t. 45. f. 1. Hibíscus præmórsus, Lin. fil. suppl. 309. Jacq. icon. rar. 1. t. 141. Flowers pale-yellow.

Bitten-leaved Pavonia. Fl. Ju. Aug. Clt. 1774. Shrub 5 ft.

SECT. III. CANCELLA'RIA (from *cancellus*, a lattice, or grate; disposition of the leaflets of the involucrum). D. C. prod. 1. p. 444. Carpels unarmed. Involucel of 5-15 leaves, longer than the calyx.

31 P. MUTI'SII (H. B. et Kunth, nov. gen. amer. 5. p. 283.) leaves ovate, somewhat acuminate, cordate, serrated, very soft, pubescent above, canescently-tomentose beneath; flowers axillary and terminal, stalked; leaflets of involucel 8, a little longer than the calyx. ♄. S. Native of New Granada on mountains.

Hibíscus cordifòlius, Lin. fil. suppl. 309. Branches downy. Flowers yellow.

Mutis's Pavonia. Shrub 3 feet.

32 P. HI'RTA (Spreng. syst. 3. p. 99.) shrubby, clothed with stellate down, hairy; leaves cordate, 3-lobed, crenated; peduncles 1-flowered; involucel of 5 lanceolate leaves. ♄. S. Native of Monte Video.

Hairy Pavonia. Shrub 4 to 5 feet.

33 P. MO'LLIS (H. B. et Kunth, nov. gen. amer. 5. p. 283.) leaves roundish-ovate, cordate, acuminated, obsoletely 3-lobed, serrated, hairy, soft and canescent beneath; flowers axillary and terminal, stalked; leaflets of involucel 8, linear, almost twice the length of the calyx. ♄. S. Native of New Granada. Branches pilose, viscid. Flowers violet.

Soft Pavonia. Shrub 2 to 3 feet.

34 P. DIURE'TICA (St. Hil. pl. usu. bras. no. 53. fl. bras. 1. p. 234.) leaves cordate, acuminated, denticulately-serrated, velvety, tomentose on both surfaces, full of pellucid dots; flowers axillary, solitary; involucel 6-7-leaved, longer than the calyx. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers sulphur-coloured. A decoction of this plant is employed with success as a diuretic in Dysuria.

Diuretic Pavonia. Shrub 2 to 3 feet.

35 P. PANICULA'TA (Cav. diss. 3. p. 135. t. 46. f. 2.) villous; leaves cordate, roundish, acuminated, crenately toothed, sometimes tricuspidate; flowers panicled; stamens declinate; involucel of 8 or 9 leaves. ♄. S. Native of Peru at the source of the river Maragnon, and near Caraccas at the river Anauco. H. B. et Kunth, nov. gen. amer. 5. p. 280. Uréna fœ'tida, Lher. mss. Flowers yellow.

Panicled-flowered Pavonia. Fl. July, Aug. Clt. 1820. Sh. 3 or 4 feet.

36 P. CORYMBÒSA (Willd. spec. 3. p. 836.) leaves cordate or angular, serrated, smooth; flowers corymbose; peduncles and many-leaved involucels pilose. ♄. S. Native of Jamaica and Hispaniola, on the banks of rivers. Althæ'a corymbòsa, Swartz, fl. ind. occid. 2. p. 1213. Flowers pale yellow. Involucel 10-12-leaved.

Corymbose-flowered Pavonia. Fl. July, Aug. Clt. 1818. Shrub 1 to 2 feet.

37 P. ODORA'TA (Willd. spec. 3. p. 837.) leaves ovate, somewhat cordate, 3-pointed, rather toothed, and are as well as the branches pilose, viscid; pedicels axillary, 1-flowered, somewhat racemose at the tops of the branches; involucel of 12 ciliated leaves. ♄. S. Native of the East Indies. Flowers red.

Sweet-scented Pavonia. Fl. Ju. Jul. Clt. 1807. Shrub 2 to 3 ft.

38 P. RÒSA-CAMPE'STRIS (St. Hil. fl. bras. 1. p. 236. t. 46.) leaves cordate, acute, unequally serrated, coriaceous, puberulous; flowers axillary or terminal, 1-3 together; involucel 12-14-leaved, much longer than the calyx; carpels acuminated. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers rose-coloured.

Field-rose Pavonia. Fl. May. Shrub 1 to 2 feet.

39 P. VISCÒSA (St. Hil. fl. bras. 1. p. 236.) leaves cordate, acute, denticulated, puberulous, clammy; flowers axillary or subterminal, solitary; involucel 15-16-leaved, a little longer than the calyx; carpels unarmed, obtuse. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers yellowish-red.

Clammy Pavonia. Fl. March. Shrub 4 to 5 feet.

40 P. MEXICA'NA (H. B. et Kunth, nov. spec. amer. 5. p. 284.) leaves hastately-cordate, acuminated, serrate-crenate, clothed beneath as well as the branches with clammy tomentum; peduncles 1-flowered; leaflets of involucel 10-15, linear. ♃. S. Native of Mexico. Flowers red. Leaves hoary beneath.

Mexican Pavonia. Pl. 3 to 6 feet.

41 P. SIDOÌDES (Horn. hort. hafn. 2. p. 658.) leaves roundish-cordate, lower ones somewhat serrated at the apex, blunt, upper ones angular, acute; pedicels 1-flowered, generally solitary, rather shorter than the petioles; involucel 12-leaved. ♂. S. Native of Bengal. The whole plant is pilose and viscid. Flowers yellow.

Sida-like Pavonia. Fl. June, Aug. Clt. 1819. Pl. 2 ft.

42 P. ZEYLA'NICA (Willd. spec. 3. p. 838. exclusive of the synonyme of Seb.) pilose; lower leaves roundish-cordate, crenate, the rest 3-5-lobed; pedicels axillary, 1-flowered; involucel of 10 fringed, bristle-like leaves. ⊙. S. Native of Ceylon. Hibíscus Zeylánicus, Lin. spec. 981. Hibíscus arenàrius, Scop. del. ins. 3. t. 2. Flowers flesh-coloured, about the size of those of *Potentílla anserìna*.

Var. α, *Burmánni* (D. C. prod. 1. p. 444.) leaves 3-5-cleft; pedicels shorter than the leaves.—Burm. ind. t. 48. f. 2.

Var. β, *Cavanillèsii* (D. C. l. c.) leaves 3-5-parted; pedicels longer than the leaves.—Cav. diss. 3. t. 48. f. 2.

Ceylon Pavonia. Fl. July, Sept. Clt. 1790. Pl. 1 to 2 ft.

43 P. CANCELLA'TA (Cav. diss. 3. p. 135.) pilose; leaves cordate, arrow-shaped, toothed; pedicels axillary, 1-flowered, longer than the petioles; involucel of 13-15 leaves, pilose. ⊙. S. Native of Surinam, French Guiana, Caraccas, and Brazil. Hibíscus cancellàtus, Lin. fil. suppl. t. 311. Plant prostrate. Flowers sulphur-coloured with a violet centre. Leaves 5-lobed.

Latticed Pavonia. Fl. July, Aug. Clt. 1820. Pl. ½ to 1 ft.

44 P. HUMIFU'SA (St. Hil. fl. bras. 1. p. 235.) leaves cordate, 3-5-lobed, unequally toothed, velvety-tomentose on both surfaces; flowers axillary, solitary; involucel 18-leaved, much longer than the calyx; carpels angular, tricuspidate at the apex. ♄. S. Native of Brazil near Rio Janeiro by the sea-side. Flowers greenish-yellow.

Trailing Pavonia. Shrub prostrate.

SECT. IV. MALVAVISCOÌDEÆ (plants agreeing with the genus *Malvavíscus* in the connivent corolla and exserted stamens). Staminiferous tube exserted beyond the connivent corolla.

45 P. MALVAVISCOÌDES (St. Hil. fl. bras. 1. p. 237.) leaves cordate, nearly entire, coriaceous, canescent beneath; flowers subterminal, solitary; involucel 10-leaved, shorter than the calyx. ♄. S. Native of Brazil, in the province of Minas Geraes on the mountains called Serra da Cadonga. Flowers splendid red.

Malvaviscus-like Pavonia. Fl. March. Shrub 5 feet.

46 P. CONFE'RTA (St. Hil. fl. bras. 1. p. 238.) leaves crowded at the tops of the branches, long-lanceolate, acuminated, nearly entire; flowers terminal, crowded; involucel many-leaved, in 2 series, shorter than the calyx. ♄. S. Native of Brazil, in woods. Flowers dark purple.

Crowded-leaved Pavonia. Fl. Oct. Shrub 4 to 5 feet.

47 P. MULTIFLÒRA (St. Hil. fl. bras. 1. p. 239. t. 47.) leaves long-lanceolate, acuminated, nearly entire, scabrous; flowers sub-terminal, rather corymbose, many-flowered; involucel many-leaved, in 2 series, a little longer than the calyx. ♄. S. Native of Brazil, in woods. Flowers greenish.

Many-flowered Pavonia. Fl. Oct. Shrub 5 to 6 feet.

48 P. LONGIFÒLIA (St. Hil. fl. bras. 1. p. 239.) leaves very long, elliptic-lanceolate, obsoletely-toothed, scabrous; flowers sub-terminal, crowded; involucel many-leaved, in 2 series, a little longer than the calyx. ♄. S. Native of Brazil, in woods. Flowers greenish.

Long-leaved Pavonia. Fl. Oct. Shrub 5 to 6 feet.

49 P. TRICALYCA'RIS (St. Hil. fl. bras. 1. p. 240.) leaves long, elliptic-lanceolate, entire; flowers terminal, crowded; involucel many-leaved, in 2 series, a little longer than the calyx, but the outer series is small. ♄. S. Native of Brazil, in woods.

Three-calyxed Pavonia. Shrub 5 to 6 feet?

50 P. ALNIFÒLIA (St. Hil. fl. bras. 1. p. 241.) leaves sub-

ovate, obtusely toothed, very smooth, shining, full of pellucid dots; flowers sub-terminal, solitary; involucel 5-leaved, connate at the base, a little longer than the calyx; genitals hardly exserted. ♄. S. Native of Brazil in the province of Rio Janeiro. Flowers yellowish, sometimes twin.

Alder-leaved Pavonia. Fl. Aug. Shrub 5-6 feet.

Cult. The greater part of the species of this genus are worth cultivating for the beauty of their blossoms. They are all free growing plants, for the most part ripening seed in abundance, and ripened cuttings of the shrubby and perennial herbaceous species will root freely if planted in sand under a hand-glass, placed in a moderate heat. The annual and biennial species require the same treatment as other stove annuals and biennials.

XI. MALVAVI'SCUS (from *malva*, mallow, and *viscus*, glue). Dill. elth. 210. Cav. diss. 3. p. 131. D. C. prod. 1. p. 445.—Achània, Swartz. prod. 2.

Lin. syst. *Monadélphia, Polyándria.* Calyx girded by a many-leaved involucel. Petals erect, convolute. Stigmas 10. Carpels 5, baccate, 1-seeded, sometimes distinct, but usually connected into a 5-celled fruit. Mallow-like shrubs, usually with scarlet campanulate flowers with the staminiferous column protruding beyond the corolla.

Sect. I. Acha'nia (from α priv. χαος, *chaos*, an opening, or αχανης, *achanes*, firm; because the corolla always appears half closed). D. C. prod. 1. p. 445. Petals eared at the base.

1 M. ca'ndidus (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. c.) leaves cordate, 5-cleft, rather acute, with the middle lobe longest; involucel 10 or 12-leaved, rather spreading. ♄. S. Native of Mexico. Flowers red.

White-leaved Malvaviscus. Shrub 12 feet.

2 M. arbòreus (Cav. diss. 3. t. 48. f. 1.) leaves cordate, 3-5-lobed, acuminated, roughish; leaflets of involucel erect. ♄. S. Native of Jamaica, NewGranada, and Mexico,on calcareous rocks. Achània Malvavíscus, Swartz, fl. ind. occ. 2. p. 1222. Sims, bot. mag. t. 2305. Hibíscus Malvavíscus, Lin. spec. 978.—Dill. elth. t. 170.—Sloan. hist. 1. p. 216. t. 136. f. 1. Flowers large, scarlet.

Tree Malvaviscus. Fl. year. Clt. 1714. Shrub 12 feet.

3 M. mo'llis (D. C. prod. 1. p. 445.) leaves cordate, somewhat 3-lobed, soft, tomentose; leaflets of involucel rather spreading. ♄. S. Native of Mexico. Achània móllis, Ait. hort. kew. ed. 1. vol. 2. p. 459. Ker. bot. reg. t. 11. Flowers scarlet.

Soft-leaved Malvaviscus. Fl. Aug. Sep. Clt. 1780. Sh. 12 ft.

4 M. pilo'sus (D. C. prod. 1. p. 445.) leaves cordate, crenated, obtuse or acuminated; branches and petioles pilose. ♄. S. Native of the south of Jamaica in bushy places. Achània pilòsa, Swartz. fl. ind. occ. 2. p. 1224. Lodd. bot. cav. 829. Flowers red.

Pilose Malvaviscus. Fl. Oct. Nov. Clt. 1780. Sh. 12 ft.

5 M. Balbi'sii (D. C. prod. 1. p. 445.) leaves cordate, acuminated, scabrous on both surfaces, with the nerves beneath as well as the petioles and branchlets hairy-tomentose; pedicels twice as long as petioles. ♄. S. Native of? M. cordàtus, Balb. herb. A very shewy plant with scarlet flowers and entire linear-acute leaflets of involucel.

Balbis's Malvaviscus. Shrub 10 feet.

6 M. penduliflòrus (Moc. et Sesse, fl. mex. icon. ind. D. C. prod. 1. p. 445.) leaves ovate, rather cordate, acute, serrated; pedicels slender, nodding inwards; involucels erectish. ♄. S. Native of Mexico. Flowers red.

Pendulous-flowered Malvaviscus. Shrub 10 feet.

7 M. pentaca'rpus (Moc. et Sesse. fl. mex. icon. ind. D. C. prod. 1. p. 445.) leaves cordate-ovate, acute, serrated, hardly 3-lobed; pedicels erect; leaflets of involucel linear; carpels 5, baccate, somewhat distinct from each other. ♄. S. Native of Mexico. Atlat-zopillin. Hern. mex. 117. icon. Flowers scarlet?

Five-fruited Malvaviscus. Shrub 10 feet.

8 M. cilia'tus (D. C. prod. 1. p. 445.) leaves ovate, acute, serrated; pedicels solitary; leaflets of involucel linear, ciliated; petals acutely auricled at the base. ♄. S. Native of the island of Tobago. Pavònia spiràlis, Cav. icon. 5. t. 434. Achània ciliàta, Spreng. Flowers scarlet. Leaves cordate.

Ciliated-involucred Malvaviscus. Shrub 8 feet.

9 M. conci'nnus (H. B. et Kunth, nov. gen. amer. 5. p. 286.) leaves ovate-oblong, acuminated, cordate, grossly crenate-serrated; puberulous on both surfaces; flowers 2 or 3 together, somewhat corymbose; pedicels shorter than the petioles; involucel 7-leaved, equal in length with the calyx. ♄. S. Native of Peru near Loxa. Achània concínna, Spreng. Flowers twin or tern. Petals fringed, scarlet. Branchlets downy.

Neat Malvaviscus. Shrub 10 feet.

10 M. grandiflòrus (H. B. et Kunth, nov. gen. amer. 5. p. 286.) leaves ovate-oblong, acute, rounded at the base or obsoletely cordate, somewhat 3-lobed, serrated, smoothish; peduncles solitary, longer than the petioles; involucel 8-leaved, shorter than the calyx. ♄. S. Native of Mexico, near Guanaxuato. Branches and petioles pilose. Flowers scarlet.

Great-flowered Malvaviscus. Shrub 10 feet.

11 M. Acapulce'nsis (H. B. et Kunth, nov. gen. amer. 5. p. 286.) leaves ovate, somewhat acuminated, profoundly-cordate, coarsely toothed, pilose on both surfaces, soft and canescent beneath; peduncles solitary, longer than the petioles; involucel usually 7-leaved, about equal in length with the calyx. ♄. S. Native of Mexico near Acapulca. Flowers scarlet. Perhaps the same as *M. pilòsus*.

Acapulca Malvaviscus. Shrub 12 feet.

12 M. Poppi'gii (Spreng. syst. 3. p. 100. under *Achània*) leaves truncate at the base, ovate-oblong, acuminated, somewhat 3-lobed, toothed, hairy; involucels spreading; genitals exserted. ♄. S. Native of Cuba. Flowers scarlet.

Poppig's Malvaviscus. Shrub 6 to 8 feet.

Sect. II. Ano'tea (from α priv. and *notus*, known; not sufficiently known). D. C. prod. 1. p. 445. Petals not eared at the base. Species not sufficiently known. Distinct from *Hibíscus* in having 10 stigmas, from section *Achània* in the petals not being eared at the base, but the plants appear to agree with section *Malvaviscoìdeæ* of *Pavònia*.

13 M.? corda'tus (Nees. and Mart. nov. act. bonn. xi. p. 99. under *Achània*) leaves cordate, crenated, tomentose underneath; involucel 8 or 9-leaved, and is as well as the calyx beset with bristles; stamens not protruding beyond the flower. ♄. S. Native of Brazil. Flowers deep red.

Cordate-leaved Malvaviscus. Shrub 5 to 10 feet.

14 M.? fla'vidus (Moc. et Sesse, fl. mex. icon. ined.) leaves acutely 5-angled, toothed, cordate at the base; corolla cylindrical; column of stamens erect, twice the length of the petals. ♄. S. Native of Mexico. Flowers yellowish.

Yellow Malvaviscus. Shrub 6 feet.

15 M.? pleuro'gonus (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 446.) leaves palmately and acutely 5-7-lobed, toothed, cordate at the base; corolla somewhat campanulate; column of stamens very long, somewhat declinate; anthers for the most part secund. ♄. S. Native of Mexico.

Side-angled Malvaviscus. Shrub 6 feet.

16 M.? pleuranthe'rus (Moc. et Sesse, fl. mex. icon. ined.) leaves cordate at the base, acutely 3-5-lobed, palmatifid; lobes toothed, middle one longest; flowers somewhat cylindrical; column of stamens erect, equal in length to the petals; anthers secund. ♄. S. Native of Mexico. Flowers red?

Side-anthered Malvaviscus. Shrub 8 feet.

Cult. The greater part of the species of this genus bear bright scarlet flowers; therefore they are desirable in all collections. A mixture of loam and peat will suit them best, and cuttings will root readily in sand under a hand-glass; these should be taken off as near the stem of the plant as possible, not being so apt to rot as when taken off by the middle of the shoot. None of the leaves should be taken off or shortened above the sand. (Sweet.)

XII. LEBRETO'NIA (in honour of Manuel Le Breton, a French botanist.) Schrank, pl. rar. hort. mon. t. 90. D. C. prod. 1. p. 446.

Lin. syst. *Monadélphia, Polyándria.* Calyx 5-parted, girded by a rather shorter 5-parted involucel. Petals 5, in part protruding, twisted in the bud, with a spreading border. Styles 10. Carpels 5, or from abortion only 4, 1-seeded, indehiscent. Perhaps sufficiently distinct from the second section of *Pavònia.*

1 L. cocci'nea (Schrank. l. c.) leaves ovate, acuminated, serrated; pedicels axillary, 1-flowered, longer than the petioles; corolla twice as long as the involucel. ♄. S. Native of Brazil. Pavònia Schránkii, Spreng. syst. 3. p. 98. Trunk hispid. Flowers large, scarlet. Leaves pubescent above, tomentose beneath.

Scarlet-flowered Lebretonia. Fl. June, Aug. Clt. 1823. Shrub 4 feet.

2 L. latifòlia (Nees et Mart. nov. act. bonn. xi. p. 98.) leaves ovate, somewhat cordate, acutish, crenately-serrated, pubescent; pedicels 1-flowered; corolla almost equal in length with the involucel. ♄. S. Native of Brazil. Pavònia latifòlia, Spreng. syst. 3. p. 98. Flowers scarlet. Calyx greenish, as in *L. coccínea.* Leaves pubescent.

Broad-leaved Lebretonia. Shrub 4 feet.

3 L. semiserra'ta (D. C. prod. 1. p. 446.) leaves oblong, serrated at the apex, coriaceous, on long stalks; flowers terminal; calyx coloured, permanent. ♄. S. Native of Brazil. Schoùwia semiserràta, Schrad. gœtt. ann. 1821. p. 717. A doubtful plant.

Semiserrated Lebretonia. Shrub 4 feet?

Cult. These shrubs deserve to be cultivated in every collection on account of their shewy scarlet blossoms. They require to be treated in the same manner as recommended for *Malvavíscus.*

XIII. HIBI'SCUS (from *ἰβισκος, hibiscos,* one of the names given by the Greeks to *Mallow.* The *Hibiscus* of Pliny appears to be an umbelliferous plant, while that of Virgil is a plant with pliant branches, which was made into baskets. The name is said to be derived from *Ibis,* a stork, which is said to chew some species.) Lin. gen. no. 846. Lam. ill. t. 584. D. C. prod. 1. p. 446.

Lin. syst. *Monadélphia, Polyándria.* Calyx encompassed by a many-leaved, rarely by a few-leaved involucel, sometimes connected at the base. Petals not auricled. Stigmas 5. Carpels joined into a 5-celled, 5-valved capsule, with a dissepiment in the middle of each valve on the inside. Cells many-seeded, rarely 1-seeded. The bark of all the species is so tough that it may be made into ropes, or spun into thread of any description.

Sect. I. Cremóntia (from *cremo,* to burn; vivid colour of the flowers of some of the species.) Comm. ined. D. C. prod. 1. p. 446. Corolla (as in *Malvavíscus*) convolute, cylindrical, but the petals are not eared at the base as in that genus. Stigmas 5. Cells of capsule many-seeded.

1 H. liliiflòrus (Cav. diss. 3. p. 154. t. 57. f. 1.) leaves lanceolate-oblong, entire or rarely trifid; involucel 5-leaved; shorter than the 5-toothed calyx; petals rather velvety on the outside. ♄. S. Native of the island of Bourbon, in mountain woods. Malvavíscus puníceus, Bory, ined. Flowers scarlet, campanulate.

Var. β, hýbridus (Hook. bot. mag. 2891.) This is a splendid hybrid, produced from *H. liliiflòrus,* impregnated by the pollen of *H. mutábilis.* Flowers large. ♄. S. Raised in the Mauritius.

Lily-flowered Hibiscus. Fl. June, July. Clt. 1822. Tree 8 to 12 feet.

2 H. biflòrus (Spreng. syst. tent. suppl. p. 19.) leaves oblong-lanceolate, remotely toothed, pilose above, but tomentose and veiny beneath; peduncles axillary, straight, forked, 2-flowered; involucel 4-leaved, stellately-pubescent, with the leaflets broad and lanceolate, and drawn out at the base, longer than the woolly calyx, but equal in length to the conniving campanulate corolla. ♄. S. Native of the Cape of Good Hope. This is a very shewy species.

Two-flowered Hibiscus. Shrub 6 to 10 feet.

3 H. Borya'nus (D. C. prod. 1. p. 446.) leaves ovate, a little toothed, undivided, 5-nerved, smooth; involucel 5-7-leaved, a little longer than the 5-toothed calyx; petals oblong, rather velvety. ♄. S. Native of the island of Bourbon. Flowers white, on very short pedicels.

Bory de St. Vincent's Hibiscus. Shrub 10 feet.

4 H. fra'gilis (D. C. prod. 1. p. 446.) leaves ovate, hardly 3-lobed, toothed, smooth; pedicels 1-flowered, length of leaves; involucel 5-leaved. ♄. S. Native of Bourbon. Malvavíscus frágilis, Bory. ined. Flowers red.

Brittle Hibiscus. Shrub 4 to 8 feet.

5 H. pedunicula'tus (Cav. diss. 3. p. 163. t. 66. f. 2.) leaves 3 or 5-lobed, obtuse, crenated, hairy; pedicels twice as long as the leaves; involucel many-leaved; corolla rather campanulate. ♄. G. Native of the Cape of Good Hope. Ker, bot. reg. t. 231. Flowers small, bright red.

Pedunculated-flowered Hibiscus. Fl. May, Dec. Clt. 1812. Shrub 3 to 4 feet.

6 H. callòsus (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 649.) leaves half 3-lobed, acuminated, upper ones heart-shaped, stellately-pubescent beneath; peduncles sub-racemose; involucels very minute, callose at the tip; calyx toothed, smooth; capsules oval, pentagonal, 3 times larger than the calyx. ♄. S. Native of Java.

Callose-involucelled Hibiscus. Tree 15 feet.

7 H. la'mpas (Cav. diss. 3. p. 154. t. 56. f. 2.) leaves cordate, 3-lobed, smooth, dotted beneath; pedicels solitary, 1-flowered at the tops of the branches, longer than the petioles; involucel small, of 5 or 7 bristle-like leaves. ♄. S. Native of the Philippine islands and Java. Flowers large, yellowish.

Lamp Hibiscus. Clt. 1806. Shrub 10 feet.

8 H. membrana'ceus (Cav. diss. 3. p. 159. t. 57. f. 2.) leaves cordate, ovate-lanceolate, acuminated, toothed; pedicels twice as long as the petioles, 1-flowered; involucel of 10 lanceolate leaves, much shorter than the 5-cleft calyx, with 3-nerved segments. ♄. S. Native of? Flowers yellow.

Membranaceous Hibiscus. Fl. Ju. Jul. Clt. 1816. Sh. 10 ft.

9 H. spira'lis (Cav. icon. 2. p. 47. t. 162.) leaves ovate, acute, toothed, smooth, quite entire at the base; pedicels 1-flowered, twice the length of the petioles; involucel of 9-10-linear leaflets. ♄. S. Native of Mexico. Petioles villous. Flowers from yellow to flesh-coloured.

Spiral-flowered Hibiscus. Fl. June, July. Clt. 1823. Shrub 6 feet.

10 H. tubiflòrus (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 447.) leaves cordate, acute, somewhat scolloped, denticulately-serrated, villous; pedicels 1-flowered, twice as long as the petioles; involucel many-leaved. ♄. S. Native of Mexico on the mountains. Flowers from yellow to red.

Tube-flowered Hibiscus. Shrub 10 feet.

11 H. Senegale'nsis (Cav. diss. 3. p. 160. t. 68. f. 1.) leaves cordate, toothed, tomentose, lower ones angular; pedicels 1-flowered, shorter than the petioles; involucel of 10 bristle-like leaves, which are equal in length to the calyx. ♄. S. Native of Senegal. Flowers small, yellow with a dark centre.

Senegal Hibiscus. Fl. Ju. July. Clt. 1824. Shrub 4 feet.

12 H. tubulòsus (Cav. diss. 3. p. 161. t. 68. f. 2.) leaves cordate, unequally toothed, hoary-villous beneath, tomentose above, lower ones somewhat 5-lobed, upper ones acuminated; pedicels 1-flowered, very short; involucel of 8 linear-spatulate leaflets. ♄. S. Native of the East Indies and Senegal. Flowers somewhat campanulate, yellowish, with a purple base.

Tubular-flowered Hibiscus. Fl. July, Oct. Clt. 1796. Pl. 2 to 4 feet.

13 H. u'rens (Lin. suppl. 309.) leaves kidney-shaped, crenated, and are as well as the stem tomentose; pedicels 2-3-together, axillary; involucel 12-parted; corolla shorter than the calyx. ↄ. G. Native of the Cape of Good Hope. Cav. diss. 3. p. 161. t. 67. f. 1. Flowers purple.

Stinging Hibiscus. Pl. 4 feet.

Sect. II. Pentaspe'rmus (from πεντε, *pente*, five, and σπερμα, *sperma*, a seed; because the fruit is usually composed of 5 1-seeded cells or carpels.) D. C. prod. 1. p. 447. Corollas expanded. Valves of capsules bearing dissepiments in the middle, with 1-seeded cells, composed of 2 valves. This section does not appear to be generically distinct from *Pavònia*.

14 H. ova'tus (Cav. diss. 3. p. 143. t. 50. f. 3.) leaves ovate, quite entire, fringed, 3-nerved, villous beneath; pedicels 1-flowered, twice the length of the petioles. ♄. G. Native of the Cape of Good Hope. Pavònia ovàta, Spreng. syst. 3. p. 99.

Ovate-leaved Hibiscus. Shrub ?

15 H. hasta'tus (Cav. diss. 3. p. 144. t. 50. f. 1.) leaves halbert-shaped, oblong, serrated, narrow; pedicels 1-flowered, about the length of the leaves; fruit globose, downy. ♄. S. Native of the East Indies. Pavònia hastàta, Spreng.—Pluk. t. 127. f. 2. Flowers reddish.

Halbert-leaved Hibiscus. Shrub 2 feet.

16 H. acumina'tus (Cav. diss. 3. p. 144. t. 50. f. 2. exclusive of the synonyme of Pluk.) leaves cordate, acuminated, lower ones 3-lobed; pedicels 1-flowered, longer than the petioles; involucel 9-leaved; fruit downy, depressed. ♄. S. Native of? Pavònia acuminàta, Spreng. syst. 3. p. 99. Flowers large, reddish, purple.

Acuminated-leaved Hibiscus. Shrub 2 feet.

17 H. pentaca'rpos (Lin. spec. 981.) leaves cordate, oblong, toothed, bluntish, angular, somewhat 3-lobed, smooth; pedicels equal with or shorter than the petioles; flowers drooping; column of stamens nodding. ↄ. H. Native of Etruria and about Venice, in marshes. Jacq. icon. rar. 1. t. 143. Pavònia Venèta, Spreng. syst. 3. p. 98. Flowers small, pale-red.

Five-fruited Hibiscus. Fl. July, Sep. Clt. 1752. Pl. 3 ft.

18 H. Virgi'nicus (Lin. spec. 981.) leaves acuminated, unequally toothed, rather villous, lower ones cordate, undivided, upper ones ovate, cordate, 3-lobed; pedicels longer than the petioles; flowers drooping; pistils nodding. ↄ. H. Native of North America in salt marshes, from New Jersey to Carolina. Pavònia Virgínica, Spreng. syst. 3. p. 98. Flowers rose-coloured, about twice the size of those of *H. pentacárpos*, disposed in racemes at the tops of the branches. Jacq. icon. rar. 1. t. 142.—Pluk. phyt. t. 6. f. 4. Sweet. fl. gard. icon.

Virginian Hibiscus. Fl. July, Sept. Clt. 1798. Pl. 3 to 4 ft.

19 H. pentaspe'rmus (Bert. ined. D. C. prod. 1. p. 447.) whole plant hispid from spreading hairs; leaves cordate, acuminated, grossly toothed; pedicels axillary, 1-flowered, a little longer than the petioles; fruit 5-sided, hispid on the angles. ↄ. S. Native of Jamaica. Pavònia Bertèrii, Spreng. syst. 3. p. 99. Flowers small, yellow.

Five-seeded Hibiscus. Pl. 2 to 3 feet.

Sect. III. Ma'nihot (altered from the Brazilian word *Mandioka*, the *Cassava* or *Casada*; resemblance in some species.) D. C. prod. 1. p. 448. Cells of capsules many-seeded. Seeds smooth. Involucel 4-6-leaved. Calyx spathaceous, 5-toothed, ruptured longitudinally.

20 H. ma'nihot (Lin. spec. 980.) stem unarmed; leaves smoothish, palmately parted into 5 or 7 acuminated, coarsely-toothed lobes; involucel 4-6-leaved, hispid; pedicels when in flower, declinate. ↄ. S. Native of the East Indies. Cav. diss. 3. p. 172. t. 63. f. 2. Sims, bot. mag. t. 1702. Sab. hort. 1. t. 56.—Dill. elth. 189. t. 156. f. 189. Flowers sulphur-coloured, with a dark-purple centre. In Japan they use the mucilage of the root to give a consistence to paper as Thunberg informs us.

Var. β, *palmàtus* (Cav. diss. 3. p. 168. t. 63. f. 1.) leaves palmately parted; root thick, spongy. ↄ. F. Native of South America as well as in North America on the banks of the Mississippi. Flowers sulphur-coloured, with a purple centre. Fruit as in var. α, pyramidal, and very hairy.

Manihot Hibiscus. Fl. July, Sep. Clt. 1712. Pl. 3 feet.

21 H. Timorie'nsis (D. C. prod. 1. p. 448.) stem unarmed; leaves smooth, palmatifid, with 7 acuminated serrated lobes; involucel 5-leaved, smooth. ↄ. ♄? S. Native of the island of Timor. Resembles var. β, of *H. Mánihot*. Fruit somewhat globose, not pyramidal. Flowers yellow with dark claws.

Timor Hibiscus. Shrub 2 to 5 feet.

22 H. Pseu'do-ma'nihot (D. C. prod. 1. p. 448.) stem unarmed; leaves trifid, rather hairy; lobes ovate, acuminated, coarsely toothed; involucel 4-leaved, hispid. ↄ. ♄? S. Native of the island of Bourbon in grassy places on the banks of the river St. Denis. Fruit and flowers of *Hibiscus triònum*, but the leaves are trifid, not 5-7-parted.

False-Manihot Hibiscus. Pl. 1 to 2 feet.

23 H. ficu'lneus (Lin. spec. 978.) stem prickly from tubercles; leaves palmately 5-lobed, upper ones 3-lobed; lobes blunt, unequally toothed, narrowed at the base; involucel 5-leaved, caducous. ♄. S. Native of Ceylon.—Dill. elth. t. 157. f. 190. H. sinuàtus, Cav. diss. 3. t. 52. f. 2. Flowers yellow, purple at the bottom.

Fig-leaved Hibiscus. Fl. Ju. July. Clt. 1732. Shrub 4 ft.

24 H. ficulnoi'des (Lindl. bot. reg. t. 938.) stem shrubby, unarmed; leaves cordate, ovate, obtuse, deeply toothed, entire or 3-lobed, pubescent, as well as the 5-leaved involucel. ♄. S. Native of the East Indies and the Mauritius. H. Mauritiànus, Spreng. syst. append. p. 258.—Pluk. amalth. p. 11. t. 355. f. 4? Petal yellow, with purple claws.

Ficulneus-like Hibiscus. Fl. Ju. Aug. Clt. 1823. Sh. 1-3 ft.

25 H. tetraphy'llus (Roxb. ex Horn. hort. hafn. 561.) stem herbaceous; leaves 5-lobed, serrated; involucel 4-5-leaved. ⊙. S. Native of Bengal. Flowers yellow, with a purplish centre?

Four-leaved-involucelled Hibiscus. Fl. July, Aug. Clt. 1818. Pl. 1 foot.

Sect. IV. Ke'tmia (derived from the Arabic word *khethmy*, signifying a Malvaceous plant.) D. C. prod. 1. p. 448. Cells of capsules many-seeded. Seeds smooth. Corollas expanded. Involucel 5-7 cleft. Calyx 5-lobed, not ruptured longitudinally as in the preceding section.

26 H. mi'cans (Cav. diss. 3. p. 167. t. 60. f. 2.) stem unarmed; leaves cordate, 5-angled, toothed, acuminated; involucel 6-parted. ♄. S. Native of Java. Flowers yellow, with a dark centre. Leaves clothed with glittering tomentum.

Glittering Hibiscus. Shrub 6 to 10 feet.

27 H. CALYCI'NUS (Willd. spec. 3. p. 817.) stem unarmed; leaves cordate, angular, somewhat 3-lobed, repand; involucel 5-leaved, stipitate, longer than the petals. ♄. S. Native of the island of Bourbon. H. calyphýllus, Cav. diss. 5. p. 283. t. 140. Corolla yellow with a dark centre.

Large-calyxed Hibiscus. Shrub 3 to 6 feet.

28 H. COLUMNA'RIS (Cav. diss. 3. p. 166. t. 59. f. 2.) stem unarmed; leaves cordate, 5-angled, repand; involucel usually 6-cleft; column of stamens exceeding the campanulate corolla. ♄. S. Native of Bourbon. Flowers large, terminal, yellow.

Columnar-stamened Hibiscus. Shrub 6 feet.

29 H. ACERIFÒLIUS (D. C. prod. 1. p. 448.) stem unarmed; leaves cordate, 5-lobed, hairy; lobes acuminated, somewhat repand; involucel of 6-7 bristle-like leaves. ♄. S. Native of the East Indies. Pavònia platanifòlia, Willd. berl. mag. 1810. p. 220. Pavònia acerifòlia, Link, and Otto, abb. 1. p. 5. t. 1. Styles 5, therefore it cannot be a *Pavònia*.

Maple-leaved Hibiscus. Fl. March, June. Clt. 1798. Shrub 6 feet.

30 H. RÒSA-SINE'NSIS (Lin. spec. 977.) stem unarmed, arboreous; leaves ovate, acuminated, smooth, entire at the base, but coarsely toothed at the apex; pedicels length of leaves; involucel 7-leaved. ♄. S. Native of the East Indies. Flowers large, single or double, purple, red, white, yellow, and variegated. Cav. diss. 3. t. 69. f. 2. Curt. bot. mag. t. 165.—Rheed. mal. 2. t. 16. A very elegant plant, for some of the prominent varieties see Lodd. bot. cab. t. 513., double dark red; t. 963, double striped; t. 932, double yellow. In China they make these handsome flowers into garlands and festoons on all occasions of festivity, and even in their sepulchral rites. They are put to a use, which seems little consistent with their elegance and beauty, that of blacking shoes, whence their name of *Ròsæ-calceolàriæ*. The women also employ them to colour their hair and eye-brows black.

Chinese-rose Hibiscus. Fl. Jul. Aug. Clt. 1731. Tree 15 ft.

31 H. SYRÌACUS (Lin. spec. 978.) stem unarmed, arboreous; leaves ovate, wedge-shaped, 3-lobed, toothed; pedicels hardly longer than the leaves; involucel 6-7-leaved. ♄. H. Native of Syria and Carniola. Cav. diss. 3. t. 69. f. 1. Curt. bot. mag. 83. Flowers large, single or double, purple, white, red or variegated. This is one of our most ornamental hardy shrubs.

Syrian Hibiscus or Althæa frutex. Fl. Aug. Sep. Clt. 1596. Shrub 6 feet.

32 H. PRU'RIENS (Rox. hort. beng. p. 51.) stem herbaceous, hairy; leaves on long stalks, ovate, somewhat 3-lobed, serrated, membranaceous, smoothish; pedicels very short; involucel and calyx very hairy at the base, equal in length to the corolla, both 5-parted, acuminated. ♂. S. Native of the East Indies. Flowers yellow with a dark centre?

Prurient Hibiscus. Pl. 2 to 6 feet.

33 H. SCA'NDENS (Roxb. hort beng. p. 51.) shrubby, scandent; leaves cordate, 3-lobed, downy beneath; stems, petioles, and panicles pilose; involucel 6-cleft, equal in length to the calyx, tomentose; flowers disposed in racemose, terminal, spreading panicles. ♄. S. Native of the East Indies. Flowers apparently red.

Scandent Hibiscus. Shrub cl.

Sect. V. FURCA'RIA (from *furca*, a fork; in allusion to the leaflets of the involucel being forked.) D. C. prod. 1. p. 449. Cells of capsule many-seeded. Seeds smooth. Leaflets of involucel 2-forked or appendiculated, with teeth. Calyx glandular.

34 H. SURATTE'NSIS (Lin. spec. 979.) stem herbaceous, scabrous from recurved prickles; stipulas semi-cordate; leaves palmately 3-5-lobed; pedicels length of petioles; leaflets of involucel 11, spatulate, appendiculated. ⊙. S. Native of the East Indies and Guinea. Cav. diss. 3. t. 53. f. 1. Sims, bot. mag. t. 1356.—Rumph. amb. 4. t. 16. Flowers yellow, with a dark purple centre. The leaves of this species are gratefully acid, and are eaten. In cataplasms they assist in dissolving hard tumours, &c. for which purpose the root is esteemed to be more efficacious. The whole plant is prickly.

Surat Hibiscus. Fl. July, Sep. Clt. 1731. Pl. straggling.

35 H. RADIA'TUS (Cav. diss. 3. p. 150. t. 54. f. 2.) stem suffruticose, scabrous from stiff prickles; stipulas lanceolate; leaves 5-7-parted into lanceolate, acuminated, serrated lobes; pedicels very short; leaflets of involucel 10, ciliated, with bristles appendiculated. ⊙. S. Native of the East Indies. Sims, bot. mag. 1911. Flowers yellow with a dark centre.

Rayed Hibiscus. Fl. July, Aug. Clt. 1790. Pl. 2 to 4 feet.

36 H. LINDLE'I (Wall. pl. asiat. rar. p. 4. t. 4.) suffruticose; petioles and peduncles scabrous and prickly; leaves roundish, cordate, palmately 3-7-parted; lobes lanceolate, acuminated, serrated; flowers axillary, solitary; involucel of 8-10, linear, hispid, ciliated leaflets, which are 2-lobed at the apex; corolla spreading; capsule clothed with silky hairs, but at length it becomes smooth. ♄. S. Native of the Burman empire near Ava on mount Taong-Dong. Flowers purple, with a darker centre.

Lindley's Hibiscus. Fl. Nov. Shrub 3 to 4 feet.

37 H. U'NIDENS (Lindl. bot. reg. 878.) stem prickly and pilose; leaves smoothish, coarsely toothed, sometimes palmately 5-lobed, sometimes roundish; flowers stalked, solitary; leaflets of involucel shorter than the calyx, with a tooth-like appendage on the inside of each. ⊙. S. Native of Brazil. Flowers large, yellow, with a dark purple centre.

One-toothed-involucelled Hibiscus. Fl. July, Aug. Clt. 1822. Pl. 2 to 4 feet.

38 H. FURCA'TUS (Roxb. hort. beng. p. 31.) stem herbaceous, and is as well as petioles and calyx covered with tubercles; leaves rather ovate, trifid, lower ones quinquefid, with acuminated serrated lobes; involucel of 9 bifid leaflets. 4. S. Native of Bengal. Flowers yellow, with a purple centre.

Forked-involucelled Hibiscus. Fl. July, Sep. Clt. 1816. Pl. 2 feet.

39 H. COLLI'NUS (Roxb. hort. beng. p. 31.) leaves smooth, 3-5-lobed, on long footstalks, cuneate at the base; peduncles solitary, axillary, short, 1-flowered; leaflets of involucel numerous, forked, hairy as well as the stem. ⊙. S. Native of the East Indies. Flowers yellow with a dark centre.

Hill Hibiscus. Pl. 2 to 3 feet.

40 H. SCA'BER (Michx. fl. bor. amer. 2. p. 45.) stem herbaceous, scabrous; leaves rough, roundish, truncated at the base, upper ones palmately-lobed, with the lobes dilated and crenate at the apex; flowers sessile; calyxes very hispid; leaflets of involucel forked. 4. F. Native of North America in marshes near the sea coast, from Carolina to Florida. Flowers large, yellow, with a dark purple centre. H. aculeàtus, Walt. fl. Car. 177.

Scabrous Hibiscus. Fl. July, Sep. Clt. 1810. Pl. 2 feet.

41 H. KITAIBELIFÒLIUS (St. Hil. fl. bras. 1. p. 248. t. 48.) hairy; leaves cordate, 3-5-lobed, dentately-serrated, hispid; involucel of 10-11-bifurcate leaflets, much shorter than the calyx, which is 5-glanded; cells of ovary 10-ovulate. ♄. S. Native of Brazil in the province of Minas Geraes, on the banks of rivulets. Flowers violet.

Kitaibelia-leaved Hibiscus. Shrub 7 to 8 feet.

42 H. FURCELLA'TUS (Desrous. dict. enc. 3. p. 358.) stem shrubby; branches and leaves downy; leaves cordate, rather angular; involucel of 10 cylindrical, forked leaflets; calyxes

hispid. ♄. S. Native of Guiana. Flowers large, purplish, with a brown centre.

Small forked-involucelled Hibiscus. Shrub 3 to 10 feet.

43 H. DI'ODON (D. C. prod. 1. p. 449.) stem shrubby; branches and leaves downy; leaves cordate, 3-5-cleft, with the middle lobe acuminated; involucel of 10 cylindrical forked leaflets; calyxes hispid. ♄. S. Native of Cayenne. Flowers yellow, with a purple bottom?

Two-toothed-involucelled Hibiscus. Shrub 3 to 4 feet.

44 H. FLAGELLIFO'RMIS (St. Hil. fl. bras. 1. p. 243.) stem suffruticose, prostrate, rough; leaves kidney-shaped, 5-angled, toothed, rough; involucel of 8 bifurcate leaves, much shorter than the calyx, which is 5-glanded; ovary with 4-seeded cells. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers axillary, and as if they were racemose at the tops of the branches, rose-coloured. Stipulas linear.

Whip-formed-stemmed Hibiscus. Shrub prostrate.

45 H. MULTIFO'RMIS (St. Hil. fl. bras. 1. p. 246.) stem herbaceous, tomentose; leaves cordate or cordate-3-lobed, dentately serrated, scabrous; involucel of 10 bifurcate leaves, much shorter than the calyx; ovary with 8-seeded cells. ♃. S. Native of Brazil, in marshes. Flowers rose-coloured, with a darker centre.

Many-formed Hibiscus. Pl. 5 to 7 feet.

46 H. DECÍPIENS (St. Hil. fl. bras. 1. p. 247.) shrubby, scabrous from prickles; leaves cordate or cordate-3-lobed, denticulately-serrated, rather scabrous; involucel of 8-10 bifurcate leaflets, longer than the calyx, which is 5-glanded; ovary with 9-seeded cells. ♄. S. Native of Brazil in the province of Rio Janeiro, in hedges. Flowers rose-coloured.

Deceiving Hibiscus. Fl. Sept. Shrub 5 to 6 feet.

47 H. UNCINE'LLUS (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 449.) stem shrubby; branches clothed with reflexed hairs; leaves palmately 3-5-lobed, cordate at the base, toothed; involucel of 10 leaflets each, furnished with a hooked appendage on the back. ♄. S. Native of Mexico. Flowers large, hardly open, of a violet-purple colour.

Hooked-appendaged Hibiscus. Shrub 5 to 6 feet.

48 H. BICÓRNIS (Meyer. esseq. 231.) stem shrubby, and is as well as the petioles prickly; leaves 3-5-lobed; lobes auriculated, lanceolate, serrated; leaflets of involucel 2-lobed, longer than the calyx. ♄. S. Native of Guiana in pastures and woods. Corolla rose-coloured, with a purple centre, six times smaller than the calyx.

Two-horned-involucelled Hibiscus. Shrub 2 to 4 feet.

49 H. BIFURCA'TUS (Cav. diss. 3. p. 146. t. 51. f. 1.) stem shrubby, prickly towards the top of the branches; peduncles and nerves of leaves furnished with reflexed prickles beneath; leaves of 3-5 acuminated-serrated lobes; involucel of 10-17 hairy bifid leaflets. ♄. S. Native of Brazil and Porto-Rico. Flowers large, red.

Two-forked-involucelled Hibiscus. Fl. June, July. Clt. 1825. Shrub 3 feet.

Sect. VI. Abelmóschus (latinized from the Arabic name *kabb-el-misk*, which signifies musk-seed. The seeds of *H. Abelmóschus* exhale a scent like musk.) Med. malv. p. 45. D. C. prod. 1. p. 449. Cells of capsule many-seeded. Seeds usually smooth, seldom with a villous line on the back. Corolla expanded. Involucel of 8 to 15, entire, narrow leaflets or segments. Stigmas 5.

§ 1. *Stem prickly from tubercles.*

50 H. Lambertia'nus (H. B. et Kunth, nov. gen. amer. 5. p. 291. t. 478.) stem prickly, simple, herbaceous; leaves ovate-lanceolate, acuminated, rounded at the base, serrate, hairy above, hoary and tomentose beneath; involucel of 11 leaflets. ⊙? S. Native of Caraccas in humid places. Flowers large, purple, with a blood-coloured centre. Stigmas peltate, convex.

Lambertian Hibiscus. Fl. July, Sept. Pl. 6 feet.

51 H. TRI'LOBUS (Cav. diss. 3. p. 147. t. 53. f. 2. exclusive of the synonyme of Rheed). Stem arboreous, prickly; pedicels unarmed; leaves cordate, with 3 serrated lobes, middle lobe longest; involucel of 12 linear leaflets. ♄. S. Native of St. Dominique, in marshes.—Plum. ed. Burm. t. 159. Corolla pale scarlet, the size of those of *H. Syríacus*.

Three-lobed-leaved Hibiscus. Fl. July, Aug. Clt. 1818. Shrub 10 feet.

52 H. DIVERSIFÒLIUS (Jacq. icon. rar. 3. p. 551.) stem and petioles prickly; pedicels short, unarmed, hairy; leaves of 3-5 obtuse, toothed lobes; upper ones oblong-lanceolate, undivided; involucel of 9 linear leaflets. ♄. S. Native of the East Indies. Ker. bot. reg. t. 381. H. ficùlneus, Cav. diss. 3. t. 51. f. 2. Flowers yellow with a dark violet centre.

Different-leaved Hibiscus. Fl. June, July. Clt. 1798. Sh. 10 feet.

53 H. MACULA'TUS (Desrous. in dict. ency. 3. p. 349.) stem and petioles prickly; lower leaves palmate-parted, toothed; upper ones ovate, somewhat 3-lobed; involucel many-leaved; calyx hispid, spotted. ♄. S. Native of St. Domingo. Flowers dark red.

Spotted-calyxed Hibiscus. Shrub 6 feet.

54 H. Cisplate'nsis (St. Hil. fl. bras. 1. p. 250.) stem shrubby, prickly; leaves cordate, acute, or cordate 3-lobed, nearly smooth; involucel of 12 linear, acute leaflets, which are 3-times shorter than the calyx. ♄. S. Native of Brazil in the western part of the province of Cisplatine. Flowers purplish.

Cisplatine Hibiscus. Fl. Dec. Shrub 3 to 4 feet.

55 H. SPLE'NDENS (Fraser, mss. Graham. in edinb. phil. journ. p. 175. Hook. bot. mag. t. 3025.) stem beset with straight prickles and tubercles at the base; corolla expanded, tomentose on the ribs beneath; segment of the calyx 3-nerved, keeled; leaflets of involucel numerous, linear, awl-shaped, a little shorter than the calyx; peduncles axillary, 1-flowered, much longer than the petioles; leaves palmately 3-5-lobed; lobes lanceolate. ♄. S. Native of New Holland. Flowers large, rose-coloured. Style protruding beyond the stamens.

Splendid Hibiscus. Fl. May, July. Clt. 1828. Shrub 5 to 20 feet.

56 H. HETEROPHY'LLUS (Vent. malm. t. 103.) stem shrubby, prickly; leaves lanceolate, acuminated, for the most part 3-lobed, with prickly serratures; involucel 10-leaved. ♄. G. Native of New Holland. Ker. bot. reg. t. 29. Flowers large, reddish-white, with a purple centre. H. grandiflòrus, Sal. par. t. 22.

Various-leaved Hibiscus. Fl. Aug. Sept. Clt. 1803. Sh. 6 ft.

57 H. CANNA'BINUS (Lin. spec. 979.) stem prickly; leaves palmately 5-parted, deeply serrated, with 1 gland beneath on the principal nerve; flowers almost sessile; calyx beset with glandular hairs. ⊙. S. Native of the East Indies. Flowers large, yellow, with a dark brown bottom. Cav. diss. 3. p. 148. t. 52. f. 1. Roxb. cor. 2. t. 190. H. vitifòlius, Mill. The bark of this species as well as that of *H. sabdaríffa* is full of strong fibres, which the inhabitants of the Malabar coast prepare and make into cordage; and it seems as if it might be wrought into fine strong thread of any size.

Hemp Hibiscus. Fl. June, July. Clt. 1759. Pl. 2 to 5 ft.

58 H. VITIFÒLIUS (Lin. mant. 569.) stem rather prickly; leaves villous, toothed, 5-angled, acuminated; flowers drooping; capsule 5-winged, hairy; involucels 12-leaved. ⊙. S. Native of the East Indies. Cav. diss. 3. p. 145. t. 58. f. 2. Rheed. mal. 6. t. 46. Flowers yellow, with a dark purple centre. Stamens probably purple.

Vine-leaved Hibiscus. Fl. Jul. Oct. Clt. 1690. Pl. 1 to 3 ft.

59 H. divarica'tus (Graham, in edinb. phil. journ. for July, Oct. 1830.) corolla campanulate; involucel 10-parted, glandularly-muricated, shorter than the calyx; stem prickly; leaves roundish, cordate, rather lobed, unequally serrate-toothed, concave, stiff, pubescent on both surfaces. ♄. G. Native of Morton Bay, New Holland. Flowers sulphur-coloured, with a large fine crimson centre. Peduncles axillary, collected at the tops of the branches.

Divaricate-branched Hibiscus. Fl. June, Aug. Clt. 1829. Shrub 3 feet.

60 H. obtusifòlius (Willd. spec. 3. p. 829.) stem rather prickly; leaves tomentose beneath, crenated, cordate, lower ones roundish, upper ones acuminated, 3-lobed, blunt; capsules hairy, 5-winged. ⊙. S. Native of the East Indies. Flower large, yellow, with a purple centre. Resembles *H. vitifòlius*, and with it perhaps will constitute a distinct section, on account of their 5-winged capsules.

Blunt-leaved Hibiscus. Fl. July, Aug. Cl. 1820. Pl. 2 ft.

61 H. pseu'do-abelmo'schus (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 649.) stem perennial, beset with retrograde hispid hairs; leaves palmately 5-lobed, toothed, acuminated, upper ones acuminated, sagittate, pilose on both surfaces as well as the capsule; peduncles shorter than the petiole; involucel 6-10-leaved; calyx cleft longitudinally. ♄. S. Native of Java. Flowers yellow with a dark base.

False-Abelmoschus Hibiscus. Shrub 6 feet.

62 H. cancella'tus (Roxb. hort. beng. p. 31.) stem shrubby, hispid, prurient; leaves 5-lobed, on long petioles, cordate, rather serrated, tomentose; racemes terminal; involucel 12-leaved. ♄. S. Native of Nipaul. H. racemòsus, Lindl. bot. reg. 917. Flowers yellow with a dark purple centre. Very like *H. prùriens*, Roxb.

Latticed-involucelled Hibiscus. Fl. July, Aug. Clt. 1826. Shrub 2 to 4 feet.

63 H. crinìtis; plant setosely hispid; leaves roundish, cordate, acuminated, toothed, obtusely 5-angled, upper ones sagittate; raceme few-flowered; involucel 12-parted, ciliated; segments and stipulas linear, filiform; seeds smooth. ⊙. S. Native of the East Indies on mountains at Prome. Abelmóschus crinìtis, Wall. pl. asiat. rar. t. 44. Flowers large, yellow, with a dark purple centre.

Hairy Hibiscus. Fl. Sept. Oct. Pl. 3 feet.

64 H. hetero'trichus (D. C. prod. 1. p. 450.) stem hairy, intermixed with bristles; leaves cordate, acutely 5-lobed, toothed; upper ones 3-lobed, and are as well as calyxes hairy; pedicels shorter than the petioles; flowers drooping. ♂. S. Native of? Flowers like those of *H. cannábinus*.

Variable-haired Hibiscus. Pl. 2 feet.

65 H. aculea'tus; the whole plant prickly; leaves deeply 3-lobed; lobes serrated; stipulas kidney-shaped; peduncles long, 1-flowered, axillary; leaves of involucel falcate; calyxes ovate, acuminated, pilose. ⊙. S. Native of Sierra Leone in cultivated places. Flowers yellow with a purple centre. Perhaps belonging to this section.

Prickly Hibiscus. Pl. 1 foot.

§ 2. *Stem unarmed.*

* *Annual plants.*

66 H. escule'ntus (Lin. spec. 980.) leaves cordate, deeply 5-lobed, bluntish, toothed; petioles longer than the flowers; involucel of 10-12-linear, ciliated, deciduous leaves; calyxes bursting lengthwise; capsule pyramidal. ⊙. S. Native of both Indies as well as being cultivated in all parts of the world within the tropics and in some parts of France. Cav. diss. 3. t. 61. f. 2. F.—Sloane, hist. 1. p. 223. t. 133. f. 3. Flowers sulphur-coloured with a dark centre. Capsule pyramidal, furrowed, eatable. The young pods of the *okro* are gathered green and used in soups, or pickled like capers. They are full of nutritive mucilage, and buttered and spiced make a very rich dish. The seeds may be boiled like barley. There are several species of *Hibiscus* cultivated under the name of *Okro* differing much in the shape of their pods.

Esculent Okro. Fl. June, July. Clt. 1692. Pl. 2 to 4 feet.

67 H. Ba'mmia (Link. enum. 2. p. 227.) leaves 5-lobed, crenated; petioles longer than the flowers; involucel of 10-12 linear deciduous leaves; calyx bursting lengthwise; capsule long; stigmas 6-10. ⊙. S. Native of Africa, where we have seen it cultivated with the *okro* or *H. esculéntus*; it is called *the autumnal okro*, and the young pods are used to make okro soup. Cav. diss. 3. p. 168. t. 61. f. 3. Toz. mus. fir. 2. p. 57. t. 7. Bámmia, Alp. ægyp. p. 28. Flowers sulphur-coloured with a dark centre. It differs from *H. esculéntus* in the leaves not being so deeply lobed, and in the pods being much longer.

Bammia or African Okro. Fl. June, July. Clt. 1818. Pl. 2 to 4 feet.

68 H. longiflòrus (Willd. spec. 3. p. 827.) leaves palmately 3-5-parted, with deeply toothed lanceolate lobes; petioles longer than the flower; involucels usually 10-leaved, deciduous; calyxes bursting lengthwise. ⊙. S. Native of the East Indies. Flower yellow, with a dark centre.

Long-flowered Hibiscus. Fl. July, Oct. Clt. 1817. Pl. 4 ft.

* *Perennial herbaceous plants.*

69 H. moscheu'tos (Lin. spec. 975.) leaves ovate, acuminated, serrated, downy beneath; petioles and peduncles joined together; involucels and calyxes downy; capsules smooth. ♃. H. Native of North America in swamps and salt-marshes, from New York to Carolina; plentifully in the marshes round the salt lake Onondago, New York. Flowers large, white, with a purplish centre, or sometimes pale purple. Cav. diss. 3. t. 65. f. 1. Sweet, fl. gard. t. 286. H. palústris, Sims, bot. mag. t. 882.

Mallow Rose or *Musk* Hibiscus. Fl. Aug. Oct.? Pl. 3 feet.

70 H. palu'stris (Lin. spec. 976.) leaves ovate, toothed, somewhat 3-lobed, hoary with down beneath; pedicels axillary, free from the petioles, jointed above the middle. ♃. H. Native of North America in swamps and marshes, from Canada to Carolina. Cav. diss. 3. t. 65. f. 2. Flowers large, rose-coloured, white, and yellowish.

Marsh Hibiscus. Fl. Aug. Oct. Clt. 1759. Pl. 2 to 3 ft.

71 H. ròseus (Thor. in Lois. fl. gall. 2. p. 434.) leaves cordate, toothed, somewhat 3-lobed, hoary from down beneath; pedicels axillary, free from the petioles, 1-flowered, and jointed above the middle. ♃. H. Native of France on the banks of the river Adour. Sweet, fl. gard. 277. Flowers rose-coloured.

Rose-coloured-flowered Hibiscus. Fl. July, Oct. Pl. 2 to 4 ft.

72 H. aqua'ticus (D. C. fl. fr. suppl. 627.) leaves ovate, toothed, somewhat 3-lobed, hoary from down beneath; pedicels axillary, 1-flowered, free from the petioles, jointed near the base. ♃. H. Native of Etruria in marshes. Flowers white. H. palústris, Sav. cent. 1. p. 126.

Water Hibiscus. Fl. July, Sep. Clt. 1819. Pl. 2 to 3 feet.

73 H. inca'nus (Willd. spec. 3. p. 807.) leaves ovate, acuminated, bluntly serrated, hoary from down on both surfaces; pedicels axillary, 1-flowered, free from the petioles, jointed about the middle. ♃. H. Native of Carolina. Wendl. hort. herrench. 4. t. 24. Flowers very large, sulphur-coloured.

Hoary Hibiscus. Fl. Sep. Clt. 1806. Pl. 2 to 4 feet.

74 H. milita'ris (Cav. diss. 6. p. 352. t. 198. f. 2.) leaves 3-lobed, halbert-shaped, acuminated, serrated, smooth on both surfaces; pedicels jointed in the middle; corolla rather campanulate; capsules ovate, acuminated, smooth; seeds silky. ♃.

F. Native of North America on the banks of rivers in Louisiana and the western parts of Pennsylvania and Carolina. Sims, bot. mag. t. 2385. Cav. diss. 6. t. 198. f. 2. H. læ'vis, Scop. del. 3. t. 17. H. Virgínicus, Walt. fl. carol. 177. H. hastàtus, Mich. fl. bor. amer. 2. p. 45. H. ripàrius, Pers. ench. 2. p. 254. Flowers large, purple. Perhaps this plant belongs to section *Bombicélla*, on account of the seeds being silky.

Military Hibiscus. Fl. Aug. Sep. Clt. 1804. Pl. 3 to 4 ft.

75 H. speciòsus (Ait. hort. kew. ed. 2. p. 456.) leaves smooth, palmately 5-parted, with lanceolate-acuminated lobes, which are serrated at the apex; pedicels jointed under the apex; corolla spreading; capsule ovate, smooth, 5-angled. ♃. F. Native of North America on the banks of rivers in South Carolina and Florida. Curt. bot. mag. t. 360. Wendl. hort. herrench. t. 11. H. coccíneus, Walt. fl. car. p. 177. Flowers very large, scarlet.

Handsome Hibiscus. Fl. Aug. Sept. Clt. 1804. Pl. 2 to 8 ft.

76 H. grandiflòrus (Michx. fl. bor. amer. 2. p. 46.) leaves triangular, cordate, 3-lobed, coriaceous, clothed with fine tomentum on both surfaces, hoary beneath; capsules tomentose, very hairy, somewhat truncate. ♃. F. Native of North America in salt marshes in Georgia and Florida, and on the banks of the Mississippi. Flowers very large, flesh-coloured, with a darker centre. The fruit is yellow.

Great-flowered Hibiscus. Fl. Aug. Oct. Clt. 1778. Pl. 3 to 4 feet.

77 H. unicau'lis (D. C. ex Spreng. syst. app. p. 258.) stem simple, very villous; leaves cordate, roundish, angular, sinuately-denticulated, hairy above, but white from villi beneath; peduncles solitary, shorter than the petioles; leaflets of involucel spatulate, equal with the calyx; capsule very hispid. ♃. G. Native of? Perhaps shrubby.

One-stemmed Hibiscus. Pl. 2 to 3 feet?

78 H. fu'gax (Mart. ex Spreng. syst. 2. app. 258.) leaves almost sessile, oblong, acuminated, tomentose beneath, as well as the branches; peduncles 1-flowered, shorter than the leaves. ♃? ♄? S. Native of Brazil.

Fugacious Hibiscus. Pl. 2 to 4 feet.

* * * *Shrubby species.*

79 H. si'mplex (Roxb. hort. beng. p. 51.) arboreous, smooth; leaves 3-lobed, acuminated; middle lobe longest; peduncles axillary, solitary, longer than the petioles; involucel 8-9-leaved, shorter than the calyx; leaflets lanceolate; capsule hispid; globose. ♄. S. Native of the East Indies. Flowers shewy, red.

Simple Hibiscus. Tree.

80 H. lasioca'rpus (Cav. diss. 3. p. 159. t. 70. f. 1.) leaves ovate-lanceolate, acute, serrated, tomentose; pedicels axillary; calyx tomentose; involucel ciliated; capsule bristly. ♄. S. Native of? Involucel usually of 13 leaflets.

Hairy-fruited Hibiscus. Shrub 10 feet.

81 H. ferrugi'neus (Cav. diss. 3. p. 162. t. 60. f. 1.) leaves cordate, obtuse, toothed, scabrous; pedicels axillary, longer than the petioles; stem clothed with rusty down; capsule setose. ♄. S. Native of Madagascar. Flowers reddish, about the size of those of *H. Triònum*.

Rusty-stemmed Hibiscus. Clt. 1824. Shrub 10 feet.

82 H. sulphu'reus (H. B. et Kunth, nov. gen. amer. 5. p. 289.) leaves oblong, blunt at both ends, quite entire, smoothish above, hoary from tomentum beneath; involucel 10-leaved, shorter than the calyx; cells of ovary usually 5-seeded; stigmas many, capitate. ♄. S. Native of Caraccas. Flowers sulphur-coloured, with a purple centre.

Var. β, *acutifòlius* (D. C. prod. 1. p. 451.) leaves larger, acute; capsules somewhat globose, acute, clothed with silky hairs. ♄. S. Native of New Andalusia on mount Cocollar.

Sulphur-coloured-flowered Hibiscus. Shrub 4 to 8 feet.

83 H. affi'nis (H. B. et Kunth, l. c.) leaves oblong, acute, blunt at the base, quite entire, hairy above, but hoary from tomentum beneath; involucel 9 or 10-leaved, equal in length to the calyx; cells of ovary 4 or 5-seeded. ♄. S. Native of South America between Angustura and Trapiche de Farreras. Flowers sulphur-coloured, with a purple centre. Style 3-5 cleft.

Allied Hibiscus. Shrub 3 to 6 feet.

84 H. Cavanillesia'nus (H. B. et Kunth, l. c.) leaves somewhat rhomboidal, ovate-oblong, acuminated, acute at the base, coarsely serrated, hairy on both surfaces from starry down; cells of ovary usually 4-seeded; style 5-cleft. ♄. S. Native on the banks of the river Amazon near Tomependa. Flowers violet-coloured. Capsules depressed, ovate.

Cavanilles's Hibiscus. Shrub 3 to 6 feet.

85 H. lunarifòlius (Willd. spec. 3. p. 811.) leaves roundish, cordate, acuminated, sharply toothed, hairy beneath; pedicels thickened, villous; involucel length of calyx. ♃. S. Native of the East Indies. Flowers the size and colour of those of *H. Mánihot*. Involucel of 10 linear leaves.

Lunaria-leaved Hibiscus. Pl. 3 to 6 feet.

86 H. Brasilie'nsis (Lin. spec. 977.) leaves cordate, toothletted; branches, petioles, pedicels, and calyxes hairy; involucel twice as long as the calyx. ♄. S. Native of Brazil. Resembles *H. mutábilis*. Flowers yellow. Involucel 8-leaved.

Brazilian Hibiscus. Shrub 3 feet.

87 H. Æthio'picus (Lin. mant. 258.) leaves wedge-shaped, generally 5-toothed, covered with starry hairs; pedicels longer than the leaves; involucel 8 or 10-leaved, hispid. ♄. G. Native of the Cape of Good Hope. Cav. diss. 3. t. 6. f. 1. Plant smelling of musk. Flowers about the size of those of a strawberry, perhaps purple.

Æthiopian Hibiscus. Fl. June, July. Clt. 1774. Shrub 1 ft.

88 H. microphy'llus (Vahl. symb. 1. p. 50.) leaves oval, hairy, serrated in front, somewhat 5-nerved; pedicels length of leaves; involucel of 9-10 setaceous leaflets, longer than the calyx. ♄. G. Native of Arabia Felix. H. flàvus, Forsk. descr. 126. Stamens 10-16. Stigmas 10. Flowers yellow.

Small-leaved Hibiscus. Shrub 1 foot.

89 H. velutìnus (D. C. prod. 1. p. 452.) leaves cordate, bluntly-toothed, soft, hoary and velvety on both surfaces; stem suffruticose; pedicels a little longer than the petioles; involucel of 8-10 linear leaflets, which are rather broadest at the apex; capsules roundish, hispid. ♄. S. Native of the island of Timor.

Velvety-leaved Hibiscus. Clt. 1818. Shrub 4 to 6 feet.

90 H. soròrius (Lin. fil. suppl. 311.) leaves cordate, crenated, scabrous; stem suffruticose, hairy; involucel of 10 terete leaflets, which are dilated at the apex. ♄. S. Native of Surinam. Corolla as in *H. Mánihot*.

Sister Hibiscus. Shrub 3 feet.

91 H. Guinee'nsis; stem erect, branched, pilose; leaves trifid or 5-lobed, serrated, subcordate, beset with forked hairs beneath; flowers racemose; peduncles short, pilose. ♄. S. Native of Guinea. Corolla large, yellow. Perhaps belonging to this section.

Guinea Hibiscus. Fl. June, Aug. Shrub 6 feet.

92 H. muta'bilis (Lin. spec. 977.) leaves cordate, angular, 3-5-lobed, acuminated, toothed, and are as well as the branches rather downy; pedicels almost the length of the leaves; involucel 7-10-leaved; lobes of calyx elongated, 5-nerved. ♄. S. Native of the East Indies. Cav. diss. 3. t. 62. f. 1. And. bot. rep. 228. H. Sinénsis, Mill. dict. no. 2.—Rumph. amb. 4. p. 27. t. 9.—Rheed. mal. 6. p. 66. t. 38—41. Flowers white in the morning, changing to a flesh-colour towards noon, but becoming rose-coloured towards the evening, usually double, resembling

those of a *Hollyhock*. This plant is often cultivated in gardens within the tropics for the beauty of its flowers.

Changeable-flowered Hibiscus. Fl. Oct. Dec. Clt. 1690. Shrub 12 feet.

93 H. ADSCE'NDENS; suffruticose; branches ascending, pilose; leaves 3-5-lobed; lobes acute, serrated, tomentose beneath; peduncles solitary, long; calyx pilose. ♄. S. Native of Guinea. Flowers large, yellow. Perhaps belonging to section *Furcària*, but the involucel is unknown.

Ascending Hibiscus. Shrub 3 feet, straggling.

94 H. CUCURBITA'CEUS (St. Hil. fl. bras. 1. p. 244.) shrubby, hairy, unarmed; leaves roundish, cordate, dentately-serrated, stellately-pubescent; involucel of 12 awl-shaped leaflets, much shorter than the calyx, which is 5-glanded; cells of ovary 4-ovulate. ♄. S. Native of Brazil in the western part of the province of Minas Geraes. Flowers rose-coloured.

Var. β, cuneifòlius (St. Hil. l. c.) leaves cuneated at the base.

Gourd-like Hibiscus. Fl. Sept. Shrub 1 to 2 feet.

95 H. LAXIFLÒRUS (St. Hil. fl. bras. 1. p. 245.) stem herbaceous? scabrous, unarmed; leaves cordate, roundish or cuneate-ovate, denticulated, rough; involucel 8-9-leaved, awl-shaped, much shorter than the calyx, which is 5-glanded; cells of ovary 7-ovulate. ♄. S. Native of Brazil in the province of Goyaz. Flowers purplish, but with a pale flesh-coloured centre.

Lax-flowered Hibiscus. Fl. June. Shrub 4 to 6 feet.

96 H. CLYPEA'TUS (Lin. spec. 980.) leaves cordate, angular, sparingly toothed, smoothish; branches velvety; pedicels longer than the petioles; involucel 8-9-leaved; lobes of calyx oval-oblong, 3-nerved; capsules turbinate, truncated, hispid. ♄. S. Native of Jamaica in bushy places, and of St. Domingo. Cav. diss. 3. t. 58. f. 1.—Sloan. jam. hist. 1. t. 135. f. 1. Flowers dusky-yellowish. This plant is called by the negroes in Jamaica *Congo-Mahoe*. Perhaps originally from Africa.

Shield-capsuled Hibiscus. Fl. July, Aug. Clt. 1759. Shrub 8 feet.

97 H. ABELMÓSCHUS (Lin. spec. 980.) leaves somewhat peltate, cordate, 5-7-angled, acuminated, serrated; stem hispid; pedicels usually longer than the petioles; involucel 8-9-leaved; capsules conical, covered with bristles. ♄. S. Native of the East Indies and South America. Cav. diss. 3. t. 62. f. 2.—Margr. bras. 45. t. 45.—Mer. surin. 42. t. 42.—Rumph. amb. 4. p. 38. t. 15. Rheed. mal. 2. p. 71. t. 38. Flowers sulphur-coloured, with a dark-purple centre. *Abelmoschus* is derived from the Arabic *Kabb-el-Misk*, grain or seed of musk. It has large seeds of a very musky odour, which are frequently used as a substitute for animal musk in scenting powders and pomatums. In Arabia and Egypt they are ground and mixed with coffee to render it more agreeable to the palate.

Musk Okro Hibiscus. Fl. July, Sep. Clt. 1640. Shrub 6 to 8 feet.

98 H. ERIOCA'RPUS (D. C. prod. 1. p. 452.) leaves smooth, ovate at the base, 5-nerved, 3-lobed; lobes acuminated, entire; pedicels longer than the petioles; involucel of 8 or 9 oblong, waved, somewhat toothed, leaflets; capsules sub-globose, very hispid both on the inside and outside. ♄. S. Native of Bengal. Flowers yellow, with a dark centre?

Woolly-fruited Hibiscus. Fl. July, Aug. Clt. 1823. Shrub 6 to 10 feet.

99 H. QUINQUE'LOBUS; leaves cordate, 5-lobed, rough; lobes acuminated, toothed, on long petioles; flowers in terminal spiked racemes. ♄. S. Native of Sierra Leone. Habit of *H. mutábilis*. Flowers yellow. Perhaps belonging to this section, but the involucel and seeds are unknown.

Five-lobed-leaved Hibiscus. Shrub 6 feet.

100 H. DOMINGE'NSIS (Jacq. icon. rar. 3. t. 550.) leaves 3-5-lobed, toothed; stem arboreous, prickly; pedicels unarmed, hairy; involucel usually of 12 setaceous leaflets; calyx flattened at the base. ♄. S. Native of St. Domingo. Flowers large, rose-coloured, with a darker centre.

St. Domingo Hibiscus. Shrub 10 feet.

101 H. STRIA'TUS (Cav. diss. 3. p. 146. t. 54. f. 1.) leaves 3-lobed, halbert-shaped, serrated, smooth; stem and pedicels prickly; involucel of 8-10 setaceous leaflets; calyx ovate at the base. ♄. S. Native of? Flowers yellow. H. Domingénsis var. striàtus, Willd. spec. 3. p. 820.

Striated-stemmed Hibiscus. Shrub 6 feet.

102 H. VENU'STUS (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 650.) shrubby; leaves roundish-cordate, half-3-lobed, acute, grossly toothed, velvety above from stellate hairs, tomentose beneath, as well as the branches, and mixed with stellate bristles; peduncles shorter than the petioles; involucel usually 5-leaved; leaflets ovate, acute, equal in length to the capsule; capsule ovate-globose, 5-angled, hispid. ♄. S. Native of Java. Flowers single or double, white or yellow, changeable? Like *H. mutábilis*.

Beautiful Hibiscus. Shrub 12 feet.

SECT. VII. BOMBICE'LLA (from *βομβυξ, bombyx*, one of the Greek names of cotton; in allusion to the cottony seeds.) D. C. prod. 1. p. 452. Bómbyx, Medik. malv. p. 44. Cells of capsule many-seeded. Seeds woolly or cottony. Corollas usually expanded. Involucel 5 to 12-leaved.

103 H. SALVIÆFÒLIUS (St. Hil. fl. bras. 1. p. 249.) shrubby, pruinosely-pubescent, unarmed; leaves ovate-lanceolate, dentately-serrated, hoary-tomentose beneath; involucel of 12-linear-acute leaflets, 3-times shorter than the calyx; cells of ovary many-ovulate. ♄. S. Native of Brazil. Flowers rose-coloured. Seeds woolly.

Sage-leaved Hibiscus. Fl. May. Shrub 6 feet.

104 H. PHŒNI'CEUS (Lin. fil. suppl. 310. Willd. spec. 3. p. 813.) leaves ovate, acuminated, serrated, lower ones somewhat cordate, 3-lobed; pedicels jointed under the middle; involucel 10-leaved, shorter than the calyx. ♄. S. Native of the East Indies. Flowers purplish. Ker, bot. reg. t. 230. Jacq. vind. t. 4. Cav. diss. 3. t. 67. f. 2. Serratures of leaves bristly.

Purple-flowered Hibiscus. Fl. July, Aug. Clt. 1796. Shrub 6 feet.

105 H. BETULI'NUS (H. B. et Kunth, nov. gen. amer. 5. p. 292.) plant herbaceous, branched; leaves deltoid-ovate, acute, rounded at the base, crenately-serrated, a little hairy on both surfaces; involucel 9-11-leaved; capsules rather globose, with few-seeded cells. ♃. S. Native near Cumana in South America. Flowers white.

Birch-like Hibiscus. Pl. 2 to 3 feet.

106 H. UNILATERA'LIS (Cav. diss. 3. p. 158. t. 67. f. F. c.) leaves ovate, acuminated, toothed; pedicels longer than the leaves, jointed above the middle; involucel 9-leaved; stamens unilateral. ♄. S. Native of St. Domingo. Plum. ed. Burm. t. 160. f. 1. Flowers scarlet. H. columbìnus, Moc. et Sesse, fl. mex. icon. ined. is the same in every particular, but the stamens are not unilateral.

Unilateral-stamened Hibiscus. Shrub 4 feet.

107 H. RHOMBIFÒLIUS (Cav. diss. 3. p. 156. t. 69. f. 3.) leaves, rhomboidal-ovate, undivided, crenated at the apex, acuminated; pedicels very short; involucel 7-leaved. ♄. S. Native of the East Indies. Flowers purple.

Rhomb-leaved Hibiscus. Fl. June, Aug. Clt. 1823. Sh. 6 ft.

108 H. GOSSYPI'NUS (Thunb. prod. 118.) leaves ovate, serrated; petioles and stems hispid; pedicels jointed above the middle, hairy, a little longer than the leaves; involucel small, 7-leaved. ♄. S. Native of the Cape of Good Hope. Burch. cat. no. 2364.? Flowers purple?

Cottony-seeded Hibiscus. Fl. Jul. Aug. Clt. 1818. Sh. 4 ft.

109 H. ROSA-MALABA'RICA (Kon. ex Spreng. syst. 3. p. 105.) branches hairy; leaves cordate, somewhat 3-lobed, serrated; peduncles elongated, equal; leaflets of involucel 5-6, linear, equal in length to the calyx. ♄. S. Native of Malabar. Ker. bot. reg. t. 337. H. hírtus, Lin. spec. 977. Cav. diss. 3. t. 67. f. 3. Flowers bright red, and also white.

Malabar-rose. Shrub 2 to 4 feet.

110 H. MICRA'NTHUS (Cav. diss. 3. p. 155. t. 66. f. 1.) leaves ovate or roundish, undivided, serrated, scabrous; pedicels longer than the leaves; corollas reflexed; involucel 7-leaved. ♄. S. Native of the East Indies. H. micránthus and H. rígidus, Lin. fil. suppl. 308 and 310. according to Ait. hort. kew. ed. 2. vol. 4. p. 226. Flowers yellow, small.

Small-flowered Hibiscus. Fl. Ju. Jul. Clt. 1794. Sh. 1 to 2 ft.

111 H. SPATHA'CEUS (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 650.) leaves orbicularly-cordate, acuminated, denticulated, clothed with stellate villi beneath; branches covered with fascicles of hairs; involucel 8-10-parted. ♄. S. Native of Java.

Spathaceous Hibiscus. Shrub 2 feet.

112 H. CLANDESTI'NUS (Cav. icon. 1. p. 1. t. 2.) leaves ovate, somewhat cordate, toothed, roughish; lower ones obsoletely 3-lobed; pedicels jointed under the apex, length of leaves; involucel 6-leaved; calyx enclosing the petals. ♄. S. Native of Senegal. Flowers whitish, becoming violet as they wither.

Clandestine Hibiscus. Fl. July, Aug. Clt. 1823. Sh. 3 ft.

113 H. OVALIFÒLIUS (Vahl. symb. 1. p. 50.) leaves oval and rather angular, hispid; stem scabrous from starry hairs; involucel 5-leaved. ♄. G. Native of Arabia Felix on mountains. Urèna ovalifòlia, Forsk. descr. 124. Flowers yellow, with a dark centre, about the size of those of *H. vitifòlius*.

Oval-leaved Hibiscus. Shrub 6-10 feet.

114 H. VIRGA'TUS (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 650.) leaves linear-lanceolate, acuminated, remotely-toothed above, lower ones cuneiform-ovate, 3-lobed; peduncles shorter than the leaves, jointed above the middle; involucel 8-10-leaved. ♄. S. Native of Java. Flowers yellow?

Twiggy Hibiscus. Shrub 4 feet.

SECT. VIII. TRIO'NUM (*τριονον, trionon*, a name applied by Theophrastes to a Malvaceous plant, said to be derived from *τρεις, treis*, three; from the 3 divisions of the leaf or from the 3 colours of the flowers). Medik. malv. p. 46. D. C. prod. 1. p. 453. Cells of capsule many-seeded. Seeds smooth. Corolla expanded. Involucel many-leaved. Calyx bladdery, inflated, full of nerves.

115 H. TRIO'NUM (Lin. spec. 981.) leaves toothed, lower ones almost undivided, upper ones 3-parted; lobes lanceolate, with the middle one very long; calyx inflated, membranaceous, full of nerves. ⊙. H. Native of Italy and Carniola. Flowers cream-coloured with a dark-purple centre. Cav. diss. 3. t. 64. f. 1. Curt. bot. mag. t. 209.

Three-coloured-flowered or Bladder Ketmia. Fl. June, Sept. Clt. 1596. Pl. $\frac{1}{2}$ to $1\frac{1}{2}$ foot.

116 H. HI'SPIDUS (Mill. dict. no. 21.) leaves toothed, lower ones 3-lobed, upper ones 5-parted, blunt; lobes lanceolate, with the middle one longest; calyxes inflated, membranaceous, full of nerves; stem hispid. ♄. G. Native of the Cape of Good Hope. Ker. bot. reg. t. 806. H. Triònum, var. *γ*, híspidus, D. C. prod. 1. p. 453. Flowers yellow, with a dark-brownish purple centre.

Var. β, ternàtus (Cav. diss. 3. p. 172. t. 64. f. 3.) leaves nearly all 3-parted, with coarsely-toothed lobes; pedicels scarcely longer than the petioles; stem dwarf. Native of the Cape of Good Hope

Var. δ, cordifòlius (Mœnch. suppl. 202. under *Triònum*,) radical leaves cordate, roundish, upper ones 3-parted. H. Africànus, Roth. beitr. 1. p. 43.

Hispid-stemmed Ketmia. Fl. Jul. Oct. Clt. 1713. Sh. 1 to 2 ft.

117 H. TRIONOÌDES; stem shrubby, hispid; leaves 3-5-lobed, middle lobe very long, all unequally toothed; calyx inflated. ♄. G. Native of New Holland (Caley). Flowers yellowish with a dark centre. A weak shrub.

Trionum-like Ketmia. Shrub 1 foot.

118 H. HUMBO'LDTII (Mart. mss. Coll. hort. rip. p. 350.) radical leaves almost undivided and cordate, upper ones more or less parted. ♄. G. Native of the Cape of Good Hope. Perhaps H. hispídus var. *δ*, cordifòlius, D. C. prod. 1. p. 453. Flowers sulphur-coloured, with a dark centre.

Humboldt's Ketmia. Pl. 3 to 4 feet.

119 H. VESICA'RIUS (Cav. diss. 3. p. 171. t. 62. f. 2.) leaves toothed, lower ones undivided, upper ones 5-cleft with oblong, blunt lobes; calyx inflated, membranaceous, full of nerves. ⊙. H. Native of Africa. H. Africànus, Mill. dict. no. 20. Flowers yellow with a dark-brownish purple centre.

Bladdery-calyxed Ketmia. Fl. June, Sept. Clt. 1713. Pl. $\frac{1}{2}$ to $1\frac{1}{2}$ foot.

120 H. RICHARDSÒNII (Sweet, hort. brit. 1. p. 51. Lindl. bot. reg. t. 875.) suffruticose; leaves hairy, 5-lobed; lobes linear-oblong, coarsely toothed; calyx villous, longer than the involucrum; peduncles axillary, 1-flowered, shorter than the leaves, or in terminal racemes. ♄. G. Native of New South Wales. Corolla yellow, with a purple bottom.

Richardson's Ketmia. Fl. June, Aug. Shrub 3 to 4 feet.

SECT. IX. SABDARI'FFA (a name given by the Turks to *H. sabdaríffa*). D. C. prod. 1. p. 453. Cells of capsule many-seeded. Seeds smooth. Involucel 1-leaved, many-toothed, joined together at the base, or even to the middle and with the calyx. Annual plants with smooth, thickish leaves. This section nearly agrees in character with the following genus *Parítium*.

121 H. SABDARI'FFA (Lin. spec. 978.) leaves fleshy, toothed, lower ones ovate, undivided, middle ones 3-lobed, cuneated at the base; flowers almost sessile; involucel 10-12-lobed. ⊙. S. Native of the East Indies. Cav. diss. 3. t. 198. f. 1. Bonpl. nav. t. 29. Lois. herb. amat. t. 296. Stems unarmed, smooth, red. Flowers sulphur-coloured with a dark-red centre. The name of this plant in the West Indies is *Red-sorrel*. The calyxes and the capsules, freed from the seeds, make very agreeable tarts; and a decoction of them, sweetened and fermented, is commonly called sorrel cool-drink. It is a small diluting liquor much used in our sugar colonies, and reckoned very refreshing in those sultry climates. The leaves are used in salads. *Sabdariffa* is the Turkish name for this plant.

Sabdariffa or Red-sorrel. Fl. June, Sept. Clt. 1596. Pl. 1 to 3 feet.

122 H. DIGITA'TUS (Cav. diss. 3. p. 151. t. 70. f. 2.) leaves palmately 5-parted, with lanceolate serrated lobes; petioles muricated; flowers almost sessile, solitary; involucel 7-cleft. ⊙. S. Native of Brazil. Flowers white, with a dark-red centre.

Var. β, Kerriànus (D. C. prod. 1. p. 453.) leaves variable, some of them 3-5-cleft, others ovate, undivided, toothed. ⊙. S. Native of Brazil at Rio Janeiro. H. digitàtus, Ker. bot. reg. t. 608. Flowers white with a red centre as well as being red on the outside. Perhaps a distinct species from the plant of Cavanilles.

Digitate-leaved Hibiscus. Fl. Jul. Sept. Clt. 1816. Pl. 2 ft.

† *Species not sufficiently known.*

123 H. DIGITIFÓRMIS (D. C. prod. 1. p. 454.) leaves digitate, usually of 9 equal very narrow lobes, somewhat pubescent; petioles clothed with cinereous down. ♄. S. Native of? H.

digitàtus, Poir. suppl. 3. p. 220. but not of Cav. Flowers yellow with a purple centre.

Finger-shaped-leaved Hibiscus. Shrub 3 feet.

124 H. flabella'tus (Poir. suppl. 3. p. 220.) shrub spiny; leaves fan-shaped, 5-parted, very smooth; lobes lanceolate, serrated. ♄. G. Native of New Holland. Flowers yellow?

Fan-leaved Hibiscus. Shrub.

125 H. spica'tus (Cav. diss. 3. p. 163. t. 59. f. 1.) leaves 5-lobed, obtuse, downy; flowers sessile, disposed in a long terminal spike. ♄. S. Native of? Perhaps a species of *Althæ'a*.

Spike-flowered Hibiscus. Shrub.

126 H. flave'scens (Cav. diss. 3. p. 164. t. 70. f. 3.) leaves 5-lobed, palmate, unequally toothed, hairy; stems and petioles unarmed. ♄. S. Native of Pondicheri. Flowers yellowish.

Yellowish-flowered Hibiscus. Shrub 3 to 6 feet.

127 H. fascicula'tus (Moc. et Sesse, fl. mex. icon. ined. D.C. prod. 1. p. 454,) leaves villous, palmately 5-cleft with toothed lobes, ultimate one longest; pedicels crowded in the axillæ of the leaves, one of which is longer than the others. ♄. S. Native of Mexico.

Bundled-pedicelled Hibiscus. Shrub 3 to 4 feet.

128 H. tripartìtus (Forsk. descr. p. 126.) leaves 3-parted, with lanceolate, serrated lobes; peduncles axillary, 4-times shorter than the fruit; stem and calyx prickly; capsules hairy. ♄. G. Native of Arabia and Egypt.

Three-parted-leaved Hibiscus. Shrub?

129 H. acetosæfòlius (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 455.) hispid; leaves deeply 3-parted with oblong, acute, toothed lobes, 2 lateral ones short, erect, middle one very long; pedicels axillary, 1-flowered. ⊙. S. Native of Mexico.

Sorrel-leaved Hibiscus. Fl. June, July. Pl. 2 feet.

130 H. frate'rnus (Lin. fil. suppl. 311.) shrub smooth; leaves 3-lobed; rays of involucel terete, mucronate-concave at the apex; capsules pubescent. ⊙. S. Native of Surinam. Flowers yellow. Merian. Surin. t. 37. Perhaps the same as *H. sabdaríffa*.

Brotherly Hibiscus. Pl. 1 to 2 feet.

131 H. Borbo'nicus (Link. enum. 2. p. 216.) leaves cordate-roundish, somewhat lobed, unequally and sharply toothed, tomentose beneath; involucel of 5 oblong, long-pointed leaflets, which taper towards the base. ♄. S. Native of the Island of Bourbon. Flowers large, yellow.

Bourbon Hibiscus. Fl. July, Aug. Clt. 1820. Shrub 10 ft.

132 H. tomentòsus (Mill. dict. no. 5.) leaves cordate, angled, serrated, tomentose; stem arboreous; capsules hairy, 5-horned. ♄. S. Native of the West Indies. Flowers yellow, but becoming purplish as they decay. Perhaps a species of *Parítium*.

Tomentose-leaved Hibiscus. Tree 80 feet.

133 H. bracteo'sus (Moc. et Sesse, fl. mex. icon. ined. D.C. prod. 1. p. 455.) leaves cordate, somewhat orbicular, mucronate, entire; stipulas large, ovate, upper ones in the form of bracteas; involucel 5-leaved. ♄. S. Native of Mexico. Flowers yellow. Resembles *H. tiliàceus*. Perhaps a species of *Parítium*.

Large-bracted Hibiscus. Tree 30 feet.

134 H. oxyphy'llus (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 455.) smooth; leaves cordate, toothed, acuminated; involucel of 5 spreading, linear leaflets, which are dilated at the apex, longer than the calyx. ♄? S. Native of Mexico on the mountains of Xochipico. Flowers white, with a flesh-coloured centre.

Sharp-leaved Hibiscus. Shrub.

135 H. cyano'gynus (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 455.) hispid; leaves cordate, acute, toothed; peduncles axillary, many-flowered, upper ones rather panicled; involucel many-leaved, spreading. ♄? S. Native of Mexico.

Blue-stigmaed Hibiscus. Shrub.

136 H. Bahame'nsis (Mill. dict. no. 14.) leaves smooth, hoary beneath, oblong, cordate, toothed, on long petioles; flowers subterminal, very large, pale-purple. ♃. G. Native of the Bahama islands.

Bahama Hibiscus. Pl. 2 feet.

137 H. purpu'reus (Forsk. descr. p. 126.) leaves cordate, oblong, acute, serrated; stigmas 5, long, capitate; capsules globose, 7-winged. ♄? G. Native of Arabia. Flowers purple.

Purple-flowered Hibiscus. Shrub.

138 H. panduræfo'rmis (Burm. ind. p. 151. t. 47. f. 2.) leaves cordate, lanceolate, toothletted, tomentose; stem herbaceous, hairy; involucel 8-leaved. ♄. S. Native of the East Indies. Flowers sulphur-coloured. Perhaps *H. tubulòsus*.

Fiddle-shaped-leaved Hibiscus. Shrub.

139 H. parvifo'rus (Weinm. in flora. 1820. p. 610.) stem shrubby, hispid; leaves cordate, angular, crenated, tomentose beneath; involucel 9-leaved; leaflets dilated at the apex. ♄. S. Native of America. Petals small, hispid on the outside, of a dirty-yellowish colour with 5 reddish spots. Resembles *H. Senegalénsis* and *H. tubulòsus*.

Small-flowered Hibiscus. Fl. July, Aug. Clt. 1823. Shrub 4 feet.

140 H. Chine'nsis (D. C. prod. 1. p. 455.) smooth; leaves ovate, acuminated, toothed; pedicels axillary, 1-flowered, longer than the petioles; involucel of 6-8 bristle-like leaves. ♄. G. Native of China. Braam. icon. chin. 1821. t. 24. Flowers white. Resembles *H. phœníceus*.

Chinese Hibiscus. Shrub 4 feet.

141 H. cucurbiti'nus (Burch. cat. geogr. no. 1481. voy. 1. p. 278.) plant trailing, tomentose; leaves roundish, repand, less downy above; flowers crowded, racemose, axillary. ⊙? G. Native of the Cape of Good Hope near Dwaal river. Corolla brown, campanulate, hardly longer than the calyx. It is called by the Hottentots *Wilde Kalebas*.

Gourd-like Hibiscus. Pl. trailing.

There are several other species of *Hibíscus* which are only known by name, viz. *H. setòsus*, Roxb. *H. tortuòsus*, Roxb. *H. truncàtus*, Roxb. *H. Chinénsis*, Roxb. *H. stríctus*, Roxb. *H. pentaphýllus*, Roxb. *H. fràgrans*, Roxb. *H. tetraloculàris*, Roxb. and *H. pùmilis*, Roxb.

Cult. The species are all showy-flowering plants. The shrubby stove kinds thrive best in a mixture of loam and peat. Cuttings will strike root readily in sand or mould under a hand-glass, in heat. The green-house shrubby species require nearly the same treatment as the stove kinds. The annual stove species should be sown in pots and placed in a hot-bed frame, and when the plants are of sufficient size they should be separated and planted singly in pots, in a mixture of loam and peat; and after they have recovered this shifting they should be removed to the stove, where they may remain until they have ripened their seed. The *H. Syrìacus* or *Althæ'a frutex* is the only hardy shrubby species. It will thrive well in any common garden-soil, and may be either raised in abundance from seeds or layers. The different varieties of this plant may be grafted on each other, and cuttings planted under a hand-glass will strike root freely. The hardy herbaceous species, which are very showy, chiefly belong to section *Abelmóschus*, thrive best in a moist soil, but being rather tender most of them require protection in severe winters; they are only to be increased by dividing the plants at the root in spring.

XIV. PARI'TIUM (*Pariti* is the Malabar name of *P. tiliàceum*). St. Hil. fl. bras. 1. p. 255. Paríti, Adans. Hibíscus, sect. x. Azánza, D. C. prod. 1. p. 454.

Lin. syst. *Monadélphia, Polyándria*. Calyx girded by a 10-

14-toothed or 10-14-cleft involucel, shorter than the calyx. Staminiferous tube 5-toothed, naked. Style 5-cleft exserted above the staminiferous tube. Capsule 5-celled, 5-valved; valves with dissepiments in the middle, appearing as if the capsule was 10-celled. Seeds kidney-shaped. Trees or shrubs. Leaves entire, crenated or lobed, glandular at the base on the nerves. Stipulas twin, broad, ovate. Peduncles 1-flowered, axillary, or terminal and bibracteolate. Flowers yellow or purplish. This genus has been separated from *Hibiscus*, we shall therefore retain the authorities for the species under that genus.

1 P. TRICU'SPIS (Cav. diss. 3. p. 152. t. 55. f. 21. under *Hibiscus*,) leaves hoary, 3-lobed; lobes lanceolate, a little toothed; peduncles axillary, usually 2-flowered, disposed in racemes at the top of the branches; involucel 9-toothed. ♄. S. Native of the Society Islands. H. hastàtus, Lin. fil. suppl. 310. Corolla yellow, with a brown centre, changing to red as they fade, as in *P. tiliàceum*.

Three-pointed-leaved Paritium. Clt. 1820. Tree 25 feet.

2 P. AZA'NZÆ (D. C. prod. 1. p. 454. under *Hibiscus*,) leaves smooth, lower ones palmately-lobed, middle ones cordate, upper ones ovate, entire; involucel 10-12-toothed. ♄. S. Native of Mexico. Azánza insígnis, Moc. et Sesse, fl. mex. icon. ined. Flowers large, scarlet.

Azánza's Paritium. Tree 20 feet.

3 P. CIRCINNA'TUM (Willd. enum. 735. under *Hibiscus*,) leaves orbicular, cordate, acuminated, very entire, hoary-pubescent beneath; involucel 10-toothed. ♄. S. Native of Caraccas. Flower purplish? Like *P. elàtum*.

Round-leaved Paritium. Clt. 1820. Tree 30 feet.

4 P. TILIA'CEUM (St. Hil. fl. bras. 1. p. 156.) leaves crenulated, cordate, acuminated, smooth above and hoary from down beneath, 9-11-nerved; involucel 10-lobed. ♄. S. Native of the East Indies and Brazil. H. tiliàceus, Lin. spec. 976. Cav. diss. 3. t. 55. f. 1. Ker. bot. reg. t. 232. Paríti, Rheed. mal. 1. t. 30.—Rumph. amb. 2. p. 218. t. 73. Leaves furnished at the nerves beneath with 1-3 linear pores. Flowers sulphur-coloured, with a large purplish-brown spot at the base of each petal.

In the island of Otaheite they make matting of the bark of this tree as fine as our coarse cloth. Also ropes and lines, from the size of an inch to that of a small packthread; and fishing nets. Forster informs us they also suck this bark for food, when the bread-fruit fails them; and in New Caledonia the inhabitants frequently subsist on it, though it is an insipid food, affording very little nourishment.

Lime-tree-like Paritium. Fl. Jul. Aug. Clt. 1739. Tree 40 ft.

5 P. ELA'TUM (Swartz. fl. ind. occid. 2. p. 1218. under *Hibiscus*,) leaves roundish-cordate, quite entire, white from down beneath; peduncles very short, 1-flowered; involucel 10-cleft. ♄. S. Native of Jamaica, Porto-Rico, French Guiana, &c. Leaves furnished on the middle nerve beneath with a linear pore. The bark of this tree is very pliable and is made into cordage of various descriptions. It is called in Jamaica *umbrella tree*. Flowers large, of a purplish-copper colour.

Tall Paritium. Clt. 1790. Tree 50 feet.

6 P. GUINEE'NSE (D. C. prod. 1. p. 454. under *Hibiscus*,) leaves roundish, cordate, quite entire, hoary from pubescence beneath; peduncles 1-flowered, longer than the petioles; involucel very short, 10-toothed. ♄. S. Native of Guinea. Resembles *P. tiliàceum*, but the flowers are twice the size. It is called in our colonies on the coast of Guinea *umbrella tree*, from the shade it affords. Flowers at first yellow, but become purplish as they fade, like those of *P. tiliàceum*.

Guinea Paritium. Fl. April. Clt. 1822. Tree 40 feet.

7 P. SI'MILE (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 651. under *Hibiscus*,) leaves orbicularly-cordate, acuminated, crenulated, covered with white stellate tomentum beneath; involucel 10-cleft. ♄. S. Native of Java. Flowers sulphur-coloured, with a purplish-brown centre. Leaves with 3-5 linear pores on the nerves beneath.

Similar Paritium. Tree 40 feet.

8 P. GANGE'TICUM; leaves ovate, cordate, sometimes slightly 3-lobed, rufescent beneath; involucel connate at the base; branches and petioles rufescent; peduncles long or short, axillary and terminal. ♄. S. Native of the East Indies. Flowers yellow with a dark-purple bottom? Hibíscus Gangéticus, Roxb.

Gangetic Paritium. Clt. 1800. Tree 30 feet.

9 P. MACROPHY'LLUM (Roxb. hort. beng. under *Hibiscus*,) villous; leaves large, roundish-cordate, acuminated, crenulated, pale and glandular beneath; petioles and peduncles hairy-tomentose; involucel 12-14-cleft; capsules many-seeded; seeds bearded on the margins. ♄. S. Native of Bengal, Chittagong, and Silhet. H. macrophýllus, Roxb. hort. beng. p. 51. Wall. pl. asiat. rar. p. 44. t. 51. Flowers terminal and axillary, solitary or twin, large, yellow, with a purple centre. There is a large single spatha which incloses the flower-bud and a 2-leaved spatha which incloses the leaf-bud. Stigmas 5-6.

Large-leaved Paritium. Clt. 1810. Tree 40 feet.

10 P. ABUTILOI'DES (Willd. enum. 736. under *Hibiscus*,) leaves roundish, cordate, acuminated, crenate, green, and smooth on both surfaces; stipulas cordate-ovate. ♄. S. Native of South America.—Sloan. jam. hist. 1. t. 134. f. 4. exclusive of the synonymes. Flowers the colour of the preceding. The bark of this species being very pliable is made into cordage.

Mulberry-like Paritium. Clt. 1820. Tree 30 feet.

11 P. PERNAMBUCE'NSE (Bertol. exc. p. 13. under *Hibiscus*,) leaves profoundly cordate, roundish, acuminated, crenated; older ones very smooth on both surfaces; stipulas lanceolate-falcate. ♄. S. Native of Brazil and Guadaloupe. Flowers unknown but probably yellow, with a dark centre.

Pernambuco Paritium. Tree 40 feet.

Cult. The species of *Paritium* will grow well in loam and sand, and half-ripened cuttings will root readily in sand, under a hand-glass, in heat. As all the species grow to considerable-sized trees before they flower, it is not likely that any of them can be brought to flower in our stoves.

XV. LAGUNA'RIA (a name given to this genus from its similarity to *Lagunæ'a*, which see). Hibíscus, sect. xi. Lagunària, D. C. prod. 1. p. 454.

LIN. SYST. *Monadélphia*, *Polyándria*. Calyx 5-cleft, girded by a hardly evident, entire, or toothed involucel or margin. Stigmas 5, adglutinate. Capsule 5-valved, 5-celled, many-seeded. Trees with entire lanceolate leaves, and large reddish flowers rising singly from the axillæ of the leaves.

1 L. PATERSO'NII (Ait. hort. kew. 4. p. 224. under *Hibiscus*) leaves lanceolate-oblong, quite entire, covered with whitish scales beneath. ♄. G. Native of Norfolk Island. Hibíscus Patersònius, Andr. bot. rep. 286. Lagunæ'a Patersònia, Sims. bot. mag. t. 769. Lagunæ'a squàmea, Vent. malm. t. 42. Flowers large, pale-red, or nearly white, solitary, axillary.

Paterson's Lagunaria. Fl. June, Aug. Clt. 1792. Tree 20 ft.

2 L. CUNEIFO'RMIS; leaves oblong, cuneated, obtuse, smooth, quite entire. ♄. G. Native of New Holland on the western coast. Pedicels length of calyx; involucel very minute, toothed; calyx cleft beyond the middle into 5 acuminated lobes. Stem and leaves resembling those of *Candóllea cuneifórmis*. Flowers pale-red?

Wedge-shaped-leaved Lagunaria. Fl. June, Aug. Clt.? Tree 15 feet.

Cult. Elegant shrubs, well adapted for conservatories. They will grow in a mixture of sand and loam, and cuttings will root in sand under a hand-glass.

XVI. THESPE'SIA (from θεσπεσιος, *thespesios*, divine; because the *T. populnea* is usually planted about churches within the tropics). Corr. ann. mus. 9. p. 290. D. C. prod. 1. p. 455. Malvavíscus, Gært. fruct. 2. t. 135.

Lin. syst. *Monadélphia*, *Polyándria*. Calyx truncate, girded by a 3-leaved deciduous involucel. Capsules 5-celled; cells semi-parted, 4-seeded at the base, with an incomplete dissepiment. Albumen sparing. Trees with entire leaves.

1 T. popu'lnea (Cor. l. c.) leaves roundish, cordate, acuminated, 5-7-nerved, with dot-like scales beneath; peduncles equal in length to the petioles. ♄. S. Native of the East Indies, Guinea, and the Society Islands. Hibíscus popúlneus, Lin. spec. 976. Cav. diss. 3. p. 152. t. 56. f. 1.—Rheed. mal. 1. p. 51. t. 29. Pedicels 1-2 inches long. Flowers large, yellowish, with a dark-red centre, inclining to green, becoming reddish as they decay. This tree is very commonly cultivated about convents and monasteries within the tropics. It is called *umbrella tree* in some of our colonies.

Var. β, Guadalupénsis (D. C. prod. 1. p. 456.) pedicels an inch long; petals narrower, and evidently fringed at the base. ♄. S. Native or cultivated in the island of Guadaloupe. Perhaps a distinct species.

Poplar-like Thespesia. Fl.? Clt. 1770. Tree 40 feet.

2 T. Brasilie'nsis (Spreng. syst. 3. p. 96.) leaves ovate-oblong, acuminated, subtrifid, serrulated, tomentose beneath; peduncles panicled, floccose. ♄. S. Native of Brazil. Flowers yellowish, with a dark centre?

Brazilian Thespesia. Tree 40 feet.

3 T. grandiflòra (D. C. prod. 1. p. 456.) leaves ovate, rather cordate, somewhat acuminated. ♄. S. Native of Porto-Rico. Hibíscus grandiflòrus, Juss. ined. Flowers red, 4 or 5 inches in diameter. Pedicels 4 inches long. Fruit unknown. Habit of *T. populnea*.

Great-flowered Thespesia. Clt. 1327. Tree 30 feet.

4 T. macrophy'lla (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 651.) leaves cordate, acuminated, 5-nerved; peduncles shorter than the petioles. ♄. S. Native of Java.—Rumph. amb. 2. p. 224. t. 47. Flowers large, yellowish, with a dark centre, becoming reddish as they decay.

Large-leaved Thespesia. Tree 30 feet.

5 T.? alti'ssima (Spreng. syst. app. 3. p. 257.) leaves oblong, retuse, entire; peduncles lateral, many-flowered; stamens nearly free. ♄. S. Native of Java. Esenbéckia altíssima, Blum. bijdr.

Tallest Thespesia. Tree 60 feet.

Cult. These trees will thrive well in a mixture of loam and sand, and half-ripened cuttings will root freely in sand or mould under a hand-glass, in heat.

XVII. GOSSY'PIUM (*qoz* or *qothn* in Arabic signifies a soft substance; hence both the Latin and English name of the genus. In Egypt the name of the cotton-tree is *Gotsnenseigiar*). Lin. gen. no. 845. Lam. ill. t. 586. D. C. prod. 1. p. 465.—Xylon, Tourn. inst. t. 27.

Lin. syst. *Monadélphia*, *Polyándria*. Calyx cup-shaped, obtusely 5-toothed, girded by a 3-parted, or 3-leaved involucel, with the leaflets joined at the base, cordate, deeply toothed. (f. 83. *a*.). Stigmas 3 (f. 83. *e*.) or 5. Capsules 3-5-celled (f. 83. *f*.), many-seeded. Seeds imbedded in the cotton (f. 83. *g*.). The species are little known. This is an important genus as furnishing the down used in the cotton manufacture. This down is found lining the capsules. There are several species cultivated for cotton in different parts of the world.

1 G. herba'ceum (Lin. spec. 975.) leaves 5-lobed, with 1 gland beneath; lobes rounded, mucronate; involucel serrated; stem even, smooth. ⊙. (Lin.) S. ♂. (Par.) S. 4. (Roxb.) S. Native of India, Africa, and Syria. Petals yellow with a purple spot on each claw. Cav. diss. 6. t. 164. f. 2.—Blackw. icon. t. 354. This is the only species cultivated in Europe, especially in the Levant, Malta, Sicily, and Naples; it is also grown in many parts of Asia. In the Levant this species of cotton is sown in well prepared land in March in lines at 3 feet distance, and the patches of seeds 2 feet apart in the lines. The plants are thinned out to 2 or 3 in a place, and the earth is stirred by a one-horse plough or by manual labour with hoes, and irrigated once or twice a-week by directing the water along the furrows between the rows. The flowering season is usually over about the middle of September, and then the ends of the shoots are pinched off to determine the sap to the capsules. The capsules are collected by hand as they ripen by a tedious process which lasts till the end of November. The cotton and the seeds are then separated by manual labour, and the former packed in bales or bags for sale. The seeds are bruised for oil or eaten, and a portion kept for sowing; they are esteemed wholesome and nutritive. The most extensive cotton farmers are in the vale of Lorento, in the vicinity of Mount Vesuvius. There the rotation of crops are 1, maize; 2, wheat, followed by beans which ripen next March; 3, cotton; 4, wheat, followed by clover; 5, melons, followed by French beans. Thus in 5 years are produced 8 crops. In this district, wherever water can be commanded, it is distributed as in Tuscany and Lombardy to every kind of crop.

Herbaceous or Common Cotton. Fl. July. Clt. 1594. Pl. 3 to 4 feet.

2 G. Java'nicum (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 651.) leaves roundish-cordate, half 3-lobed, never entire, quite smooth, with 1 gland beneath; involucel jagged, 3-leaved; calyx unequally 5-toothed; petioles and branches covered with black dots. ♄. S. Native of Java, where it is cultivated for its cotton. Flower yellow, with purple claws.

Java Cotton Tree. Shrub 5 feet.

3 G. I'ndicum (Lam. dict. 2. p. 134.) leaves 3-5-lobed, obtuse, glandless; involucel rather cut at the apex; stem herbaceous, hairy. ⊙. ♂. S. Native of the East Indies.—Rumph. amb. 4. p. 38. t. 12. Cav. diss. 6. t. 169. Flowers yellow, with purple claws. This species is cultivated in Amboyna for its cotton.

Indian Cotton. Fl. July, Aug. Clt. 1800. Pl. 3 to 6 feet.

4 G. micra'nthum (Cav. diss. 6. p. 311. t. 193.) leaves 5-lobed, obtuse, very smooth, with 1 gland beneath; involucel multifid, longer than the petals; stem smooth, dotted. ⊙. S. Native of Persia at Ispahan. Flowers yellow, with purple claws? This species is cultivated in Persia for its cotton.

Small-flowered Cotton. Fl. July, Aug. Clt. 1820. Pl. 2 or 4 feet.

5 G. arbòreum (Lin. spec. 975.) leaves 5-lobed, palmate; lobes lanceolate, obtuse, mucronate from a short bristle, with 1 gland beneath; involucel deeply serrated; stem hairy. ♄. S. Native of the East Indies in sandy places.—Rheed. mal. 1. t. 31.—Alp. exot. t. 38. Cav. diss. 6. t. 193. G. rùbrum, Forsk. descr. no. 88? Flowers pale yellow, with brown claws. This species is cultivated in the East Indies, as well as in Africa.

Cotton *Tree*. Fl. July, Aug. Clt. 1694. Shrub 4 to 10 ft.

6 G. vitifòlium (Lam. dict. 2. p. 135.) lower leaves 5-lobed, palmate, upper ones 3-lobed, with 1 or 3 glands beneath; involucels jagged; calyx with three glands at the base; stem dotted, smooth. ⊙. (Com.) S. ♄. (Roxb.) S. Native of the East Indies. Cav. diss. 6. t. 166.—Rumph. amb. 4. t. 13.—G. glàbrum, Lam. according to Cav. is not distinct from this plant. This species is cultivated in the East Indies and Brazil. Flowers yellow, with purple claws.

Vine-leaved Cotton. Fl. July, Aug. Clt. 1805. Pl. 5 feet.

7 G. hirsu'tum (Lin. spec. 975.) upper leaves undivided,

cordate, lower ones 3-5-lobed, with 1 gland beneath; branches and petioles hairy; involucels 3-toothed at the apex. ⊙. or ♂. (Willd.) S. ♄. (Roxb.) S. Native of South America. Flowers yellow.—Pluk. alm. 172. t. 299. f. 1.—Sab. hort. 1. t. 55.—Cav. diss. 6. t. 167. This species is occasionally cultivated in the West Indies, but the cotton is not considered good, nor is it easy to separate it from the seeds.

Hairy Cotton. Fl. July, Aug. Clt. 1731. Pl. 3 to 6 feet.

8 G. eglandulòsum (Cav. diss. 6. p. 354.) leaves 5-lobed, glandless, with 3 oblong acuminated lobes; stem villous; involucels 3-4-toothed. ⊙. S. Native of? Perhaps the same as *G. herbàceum*. Flowers yellow, spotted at the base.

Glandless-leaved Cotton. Fl. July, Aug. Pl. 3 feet?

9 G. religiòsum (Lin. spec. 975.) upper leaves 3-lobed, lower ones 5-lobed, with 1 gland beneath; branches and petioles villous, and with black spots; involucel usually 3-lobed, jagged, villous; cotton pale-copper coloured. ♂. (Cav.) S. ♃. (Rottb.) S. Native? Cav. diss. 6. t. 164. f. 1. Leaves almost the size of the hand. Perhaps G. tricuspidàtum, Lam. dict. 2. p. 136. Flowers at first white. This is probably the species of *Gossýpium*, from whence the nankeen clothing is formed without any dyeing process, if so it is a native of China.

Religious Cotton. Fl. July. Clt. 1777. Pl. 3 to 6 feet.

10 G. latifòlium (Murr. comm. gœtt. 1776. p. 32. t. 1.) leaves acute, the lower ones undivided, the rest 3-lobed, with 1 gland beneath. ♂? ♄. S. Native of? Flowers large, white, turning red as they wither.

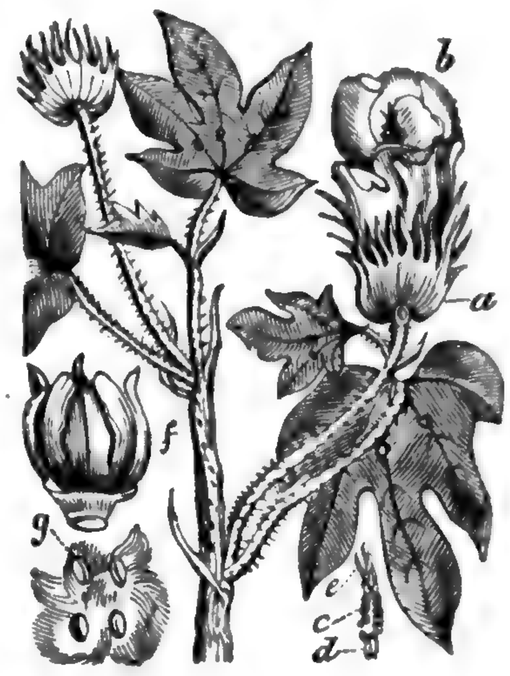
Broad-leaved Cotton. Fl. July, Aug. Clt. 1800. Shrub 6 ft.

11 G. Barbade'nse (Lin. spec. 975.) upper leaves 3-lobed, lower ones 5-lobed, with 3 glands beneath; stem smooth; seeds free. ♂? ♄. S. Native of Barbadoes.—Pluk. alm. 172. t. 188. f. 1. Flowers large, yellow, with a purple spot at the base of each petal, finally turning red. This is the species which is generally cultivated in the West Indies, and forms a considerable branch of their exports. The seeds are sown in rows about 5 feet asunder, at the end of September or the beginning of October; at first but slightly covered, but after it is grown up the root is well moulded. The soil should not be stiff nor shallow, as this plant has a tap root. The ground is hoed frequently, and kept very clean about the young plants until they rise to a moderate height. It grows from 4 to 6 feet high, and produces two crops annually; the first is eight months from the time of sowing the seed; the second within four months after the first, and the produce of each plant is reckoned about one pound weight. The branches are pruned and trimmed after the first gathering; and if the growth is over luxuriant, this should be done sooner. When great part of the pods are expanded, the wool is picked and afterwards cleared from the seeds by a machine, called a gin, composed of two or three smooth wooden rollers of about one inch diameter, ranged horizontally, close, and parallel to each other, in a frame; at each extremity they are toothed or channelled longitudinally, corresponding one with the other; and the central roller being moved with a treadle or foot-lathe, resembling that of a knife-grinder, makes the other two revolve in contrary directions. The cotton is laid in small quantities at a time upon these rollers whilst they are in motion, and readily passes between them, drops into a sack, placed underneath to receive it, leaving the seeds which are too large to pass with it, behind. The cotton thus separated from the seeds is afterwards hand-picked and cleansed thoroughly from any little particles of the pods or other substances, which may be adhering to it. It is then stowed in large bags, where it is well trod down, that it may be close and compact; and the better to answer this purpose, some water is every now and then sprinkled on the outside of the bag; the marketable weight of which is usually three hundred pounds. An acre may be expected to produce two hundred and forty pounds to that quantity, or two hundred and seventy pounds on an average. Long's jam. iii. p. 686, &c. and Browne.

Barbadoes Cotton. Fl. Sep. Clt. 1759. Pl. 5 feet.

12 G. Peruvia'num (Cav. diss. 6. p. 313. t. 168.) leaves 5-lobed, with 3 glands beneath, lower ones undivided; involucels jagged, with 3 glands at the base. ♂. S. Native of Peru. Flowers yellow, with red dots at the base (f. 83.).

FIG. 83.



Peruvian Cotton. Pl. 4 feet.

13 G. purpura'scens (Poir. suppl. 2. p. 369.) leaves 3-lobed, pubescent beneath, with ovate-lanceolate acute lobes; involucel jagged; branches puberulous at the top; capsules 3-valved. ♄. S. Native of South America.

Purplish-stemmed Cotton. Sh. 6 feet.

14 G. racemòsum (Poir. suppl. 2. p. 370.) very smooth; leaves somewhat cordate, 3-lobed, acuminated; flowers somewhat racemose at the tops of the branches; capsules 3-valved. ♄. S. Native of Porto-Rico. Flowers yellow, with purple claws.

Racemose-flowered Cotton. Shrub 4 to 6 feet.

† *Names of species to be enquired into; they are probably synonymes of the former species.*

15 G. obtusifòlium (Roxb. hort. beng. 51.) ♄. S. Native of Ceylon. Lobes of leaves blunt.

Blunt-leaved Cotton. Fl. July, Aug. Clt.? Shrub 6 feet.

16 G. acumina'tum (Roxb. hort. beng. 51.) ♄. S. Native of Hindostan. Lobes of leaves acuminated.

Acuminated-leaved Cotton. Fl. July, Aug. Clt. 1822. Shrub 6 feet.

17 G. glandulòsum (Ræusch. nom.) This is probably *G. Peruviànum* or *G. vitifòlium*.

Glandular Cotton. Pl. 4 feet?

N. B. There are 29 species described by Von Rohr, which are probably varieties or synonymous with those described above. There are 7 species described by Paris, which are also probably synonymous with those above.

Cult. The shrubby species may be increased by seeds, or cuttings not too much ripened will root freely under a hand-glass in a light soil. The annual and biennial species should be sown in pots in spring, and placed in a hot-bed frame, and when the plants are of sufficient size they should be planted in separate pots and shifted into larger ones as they grow. A light rich soil suits them best. The species require a moist heat.

XVI. REDOUTE'A (in honour of P. J. Redouté, a meritorious botanical artist; he is well known by his drawings in Redouté Liliacees, and in Ventenats Jardin de Malmaison.) Vent. cels. t. 11. D. C. prod. 1. p. 457.

Lin. syst. *Monadélphia, Polyándria.* Calyx 5-parted, girded by a 10 or 12-leaved involucel (f. 84. *a.*), shorter than the calyx (f. 84. *b.*). Stigmas 3 (f. 84. *g.*). Capsules 3-celled, 3-valved (f. 84. *h.*), many-seeded, with 3 placentas, alternating with the valves, bearing woolly seeds (f. 84. *l.*) on both sides.

1 R. HETEROPHY'LLA (Vent. cels. t. 11.) leaves ciliated, elliptical, rounded at both ends, entire, rarely 3-lobed. ♄. S. Native of the West Indian Island St. Thomas, and on the banks of the river Orinoco. H. B. et Kunth, nov. gen. and spec. amer. 5. p. 293. Stem erect, smooth, branched. Leaves 3-nerved, beset with scattered scales. Flowers sulphur-coloured, with purple claws, standing on trigonal pedicels (f. 84.).

FIG. 84.

Variable-leaved Redoutea. Fl. July. Clt. 1822. Shrub 3 feet.

2 R. TRIPARTI'TA (H. B. and Kunth, nov. gen. and spec. amer. 5. p. 293.) leaves smoothish, deeply 3-parted; segments oblong, acute, cuneated at the base, intermediate one entire or obsoletely 3-lobed, lateral ones bifid. ♄. S. Native of South America on the banks of the river Amazon. A trailing shrub with yellow flowers.

Three-parted-leaved Redoutea. Shrub procumbent.

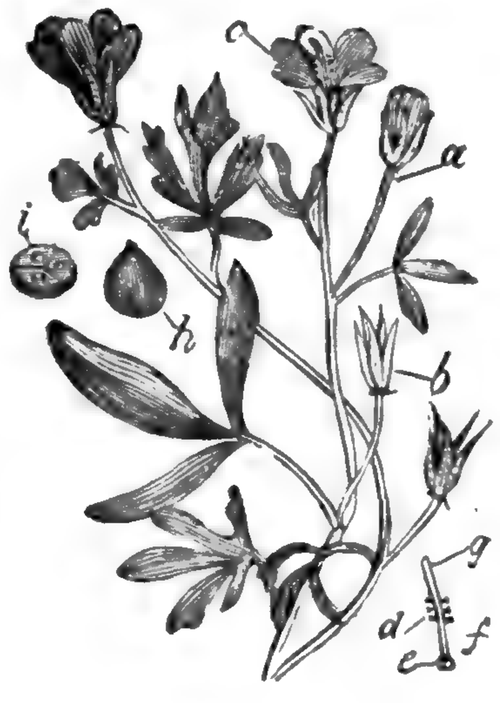
Cult. These shrubs are easily increased by seeds; they should be sown in pots, and placed in a hot-bed frame, and when the plants are of sufficient size they should be separated, and planted singly into other pots, or they may be reared by cuttings planted in sand or mould, under a hand-glass, in heat.

XIX. FUGO'SIA (a name abridged by Jussieu from *Cienfuegòsia*, instituted by Cavanilles in memory of Bernard Cienfuegos, a Spanish botanist, who lived towards the end of the sixteenth century.) Juss. gen. 274. D. C. prod. 1. p. 457.—Cienfuegòsia, Cav. diss. 3. p. 174. t. 72. f. 2. Lam. ill. t. 577.

LIN. SYST. *Monadélphia, Polyándria.* Calyx 5-cleft, girded by a 6-12-leaved involucel; leaflets bristle-like, very short (f. 85. *a.*). Anthers numerous from the sides and lower part of the staminiferous tube (f. 85. *d.*). Stigmas 3-4, adglutinate or free, clavated. Capsule 3-4-celled, 3-4-valved, 3-seeded, from abortion. Seeds naked or covered with short wool.

1 F. DIGITA'TA (Pers. ench. 2. p. 240.) leaves 3-5-parted, with linear blunt lobes; pedicels 1-flowered; seeds smooth. ♄. S. Native of Senegal. Cienfuègia digitàta, Willd. spec. 3. p. 723. Flowers yellow, with a red tube. (f. 85.). Stigmas adglutinated.

FIG. 85.



Digitate-leaved Fugosia. Shrub 1 foot.

2 F. SULFU'REA (St. Hil. fl. bras. 1. p. 252. t. 49.) leaves roundish, toothed, pubescent; stigmas 4, adglutinate; capsule smooth; seed solitary, covered with short wool. ♄. S. Native of Brazil in the province of Cisplatine in dry pastures. Flowers sulphur-coloured, axillary, solitary.

Sulphur-coloured-flowered Fugosia. Pl. prostrate.

3 F. AFFI'NIS (St. Hil. fl. bras. 1. p. 253.) leaves oblong-ovate, farinosely-tomentose beneath; stigmas 4, distinct; cells of ovary 7-8-ovulate. ♄. S. Native of Brazil. Peduncles solitary, axillary, 1-flowered. Seeds solitary from abortion.

Allied Fugosia. Shrub 1 foot.

4 F. PHLOMIDIFÒLIA (St. Hil. fl. bras. 1. p. 253. t. 50.) leaves ovate or lanceolate, entire, densely tomentose beneath; stigmas 3, distinct; cells of ovary 5-ovulate; capsule villous; seeds woolly. ♄. S. Native of Brazil in the province of Minas Geraes in fields. Flowers yellow, with a dark-purple base.

Phlomis-leaved Fugosia. Fl. May. Shrub 1 foot.

Cult. These plants are hardly worth cultivating except in botanical gardens. They will grow well in a mixture of loam and peat, and cuttings not too much ripened will root readily in sand or mould under a hand-glass, in heat.

XX. SE'RRA (to the memory of — Serra, a Spanish botanist, who wrote upon the plants of Majorca.) Cav. diss. 2. p. 83. t. 35. f. 3. D. C. prod. 1. p. 457.—Serræ'a, Willd. spec. 3. p. 695.

LIN. SYST. *Monadélphia, Decándria.* Calyx 5-toothed, small, girded by a 3-leaved involucel; leaflets cordate, entire. Anthers about 10, stipitate at the top and upper part of the tube, and with a 4 or 5-crenate membrane under the ovary. Stigmas 5. Capsules 2-celled? 10-seeded.

1 S. INCA'NA (Cav. l. c.) ⊙? F. Native of Arabia in the island of Soccotara. The whole plant downy, 3 inches high. Leaves cordate, truncate, 3-toothed. Flowers yellowish, axillary, almost sessile.

Hoary Serra. Pl. ¼ to ½ foot.

Cult. A plant of easy culture. It can be propagated by seeds.

XXI. LOPI'MIA (from λωπιμος, *lopimos*, easy of decortication.) Mart. in nov. act. bonn. xi. p. 96. D. C. prod. 1. p. 457.

LIN. SYST. *Monadélphia, Polyándria.* Involucel longer than the calyx, of 20, bristle-like connivent leaflets. Corolla flat. Column of stamens deflexed. Stigmas 10. Anthers 30-40. Capsule of 5 carpels; carpels indehiscent, covered with mucilaginous glue. Habit of *Sìda*. The bark is used for cordage.

1 L. MALACOPHY'LLUM (Mart. l. c.) ♄. S. Native of Brazil about Bahia. Sìda malacophýlla, Link, and Otto, abb. gew. berl. 1. p. 67. t. 30. Shrub clothed with soft starry white pubescence. Leaves orbicular, cordate, coarsely toothed. Flowers axillary, solitary, or crowded at the tops of the branches, scarlet. This plant when growing in its place of natural growth, and when in flower, has much the appearance of *Chirònia frutéscens*.

Soft-leaved Lopimia. Fl. Aug. Sep. Clt. 1823. Shrub 1 to 4 ft.

Cult. This beautiful shrub will do well in a mixture of loam and peat, and half-ripened cuttings will root freely in sand under a hand-glass in heat, or it may be raised from seed, which no doubt will ripen in this country.

XXII. POLYCHLÆ'NA (from πολυ, *poly*, many, χλαινα, *chlaina*, a cloak, alluding to the many-leaved involucel.)

LIN. SYST. *Monadélphia, Polyándria.* Involucel of numerous linear, ciliated leaflets, which are longer than the calyx. Capsule 5-celled, pilose; cells 1-seeded. Seeds angular. Annual plants with serrated leaves and crowded cymose heads of small white flowers, and awl-shaped stipulas.

1 P. RAMÒSA; erect branched, pilose; leaves lanceolate, acute, serrated, on short petioles; flowers cymose, terminal. ⊙. S. Native of Guinea.

Branched Polychlæna. Pl. 1 foot.

2 P. SI'MPLEX; simple, hispid; leaves ovate, acute, serrated, stalked; flowers terminal, sessile. ⊙. S. Native of Guinea.

Simple Polychlæna. Pl. 1 foot.

Cult. These plants will grow in any common garden-soil; however they are not worth cultivating except in general collections.

Division II. Calyx naked at the base, that is to say, without an involucel.

XXIII. PALA'VIA (in honour of Antonio Palau y Verdera, M. D. once professor of botany at Madrid.) Cav. diss. 1. p. 40. Lam. ill. t. 577. D. C. prod. 1. p. 458.

Lin. syst. *Monadélphia, Polyándria.* Calyx naked, 5-cleft. Carpels many, capsular, 1-seeded, collected into a head without order. This genus differs from *Sìda* as *Málope* does from *Málva*, and from *Málope* as *Sìda* does from *Málva*.

1 P. malvæfòlia (Cav. diss. 1. p. 40. t. 11. f. 4.) plant smoothish, prostrate; leaves sub-lobate, rather cordate; peduncles solitary, about the length of the leaves. ⊙. H. Native of Peru in sand near Lima. Málope parviflòra, Lher. stirp. 1. p. 103. t. 50. Palàvia declinàta, Mœnch. Flowers small, red.

Mallow-leaved Palavia. Fl. July, Aug. Clt. 1794. Pl. prostrate.

2 P. moscha'ta (Cav. diss. 1. p. 41. t. 11. f. 5.) plant tomentose, erect; leaves cordate, crenate; peduncles longer than the leaves. ⊙. H. Native of Peru near Lima, in the sand. Flowers yellowish or purplish. There is a specimen of this plant in the herbarium of Balbis under the name of *P. prostràta* of All.; it is probably the same as the following species.

Musk-scented Palavia. Fl. Jul. Aug. Clt. 1822. Pl. 1 to 2 ft.

3 P. rhombifòlia (Graham, in edinb. new phil. journ. July, Oct. 1830.) leaves rhomboidal, lobately-crenate, stellately pilose on the veins, shorter than the peduncles; stipulas awl-shaped, ciliated, green; petals obovately-cuneated, obliquely emarginate; peduncles longer than the leaves. ⊙. H. Native of Peru near Lima. Flowers large, rose-coloured, with orange-coloured anthers, on long peduncles in the axils of the upper leaves. Lindl. bot. reg. t. 1375.

Rhomb-leaved Palavia. Fl. July, Aug. Pl. prostrate.

Cult. These plants are not worth cultivating except in botanical gardens. The seeds require to be sown on a hot-bed early in the spring, and the plants should be transplanted into the open border in the month of May, where they will ripen their seeds.

XXIV. CRISTA'RIA (from *crista*, a crest, because of the carpels having two crest-like wings in the centre of each,) Cav. icon. 5. p. 10. D. C. prod. 1. p. 458. but not of Sonn.

Lin. syst. *Monadélphia, Polyándria.* Calyx naked, 5-cleft. Fruit orbicular, depressed, covered with a skin, consisting of several 1-seeded carpels, which have 2 wings in the centre of each. Small plants with the habit of *Sìda*.

1 C. betonicæfòlia (Pers. ench. 2. p. 248.) plant erect; leaves somewhat cordate, deeply-crenated, hoary. ♃ ? F. Native of Chili. Sìda Chilénsis, Spreng. syst. 3. p. 109. Feuill. hist. 3. p. 40. t. 27. Flowers red ? racemose.

Betony-leaved Cristaria. Pl. trailing.

2 C. glaucophy'lla (Cav. icon. 5. p. 11. t. 418.) plant prostrate; leaves lobed, cut, downy, glaucous. ♃ ? F. Native of Chili in the sea-sand near the town of Coquimbo. Sìda glaucophýlla, Spreng. Petals flesh-coloured, with villous claws.

Glaucous-leaved Cristaria. Pl. prostrate.

3 C. multi'fida (Cav. l. c.) plant prostrate; leaves multifid, smooth. ♃. F. Native of Peru in sandy places. Sìda multífida, Cav. diss. 1. p. 25. t. 4. f. 2. Sìda pterospérma, Lher. stirp. 1. p. 119. t. 57. Flowers white, axillary, solitary, turned towards the earth.

Multifid-leaved Cristaria. Pl. prostrate.

4 C.? coccínea (Pursh. fl. amer. sept. 2. p. 453.) plant beset with hoary tomentum and starry hairs; leaves 3-5-cleft, with cut acute segments; racemes terminal; stem diffuse, prostrate. ♃. H. Native of North America on the dry prairies and extensive plains of the Missouri. Sìda coccínea, D. C. prod 1. p. 465. Málva coccínea, Fras. cat. Nutt. gen. amer. 2. p. 81. Flowers bright scarlet. Styles 10. Carpels not winged.

Scarlet-flowered Cristaria. Fl. Aug. Sep. Clt. 1811. Pl. ½ ft.

Cult. The three first species should be grown in pots in a mixture of sand and peat, and in winter they should be kept in a green-house or a frame. The *C. coccínea* will only thrive when planted in a border of peat soil, and it is propagated but slowly by dividing the roots, or by seeds. The others may be propagated in the same manner.

XXV. A'NODA (from *a* priv. and *nodus*, knot; given to this genus because the pedicels are without the articulation which is remarked in *Sìda*.) Cav. diss. 1. p. 38. D. C. prod. 1. p. 458.

Lin. syst. *Monadélphia. Polyándria.* Calyx naked, 5-cleft; lobes acuminated, much spreading when in fruit. Capsules hemispherical beneath, depressed and stellate above, many-celled, or with 1-celled 1-seeded divisions. Habit of *Sìda*.

* *Carpels or cells of capsule stellately disposed, each ending in a somewhat spiny mucrone.*

1 A. hasta'ta (Cav. diss. 1. p. 38. t. 11. f. 2.) lower leaves cordate, acuminate, 5-angled, a little toothed, obtuse, upper ones hastate, acuminated, somewhat toothed at the base; pedicels solitary, axillary, length of leaves. ⊙. G. Native of Mexico and Peru in moist places. Sìda hastàta, Willd. spec. 3. p. 763. Flowers white, blue or purplish, about the size of those of *Málva rotundifòlia*. Style 10-15-cleft.

Halbert-leaved Anoda. Fl. June, July. Clt. 1799. Pl. 2 ft.

2 A. tríloba (Cav. diss. 1. p. 39. t. 10. f. 3.) leaves all crenated, lower ones roundish-cordate, obtuse, usually 5-angled, upper ones roundish, halbert-shaped, 3-lobed, acuminated; pedicels solitary, axillary, longer than the leaves. ⊙. G. Native of Mexico. Petals purple, somewhat emarginated. Calyx very villous. Sìda cristàta, Willd. spec. 3. p. 763. Flowers about the size of those of *Lavatèra O'lbia*. Style 15-25-parted.

Three-lobed-leaved Anoda. Fl. July, Sept. Clt. 1720. Pl. 2 feet.

3 A. Dillenia'na (Cav. diss. 1. p. 40. t. 11. f. 1.) lower leaves halbert-shaped, 3-lobed, acuminated, crenate, upper ones ovate-lanceolate, almost entire; pedicels solitary, axillary, length of leaves, and twice as long as the petioles. ⊙. G. Native of Mexico.—Dill. elth. 1. t. 2. Sìda Dilleniàna, Willd. spec. 3. p. 764. Sìda cristàta, Curt. bot. mag. t. 330. exclusive of the synonymes. Petals rose-coloured, emarginated at the apex. Flowers the size of those of the preceding species.

Dillenius's Anoda. Fl. July, Nov. Clt. 1725. Pl. 2 feet.

4 A. triangula'ris (D. C. prod. 1. p. 459.) leaves triangular, somewhat rhomboidal, acuminated, toothed at the base, quite entire at the apex; pedicels solitary, axillary, length of leaves 5-times longer than the petioles. ⊙. G. Native of Mexico. Sìda deltoìdea, Horn. hort. hafn. 36. Flowers rose-coloured, about the size of those of the preceding.

Triangular-leaved Anoda. Fl. July, Aug. Clt. 1820. Pl. 1 ft.

5 A. incarna'ta (H. B. et Kunth, nov. gen. and spec. amer. 5. p. 255.) branches and leaves hairy, lower leaves ovate-oblong, cordate, halbert-shaped, serrated, upper ones narrow, trifid; pedicels solitary, axillary, somewhat longer than the leaves. ♃. S. Native of Mexico in gardens. Flowers flesh-coloured. Carpels 12. Perhaps the same as the first.

Flesh-coloured-flowered Anoda. Fl. July, Aug. Clt. 1824. Pl. 1 to 3 feet.

** *Carpels mutic.*

6 A. acerifòlia (D. C. prod. 1. p. 459.) lower leaves cordate, angular, upper ones hastate, elongated, the rest 5-lobed,

halbert-shaped; pedicels longer than the leaves; petals obovate, longer than the calyx. ⊙. G. Native of Mexico. Flowers small, blue. Sìda acerifòlia, Zucc. obs. no. 80. Sìda hastàta, Sims, bot. mag. t. 1541. Sìda quinquéloba, Moc. et Sesse, fl. mex. ined.

Maple-leaved Anoda. Fl. July, Aug. Clt. 1809. Pl. 4 feet.

7 A. parviflòra (Cav. icon. 5. p. 19. t. 431.) lower leaves cordate, angular, upper ones halbert-shaped; pedicels shorter than the leaves; petals crenated, rather longer than the calyx. ⊙. G. Native of New Spain in the valley called Queretaro. Flowers pale-yellow. A. crenatiflòra, Ort. dec. p. 96. Sìda crenatiflòra, Pers. ench. 2. p. 247.

Small-flowered Anoda. Fl. July, Aug. Clt. 1820. Pl. 6 feet.

Cult. These plants are not worth cultivating except in botanical gardens. The seeds only require to be sown on a hot-bed frame in spring, and when the plants are of sufficient size they should be transplanted separately into other pots, and about the end of May they should be removed into the green-house, where they will ripen seed. A mixture of loam and peat will suit them well. The perennial species, *A. incarnàta*, should be kept in the stove, and may be easily increased by seeds, or cuttings.

XXVI. PERI'PTERA (from περιπτερα, *periptera*, a shuttlecock; resemblance in shape of flower.) D. C. prod. 1. p. 459.

Lin. syst. *Monadélphia, Polyándria.* Calyx naked, 5-cleft. Petals erect, spirally twisted into a tube, but at length becoming distinct. Capsule stellately many-celled. Cells 1-seeded. This genus differs from *Sìda* as *Malvavíscus* does from *Hibíscus.*

1 P. puni'cea (D. C. prod. 1. p. 459.) downy; lower leaves cordate, somewhat 5-lobed, halbert-shaped, upper ones halbert-shaped; peduncles solitary, axillary; petals erect, spatulate, somewhat toothed at the apex, twice the length of the calyx. ♄. S. Native of New Spain. Flowers crimson. Sìda perí-ptera, Sims, bot. mag. t. 1644. Sìda Malvavíscus, Moc. et Sesse, fl. mex. icon. ined. Sìda rùbra, Tenor. hort. nap. A'noda puní-cea, Lag. nov. gen. t. 21. An elegant plant.

Crimson-flowered Periptera. Fl. May, Aug. Clt. 1814. Shrub 1 to 2 feet.

2 P. Megapota'mica; smooth; leaves subcordate, acuminated, trifid, toothed, 5-nerved; peduncles solitary, axillary, much longer than the leaves; petals at first conniving into a tube, erect, much longer than the calyx, which is truncate at the base, veined, pale; genitals exserted. ♄. S. Native of Brazil on the banks of the Rio Grande. Sìda Megapotámica, Spreng. syst. tent. suppl. p. 19. Flowers probably pale-red.

Rio Grande Periptera. Shrub 2 feet.

Cult. These pretty little shrubs will thrive well in a mixture of loam and peat, and cuttings will root freely in sand under a hand-glass, but as they ripen seed in abundance this will not be necessary.

XXVII. SI'DA (a name given by Theophrastes to an aquatic plant, which is believed to be analogous with *Althæ'a.*) Cav. diss. p. 5. D. C. prod. 1. p. 459.—Sìda and Napæ'a, Lin. Lam. ill. t. 578 and 579. Sìda Bastárdia and Gàya, Kunth. malv. p. 4.

Lin. syst. *Monadélphia, Polyándria.* Calyx naked, 5-cleft, usually angular. Style multifid at the apex. Carpels capsular, 5-30, in a whorl around the central axis, more or less connected together, 1-celled, 1-seeded, mutic or awned at the apex.—A very polymorphous genus, differing greatly from each other in the structure of the fruit and seeds; but notwithstanding we consider it most adviseable to retain the whole under *Sìda*, as the carpology of the greater mass of the species are not sufficiently known.

Sect. I. Malvi'nda (a diminutive of *Málva.*) Medik. malv. p. 23. D. C. prod. 1. p. 459. Carpels 5-12, 1-seeded, but not bladdery.

* *Brèvi-pedicellàtæ. Pedicels usually not exceeding the petioles in length. Leaves linear, lanceolate, oblong or ovate, seldom cordate at the base.*

1 S. linifòlia (Cav. diss. 1. p. 14. t. 2. f. 1.) leaves linear, hairy, quite entire, much longer than the diameter of the flower; racemes terminal, corymbose; carpels 5-8, almost awnless. ♄. S. Native of Peru, Cayenne, and St. Domingo. Màlva hir-sùta gramineo folio, Aubl. guian. 2. p. 704. Flowers small, scarcely 4 lines in diameter, white.

Flax-leaved Sida. Fl. July. Clt. 1822. Shrub 2 feet.

2 S. stella'ta (Torrey in anal. lyc. new york, vol. 2.) plant beset with stellate pubescence; leaves lanceolate, acute, erosely-serrated, wrinkled; pedicels axillary, 3-5-flowered, shorter than the petioles; flowers capitately glomerate; carpels 12-14, with 2 mucrones, 1-2-seeded, with the sides reticulated at the base. ♄. S. Native of North America on the Rocky Mountains.

Stellate-pubescent Sida. Shrub 1 foot?

3 S. brachyste'mon (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 459.) leaves linear, quite entire, hardly longer than the diameter of the flower; pedicels axillary, 1-flowered, length of the stipulas and petioles. ♄. S. Native of Mexico. Flowers white, with a red centre. Stamens very short.

Short-stamened Sida. Shrub 2 feet.

4 S. prostra'ta; stem prostrate, pilose; leaves lanceolate, unequally serrated on short footstalks; stipulas setaceous; pedi-cels short, 1-flowered, axillary. ♄. S. Native of Sierra Leone in cultivated places. Flowers yellow.

Prostrate Sida. Shrub prostrate.

5 S. angustifòlia (Lam. dict. 1. p. 4.) leaves linear-lanceo-late, toothed, with a spiny tubercle under the base of the petiole; pedicels axillary, usually solitary; carpels 5, ending in 2 points. ♄. S. Native of the island of Bourbon. Flowers small, yellow. Cav. diss. 1. p. 14. t. 2. f. 2. but not of Mill. S. ulmifòlia, Retz, obs. 3. p. 37.

Narrow-leaved Sida. Fl. July, Sep. Clt. 1726. Shrub 3 ft.

6 S. linea'ris (Cav. icon. 4. p. 6. t. 312. f. 1.) leaves linear, serrated, with a spiny tubercle under the base of the petiole; pe-dicels axillary, solitary; carpels 10, mutic. ♄. S. Native of New Spain. Flowers small, yellow, hardly open.

Linear-leaved Sida. Shrub 1½ foot.

7 S. spino'sa (Lin. spec. 960.) leaves ovate-lanceolate, tooth-ed, with a spiny tubercle under the base of the petiole; pedicels axillary, solitary, shorter than the stipulas and petioles; capsules 5, ending in 2 beaks. ⊙. S. Native of the East Indies, Egypt, Senegal, and Jamaica. Cav. diss. 1. p. 11. t. 1. f. 9. Stewártia corchoroìdes, Forsk. Flowers yellow. There is a variety of this with somewhat cordate leaves.

Spinose-leaved Sida. Fl. July, Sep. Clt. 1680. Pl. 1 foot.

8 S. acu'ta (Burm. ind. 147.) leaves linear-lanceolate, tooth-ed, smooth; pedicels axillary, solitary, length of stipulas and petioles; carpels 5, 2-beaked. ♄. S. Native of Coromandel, Java, and Cochin-china. Cav. diss. 1. p. 15. t. 2. f. 3.—Pluk. mant. 10. t. 334. f. 2.—Rumph. amb. 6. p. 43. t. 18. S. scopària, Lour. coch. 2. p. 504. Flowers pale-yellow.

Acute-fruited Sida. Shrub 1 to 6 feet.

9 S. a'lba (Lin. spec. 960. but not of Cav.) leaves oblong-ovate, somewhat cordate, obtuse, toothed; pedicels equal in length to the petioles; carpels 5, 2-horned. ⊙. S. Native of the East Indies.—Dill. hort. elth. 2. t. 171. f. 210. Flowers white. Pedicels solitary.

White-flowered Sida. Fl. June, July. Clt. 1732. Pl. 1 to 2 feet.

10 S. Stauntonia'na (D. C. prod. 1. p. 460.) leaves oblong-lanceolate, toothed, smooth, pale beneath; pedicels axillary, solitary, length of stipulas and petioles; carpels 7, 2-horned. ♄. S. Native of China. S. lanceolàta, Willd. spec. 3. p. 736? S. stipulàta e China, Cav. diss. 1. p. 23? Flowers yellow.

Staunton's Sida. Shrub 2 feet.

11 S. stipula'ta (Cav. diss. 1. p. 22. t. 3. f. 10.) leaves lanceolate, toothed, acute, pilose; pedicels solitary, axillary; stipulas linear, fringed, longer than the petioles; carpels 7-10, ending in 2 beaks. ♄? S. Native of the Mauritius. The leaves are either hairy or smoothish. Flowers yellow.

Stipulate-leaved Sida. Fl. July, Aug. Clt. 1819. Shrub 1 to 3 feet.

12 S. murica'ta (Cav. icon. 6. p. 78. t. 597. f. 2.) leaves lanceolate, serrated, scarcely longer than the petioles; stipulas ciliated, elongated; flowers somewhat capitate; carpels 7, muricated, ending in 2 beaks. ♄? S. Native of New Spain near Chalma. Stem villous. Flowers yellow.

Muricated-carpelled Sida. Shrub 1 foot.

13 S. Berteria'na (Balb. in litt. D. C. prod. 1. p. 460.) leaves lanceolate, toothed, acute, rather pilose; pedicels 1-2, axillary, 1-flowered, very short; stipulas ciliated, twice as long as the petioles and flowers; carpels 5, almost mutic. ♄? S. Native of St. Domingo and Porto-Rico. Resembles *S. stipulàta*. Flowers yellow.

Bertero's Sida. Shrub 2 feet.

14 S. glomera'ta (Cav. diss. 1. p. 18. t. 2. f. 6.) leaves ovate-lanceolate, serrated, downy; pedicels glomerate, axillary, 1-flowered, very short; carpels 5, 2-horned. ♄? S. Calyx ciliated. Resembles *S. Jamaicénsis*. Flowers yellow.

Glomerated-flowered Sida. Shrub 1 to 2 feet.

15 S. Jamaice'nsis (Cav. diss. 1. p. 17. t. 2. f. 5.) leaves ovate, serrated, tomentose, with blunt awned serratures; pedicels axillary, solitary, 1-flowered, short; carpels 5, 2-horned. ♄. S. Native of Jamaica in arid places, as well as in St. Domingo.

Jamaica Sida. Fl. July, Aug, Clt. 1817. Shrub 2 feet.

16 S. Balbisia'na (D. C. prod. 1. p. 460.) leaves ovate-lanceolate, somewhat rhomboid, acuminated, entire at the base, serrate-toothed at the top, and are as well as the branches rough from starry down; pedicels solitary, 1-flowered, length of stipulas; stipulas ciliated; carpels 8-10, ending in 2 beaks. ♄. S. Native of Porto-Rico. Flowers yellow.

Balbis's Sida. Shrub 2 feet.

17 S. brachype'tala (D. C. prod. 1. p. 460.) leaves ovate-lanceolate, acuminated, unequally serrated, somewhat pubescent from pressed down; stipulas and calyxes ciliated; pedicels solitary, 1-flowered, length of stipulas; corolla shorter than the calyx; carpels 8-10, 2-beaked. ♄. S. Native of Martinico and St. Domingo. Flowers yellow. Differing from *S. frutéscens* in the pedicels being jointed at the base, not at the apex.

Short-petalled Sida. Shrub 1 to 3 feet.

18 S. repa'nda (Roth. nov. spec. p. 328.) leaves ovate, acuminated, doubly serrated, covered with small starry hairs above; pedicels solitary, shorter than the linear-lanceolate, ciliated stipulas; petals obliquely-repand; carpels 2-beaked. ♄. S. Native of? Flowers sulphur-coloured. Resembles *S. carpinifòlia*.

Repand-petalled Sida. Shrub 1 foot.

19 S. bracteola'ta (D. C. prod. 1. p. 460.) leaves ovate-lanceolate, acuminated, toothed, smooth; branches round, hairy; stipulas of two forms, one awl-shaped, the other linear; racemes very short, 1-3-flowered, bracteolate; carpels 7-8, 2-beaked. ♄. S. Native of South America on the road from Chili to Brazil. Flowers small, yellow.

Bracteolate-flowered Sida. Shrub 1 to 2 feet.

20 S. carpinifo'lia (Lin. fil. suppl. 307.) leaves ovate-oblong, doubly-serrated; peduncles axillary. very short, usually 4-flowered; branchlets flattened; carpels 8, 2-beaked. ♄. G. Native of the Canary Islands and Brazil. Cav. diss. 1. p. 24. t. 3. p. 11. Flowers yellow. The leaves are chewed by the inhabitants of Brazil, and applied with success to the bites of wasps and bees.

Var. β? *betulìna* (Lag. hort. madr. 1815.) leaves broader and somewhat cordate at the base. ♄. S. Native of the Mauritius. S. carpinifòlia, Jacq. icon. rar. 1. t. 135.

Hornbean-leaved Sida. Fl. July, Sep. Clt. 1774. Shrub 2 ft.

21 S. carpinoi'des (D. C. prod. 1. p. 461.) leaves ovate-oblong, somewhat doubly serrated; pedicels axillary, 1-flowered, solitary; carpels 10-12, 2-horned on the back, and with 1 awn at the base on the inside. ♄. S. Native of Brazil. Flowers yellow. This plant is often to be found in gardens under the name of *S. carpinifòlia*.

Horn-bean-like Sida. Fl. July, Sep. Clt. 1800. Shrub 2 feet.

22 S. mucronula'ta (D. C. prod. 1. p. 461.) lower leaves ovate-oblong, upper ones oblong, somewhat double-toothed; pedicels axillary, very short, 1-flowered; carpels 10-11, 2-beaked, and with 1 short awn at the base. ♄. S. Native of Java. Resembles *S. carpinoìdes*, but differing in the leaves being more oblong and smooth, and in the fruit being more hispid, as well as smaller. Flowers yellow.

Mucronulate-carpelled Sida. Shrub 2 feet.

23 S. orienta'lis (Cav. diss. 1. p. 21. t. 12. f. 1.) leaves ovate, acuminated, toothed above, smooth; pedicels axillary, 1-flowered, rather shorter than the petioles; carpels 9-10-mutic. ♄? S. Native of the East Indies. Flowers yellow.

Oriental Sida. Shrub 1 to 2 feet.

24 S. Cape'nsis (Cav. diss. 1. p. 23. t. 12. f. 3. and 2. p. 49.) leaves ovate-lanceolate or roundish-ovate, toothed; pedicels axillary, solitary, length of petioles; stipulas ciliated, longer than petioles; carpels 10, mutic. ♄? G. Native of the Cape of Good Hope.—Pluk. alm. t. 240. f. 5. Flowers yellow.

Cape Sida. Shrub 2 to 3 feet.

25 S. microphy'lla (Cav. diss. 1. p. 22. t. 12. f. 2.) leaves elliptical, toothed; pedicels axillary, solitary, somewhat longer than the petioles; carpels 7, 2-beaked. ♃. S. Native of the East Indies. Flowers yellow, sometimes crowded on the tops of the branches.

Small-leaved Sida. Pl. 2 feet.

26 S. tridenta'ta (Cav. icon. 4. t. 312.) leaves ovate, 3-toothed at the apex, tomentose beneath; pedicels axillary, 1-flowered, solitary, equal in length with the petioles and stipulas; stem filiform, very short. ♄. S. Native of St. Domingo. Flowers yellow, small.

Three-toothed-leaved Sida. Fl. July, Aug. Clt. 1824. Shrub 1 foot.

27 S. ero'sa (Link. enum. hort. berl. 2. p. 203.) leaves rhomboid, tapering to the base, toothed in front, clothed with starry tomentum beneath; pedicels shorter than the petioles; carpels 2-beaked. ♃. S. Native of Brazil. S. emarginàta, Retz. Flowers yellow.

Bitten-leaved Sida. Fl. July, Sep. Clt. 1824. Pl. 2 feet.

28 S. via'rum (St. Hil. fl. bras. 1. p. 182.) suffruticose, trailing, prostrate; branches clothed with the permanent stipulas; leaves small, oblong-linear, obtuse at both ends, serrated at the apex, somewhat farinaceously-tomentose beneath; peduncles equal in length to the petioles; flowers glomerate; carpels 5, smooth, bifid, attenuated. ♄. S. Native of Brazil in the province of Minas Geraes by road-sides. Flowers pale-yellow.

Way-side Sida. Fl. Jan. Mar. Pl. prostrate.

29 S. cilia'ris (Lin. spec. 961.) leaves elliptical, somewhat ovate, retuse, toothed at the apex; pedicels axillary, solitary, very short; stipulas ciliated, rather longer than the flower; carpels 7, muricated, ending in two short beaks. ♂. S. Na-

tive of Jamaica, St. Domingo, and St. Thomas. Cav. diss. 1. p. 21. t. 3. f. 9. & 5. t. 127. f. 2.—Sloan. hist. t. 137. f. 2. Flowers small, reddish.

Ciliary-stipuled Sida. Fl. Aug. Sep. Clt. 1759. Pl. ½ ft.

30 S. PUSI'LLA (Cav. diss. 1. p. 6. t. 1. f. 4 and 5. t. 127. f. 1.) leaves roundish-elliptical, toothed, smooth; pedicels axillary, 1-flowered, rather longer than the petioles; carpels 5, mutic; stem prostrate. ♄. S. Native of the Island of Mahe. Flowers yellow. Pedicels solitary.

Small Sida. Pl. prostrate.

31 S. URTICÆFÒLIA (St. Hil. fl. bras. 1. p. 189.) stems suffruticose, ascending, hairy; leaves cordate at the base, deeply toothed, lower ones roundish, very blunt, pubescent on both surfaces, upper ones oblong, obtuse, tomentose; pedicels numerous, axillary, 1-flowered, shorter than the petioles; carpels 4-5, mutic. ♄. S. Native of Brazil in the province of the Missions. Petals rose-coloured.

Nettle-leaved Sida. Fl. Jan. Shrub 1 foot.

32 S. ALNIFÒLIA (Lin. spec. 961.) lower leaves roundish-ovate, cordate; upper ones oblong, toothed, cuneated, and quite entire at the base; pedicels many, axillary, shorter than the petioles; carpels 5-7, 2-beaked. ⊙. S. Native of the East Indies. Cav. diss. 1. p. 12. t. 1. f. 13.—Dill. hort. elth. t. 172. f. 211. Flowers pale copper-coloured.

Alder-leaved Sida. Fl. July, Sept. Clt. 1732. Pl. 1 to 2 ft.

33 S. INTERME'DIA (St. Hil. fl. bras. 1. p. 188. t. 34. f. 1.) stem suffruticose, short, almost simple; leaves roundish-ovate, cordate at the base, deeply toothed, pubescent above, but tomentosely pubescent and hoary beneath; pedicels usually numerous, somewhat shorter than the petioles; divisions of the calyx very narrow, acuminated, awl-shaped at the apex; ovary of 5 carpels. ♄. S. Native of Brazil on the banks of the river Uruguay. Flowers white or flesh-coloured.

Intermediate Sida. Shrub very short.

34 S. PARVIFÒLIA (D. C. prod. 1. p. 461.) leaves ovate, toothed, hoary beneath; pedicels axillary, 1-flowered, much longer than the petioles; carpels 5, rough, mutic. ♃. S. Native of the Island of Bourbon. Flowers small, yellow.

Small-leaved Sida. Pl. 1 foot.

35 S. HERMANNIOÌDES (H. B. et Kunth, nov. gen. amer. 5. p. 258.) leaves elliptical, rounded at both ends, serrate-crenate, clothed with pressed hairs above, hoary from tomentum beneath, on short petioles; pedicels axillary, solitary, 1-flowered, shorter than petioles; carpels 5, 2-beaked. ♄. S. Native of South America between Honda and the river Guali in dry places. Shrub trailing, with hairy branches. Flowers about the size of those of *Gerànium mólle*. Resembles *S. rotundifòlia*.

Hermannia-like Sida. Shrub trailing.

36 S. OVA'TA; erect, branched; leaves ovate-lanceolate, acute, serrated, on short petioles; pedicels terminal and axillary, short, solitary, 1-flowered. ♄. S. Native of Guinea.

Ovate-leaved Sida. Shrub 1 foot.

37 S. CRENA'TA; erect, branched; leaves oblong, ovate, smooth, crenated, acuminate, entire at the base; pedicels terminal; solitary, 1-flowered. ♄. S. Native of Guinea.

Crenate-leaved Sida. Shrub 1 foot.

* * *Oblongifòliæ. Pedicels elongated, distinctly jointed. Leaves linear, lanceolate, oblong or ovate, seldom cordate at the base.*

38 S. FRUTE'SCENS (Cav. diss. 1. p. 12. t. 10. f. 1.) leaves ovate-oblong, somewhat cordate, serrated, whitish beneath; pedicels axillary, 1-flowered, twice as long as petioles, jointed under the apex. ♄. S. Native of the Mauritius. Flowers yellow. Perhaps this plant is only a variety of *S. spinòsa*.

Shrubby Sida. Fl. Jul. Aug. Clt. 1810. Shrub 4 feet.

39 S. COMPRE'SSA (D. C. prod. 1. p. 462.) leaves ovate-lanceolate, acuminated, toothed, hoary beneath; branchlets compressed, beset with starry down; pedicels axillary, 1-flowered, thrice the length of the petioles, carpels 5, pubescent, rather mucronate. ⊙? G. Native of Nipaul. Flowers yellow.

Compressed-branched Sida. Fl. July, Sept. Pl. 1 foot.

40 S. BI'COLOR (Cav. icon. 4. t. 311.) leaves lanceolate, very much pointed, serrated; pedicels axillary, 1-flowered, much longer than the petioles; carpels 5, mutic. ♄. S. Native of New Spain. Stem greenish-violet with spreading branches. Petals yellowish, red on the outside, obliquely truncated at the apex. S. oblíqua, Moc. et Sesse, fl. mex. icon. ined. differs in the leaves being less acuminated. Pedicels solitary.

Two-coloured-petalled Sida. Shrub 2 feet.

41 S. ASCE'NDENS (St. Hil. fl. bras. 1. p. 182.) suffruticose, ascending; leaves serrated, but entire at the apex, pubescent on both surfaces, ciliated; peduncles axillary, hardly articulated, much longer than the petioles; calyx 5-plicate, ciliated; carpels 9, mutic, smooth. ♄. S. Native of Brazil in the southern part of the province of St. Paul. Flowers white, at length flesh-coloured.

Ascending-stemmed Sida. Fl. Jan. Pl. ½ foot.

42 S. RIBIFÒLIA (St. Hil. fl. bras. 1. p. 183. t. 34.) stem suffruticose, ascending, flexuous; leaves ovate-oblong, serrated, green above but canescent beneath; peduncles axillary, hardly articulated, solitary, 1-flowered, much longer than the petioles; calyx pentagonal, tomentose; carpels 10, wrinkled, 2-beaked. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers pale-yellow.

Gooseberry-leaved Sida. Shrub 1 foot.

43 S. CANARIE'NSIS (Willd. spec. 3. p. 755.) leaves lanceolate, toothed, smooth; pedicels axillary, 1-flowered, length of leaves; carpels 7-10, 2-beaked. ♄. G. Native of the Canary Islands, S. álba, Cav. diss. 1. p. 22. t. 3. f. 8. but not of Linnæus. Leaves whitish beneath. Flowers yellow. This is perhaps the same as *S. rhombifòlia*. Pedicels solitary.

Canary Island Sida. Fl. Ju. Sep. Clt. 1820. Sh. 3 feet.

44 S. RHOMBIFÒLIA (Lin. spec. 961.) leaves oblong-lanceolate, toothed, cuneated at the base, whitish beneath; pedicels axillary, 1-flowered, length of the leaves; carpels 8-10, 2-beaked. ♄. G. Native of Carolina and South America, and probably of the East Indies. Flowers small, yellow. Cav. diss. 1. p. 23. t. 3. f. 12.—Dill. elth. t. 172. f. 212. Pedicels solitary.

Var. β, canéscens (Cav. diss. 1. p. 23. t. 8. f. 3.) leaves more villous beneath; pedicels longer than the leaves. ♄. S. Native of Senegal.

Rhomb-leaved Sida. Fl. Ju. Aug. Clt. 1732. Sh. 1 to 3. ft.

45 S. SERRA'TA (Willd. herb. ex Spreng. syst. 3. p. 111.) leaves linear, involute, serrated, covered with stellate pubescence beneath; peduncles filiform, straight, longer than the petiole; carpels 2-pointed. ♄. S. Native on the banks of the Orinoco.

Serrated-leaved Sida. Shrub 2 feet.

46 S. POTENTILLOÌDES (St. Hil. fl. bras. 1. p. 178.) shrubby, branched; leaves linear-lanceolate, serrated, green above, canescent beneath; peduncles axillary, twin, or solitary, crowded on the tops of the branches, shorter than the leaves; calyx 10-ribbed; carpels 8-10, 2-awned. ♄. S. Native of Brazil in woods near St. Nicholas in the province of the Missions.

Potentilla-like Sida. Shrub 1 foot.

47 S. ANGUSTI'SSIMA (St. Hil. fl. bras. 1. p. 179.) stem suffruticose, branched; leaves linear, very narrow, obtuse, remotely and dentately serrated at the base; peduncles axillary, solitary, 1-flowered, longer than the petioles; carpels 7-9, wrinkled, puberulous and 2-awned at the apex. ♄. S. Native of Brazil in the western part of the province of Minas Geraes. Flowers yellow.

Very narrow-leaved Sida. Fl. Sept. Oct. Shrub 2 feet.

48 S. LINEARIFÒLIA (St. Hil. fl. bras. 1. p. 180.) leaves on short petioles, linear, remotely toothed at the apex, rather cordate at the base, pilose above but tomentosely pubescent beneath, hoary; stipulas longer than the petioles; peduncles axillary, solitary, 1-flowered; carpels smooth, mutic. ♄. S. Native of Brazil in the western part of the province of Minas Geraes. Flowers yellow.

Linear-leaved Sida. Shrub 1 foot.

49 S. HONDE'NSIS (H. B. et Kunth, nov. gen. amer. 5. p. 260.) leaves lanceolate-oblong, somewhat rhomboid, acute, cordate, serrated, hoary from tomentum beneath; pedicels axillary, 1-flowered, shorter than the leaves; carpels 8, roughish, bidentate. ♄. S. Native of New Granada near Honda. Flowers yellow. Resembles *S. rhombifòlia*. Pedicels solitary.

Honda Sida. Shrub 2 to 3 feet.

50 S. RHOMBOÌDEA (Roxb. ex journ. bot. 1814. vol. 4. p. 207.) leaves lanceolate, toothed, hoary beneath; pedicels axillary, 1-flowered, shorter than the leaves; carpels 8-10, almost awnless. ♄. S. Native of Timor and Bengal. Flowers yellow.

Rhomboid-leaved Sida. Fl. July, Aug. Clt. 1818. Shrub 1 to 2 feet.

51 S. AURANTI'ACA (St. Hil. fl. bras. 1. p. 185.) suffruticose, erect, branched; leaves small, ovate-linear, or linear, bluntish, rather cordate at the base, toothed, pubescent on both surfaces; peduncles axillary, solitary, longer than the petioles; carpels 5, gibbous, mutic, pubescent at the apex. ♄. S. Native of Brazil in the province of Minas Geraes. Corolla orange. Stigmas purple.

Orange-flowered Sida. Shrub 1½ foot.

52 S. RETU'SA (Lin. spec. 961.) leaves obovate or wedge-shaped, toothed and retuse at the apex, somewhat tomentose below; pedicels axillary, 1-flowered, or crowded at the tops of the branches; carpels 7-8, beaked. ♄. S. Native of the East Indies and the Mauritius. Cav. diss. 1. p. 18. t. 3. f. 4. and 5. t. 131. f. 2. Flowers yellow. Pedicels either shorter or longer than the leaves.—Rumph. amb. 6. p. 44. t. 19. Pedicels solitary.

Retuse-leaved Sida. Fl. July, Aug. Clt. 1818. Sh. 2 ft.

53 S. PHILI'PPICA (D. C. prod. 1. p. 462.) leaves obovate, toothed at the apex, blunt, cuneated at the base, entire, smoothish; pedicels axillary, 1-flowered, rather shorter than the leaves; carpels 8-10, almost mutic. ♄. S. Native of the Philippine islands. Flowers yellow. Pedicels solitary.

Philippine Sida. Fl. Jul. Aug. Shrub 2 feet.

54 S. RECI'SA (Link. enum. hort. berl. 2. p. 203.) leaves somewhat rhomboid, retuse, crenate in front, clothed with starry tomentum beneath as well as branches; pedicels longer than the petioles but almost thrice as short as the leaves; carpels mutic. ♃. S. Native of Brazil. Flowers yellow.

Pared-leaved Sida. Fl. June, Aug. Clt. 1823. Pl. 1 foot.

55 S. ABSCI'SSA (Willd. herb. ex Spreng. syst. 3. p. 117.) leaves linear-oblong, tapering to the base, truncate at the top, covered with hoary stellate down; peduncles capillary, equal in length to the leaves; carpels mutic. ☉. S. Native of South America. Flowers yellow. Pedicels solitary.

Cut-leaved Sida. Pl. 1 foot.

56 S. HERMANNIÆFÒLIA (Willd. herb. ex Spreng. syst. 3. p. 117.) shrubby; leaves oblong, acute, serrulated, tomentose; peduncles 1-flowered, longer than the leaves. ♄. S. Native of Mexico. Pedicels solitary. Flowers yellow?

Hermannia-leaved Sida. Shrub 1½ foot.

57 S. CALYXHYME'NIA (Gay, ined. D. C. prod. 1. p. 462.) leaves lanceolate, obtuse, toothed, hoary on both surfaces; pedicels axillary, 1-flowered, hardly double the length of the petioles; calyx tomentose. ♄. G. Native of New Holland. Perhaps this species will form a distinct genus. Flowers yellow?

Membrane-calyxed Sida. Fl. Ju. Jul. Clt. 1820. Sh. 2 ft.

58 S. MÌCANS (Cav. diss. 1. p. 19. t. 3. f. 1.) leaves ovate, obtuse, somewhat cordate, serrated, clothed with soft glittering tomentum; pedicels axillary, solitary, much longer than the petioles; carpels 9-10, each with 2 short horns. ♃. S. Native of the East Indies. Flowers yellow. Scarcely differing from *S. althæifòlia* of Kunth. nov. gen. amer. 5. p. 262.

Glittering-leaved Sida. Fl. Ju. Aug. Clt. 1820. Pl. 1 ft.

59 S. MACULA'TA (Cav. diss. 1. p. 20. t. 3. f. 7.) leaves ovate, obtuse, toothed; branchlets, calyxes, and stipulas tomentose; pedicels axillary, 1-flowered, twice as long as the petioles, somewhat racemose at the apex of the branches; carpels 9-10, 2-horned. ♄. S. Native of St. Domingo. Petals yellow, with a red spot at the base of each. S. suberòsa, Lher. stirp. p. 113. t. 54. Pedicels solitary.

Spotted-petalled Sida. Fl. Jul. Aug. Clt. 1818. Sh. 1½ ft.

60 S. ACUMINA'TA (D. C. prod. 1. p. 462.) leaves ovate, acuminated, toothed; branches, stipulas, and calyxes tomentose; axillary branchlets floriferous; pedicels 1-flowered, twice as long as the petioles. ♄. S. Native of St. Domingo. S. maculàta, Bertero, ined. Petals yellow, with a red spot at the base of each. Perhaps the same as the last.

Acuminated-leaved Sida. Fl. June, Aug. Clt. 1800. Shrub 2 feet.

61 S.? HASTA'TA (St. Hil. fl. bras. 1. p. 190. t. 34. f. 2.) stem hairy, short; leaves roundish, very obtuse, hardly cordate at the base, crenate, upper ones ovate, or ovate-oblong; peduncles axillary, solitary, a little longer than the petioles; segments of the calyx hastately-ovate; ovary 11-12-lobed. ♄. S. Native of Brazil in the province of Cisplatine by road-sides.

Hastate-sepalled Sida. Fl. Dec. Pl. ½ foot.

* * * *Cordifòliæ. Pedicels elongated. Leaves toothed, not lobed, cordate at the base.*

62 S. PILÒSA (Cav. diss. 1. p. 9. t. 8.) leaves small, ovate-cordate, obtuse, toothed; pedicels pilose, solitary, 1-flowered longer than the petioles; carpels 5, 2-beaked. ☉. S. Native of the Caribbee islands. The whole plant is hairy. Flowers small, yellow.

Var. β, glàbra (D. C. prod. 1. p. 463.) plant smooth. Native of Porto-Rico.

Pilose Sida. Fl. July, Aug. Clt. 1793. Pl. 2 feet.

63 S. BETONICÆFÒLIA (Balb. in litt. D. C. prod. 1. p. 463.) plant very hispid; leaves ovate, cordate, acutish, crenated; pedicels solitary, 1-flowered, lower ones longer than the petiole, upper ones shorter; carpels 5. netted with nerves, pubescent, 2-beaked. ♄. S. Native of St. Martha. S. híspida, Bertero but not of Pursh. Flowers white.

Betony-leaved Sida. Shrub 2 feet.

64 S. MULTICAU'LIS (Cav. diss. 1. p. 10. t. 1. f. 6.) stems many from the root; leaves roundish, cordate, acute, toothed; pedicels solitary, 1-flowered, twice as long as the petioles; carpels 5, mutic. ☉. S. Native of Malabar. Plant hispid from long hairs. Stems slender, tomentose. Flowers yellow.

Many-stemmed Sida. Pl. 2 feet.

65 S. RADÌCANS (Cav. diss. 1. p. 8.) leaves roundish, cordate, acute, ciliately-toothed; pedicels solitary, 1-flowered, longer than the petioles; carpels 5, awnless. ♃. S. Native of the East Indies.—Rheed. mal. 10. p. 137. t. 69. Stems rooting, white from hairs. Flowers transparent with white veins.

Rooting Sida. Pl. creeping.

66 S. HEDERÆFÒLIA (Cav. diss. 1. p. 8. t. 9. f. 3.) leaves roundish, cordate, obtuse, repand; pedicels solitary, 1-flowered, longer than the petioles; carpels 5, 2-awned; stem creeping, rooting. ♃. S. Native of St. Domingo.—Plum. ed Burm. 1.

p. 7. t. 1. f. 2. Plant with the habit of *Glechòma* not *Hédera*. Flowers yellow.

Ivy-leaved Sida. Pl. creeping.

67 S. Jussiæa'na (D. C. prod. 1. p. 463.) leaves roundish, cordate, toothed, hispid on both surfaces; pedicels solitary, 1-flowered, longer than the petioles; carpels 5, awnless; stem filiform, prostrate. ⊙? S. Native of Peru. S. rèpens, var. Cav. diss. 1. p. 7. t. 1. f. 2. Flowers yellow, with the claws lined with red.

Jussieu's Sida. Pl. prostrate.

68 S. alpe'stris (St. Hil. fl. bras. 1. p. 186.) leaves ovate, somewhat cordate at the base, dentately-serrate, pubescent above, but subtomentose beneath; pedicels capillary, much longer than the petioles, racemose or panicled; carpels 5, 2-beaked. ♄. S. Native of Brazil in the province of Minas Geraes on mountains. Flowers violet-purple. Like *S. paniculàta* and *S. racemòsa*.

Alp Sida. Shrub 1 to 2 feet.

69 S. Martia'na (St. Hil. fl. bras. 1. p. 187.) suffruticose, clammy, branched; leaves oblong, cordate, acutish, toothed. pubescent on both surfaces; peduncles axillary, solitary, reflexed, longer than the petioles; carpels 5, mutic, wrinkled, obtuse at the apex. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers rose-coloured.

Var. β, viscosissima (St. Hil. l. c.) stem much longer, procumbent, much more branched and very clammy, and the leaves much larger. Native of Brazil on mountains near Villa Rica.

Martius's Sida. Shrub erect and procumbent.

70 S. Dombeya'na (D. C. prod. 1. p. 463.) leaves ovate, cordate, toothed, hairy on both surfaces; pedicel solitary, 1-flowered, longer than petioles; carpels 5, 2-beaked; stem filiform, prostrate. ⊙? S. Native of Peru about Lima. Flowers yellow or reddish.

Dombey's Sida. Pl. prostrate.

71 S. hu'milis (Willd. spec. 3. p. 744.) leaves roundish, cordate, serrated, pilose above; pedicels usually solitary, longer than the petioles; carpels 5. ⊙. S. Native of the East Indies. S. uniloculàris, Lher. stirp. 1. p. 127. t. 53. S. pilòsa, Retz. but not of Cav. Flowers small, yellow.

Var. α; carpels awnless. S. hùmilis, Cav. diss. 5. t. 134. f. 2.

Var. β; carpels rather mucronate. S. morifòlia, Cav. diss. 1. p. 9. t. 1. f. 1.

Var. γ; carpels 2-awned. S. veronicæfòlia, Lam. dict. no. 11. Cav. diss. 1. p. 7. t. 1. f. 3. and 5. t. 127. f. 3. Flowers whitish. Perhaps this is a distinct species.

Humble Sida. Fl. July, Aug. Clt. 1800. Pl. ½ to 2 feet.

72 S. supi'na (Lher. stirp. 1. p. 109. t. 52.) leaves roundish, cordate, bluntish, crenated, soft, velvety; pedicels solitary, 1-flowered, longer than the petioles; carpels 5, each ending in two short horns; stem procumbent. ♃. S. Native of Hispaniola in dry fields. S. ovàta, Cav. diss. 6. t. 196. f. 2. S. procúmbens, Swartz, fl. ind. occ. 2. p. 1211. Flower pale-yellow, fugacious.

Supine Sida. Fl. July. Aug. Clt. 1821. Pl. trailing.

73 S. diffu'sa (H. B. et Kunth, nov. gen. amer. 5. p. 257.) leaves somewhat elliptic, rounded at the apex, cordate, crenate-serrated, hairy, but hoary beneath, on long stalks; pedicels solitary, axillary, almost equal in length with the leaves; carpels 5, awnless. ♄. S. Native of Mexico near Zelaya. Stem procumbent, branched, filiform, covered with soft hairs. Leaves 4 lines long. Flowers small, violet.

Diffuse-branched Sida. Pl. trailing.

74 S. subcunea'ta (St. Hil. fl. bras. 1. p. 184.) stem nearly simple; leaves somewhat cuneately-oblong, hardly cordate at the base, entire at the base, obtuse and serrated at the apex, silky-villous on both surfaces; flowers glomerate, axillary; carpels 5, mutic, smooth. ♄. S. Native of Brazil near Villa Rica. Flowers yellow, with a purple spot at the base of each petal.

Subcuneated-leaved Sida. Fl. Jan. Pl. ½ foot.

75 S. rufe'scens (St. Hil. fl. bras. 1. p. 185.) suffruticose, branched, very hairy; leaves cordate-lanceolate, serrated, very hairy; flowers crowded together as if they were capitate; calyx 10-ribbed, hairy; carpels 5, smooth. ♄. S. Native of Brazil in the province of Minas Geraes near Formigas. Flowers orange-yellow.

Rufescent Sida. Shrub 1½ foot.

76 S. flave'scens (Willd. spec. 3. p. 755.) leaves ovate, cordate, obtuse, unequally toothed, tomentose; pedicels in pairs; 1-flowered, shorter than the petioles; carpels 5, awnless. ♄. S. Native of Monte Video on rocks. S. flavéscens, Cav. diss. 1. p. 14. t. 13. f. 2. S. prostràta, Cav. diss. 1. t. 13. f. 3. Flowers reddish.

Yellowish-leaved Sida. Pl. prostrate.

77 S. calycìna (Cav. diss. 1. p. 9. t. 8. f. 2.) leaves roundish, cordate, acuminated, repandly toothed; pedicels solitary, 1-flowered, longer than the petioles; carpels 5, awnless, pear-shaped. ♄. S. Native of the Island of Bourbon. Calyx large, 5-parted. Flowers large, yellow, spreading.

Large-calyxed Sida. Shrub 2 feet.

78 S. herba'cea (Cav. diss. 1. p. 19. t. 13. f. 1.) leaves oblong, cordate at the base, acute, toothed, hairy; pedicels 1-flowered, shorter than the petioles; carpels 9-10, 2-awned. ⊙. S. Native of the East Indies. Flowers yellow.

Herbaceous Sida. Pl. 1 foot.

79 S. rotundifòlia (Cav. diss. 1. p. 20. t. 3. f. 6. and 6. t. 194. f. 2.) plant hairy; leaves roundish-ovate, cordate, toothed, tomentose; pedicels solitary, 1-flowered, much longer than the petioles; carpels 9-10, each ending in 2 long awns. ♄. S. Native of the Island of Bourbon. Awns pilose, with the hairs protruding in bundles. Flowers yellow.

Round-leaved Sida. Fl. June, Aug. Clt. 1819. Shrub 1½ foot.

80 S. Bonarie'nsis (Willd. herb. ex Spreng. syst. 3. p. 120.) shrubby; leaves cordate, oblong, coarsely crenated, covered with stellate pubescence above, but tomentose beneath; peduncles elongated, 1-flowered; carpels very villous, mutic. ♄. S. Native of Buenos Ayres. Perhaps a species of *Abùtilon*.

Buenos Ayrean Sida. Shrub 1 to 2 feet.

81 S. ma'crodon (D. C. prod. 1. p. 464.) plant hairy; leaves roundish, cordate, coarsely crenated; pedicels solitary or twin, 1-flowered, 4-times longer than the petioles; carpels 10, awnless. ♄. S. Native of Brazil. Flowers white, flesh-coloured, rose-coloured, or scarlet.

Long-toothed-leaved Sida. Fl. Nov. Mar. Pl. prostrate.

82 S. cordifòlia (Lin. spec. 961.) leaves ovate, cordate, toothed, rather angular, bluntish, villous; pedicels solitary, 1-flowered, a little shorter than the petioles; carpels 9-10, 2-beaked. ⊙. S. Native of the East Indies and Africa. Cav. diss. 1. p. 19. t. 3. f. 2.—Dill. elth. t. 171. f. 209. Flowers sulphur-coloured.

Heart-leaved Sida. Fl. Ju. Sep. Clt. 1732. Pl. 1 foot.

83 S. biva'lvis (Cav. diss. 1. p. 13. t. 11. f. 2.) leaves ovate, cordate, acuminated, crenated, tomentose; pedicels solitary, 1-flowered, shorter than the petioles; calyxes awnedly acuminated; carpels 5, bidentate at the apex, cohering; 2-valved. ♄? S. Native of St. Domingo. Flowers yellow.

Two-valved-capsuled Sida. Shrub 3 feet.

84 S. elonga'ta (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 652.) leaves heart-shaped, grossly toothed, smooth on both surfaces; stipulas and petioles setaceously-pilose; racemes axillary, solitary, elongated, few-flowered, leafy; calyx campanulate, cili-

ated; carpels 5, awnless. ♄. S. Native of Java. Flowers yellow.

Elongated-racemed Sida. Shrub 2 feet.

85 S. HOLOSERÍCEA (Willd. herb. ex Spreng.) leaves cordate, ovate-elliptical, bluntish, serrate-crenated, clothed with close-pressed hairs above, beneath as well as the branches with soft villous tomentum; carpels 10-11, 2-beaked. ♄. S. Native on the banks of the Orinoco near Angustura. S. pellìta, H. B. et Kunth, nov. gen. amer. 5. p. 263. Flowers yellow, conglomerate.

Whole-silky Sida. Shrub 2 feet.

86 S. MULTIFLÒRA (Cav. diss. 1. p. 18. t. 3. f. 3.) leaves ovate-cordate, bluntish, toothed, tomentose; pedicels solitary, 1-flowered, longer than the petioles; carpels 9, each ending in two long beaks. ♄. S. Native of Brazil. Flowers yellow.

Many-flowered Sida. Fl. July, Aug. Clt. 1818. Sh. 2 ft.

87 S. SESSILIFLÒRA (Hook. bot. mag. 2857.) plant very soft, pubescent; leaves cordate, acute, serrated; flowers somewhat glomerate, sessile, axillary and terminal; carpels 10, pubescent, awnless; corolla hardly twice the length of the calyx. ♄. S. Native of South America about Mendoza. Flowers small, yellow.

Sessile-flowered Sida. Fl. Aug. Nov. Clt. 1827. Sh. 3 ft.

88 S. EMARGINÀTA (Willd. spec. 3. p. 757.) leaves ovate-lanceolate, cordate, toothed, truncate and retuse at the apex; pedicels solitary, 1-flowered, one-half shorter than the petioles; carpels 5, 2-beaked. ♄. S. Native of Hispaniola. S. truncàta, Lher. stirp. 1. t. 51. but not of Cav. Flowers yellow.

Emarginate-leaved Sida. Shrub 2 feet.

89 S. ARGUTA (Swartz, fl. ind. occ. 2. p. 1205.) leaves cordate, serrated, tapering to the apex, hairy on the petioles, margins and nerves beneath, the rest smooth; pedicels solitary, 1-flowered, longer than the petioles; carpels 5, 2-awned. ♄. S. Native of Jamaica and Guadaloupe, in hedges. S. glàbra, Mill. dict. no. 14. Flowers small, of a whitish-yellow colour.

Slender-leaved Sida. Fl. July, Aug. Clt. 1732. Sh. 3 feet.

90 S. ULMIFÒLIA (Cav. diss. 1. p. 15. t. 2. f. 4. but not of Retz.) leaves ovate, cordate, acuminated, crenate, pubescent; pedicels solitary, 1-flowered, almost equal in length with the petioles; carpels 5, each ending in two long beaks. ♄. S. Native of St. Domingo. Flowers yellow. Beaks of capsule scabrous from retrograde hairs.

Elm-leaved Sida. Shrub 2 feet.

91 S. FASCICULÀTA (Willd. herb. ex Spreng. syst. 3. p. 113.) branches beset with glandular hairs; leaves cordate, oblong, acuminated, toothed, rather pilose; peduncles 1-flowered, longer than the petioles; petals longer than the calyx. ♄? S. Native of Cumana. Flowers yellow.

Fascicled Sida. Shrub 2 feet?

92 S. BORBÓNICA (Cav. diss. 1. p. 9. t. 10. f. 2.) leaves roundish, cordate, acute, toothed; pedicels solitary, 1-flowered, a little longer than the petioles; carpels 5, each ending in 2 long awns. ♄. S. Native of the Island of Bourbon. Stems hairy. Flowers yellow.

Bourbon Sida. Shrub 2 feet.

93 S. FRÀGRANS (Lher. stirp. 2. p. 111. t. 53.) leaves roundish-cordate, acuminated, crenate, clammy, hairy; pedicels solitary, 1-flowered, shorter than the petioles; carpels 5, somewhat awned. ♄. S. Native of Hispaniola. Flowers yellow.

Fragrant Sida. Shrub 2 feet.

94 S. VISCÍDULA (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 651.) leaves roundish-cordate, acuminated, mucronately-crenate, clothed with stellate down beneath; petioles and stems clammy, pubescent; pedicels usually solitary, 1-flowered, shorter than the petioles, crowded at the tops of the branches; petals obcordate; carpels 5, beaked. ♄. S. Native of Java. Flowers yellow.

Viscid Sida. Shrub 1 to 2 feet.

95 S. GLUTINÒSA (Cav. diss. 1. p. 16. t. 2. f. 8.) stem clammy, tomentose; leaves roundish, cordate, acuminated, toothed, tomentose beneath; pedicels twin or tern, usually 2-flowered, longer than the petioles; carpels 5, each ending in 2 long awns. ♄. S. Native of the Mauritius. S. racemòsa, Burm. Flowers yellow?

Clammy Sida. Shrub 2 feet.

96 S. PORTORICÉNSIS (Spreng. syst. 3. p. 114.) herbaceous; leaves cordate, oblong, smooth above, but hoary and villous beneath, as well as the branches; peduncles short, many-flowered, upper ones crowded; carpels 2-beaked. ⊙. S. Native of Porto-Rico. Flowers probably yellow.

Porto-Rico Sida. Pl. 1 foot.

97 S. INTERRÚPTA (Balb. in litt.) leaves heart-shaped, acuminated, toothed, adult ones smooth, younger ones and calyxes hoary-velvety; stipulas setaceous, deciduous; flowers disposed in bundles, in a terminal interrupted spike, which is leafless at the top; carpels 8-10, 1-beaked. ♄. S. Native of the Island of St. Martha. Flower yellow.

Interrupted-spiked Sida. Shrub 1½ foot.

98 S. ALTHÆIFÒLIA (Swartz, prod. 101. fl. 2. p. 1207.) leaves cordate, somewhat angular, obtuse. serrate-crenate, tomentose; pedicels 3-4, 1-flowered, shorter than the petioles; carpels 10-12, each ending in 2 short beaks. ♄. S. Native of the south of Jamaica, New Granada and Brazil. Lher. stirp. 1. p. 112.—Sloan. hist. 1. t. 136. f. 2. Flowers orange-yellow, rather large.

Var. β, aristòsa (D. C. prod. 1. p. 465.) awns longer than the carpels, scabrous from retrograde hairs. ♄. S. Native of French Guiana. There is a plant from Guadaloupe intermediate between the species and variety.

Hollyhock-leaved Sida. Fl. June, Sep. Clt. 1820. Shrub 2 ft.

99 S. URENS (Lin. spec. 963.) leaves ovate, cordate, acuminated, toothed; peduncles axillary and terminal, 3-4-flowered, very short; carpels 5, awned; stem and petioles hispid. ♄. S. Native of Jamaica, and Guadaloupe, in arid bushy places. Cav. diss. 1. p. 15. t. 2. f. 7. There is a plant cited from Senegal, which is probably different. Flowers yellow?

Stinging Sida. Fl. July, Sep. Clt. 1781. Shrub 1 to 2 feet.

100 S. LEIOPHÝLLA (Spreng. syst. 3. p. 121.) shrubby; leaves cordate, ovate, acute, crenulated, smooth on both surfaces; peduncles sub-corymbose, short, axillary and terminal; carpels mutic, rather hispid, hoary. ♄. S. Native of Hispaniola. Perhaps a species of *Abùtilon*.

Smooth-leaved Sida. Shrub.

101 S. VERTICILLÀTA (Cav. diss. 1. p. 13. t. 1. f. 12.) leaves ovate, cordate, acuminated, toothed, and are as well as branches rather pilose; flowers axillary, many, almost sessile, and as if they were in whorls; carpels 5, almost awnless. ⊙? S. Native of Brazil at Rio Janeiro. Flowers yellow.

Whorled-flowered Sida. Fl. July, Aug. Clt. 1823. Pl. 1 ft.

102 S. PYRAMIDÀTA (Cav. diss. 2. p. 11. t. 1. f. 10. and 6. t. 194. f. 1.) leaves large, roundish, cordate, acuminated, serrate, smooth; peduncles many-flowered, forming a panicle; carpels 5, velvety, each ending in 2 short points. ♄. S. Native of St. Domingo and Porto-Rico in bushy places by the sea-side. Flowers small, yellow.

Pyramidal-flowered Sida. Fl. Jul. Aug. Clt. 1830. Sh. 2 ft.

103 S. MICRÁNTHA (Cambess. pl. us. bras. no. 49. St. Hil. fl. bras. 1. p. 190.) upper leaves subcordate, acute, unequally toothed, tomentose on both surfaces; flowers small, disposed in compound glomerate racemes; carpels 5, 2-beaked, pubescent on the back. ♄. S. Native of Brazil in the province of Minas Geraes. The shoots of this plant being very pliable are used by the inhabitants of Brazil for rocket-sticks. Flowers red?

Small-flowered Sida. Shrub 1 to 2 feet.

104 S. DUMÒSA (Swartz, fl. ind. occ. 2. p. 1209.) leaves cordate, ovate, acuminated, serrated, smooth; peduncles many-flowered, forming a panicle; carpels 5-6, roundish, roughish from very minute, stellate tomentum. ♄. S. Native of Jamaica and St. Domingo, in bushy places. Flowers pale yellow.

Bushy Sida. Fl. July, Sept. Clt. 1818. Shrub 2 feet.

105 S. FLORIBU'NDA (H. B. et Kunth, nov. gen. amer. 5. p. 258.) leaves cordate, ovate-oblong, acuminated, serrate, villous, brownish beneath; racemes axillary; carpels 5, awnless. ♄. S. Native of New Granada in arid places. Shrub very branchy; branches clothed with rusty tomentum. Pedicels capillary. Flower small, violet-coloured.

Bundle-flowered Sida. Fl. July, Sept. Shrub 2 to 3 feet.

106 S. ATROSANGUI'NEA (Jacq. icon. rar. 1. t. 136.) shrubby; branches pilose with simple hairs; leaves cordate, ovate, acuminated, serrated, rather villous; peduncles sub-corymbose, few flowered; petals reflexed; calyx nerveless; carpels 5, 2-beaked. ♄. S. Native of South America. S. capillàris. Cav. diss. 1. p. 16. et 10. t. 12. Corolla small, dark-purple.

Dark-bloody-flowered Sida. Fl. July, Sep. Clt. 1795. Shrub 4 feet.

107 S. PANICULA'TA (Lin. spec. 962.) stem beset with forked hairs; leaves ovate-cordate, toothed, acuminated, puberulous from starry tomentum beneath; peduncles loosely panicled; capillary long; calyxes nerveless; carpels 5, each ending in two short beaks. ♂. S. Native of Jamaica, Peru, and Brazil, on calcareous rocks. S. paniculàta, Cav. diss. 1. p. 16. Flowers dark-purple, but yellow according to Cav.

Panicled-flowered Sida. Fl. July, Sep. Clt. 1795. Pl. 2 ft.

108 S. VELUTI'NA (Willd. herb. ex Spreng. syst. 3. p. 115.) shrubby, pilose; leaves subcordate. ovate, obtuse, crenate, tomentose on both surfaces; peduncles sub-racemose, and are as well as the calyxes very villous; carpels 2-awned. ♄. S. Native of the East Indies. Perhaps a species of *Abùtilon*.

Velvety Sida. Shrub 1 to 2 feet.

109 S. PELLI'TA (Willd. herb. ex Spreng. syst. 3. p. 115. but not of Kunth,) shrubby; branches spreading; leaves nearly sessile, cordate, oblong, acute, serrated, covered with brown villi on both surfaces; peduncles capillary, racemose, elongated; flowers dioecious; carpels 2-awned. ♄. S. Native of New Granada. Flowers probably yellow.

Clad Sida. Shrub 1 to 3 feet.

110 S. NERVO'SA (D. C. prod. 1. p. 465,) leaves cordate, acuminated, toothed, puberulous from starry down; peduncles panicled; calyxes nerved; carpels 5, 2-beaked. ♄ ? S. Native of St. Domingo. Flowers yellow.

Nerved-calyxed Sida. Shrub 2 feet.

* * * * *Palmatilobàtæ. Leaves cleft in 3-5-7 or 9 lobes.*

111 S. JAVE'NSIS (Cav. diss. 1. p. 10. t. 1. f. 5.) leaves roundish, cordate, toothed, tricuspidate; pedicels solitary, 1-flowered, longer than the petioles; carpels 5, 2-beaked; stem reclinate. ♄ ? S. Native of Java.

Java Sida. Shrub prostrate.

112 S. OXYPHY'LLA (Moc. et Sesse, fl. mex. icon. ined. D.C. prod. 1. p. 465.) leaves cordate, toothed, villous, 3-lobed; lateral lobes short, bifid, middle one longer, acuminated; pedicels solitary, 1-flowered, length of petioles; carpels 5, 2-beaked.—Native of Mexico. Flowers probably yellow.

Sharp-leaved Sida. Pl. 1 to 2 feet.

113 S. PU'NGENS (H. B. et Kunth, nov. gen. amer. 5. p. 263.) leaves cordate, somewhat ovate, obsoletely 3-lobed, coarsely serrate-crenated, soft, pubescent above, but tomentosely-villous beneath, as well as branches; flower axillary, solitary, but collected in bundles at the tops of the branches; carpels 12, 2-awned. ♄. S. Native of South America on the banks of the Orinoco near Angustura. Flowers yellow.

Pungent Sida. Shrub 10 feet.

114 S. DIVERSIFÒLIA (Spreng. syst. 3. p. 116.) herbaceous, villous; lower leaves somewhat angularly toothed, upper ones sinuately 3-lobed, uppermost ones lanceolate; peduncles solitary, 1-flowered; capsule awned, exceeding the acuminated calyx. ⊙. S. Native of the East Indies. S. heterophýlla, Klein.

Diverse-leaved Sida. Pl. 1 to 3 feet.

115 S. HETEROPHY'LLA (Cav. icon. 5. p. 12. t. 421.) radical leaves ovate, scolloped, cauline ones 3-parted, with deeply jagged, toothed lobes, middle lobe long; pedicels solitary, 1-flowered, longer than the leaves. ⊙. S. Native on the mountains of Chili. Flowers pale-blue when dry; style violet. Fruit unknown. Perhaps a species of *Cristària*.

Variable-leaved Sida. Pl. 1 foot.

116 S. ? CRISPIFLO'RA (Cav. icon. 5. p. 11. t. 419.) leaves cordate, lobed, tomentose beneath, with stellate dots above, curled on the margins; pedicels solitary, longer than the petioles; calyxes sinuately waved, and lobed; carpels 7, mutic. ⊙. S. Native of South America at Port Desederado. Perhaps a species of *Cristària*. Corolla blue, when dry reddish.

Curled-flowered Sida. Pl. ½ foot.

117 S. TRI'LOBA (Cav. diss. 1. p. 11. t. 1. f. 11 and 5. t. 131. f. 1.) leaves cordate, crenate, 3-lobed, with the intermediate lobe longest, acute; pedicels solitary, 1-flowered, longer than the leaves; carpels 7, awnless. ♄. G. Native of the Cape of Good Hope. Jacq. schœnbr. 2. t. 142. Lower leaves undivided. Flowers at first white, then yellowish.

Three-lobed-leaved Sida. Fl. July, Sep. Clt. 1794. Shrub 3 ft.

118 S. CENTRO'TA (Spreng. syst. app. p. 259.) stem procumbent, branched, hispid, lower leaves 5-lobed, upper ones hastately trifid, glabrous; segments acute, quite entire; peduncles 1-flowered, longer than the leaves; carpels 2-awned, setosely-prickly. ♄. S. Native of? Sìda hastàta of English gardeners. Flowers yellow. Perhaps a species of *Abùtilon*.

Spurred-carpelled Sida. Fl. June, July. Clt.? Shrub 1 ft.

119 S. RICINOI'DES (Lher. stirp. 1. p. 115. t. 55.) leaves somewhat buckler-shaped, 5-lobed, lobes ovate, acute, toothed, undivided; peduncles usually 1-flowered; flowers sub-umbellate (Cav.); carpels 8-9, 2-awned. ⊙. S. Native of Peru. S. palmàta, Cav. diss. 1. p. 20. t. 3. f. 3. Malvínda palmàta, Mœnch. S. Rícini, Spreng. Flowers pale-purple. Leaves like those of *Ricinus*.

Ricinus-like Sida. Fl. June, July. Clt. 1820. Pl. 3 feet.

120 S. JATROPHOI'DES (Lher. stirp. 1. p. 117. t. 56.) leaves somewhat peltate, with 7-lanceolate, acuminated, pinnatifid, toothed lobes; peduncles many-flowered; carpels 7-8, awnless. ⊙. S. Native of Peru in sandy places. S. palmàta, Jacq. icon. rar. 3. t. 547. Cav. diss. 5. t. 131. f. 3. Flowers violet-coloured.

Jatropha-like Sida. Fl. Aug. Clt. 1787. Pl. 3 feet.

121 S. NAPÆ'A (Cav. diss. 5. p. 277. t. 132. f. 1.) leaves palmately 5-lobed, smooth; lobes oblong, acuminated, toothed; peduncles many-flowered; carpels 10, awnless, acuminated. ♃. H. Native of North America from Pennsylvania to Virginia in shady rocky places. Napæ'a læ'vis, Lin. syst. 750. Lam. ill. t. 579. f. 1. Sims, bot. mag. 2193. Napæ'a hermaphrodìta, Lin. spec. 965. Flowers small, white. From *Napææ*, the nymphs of the wood, which comes from νε, a negative, and παος, brilliant; that is to say, obscure in allusion to its habitat, in woods.

Napæa Sida. Fl. Aug. Sep. Clt. 1748. Pl. 3 to 4 ft.

122 S. DIOI'CA (Cav. diss. 5. p. 278. t. 132. f. 2.) leaves palmately 7-lobed, scabrous; lobes lanceolate, deeply toothed; peduncles many-flowered, bracteated, somewhat corymbose; flowers dioecious; carpels 10, awnless. ♃. H. Native of the upper parts of Virginia in stony places. Napæ'a scàbra, Lin.

syst. 750. Napæ'a dioíca, Lin. spec. 965. Flowers small, white, in many-flowered, terminal, or lateral peduncles.

Dioecious Sida. Fl. July, Aug. Clt. 1759. Pl. 6 feet.

123 S. MALVÆFLO'RA (D. C. prod. 1. p. 474. Lindl. bot. reg. t. 1036.) radical leaves roundish, 9-lobed, truncate at the base; lobes 3-toothed at the apex; stem leaves 5-parted; segments linear, sub-dentate; flowers disposed in terminal racemes; carpels mutic. ♃. H. Native of North America in New Albion in the vicinity of the Multomah river. Leaves and stem pilose. Flowers pale rose-coloured. An elegant plant.

Malva-flowered Sida. Fl. July, Aug. Clt. 1826. Pl. 1 to 3 ft.

***** *Pinnatilobàtæ. Leaves pinnatifid, or pinnate-parted.*

124 S. PINNA'TA (Cav. icon. 5. p. 13. t. 422. f. 1.) leaves pinnate-parted, imbricate, tomentose beneath, with quite entire lobes; flowers axillary, sessile, solitary. ♃. G. Native of Peru at the bottom of mount Chimborazo. Plant almost stemless. Root thick. Flowers large, yellow when dry.

Pinnate-leaved Sida. Pl. 2 inches.

125 S. ACAU'LIS (Cav. icon. 5. t. 422. f. 2.) leaves pinnate-parted, with ovate, tomentose, tricuspidate lobes; flowers axillary, sessile, solitary; carpels 8-10, awnless. ♃. G. Native of Peru at the bottom of mount Chimborazo. Flowers probably yellow. Root thick. Habit of the last.

Stemless Sida. Pl. 1 to 2 inches.

126 S. PICHINCHE'NSIS (H. et B. pl. æquin. 2. t. 116.) plant tufted; leaves pinnatifid, hoary from tomentum above, smooth beneath, with linear-lanceolate 3-parted segments; stems 1-flowered, bearing one leaf in the middle; carpels hairy. ♃. G. Native of Quito on the top of the burning mountain Pichincha, at the height of 7050 feet. H. B. et Kunth, nov. gen. amer. 5. p. 255. Flowers yellow?

Pichincha Sida. Pl. 1 to 2 inches.

SECT. II. ABUTILOI'DES (agreeing with the genus *Abùtilon*, in the carpels being connected as it were into a many-celled fruit.) D. C. prod. 1. p. 466. Gàya and Bastàrdia, Kunth, malv. p. 4. Carpels 15 to 40, 1-seeded, bladdery, so closely joined together as to form a many-celled capsule.

127 S. OCCIDENTA'LIS (Lin. spec. 964.) leaves oblong, cordate, toothed, somewhat lobed; pedicels solitary, shorter than the petioles; carpels 27-30, blunt, disposed into a globose fruit. ☉. S. Native of South America.—Dill. elth. 1. t. 6. Cav. diss. 1. p. 24. t. 4. f. 3. Abùtilon defléxum, Mœnch. Fruit-bearing pedicels deflexed. Flowers yellow; petals crenate.

Occidental Sida. Fl. July, Aug. Clt. 1732. Pl. 2 feet.

128 S. SYLVA'TICA (Cav. diss. 2. p. 56 and 5. p. 276. t. 133. f. 2.) leaves ovate, cordate, acuminated, crenated; pedicels twin, much longer than the petioles; carpels 30-36, awnless, collected into an umbilicated globe. ♄. S. Native of Peru in woods near the river Maragnon. Flowers pale-yellow.

Wood Sida. Shrub 10 feet.

129 S. SPICA'TA (Cav. diss. 1. p. 24. t. 8. f. 1.) leaves ovate, cordate, acute, toothed; racemes terminal, leafy; carpels 30, awnless, disposed into an umbilicated globe. ♄. S. Native of St. Domingo.—Plum. ed. Burm. 1. t. 2. Flowers yellow.

Spiked-flowered Sida. Shrub 2 feet.

130 S. GA'YA (D. C. prod. 1. p. 466.) leaves nearly elliptical, acute, obliquely cordate, sharply serrated, and are as well as branches white from tomentum; pedicels solitary, 3 times longer than the petioles; carpels 15. ♄. S. Native of Mexico. Gàya hermannioìdes, H. B. et Kunth, nov. gen. 5. p. 268. t. 475. Flowers yellow, about the size of those of *Málva rotundifòlia*. Fruit 15-celled.

Gay's Sida. Shrub 2 feet.

131 S. GAUDICHAUDIA'NA; suffruticose; cauline leaves ovate-oblong, somewhat unequal-sided, cordate at the base, obsoletely serrate-toothed, pubescently-pilose above, but pubescent beneath; branches flattened; peduncles axillary, solitary, 1-flowered; ovary 12-lobed. ♄. S. Native of Brazil in the province of Rio Janeiro. Gàya Gaudichaudiàna, St. Hil. fl. bras. 1. p. 192. Flowers white.

Gaudichaud's Sida. Shrub 1 foot.

132 S. AU'REA; suffruticose; cauline leaves cordate, oblong, acute, obsoletely toothed, tomentose, canescent below; peduncles solitary, axillary, 1-flowered; ovary villous, 12-celled. ♄. S. Native of Brazil in the province of Minas Geraes. Gàya aúrea, St. Hil. fl. bras. 1. p. 193. t. 38. Flowers golden-yellow.

Golden-flowered Sida. Fl. Sept. Oct. Shrub 1 foot.

133 S. CA'NDICANS (D. C. prod. 1. p. 466.) leaves ovate-elliptical, blunt, cordate, crenate-serrate, and are as well as branchlets hoary from tomentum; pedicels solitary, twice or thrice the length of the petioles; carpels 14-15. ♄. S. Native of Quito on the banks of the river Guancabamba. Gàya canéscens, H. B. et Kunth, l. c. p. 269. Flowers yellow.

Whitened-leaved Sida. Shrub 1 foot.

134 S. SUBTRI'LOBA (H. B. et Kunth, nov. gen. 5. p. 270. t. 476. under *Gàya*,) leaves on long stalks, ovate, acuminated, obsoletely 3-lobed, profoundly cordate, clothed with very fine tomentum, hoary beneath; pedicels solitary, when in fruit almost the length of the petioles. Native of New Granada. Resembles *S. occidentàlis*. Flowers yellow.

Subtrilobed-leaved Sida. Shrub 2 feet.

135 S. DI'STICHA (Cav. icon. 5. p. 12. t. 432.) leaves cordate or ovate, acuminated, toothed, hoary-velvety, distich; pedicels solitary, 1-flowered, 4 times longer than the petioles; carpels 10-15, awnless. ♄. S. Native of New Spain. Petals yellow, oblong-ovate, twice as long as the acuminated calyx.

Distich-leaved Sida. Shrub 2 feet.

136 S. NU'TANS (Lher. stirp. 1. p. 119. t. 57.) leaves oblong-cordate, acute, toothed, soft, velvety; pedicels usually in pairs, 1-flowered, hardly twice the length of the petioles; carpels 10, blunt, depressed. ♄. S. Native of Peru in sandy places. S. calyptràta, Cav. diss. 2. p. 57 and 5. t. 133. f. 1. Petals yellow, a little larger than the calyx. Seeds calyptrate.

Nodding-flowered Sida. Shrub 2 feet.

137 S. VISCÒSA (Lin. spec. 963.) leaves ovate, cordate, acuminated, finely serrated, tomentose, viscid; petioles and pedicels hairy; stipulas setaceous; pedicels solitary, longer than the petioles; carpels 7, awnless. ♄. S. Native of Jamaica, St. Thomas, and Porto-Rico.—Sloan. hist. 1. t. 139. f. 4. Bastàrdia viscòsa, H. B. et Kunth, nov. gen. amer. 5. p. 256. Flowers yellow. Capsule 7-celled.

Clammy Sida. Fl. July. Clt. 1795. Shrub 2 to 4 feet.

138 S. NEMORA'LIS; branched; leaves heart-shaped, acuminated, toothed, pubescent above, tomentose beneath; racemes compound, axillary, or terminal, numerous, very slender, few-flowered; capsule orbicular, 9-14-celled, pilose. ♄. S. Native of Brazil in the province of Goyaz. Bastàrdia nemoràlis, St. Hil. fl. bras. 1. p. 195. t. 39. Flowers pinkish.

Grove Sida. Fl. June. Shrub 1 foot.

139 S. BASTA'RDIA (D. C. prod. 1. p. 467.) leaves cordate, roundish-ovate, bluntly acuminated, a little crenated, tomentose from starry down; petioles and pedicels tomentose, rather viscid; carpels 5, awnless. ♄. S. Native of South America on the banks of the river Amazon. Bastárdia parvifòlia, H. B. et Kunth, nov. gen. amer. 5. p. 255. t. 472. Flowers yellow.

Bastard's Sida. Fl. July, Aug. Shrub 1 to 2 feet.

140 S. RETROFRA'CTA (D. C. prod. 1. p. 467.) leaves heart-shaped, acuminated, toothed, and are as well as pedicels tomentose; stipulas setaceous, deflexed; pedicels length of petioles usually broken at the articulation; carpels 7, pubescent, awnless.

ħ. S. Native of Martinico. H. B. et Kunth, t. 476. Calyx with acuminated, spreading, or reflexed lobes. Flowers yellow.

Retrofracted-pedicelled Sida. Shrub 2 feet.

141 S. FŒ'TIDA (Cav. diss. 6. p. 349.) leaves cordate, ovate, acute, toothed, tomentose; petioles and pedicels hairy; stipulas setaceous, somewhat spreading; pedicels one-half shorter than the petioles; carpels 7-8, awnless, collected into a globe. ⊙. S. Native of Peru and Martinico. S. viscòsa, Lher. stirp. 1. p. 52. t. 53. Abùtilon fœ'tidum, Mœnch. Pedicels rising along the stem, which is dark purple. Leaves fetid. Flowers yellow.

Fetid Sida. Fl. July, Aug. Clt. 1795. Pl. 1½ foot.

142 S. BRE'VIPES (D. C. prod. 1. p. 467.) leaves cordate, roundish, acuminated, toothed, velvety-pubescent; petioles and branches covered with spreading hairs; stipulas setaceous, somewhat erect; pedicels 1-2, axillary, 5-times shorter than the petioles; carpels 5-6, awnless. ⊙. S. Native of St. Martha. Very like the preceding. Flowers yellow.

Short-pedicelled-flowered Sida. Fl. July, Aug. Pl. 1 foot.

143 S. MAGDALE'NÆ (D.C. prod. 1. p. 467.) leaves heart-shaped, acuminated, toothletted, and are as well as petioles and branches hoary-velvety; stipulas setaceous, rather erect; pedicels a little shorter than the petioles; carpels 5, awnless, scarcely bladdery; seeds pubescent. ħ. S. Native of South America on the banks of the river Magdalena. Flowers yellow.

Magdalena Sida. Shrub 2 feet.

144 S. DENUDA'TA (Nees and Mart. nov. act. bonn. xi. p. 100.) leaves cordate, roundish, acuminated, doubly crenated, hairy; panicle terminal, naked; calyx hispid; carpels 6-7, mucronated. ħ. S. Native of Brazil at Serra do Mundo novo. Habit of *Abùtilon nudiflòrum*. Flowers yellow.

Naked-panicled Sida. Shrub 2 feet.

SECT. III. MALACROI'DEÆ. Heads of flowers involucrated.

This section of Sida agrees with Malàchra, as it is now constituted. There is much difference of opinion about the character of that genus. According to St. Hilaire, the heads of flowers are involucrated, but the calyx is simple, and the pedicels are bracteate, with 10 *stigmas and 5 separable 2-valved carpels; therefore those species, included in that genus, with a double calyx, belong to Pavònia, such as M. cordàta and M. bracteàta.*

145 S. FU'LVA (St. Hil. fl. bras. 1. p. 176.) stems trailing; leaves elliptical, very blunt, entire at the base, but serrated at the apex, smoothish above, villous beneath; leaflets of involucre elliptical-oblong; carpels mutic. ħ. S. Native of Brazil in the province of Rio Janeiro, by the sea-side. Flowers yellow.

Fulvous Sida. Pl. 1 foot.

146 S. ANO'MALA (St. Hil. fl. bras. 1. p. 177.) stem suffruticose, nearly simple; leaves erect, linear, cordate at the base, and toothed at the apex, smooth above, but pilose and scabrous beneath; petioles recurved and jointed at the apex; leaflets of involucel linear; carpels 8, 2-beaked, wrinkled, and rather muricated. ħ. S. Native of Brazil in the province of Cisplatine. Flowers red.

Anomalous Sida. Shrub ½ foot.

147 S. PLUMÒSA (Cav. diss. 1. t. 12. f. 4. St. Hil. fl. bras. 1. p. 177.) stem suffruticose; leaves elliptical, toothed; heads many-flowered; leaflets of involucre numerous; bracteas ciliately-plumose. ħ. S. Native of Brazil. Malàchra plumòsa, Desrous. in Lam. dict. 3. p. 686. Flowers yellow.

Feathered Sida. Pl. 1 foot.

† *Species not sufficiently known from the structure of the fruit not having been ascertained; but the most of which belong to section Malvínda.*

* *Leaves linear, oblong, ovate or lanceolate.*

148 S. PAUCIFÒLIA (D. C. prod. 1. p. 472.) plant smooth, much branched; leaves linear, entire; pedicels axillary, 1-flowered, shorter than the leaves, with a joint just under the flower, permanent. ħ. S. Native of the island of Timor. A very distinct species, probably allied to *S. linifòlia*.

Few-leaved Sida. Shrub 1 to 2 feet.

149 S. MILLE'RI (D. C. prod. 1. p. 472.) leaves linear-lanceolate, toothed, villous beneath; pedicels axillary, 1-flowered; stem erect, branched. ħ. S. Native of South America. S. angustifòlia, Mill. dict. no. 3. Flowers small, yellow. Carpels bidentate.

Miller's Sida. Fl. July, Aug. Clt. 1749. Shrub 1½ foot.

150 S. FRUTICÒSA (Mill. dict. no. 18.) leaves lanceolate, unequally serrated, acuminate; flowers capitate, terminal; carpels 5, bidentate. ħ. S. Native of Jamaica. Flowers small, pale-sulphur coloured. Perhaps belonging to sect. *Malacroìdeæ*.

Shrubby Sida. Fl. June, July. Clt.? Shrub 6 feet.

151 S.? HI'SPIDA (Pursh. fl. amer. sept. 2. p. 452.) plant clothed with hispid hairs; leaves lanceolate, serrated; pedicels solitary, axillary, length of leaves; involucel filiform. ♃. G. Native of North America in sandy plains of Georgia. Flowers yellow. This is perhaps a species of *Málva*.

Hispid Sida. Pl. 1 foot.

152 S. VIMI'NEA (Fisch. in Link. enum. berl. 2. p. 202.) leaves lanceolate, very long, and very entire, pilose; racemes terminal, very short. ♃. S. Native of Brazil. Stems erect, and are as well as calyx strigose. Corolla larger than the calyx, with an orange base.

Twiggy Sida. Fl. July. Clt. 1824. Pl. 1 foot.

153 S. SEMICRENA'TA (Link. l. c.) leaves broadly lanceolate, obtuse, crenated, quite entire at the base, 3-nerved, younger ones tomentose beneath; peduncles axillary, 1-flowered; segments of the calyx with long points. ♃. S. Native of Manilla. Stem erect, smooth. Calyx somewhat tomentose. Corolla yellow, a little larger than the calyx.

Half-crenated-leaved Sida. Fl. July, Sep. Clt. 1823. Pl. 1½ foot.

154 S. ACRA'NTHA (Link. l. c.) middle leaves oblong, obtuse, acutely crenated in front, upper ones lanceolate, acute, serrated in front; flowers terminal, almost sessile. ħ. S. Native of Brazil. Stem erect. Corolla yellow, a little larger than the acuminate hairy calyx.

Pointed-flowered Sida. Fl. July. Clt. 1820. Shrub 3 feet.

155 S. SPIRÆIFO'LIA (Willd. enum. suppl. 49. Link. enum. 2. p. 203.) leaves oblong-lanceolate, serrated, quite entire at the base, smooth; peduncles axillary, solitary, longer than the petioles; calyx smooth, with acuminate segments. ħ. S. Native of? Corolla yellow, a little larger than the calyx. Carpels 2-beaked.

Spiræa-leaved Sida. Fl. Aug. Sep. Clt. 1824. Shrub 2 ft.

156 S. SCHRA'NKII (D. C. prod. 1. p. 473.) leaves oblong-lanceolate, serrated, very entire at the base, rather tomentose beneath; peduncles crowded on the branchlets; calyx rather tomentose, with acute segments. ♃. S. Native of Brazil. Resembles *S. spiræifòlia*. S. Brasíla, Schrank. in Link. enum. hort. berl. 2. p. 203. but not of Cav. Flowers yellow.

Schrank's Sida. Fl. July, Aug. Pl. 1 foot.

157 S. BETULI'NA (Horn. hort. hafn. 2. p. 646.) leaves ovate-oblong, somewhat doubly serrated, quite entire at the base; peduncles axillary, many-flowered. ħ ? S. Native of South America? Flowers yellow.

Birch-like Sida. Fl. July, Aug. Clt. 1820. Pl. 2 feet.

158 S. PA'TULA (Pers. ench. 2. p. 243.) plant herbaceous, spreading, flexuous; leaves on short stalks, ovate, somewhat crenate, clothed with very soft down; flowers axillary, sessile. ⊙. S. Native of Cayenne. S. móllis, Rich. act. soc. h. nat. par. Flowers white.

Spreading Sida. Pl. 1 foot.

159 S. BRASILIE'NSIS (Cav. diss. 1. p. 37. t. 34. f. 1.) leaves ovate, acuminate, 5-nerved, hardly toothletted, tomentose beneath, as well as the branches; stipulas filiform; pedicels 1-flowered, equal in length with the petioles; capsules hairy. ♂. S. Native of Brazil. Schrad. ill. pl. bras. in Gœt. anz. Flowers yellow?

Brazilian Sida. Fl. July, Sep. Clt. 1818. Pl. 2 feet?

* * *Leaves cordate, undivided.*

160 S. GRA'CILIS (Rich. act. soc. nat. par. p. 111.) leaves oblong, cordate, quite entire, tapering to the base, reflexed; branchlets with fascicles of flowers; stem shrubby, brittle. ♄. S. Native of Antilles. Flowers yellow?

Slender Sida. Fl. July, Aug. Shrub.

161 S. CA'RNEA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 473.) leaves ovate-oblong, somewhat cordate, toothed, acute; pedicels solitary, axillary, longer than the petioles; carpels 5, distinct. ♄. S. Native of Mexico. Stem very much branched. Flowers small, flesh-coloured. Stigmas purple.

Flesh-coloured-flowered Sida. Pl. 2 feet?

162 S. VILLO'SA (Mill. dict. no. 6.) leaves somewhat cordate, sessile, serrated, rather villous; flowers axillary, crowded; carpels bidentate. ♄. S. Native of South America. An erect hairy shrub, with pale-yellow flowers.

Villous Sida. Fl. July, Aug. Clt. 1739. Shrub 3 feet.

163 S. VERRUCULA'TA (D. C. prod. 1. p. 473.) stem warty-pubescent; leaves cordate, lanceolate, acuminate, acutely crenate, pubescent; pedicels axillary, 1-flowered, filiform, a little longer than the petioles. ♄. S. Native of Brazil. S. argùta, Fisch. in Link. enum. hort. berl. 2. p. 206. but not of Swartz. Petals yellow, a little larger than the calyx.

Warted-stemmed Sida. Fl. July, Aug. Clt. 1822. Shrub 3 ft.

164 S. GRAVE'OLENS (Roxb. ex Horn. hafn. suppl. 77.) leaves roundish, cordate, somewhat acuminated; peduncles shorter than the petioles; carpels truncate, longer than the calyx. ⊙. S. Native of the East Indies. Flowers yellow.

Strong-scented Sida. Pl. $1\frac{1}{2}$ foot.

165 S. PURPURA'SCENS (Link. enum. hort. berl. 2. p. 206.) leaves cordate, acuminate, crenately-denticulate, and are as well as stems clothed with green down; pedicels axillary, 1-flowered, a little longer than the petioles. ♄. S. Native of Brazil. Petioles long, nevertheless they are shorter than the limbs of the leaves. Nerves yellowish on the under side of the leaf. Petals with narrow claws, purplish.

Purplish Sida. Fl. July, Aug. Clt. 1822. Shrub 1 to 3 ft.

166 S. PA'TENS (Andr. bot. rep. 571.) leaves cordate, acuminate, deeply serrate; peduncles solitary, longer than the petioles; carpels 5, awned. ♄. S. Native of Abyssinia. Flowers yellow. Carpels 4-5 seeded. A species of *Abùtilon*.

Open Sida. Fl. July, Sep. Clt. 1806. Pl. 4 feet.

167 S. CONTRA'CTA (Link. enum. hort. berl. 2. p. 204.) leaves cordate, acuminate, repand, rarely crenate, hoary from down; panicle contracted, bracteolate; calyxes tomentose. ♄. S. Native of Madagascar. Flowers yellow?

Contracted-panicled Sida. Fl. July, Sep. Clt. 1823. Shrub.

168 S. CONFE'RTA (Link. l. c. p. 207.) leaves cordate, acute, crenate, wrinkled, and are as well as stems clothed with yellow down; flowers almost sessile, aggregate. ♄. S. Native of Brazil. Corolla obscurely yellow, a little longer than the calyx. Calyx tomentose.

Crowded-flowered Sida. Fl. July, Sep. Clt. 1822. Shrub 1 to 3 feet.

169 S. HIRSU'TA (Mill. dict. no. 9.) leaves orbicular, cordate, crenate; stem and petioles hairy; peduncles long, axillary, 1-flowered.—Native of? Flowers small, yellow.

Hairy Sida. Pl. $1\frac{1}{2}$ foot.

170 S. SESSILIFLÒRA; erect, pilose; leaves roundish, cordate, acuminated, crenate, on long petioles; flowers axillary, and terminal, racemose, almost sessile. ♄. S. Native of Guinea.

Sessile-flowered Sida. Shrub 1 to 2 feet.

171 S. DE'BILIS; plant pilose; stem weak, simple; leaves roundish-cordate, acuminated, unequally serrated on long petioles; pedicels solitary, 1-flowered, short. ♄. S. Native of Guinea.

Weak Sida. Shrub 1 foot.

172 S. STELLA'TA; erect, branched; leaves roundish, cordate, acuminated, entire, tomentose beneath; panicle terminal; carpels 4-5, awnless. ♄. S. Native of Guinea.

Stellate-carpelled Sida. Shrub 1 foot.

173 S. PE'RSICA (Burm. ind. t. 47. f. 1.) lower leaves stalked, cordate, acuminate, upper ones sessile, lanceolate, toothed; pedicels solitary, 1-flowered. ⊙? H. Native of Persia. Cav. diss. 1. p. 35. t. 4. f. 1. Flowers yellow.

Persian Sida. Pl. 1 foot.

174 S. LASIOSTE'GA (Link. enum. hort. berl. 2. p. 205.) leaves cordate, acuminate, hoary from tomentum beneath; pedicels axillary, 1-flowered, longer than the petioles; calyxes and capsules awnless, downy-villous. ♄. S. Native of Brazil. Stem round, hoary from down. Corolla yellow, a little larger than the calyx.

Hairy-covered Sida. Fl. Aug. Sep. Clt. 1824. Shrub 2 ft.

* * * *Leaves cordate, tricuspidate or 3-lobed.*

175 S. BIFLÒRA (Cav. diss. 1. p. 37. t. 9. f. 1.) leaves ovate, cordate, acuminate, toothed, tricuspidate; peduncles twin, axillary, equal in length to the petioles. ♄. S. Native of? Flowers yellow.

Two-flowered Sida. Shrub.

176 S. PENTACA'RPOS (Roxb. ex horn. suppl. 78.) leaves cordate, somewhat tricuspidate; peduncles length of petioles; carpels awnless, very hispid. ⊙. S. Native of the East Indies. Flowers probably yellow.

Five-fruited Sida. Fl. July, Aug. Clt. 1620. Pl. 1 foot.

177 S. SESSE'I (Lag. nov. gen. 21.) leaves cordate, ovate, somewhat 3-lobed, acuminate, toothed, downy beneath; peduncles axillary, solitary, and in pairs, longer than the petiole, usually 2-flowered; carpels 5. ♄. S. Native of New Spain.

Sesse's Sida. Shrub 1 to 3 feet.

* * * * *Leaves palmately lobed.*

178 S. GERANIÒIDES (D. C. prod. 1. p. 474.) leaves hoary with down beneath, velvety above, palmately 5-lobed; lobes deeply-toothed, middle one elongated; pedicels axillary, solitary, 1-flowered, length of petioles; calyx tomentose, campanulate, truncate, with 5-6 blunt teeth. ♄. G. Native of New Holland. Petals twice as long as the calyx. Perhaps a species of *Lagunæ'a*.

Geranium-like Sida. Shrub.

179 S. ALCÆOÌDES (Mich. fl. bor. amer. 2. p. 44.) lower leaves triangular, cordate, cut, upper ones palmately multifid; corymb terminal; calyx hispid. ♃. H. Native of North America in stony fields of Kentucky and Tennassee, &c. Resembles in habit *Málva alcèa*.

Alcea-like Sida. Fl. July, Aug. Pl. 4 feet?

180 S. PHYLLA'NTHUS (Cav. diss. 5. p. 276. t. 127.) plant stemless; leaves 3-parted, with sessile, 3-parted, wedge-shaped, blunt, very entire segments; flowers solitary, inserted on the winged petioles; carpels 12. ♃. S. Native of Peru. Leaves downy, rufescent beneath. Flower large, blue or pale-violet. H. B. Kunth, nov. gen. et spec. amer. 5. p. 264. This is a very singular species.

Leaf-flowered Sida. Pl. $\frac{1}{2}$ foot.

† *Species the names of which are only known. Natives of the East Indies. S. glutinòsa, and S. cuneifòlia, Roxb.*

Cult. The species of this genus are free flowering plants of no great beauty, therefore they are hardly worth cultivating, except in botanical gardens. They are increased by seed, which they usually produce in abundance, or by cuttings in sand, under a hand-glass. Most of them require the heat of a stove. The hardy perennial species are easily increased by dividing the plants at the root in spring. Those belonging to section *Malvínda*, division *Pinnatilobàtæ*, are very singular plants, chiefly natives of Chili and Peru; none of these have yet been introduced to the gardens.

XXVIII. ABU'TILON (*αβυτιλον* is the Greek name for the mulberry tree; resemblance in the shape of the leaves). Kunth, malv. p. 4. Sìda, sect. 3. Abùtilon, D. C. prod. 1. p. 467.

Lin. syst. *Monadélphia, Polyándria.* Calyx naked, 5-cleft, usually angular. Style multifid at apex. Carpels capsular, usually bladdery, 5-30, in a whorl around the central axis, 1-celled, 3 or many-seeded, connected so closely together as to form a many-celled capsule, mutic or awned at the apex. This genus has been divided from *Sìda*, we shall therefore retain the authorities for the species under that genus.

* *Oligocárpæ. Carpels or cells 5 to 8.*

1 A. periplocifòlium (Lin. spec. 962. under *Sìda.*) leaves cordate, lanceolate, acuminated, quite entire. tomentose beneath; pedicels panicled, very slender, longer than the petioles, jointed under the flower; carpels 5, ovate, acuminated, 3-seeded. ⊙. S. Cav. diss. 1. p. 26. t. 5. f. 2. Flowers pale-yellow, sometimes light-purple.

Var. α, Zeylánicum (D. C. prod. 1. p. 467.) leaves narrow, rather scabrous above. Native of Ceylon.—Pluk. t. 74. f. 7. —Dill. elth. 1. t. 3. f. 2.

Var. β, Caribæ'um (D. C. prod. 1. p. 468.) leaves evidently cordate, somewhat wrinkled and smooth above. Native of Jamaica. Sloan. hist. 1. t. 139. f. 2.

Var. γ, Peruviànum (D. C. prod. 1. p. 468.) leaves evidently cordate, whitish velvety above; pedicels simple, shorter than the leaves. Native of Peru. Perhaps a distinct species.

Periploca-leaved Abutilon. Fl. July, Aug. Clt. 1691. Pl. 2 to 4 feet.

2 A. ferrugi'neum (H. B. et Kunth, nov. gen. amer. 5. p. 271.) leaves ovate, somewhat cordate, acuminated, tomentose, quite entire; pedicels simple, 1-flowered, shorter than the leaves, jointed in the middle; carpels 5, beaked, 3-seeded. ♄. S. Native of Peru near Loxa. Resembles S. periplocifòlia. Sìda ferrugínea, D. C. prod. 1. p. 460. Flowers yellow.

Rusty Abutilon. Fl. July, Aug. Clt. 1822. Shrub 3 feet.

3 A. exce'lsior (Cav. diss. 1. p. 27. t. 5. f. 3. under *Sìda,*) leaves cordate, ovate, acuminated, quite entire, yellowish and tomentose beneath; racemes panicled; carpels 5, bidentate, 3-seeded. ♄. S. Native of Peru. Flowers yellow.

Taller Abutilon. Tree 14 feet.

4 A. hernandioìdes (Lher. stirp. 1. p. 121. t. 58. under *Sìda,*) leaves somewhat peltate, cordate, ovate, acuminated, almost entire, pubescent; pedicels 1-flowered, shorter than the petioles; carpels 5, awnless. ♄. S. Native of Hispaniola. Flowers yellow.

Hernandia-like Abutilon. Fl.? Clt. 1798. Shrub 2 to 5 ft.

5 A. Lucia'num (D. C. prod. 1. p. 468. under *Sìda,*) leaves cordate, ovate-roundish, acuminated, almost entire, rather velvety above, hoary from tomentum beneath; peduncles branched, very short, disposed in an interrupted panicle; carpels 5, somewhat inflated, bidentate. Native of the Island of St. Lucia. Flowers white.

St. Lucia Abutilon. Fl. July, Aug. Clt. 1810. Sh. 2 ft.

6 A. Sunda'icum (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 652. under *Sìda,*) leaves profoundly-cordate, roundish, acuminated, grossly toothed, velvety above, hoary-tomentose beneath; flowers racemosely panicled; carpels 5, awnless; stipulas setaceous. ♄. S. Native of Java. Flowers yellow. Like *A. Luciànum.* Sìda Sundénsis, Spreng. syst. app. p. 259.

Sunda Abutilon. Shrub 1 to 2 feet.

7 A. spica'tum (H. B. et Kunth, nov. gen. amer. 5. p. 271.) leaves cordate, somewhat orbicular, much pointed, somewhat crenulated, pubescent, hoary beneath; spikes terminal, slender; flowers fascicled, usually pentagynous. ♄. S. Native of Guiana near St. Carlos del Rio Negro. Branches hoary. Flowers decandrous, about the size of those of *Gerànium parviflòrum.* Sìda spiciflòra, D. C. prod. 4. p. 468. Cells of capsule 3-seeded.

Spiked-flowered Abutilon. Sh. 2 feet.

8 A. pa'tens (St. Hil. fl. bras. 1. p. 200.) stem suffruticose, terete, branched, tomentose; leaves cordate at the base, ovate-lanceolate, entire, green, and smooth above, but hoary-tomentose beneath; panicle many-flowered; capsule inflated, smoothish, tubercled, 5-beaked, 5-celled; cells 3-seeded. ♄. S. Native of Brazil in the province of Rio Janeiro. Flowers golden yellow. This is rather an elegant plant.

Spreading Abutilon. Shrub 3 to 4 feet.

9 A. parviflòrum (St. Hil. fl. bras. 1. p. 201.) branches suffruticose, terete, twiggy, tomentose; leaves cordate, acuminated, entire green and smoothish above, but hoary-tomentose beneath; panicle few-flowered; capsule inflated, puberulous, 5-beaked, 5-celled; cells 3-seeded. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers white and yellow.

Small-flowered Abutilon. Fl. April. Shrub 1 to 2 feet.

10 A. Lechenaultia'num (D. C. prod. 1. p. 468. under *Sìda,*) leaves cordate, roundish, acuminated, quite entire, velvety above, hoary beneath; pedicels many-flowered, axillary, length of petioles, ultimate ones disposed in a racemose panicle; petals obcordate; carpels 5, somewhat bidentate. ♄. S. Native of the East Indies. Flowers yellow.

Lechenault's Abutilon. Fl. Jul. Aug. Clt. 1820. Pl. 2 to 4 ft?

11 A. nudiflòrum (Lher. stirp. 1. p. 123. t. 59. under *Sìda,*) leaves roundish, cordate, acuminated, almost entire, tomentose beneath; panicle terminal, racemose; carpels 5-7, somewhat bidentate, 3-seeded. ♄. S. Native of St. Domingo. S. stellàta, Cav. diss. 1. t. 5. f. 4.—Plum. spec. t. 3. Flowers large, yellow. This is an elegant species.

Naked-flowered Abutilon. Fl. May, June. Clt. 1731. Shrub 4 feet.

12 A. polya'ndrum (Schlecht. in Link, enum. hort. berl, 2. p. 264. under *Sìda,*) leaves cordate, short-pointed, rather crenulated, downy, green; panicle leafless. ♄. S. Native of? Resembles *A. nudiflòrum.* Flowers small, deep yellow.

Polyandrous Abutilon. Fl. May, June. Clt. 1821. Sh. 3 ft.

13 A. aurìtum (Wall. in Link, enum. hort. 2. p. 206. under *Sìda,*) leaves profoundly cordate, with a narrow recess; acuminated, toothletted, pilose above, hoary beneath; stipulas broad, cordate, eared, acuminated; flowers disposed in corymbose panicles; tube of stamens very villous; carpels 5, hairy. ♄. S. Native of Bengal. Flowers yellow?

Eared-stipuled Abutilon. Fl. May, Ju. Clt. 1823. Sh. 4 ft.

14 A. Timorie'nse (D. C. prod. 1. p. 468. under *Sìda,*) leaves cordate, roundish, acuminated, somewhat crenate, white-velvety; panicle terminal, loose; carpels 5-6, oblong, hispid. Native of the Island of Timor. Flowers yellow?

Timor Abutilon. Shrub 3 feet.

15 A. tri'quetrum (Lin. spec. 962.) leaves cordate, acuminate, serrulated, white-velvety; pedicels solitary, 1-flowered; carpels 5, awnless, 3-seeded; branches triangular. ♄. S. Na-

tive of South America. Cav. diss. 1. t. 5. f. 1. S. trisulcàta, Jacq. amer. 195. Schœnbr. t. 118.—Gærtn. fruct. 2. t. 134. According to Kunth this is the type of a separate genus. Flowers yellow with a purple bottom.

Triangular-branched Abutilon. Fl. July, Aug. Clt. 1775. Shrub 3 feet.

16 A. INCA'NUM (Link. enum. hort. berl. 2. p. 204. under *Sìda*,) leaves hoary with tomentum, cordate, somewhat acuminated, acutely crenulated; pedicels 1-flowered, longer than the petioles; calyxes and capsules tomentose. ♄. S. Native of the Sandwich Islands. Stems somewhat triangular. Flowers yellow, a little longer than those of *S. triquetra*.

Hoary-leaved Abutilon. Fl. July, Aug. Clt. 1818. Shrub 3 feet.

17 A. INÆQUILA'TERUM (St. Hil. fl. bras. 1. p. 198. t. 40.) leaves ovate-oblong, cordate at the base, unequal-sided, with a short acumen, unequally serrately-ciliated, pilose above, somewhat tomentose beneath; peduncles axillary, solitary, 1-flowered; capsule 8-celled; cells 3-seeded. ♄. S. Native of Brazil in the provinces of Minas Geraes and Rio Janeiro. Flowers golden-yellow.

Unequal-sided-leaved Abutilon. Fl. Feb. Shrub 2 feet.

18 A. GLECHOMÆFÒLIUM (St. Hil. fl. bras. 1. p. 198. t. 411.) stems numerous, terete, prostrate, puberulous; leaves cordate at the base, roundish, crenated, puberulous; flowers axillary, solitary; capsule 3-5-celled, terminated by as many points; cells 3-seeded. ♄. S. Native of Brazil in the province of Cisplatine. Flowers pinkish.

Ground-ivy-leaved Abutilon. Fl. Nov. Jan. Shrub 3 to 5 ft.

19 A. RAMIFLÒRUM (St. Hil. fl. bras. 1. p. 199.) stem simple, suffruticose, profoundly furrowed, densely tomentose; leaves cordate, acuminated, nearly entire, velvety-tomentose; flowers panicled; capsule hispid, clammy, 5-6-celled; cells 3-seeded. ♄. S. Native of Brazil in the provinces of Minas Geraes and Minas Novas. Flowers yellow.

Branch-flowered Abutilon. Shrub 5 to 6 feet.

20 A. LEUCA'NTHEMUM (St. Hil. fl. bras. 1. p. 200.) stem suffruticose, angular, pubescent; leaves cordate, acuminated, quite entire, pubescent; flowers disposed in few-flowered racemes; capsule puberulous, 5-celled, 5-beaked; cells 3-seeded. ♄. S. Native of Brazil in the province of Rio Janeiro. Flowers white.

White-flowered Abutilon. Fl. Aug. Shrub 2 feet.

21 A. PULCHE'LLUM (Bonpl. nav. t. 2. under *Sìda*,) leaves cordate, ovate-lanceolate, coarsely and unequally crenated, somewhat downy beneath from starry pubescence, scabrous above; racemes axillary, few-flowered, longer than the petioles; carpels 5, 2-awned, 2-3-seeded. ♄. S. Native of New Holland. Hook. bot. mag. t. 2753. Flowers white. Carpels 2-seeded. The plant figured in Bot. Mag. may be a distinct species, the racemes being much shorter than the petioles, and the carpels not evidently 2-awned.

Neat Abutilon. Fl. July, Aug. Clt. 1824. Shrub 2 feet.

22 A. LIGNÒSUM (Cav. diss. 1. p. 28. t. 6. f. 2. under *Sìda*,) leaves roundish, cordate, acuminate, crenate, tomentose; pedicels solitary, longer than the petioles; carpels 7-8, awnless, 3-seeded, very hard. ♄. S. Native of St. Domingo. Flowers yellow. Stem hard.

Woody-fruited Abutilon. Shrub 3 feet.

23 A. OBTU'SUM (Cav. diss. 1. p. 34. t. 9. f. 2. under *Sìda*,) leaves cordate, ovate, obtuse, toothed, tricuspidate; peduncles usually 4-flowered, umbellate, longer than the petioles; carpels 8-10, acute, 3-seeded. ♄. S. Native of? Flowers pale-yellow.

Blunt-leaved Abutilon. Shrub 3 feet.

24 A. RAMÒSUM (Cav. diss. 1. p. 28. t. 6. f. 1. under *Sìda*,) leaves ovate, cordate, unequally and deeply toothed; peduncles axillary, 4-6-flowered; carpels 5-6, 2-awned, 3-seeded. Native of Senegal and other parts of Guinea. S. Africàna, Beauv. fl. d. ow. 2. t. 116. Flowers yellow.

Branched Abutilon. Fl. July. Shrub 2 to 4 feet.

25 A. UMBELLA'TUM (Lin. spec. 962. under *Sìda*,) leaves roundish, cordate, toothed, rather angular, acuminate; peduncles usually 4-flowered, umbellate, axillary; carpels 6-11, 2-awned, 3-seeded. ⊙. S. Native of Jamaica. Jacq. hort. vind. t. 56. Cav. diss, 1. t. 6. f. 3. and 5. t. 129. f. 2. Flowers yellow. Peduncles somewhat 6-7-flowered.

Umbellate-flowered Abutilon. Fl. July, Sept. Clt. 1788. Pl. 1½ foot.

26 A. GIGANTE'UM (Jacq. Schœnbr. 2. p. 8. t. 141. under *Sìda*,) leaves roundish, cordate, crenate, tricuspidate, white and velvety on both surfaces; flowers racemose; corollas reflexed; carpels 5, many-seeded, villous. ♄. S. Native of Caraccas. Carpels 8-12, according to Jacquin. Flowers yellow.

Giant Abutilon. Fl. July, Aug. Clt. 1820. Shrub 10 ft.

27 A. E'LEGANS (St. Hil. fl. bras. 1. p. 207.) stem hairy; leaves oblong, cordate, acuminated, unequally toothed, velvety-tomentose beneath and hoary; pedicels axillary, twin, hairy; ovary 8-celled; cells 4-9-seeded. ♄. S. Native of Brazil in the provinces of Rio Janeiro and Minas Geraes. Flowers red?

Elegant Abutilon. Shrub 2 to 4 feet.

* * *Polycárpæ. Carpels or cells 9 or more.*

28 A. REFLE'XUM (Cav. diss. 1. p. 36. t. 7. and 6. t. 195. f. 1. under *Sìda*,) leaves roundish, cordate, acuminate, crenate, tomentose; pedicels solitary, longer than the petioles; petals wedge-shaped, toothed at the apex, reflexed; carpels 12, 3-seeded. ♄. S. Native of Peru in sandy places. S. retrórsa, Lher. stirp. 1. t. 64. Flowers large, scarlet, with a dusky spot at the base of each petal.

Reflexed-petalled Abutilon. Fl. July, Aug. Clt. 1799. Sh. 4 ft.

29 A. PEDUNCULA'RE (H. B. et Kunth, nov. gen. amer. 5. p. 273.) leaves roundish-ovate, acuminate, profoundly cordate, repandly-toothed, hairy above, hoary from soft tomentum beneath; pedicels solitary, very long; petals oblong-spatulate, reflexed; carpels about 20, 3-4-seeded. ♄. S. Native of South America in shady places on the banks of the river Amazon. Sìda pedunculàris, D. C. prod. 1. p. 469. Flowers purple.

Long flower-*stalked* Abutilon. Shrub 4 feet.

30 A. MICROSPE'RMUM (Cav. diss. 1. p. 29. t. 13. f. 4. under *Sìda*,) leaves roundish, cordate, acute, rather crenate; pedicels solitary, shorter than the petioles; carpels 12-13, 2-3-seeded, each ending in two fringed beaks. ♄. S. Native of? Flowers yellow. Seeds very small.

Small-seeded Abutilon. Shrub 2 feet.

31 A. UMBELLI'FERUM (St. Hil. fl. bras. 1. p. 204.) stem suffruticose, terete, densely tomentose; leaves cordate at the base, abruptly acuminated, velvety-pubescent above, but hoary and tomentose beneath; flowers in umbels on the tops of long peduncles; capsule villous, 12-13-celled, with an equal number of beaks; cells 3-seeded. ♄. S. Native of Brazil in the province of Rio Grande do Sul. Flowers pinkish.

Umbelliferous Abutilon. Shrub 7 to 8 feet.

32 A. ESCULE'NTUM (St. Hil. fl. bras. 1. p. 204.) stem shrubby, terete, tomentose with grey hairs; leaves cordate, acuminated, toothed, puberulous above, and tomentose beneath; flowers axillary, solitary; cells of capsule 3-seeded. ♄. S. Native of Brazil in the province of Rio Janeiro, where it is called *Bencao de Deos*, and where the inhabitants dress and eat the flowers with their viands. Flowers purple. St. Hil. pl. us. bras. no. 51.

Esculent-flowered Abutilon. Fl. Sept. Shrub 7 to 8 feet.

33 A. CA'RNEUM (St. Hil. fl. bras. 1. p. 205.) stem suffruticose, terete, tomentose from rufescent hairs; leaves cordate,

acuminated, toothed, puberulous above, but clothed with white tomentum beneath; flowers solitary, terminal; capsule tomentose, 10-horned, 10-celled; cells 4-9-seeded. ♄. S. Native of Brazil in the province of Rio Janeiro. Flowers flesh-coloured.

Flesh-coloured-flowered Abutilon. Fl. Sept. Shrub 1 to 3 ft.

34 A. IMBE'RBE (D.C. prod. 1. p. 469. under *Sìda*,) leaves cordate, acute, crenulate, white and velvety on both surfaces, upper leaves almost sessile; pedicels solitary, 3-times longer than the petioles; carpels 12-13, a little inflated, rather scabrous, or ciliated, awnless. Native of Guadaloupe and St. Domingo. Resembles *A. crìspum*, Lin. Flowers yellow.

Beardless Abutilon. Shrub 2 feet.

35 A. RUFE'SCENS (St. Hil. fl. bras. 1. p. 205. t. 42.) stem shrubby, tomentose, rusty; leaves ovate-lanceolate, obtuse at the base, acuminated at the apex, toothed, smooth above, tomentose beneath; flowers corymbose; capsule subglobose, very villous, mutic, 13-16-celled; cells 4-9-seeded. ♄. S. Native of Brazil. Flowers yellow.

Var. β, confértum (St. Hil. l. c. p. 206.) leaves lanceolate, sublinear, more crowded and smooth than in var. α. Brazil at Villa Rica.

Rufescent Abutilon. Shrub 2 to 4 feet.

36 A. CRI'SPUM (Lin. spec. 964. under *Sìda*,) leaves cordate, acuminate, crenated, rather tomentose, upper ones sessile; pedicels solitary, longer than the petioles, when in fruit deflexed; carpels 12-13, 3-seeded, inflated, awnless, undulately-curled with a hairy keel. ⊙. S. Native of Carolina, New Spain, Providence, Bahama Islands and Peru by the sea-coast.—Dill. elth. t. 5. f. 5.—Cav. diss. 1. p. 30. t. 7. f. 1. and 5. t. 135. f. 2. S. amplexicaúlis, Lam. dict. 1. p. 7. Flowers white, small.

Curled-fruited Abutilon. Fl. July, Aug. Clt. 1726. Pl. 1 ft.

37 A. AMPLEXIFÒLIUM (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 469. under *Sìda*,) leaves cordate, acuminate, crenated, upper ones sessile, stem-clasping; panicle terminal, many-flowered. ♃. S. Native of Mexico. Flowers yellow. Fruit-bearing pedicels erect.

Clasping-leaved Abutilon. Pl. 1 foot.

38 A. RIVULA'RE (St. Hil. fl. bras. 1. p. 202.) stem suffruticose, terete, tomentose; leaves cordate, oblong, obtuse, toothed, tomentose; flowers umbellate; capsule very villous, mutic, 10-12-celled; cells 3-seeded. ♄. S. Native of Brazil in the province of Cisplatine on the banks of a rivulet called Rio del Samé. Flowers red.

Rivulet Abutilon. Fl. Dec. Shrub 3 to 4 feet.

39 A. VIRGA'TUM (Cav. icon. 1. p. 53. t. 73. under *Sìda*,) leaves cordate, ovate, acuminated, serrated, puberulous; pedicels solitary, longer than the petioles; petals shorter than the calyx; carpels 7-9, 2-awned, 3-seeded. ♄. S. Native of Peru. Flowers yellow.

Twiggy Abutilon. Fl. July, Aug. Clt. 1818. Shrub 3 ft.

40 A. MICRA'NTHUM (St. Hil. fl. bras. 1. p. 208.) leaves cordate, acuminated, toothed, tomentose beneath; flowers large, racemosely-glomerated; capsule globose, mutic, very villous, 12-celled; cells 4-9-seeded. ♄. S. Native of Brazil.

Small-flowered Abutilon. Shrub 2 to 6 feet.

41 A. ARBÒREUM (Lin. fil. suppl. 397. Lher. stirp. p. 131. t. 63. under *Sìda*,) leaves orbicular, cordate, acuminate, crenated, tomentose; stipulas ciliated; pedicels longer than the leaves; carpels 13-15, truncate, villous, 5-seeded. ♄. S. Native of Peru. S. Peruviàna, Cav. diss. 1. p. 36. t. 7. f. 8. and 5. t. 130. S. grandifòlia, Poir. suppl. 1. p. 31. Flowers large, sulphur-coloured, or nearly white.

Tree Abutilon. Fl. July, Aug. Clt. 1772. Tree 12 feet.

42 A. MONTA'NUM (St. Hil. fl. bras. 1. p. 207.) stem shrubby, terete, branched, pubescent; leaves cordate, acuminated, serrate, puberulous above, tomentose, and much paler beneath; flowers axillary, solitary, and twin; capsule villous, mutic, 10-celled; cells 4-9-seeded. ♄. S. Native of Brazil in the provinces of Rio Janeiro and Minas Geraes. Flowers purple.

Mountain Abutilon. Shrub 4 to 6 feet.

43 A. MAURITIA'NUM (Jacq. icon. rar. 1. t. 137. under *Sìda*,) leaves roundish, cordate, acuminate, toothed, tomentose beneath; pedicels longer than the petioles; carpels 30, 3-seeded, truncated, beaked, villous, longer than the calyx. ♄. S. Native of the Mauritius. S. planiflòra, Cav. diss. 1. p. 32. t. 7. f. 4. and 5. t. 135. f. 1. Flowers orange-coloured.

Mauritian Abutilon. Fl. July, Sept. Clt. 1789. Sh. 3 ft.

44 A. ATROPURPU'REUM (Blum. bijdr. ex Schlecht. Linnæa, 1. p. 652. under *Sìda*,) leaves orbicularly-cordate, acuminated, unequally crenate, pubescent above from simple and stellate hairs, tomentose beneath; stipulas leafy, unequally cordate; panicle terminal; pedicels much shorter than the petioles; carpels about 10, truncate, acuminated, longer than the calyx. ♄. S. Native of Java. Flowers dark-purple.

Dark-purple-flowered Abutilon. Shrub 2 to 3 feet.

45 A. GLOBIFLÒRUM (Hook, bot. mag. 2821. under *Sìda*,) smooth; leaves on long stalks, cordate, serrated, tapering much at the apex and entire; peduncles solitary, length of petioles; calyx truncate at the base; corolla subglobose. ♄. S. Native of the Mauritius. Stamens collected into a globe at the top of the tube, exserted beyond the corolla. Style tipped by 10 capitate stigmas. Carpels 10. Flowers large, globose, cream-coloured. This is certainly a species of *Periptera*, or a new genus.

Globe-flowered Abutilon. Fl. Nov. Clt. 1825. Sh. 4 to 5 ft.

46 A. TILIÆFÒLIUM (Fisch. cat. hort. goren. 1808. D. C. prod. 1. p. 470. under *Sìda*,) leaves roundish, cordate, with a broad recess, acuminate, toothed, soft, pubescent; pedicels shorter than the petioles; carpels 15, hairy, 2-awned. ⊙. G. Native of China and Thibet. Willd. enum. 722. Jacq. fil. eccl. 1. f. 35. Flowers yellow. Leaves large.

Lime-tree-leaved Abutilon. Fl. July, Aug. Clt. 1821. Pl. 2 feet.

47 A. MU'TICUM (Delil. ill. æg. no. 633. under *Sìda*,) leaves orbicular, cordate, somewhat acuminated, coarsely toothed, clothed with soft tomentum on both surfaces; pedicels shorter than the petioles; carpels 25-30, hairy, awnless, scarcely longer than the calyx. Native of Upper Egypt. Flowers yellow.

Awnless-capsuled Abutilon. Pl. 1 foot.

48 A. CIRCINNA'TUM (Willd. herb. ex Spreng. syst. 3. p. 119. under *Sìda*,) shrubby; leaves roundish, cordate, acutish, nearly entire, tomentose; peduncles 1-flowered, elongated; capsule bladdery. ♄. S. Native of South America near the river Amazon. Flowers probably yellow.

Circinnate-leaved Abutilon. Shrub 1 to 3 feet.

49 A. SPECIÒSUM (Willd. herb. ex Spreng. syst. 3. p. 119. under *Sìda*,) shrubby; leaves cordate, acuminated, crenately-serrate, stellately-tomentose; stipulas obsolete; peduncles twin, elongated, 1-flowered; carpels mutic. ♄. S. Native of Brazil and Cumana. Flowers rose-coloured. Perhaps a species of *Sìda*.

Shewy Abutilon. Shrub 4 feet?

50 A. AMERICA'NUM (Lin. spec. 963. under *Sìda*,) leaves cordate, oblong, undivided, tomentose; pedicels shorter than the leaves; carpels 12, tomentose, acuminated, length of the calyx. ♄. S. Native of Jamaica. Flowers large, yellow.

American Abutilon. Fl. July, Aug. Clt. 1733. Sh. 6 ft.

51 A. AVICE'NNÆ (Gært. ex D. C. prod. 1. p. 469.) leaves roundish, cordate, acuminated, toothed, tomentose; peduncles shorter than the petioles; carpels 15, truncate, 2-beaked, hairy, 3-seeded. ⊙. H. Native of the South of France, Switzerland, and both Indies. In North America from Pennsylvania to Carolina

in cultivated ground. Sìda Abùtilon, Lin. spec. 963. Houtt. syst. 8. t. 61. Schkuhr. handb. t. 190. Flowers deep yellow.

Avicenna's Abutilon. Fl. July, Aug. Clt. 1596. Pl. 3 or 4 feet.

52 A. PAUCIFLÒRUM (St. Hil. fl. bras. 1. p. 206.) stem suffruticose, terete, hairy; leaves roundish, heart-shaped, acuminated, unequally toothed, velvety on both surfaces, hoary beneath; flowers axillary, solitary; capsule villous, 12-13-horned, 12-13-celled; cells 4-9-seeded. ♄. S. Native of Brazil in the southern part of the province of Cisplatine. Flowers red.

Few-flowered Abutilon. Shrub 4 to 5 feet.

53 A. JACQUÌNI; leaves cordate, undivided, acuminate, crenated, downy; peduncles length of petioles; carpels 10, 3-seeded. ⊙. S. Native of Jamaica. Sìda abutiloìdes, Jacq. obs. 1. p. 17. t. 7. Lavatèra Americàna, Lin. spec. 973. Flowers yellow.

Jacquin's Abutilon. Pl. 4 feet.

54 A. ASIA'TICUM (Lin. spec. 964. under *Sìda*,) leaves cordate, ovate-oblong, toothed, velvety; pedicels longer than the petioles; carpels 20, 3-seeded, truncated, acute, almost equal in length with the calyx, woolly. ⊙. S. Native of the East Indies. Cav. diss. 1. p. 31. t. 7. f. 2. and 5. t. 128. f. 1. Lher. stirp. p. 130. Flowers small, yellow.

Asiatic Abutilon. Fl. July, Aug. Clt. 1768. Pl. 2 feet.

55 A. SONNERATIA'NUM (Cav. diss. 1. p. 29. t. 6. f. 4. under *Sìda*,) leaves roundish, cordate, acuminated, toothed, tomentose; peduncles solitary, longer than the leaves; carpels 9, 3-seeded, truncate, obtuse, longer than the calyx. ♂? S. Native of the Cape of Good Hope. Resembles *A. Asiáticum*. Flowers yellow.

Sonnerat's Abutilon. Fl. June, July. Clt. 1806. Pl. 2 ft.

56 A. CISTIFLÒRUM (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 652. under *Sìda*,) leaves ovate, cordate, acuminated, crenate-toothed, clothed with white tomentum; peduncles axillary, solitary, 1-flowered, twice the length of the petioles; carpels 10-13, obtuse, villous; stipulas setaceous, spreading. Like *Sìda dísticha*. Flowers probably yellow.

Cistus-flowered Abutilon. Shrub 1 to 2 feet.

57 A. IBARRE'NSE (H. B. et Kunth, nov. gen. amer. 5. p. 272.) leaves roundish, profoundly cordate, acuminate, on long stalks, crenate-toothed, clothed with very soft tomentum, hoary above, and white beneath; peduncles axillary, 2-flowered. ♄. S. Native of Quito in South America. Flowers pale yellow. Sìda Ibarrénsis, D. C. prod. 1. p. 470. Cells of capsule 3-seeded.

Ibarra Abutilon. Shrub 6 feet.

58 A. PETIOLA'RE (H. B. et Kunth, nov. gen. et spec. amer. l. c.) leaves roundish, profoundly cordate, acuminate, on long stalks, doubly toothed, soft, pubescent above, but clothed with white tomentum beneath; pedicels axillary, 1-flowered; carpels 11, truncate and angular at the apex, 3-4-seeded. ♄. S. Native of New Granada. Sìda petiolàris. D. C. prod. 1. p. 478. Flowers white, the size of those of *A. Jacquìni*.

Long *leaf-stalked* Abutilon. Shrub 4 feet.

59 A. GEMINIFLÒRUM (H. B. et Kunth, nov. gen. et spec. amer. 5. p. 274. t. 474.) leaves ovate, cordate, acuminated, crenate-serrate, hairy; pedicels axillary, twin, 1-flowered; flowers with 13 styles; calyxes clothed with rusty tomentum. ♃. S. Native of Caraccas. Sìda geminiflòra, D. C. prod. 1. p. 470. Resembles *A. sylváticum*, but differs in having 4 ovulæ in each cell. Flowers from white to yellow.

Twin-flowered Abutilon. Pl. 1 to 2 feet.

60 A. POPULIFÒLIUM (Lam. dict. 1. p. 7. under *Sìda*,) leaves roundish, cordate, acuminate, unequally and repandly toothed, tomentose; peduncles longer than the petioles; carpels 11-19, 3-seeded, truncate, acute, longer than the calyx. ⊙. S. Native of the East Indies. Beloère, Rheed. mal. 6. t. 45. S. Beloère, Lher. stirp. 1. p. 130. S. populifòlia, Cav. diss. 1. p. 32. t. 7. f. 9. S. heteromíschos, Cav. diss. 2. p. 55. and 5. p. 275. t. 128. f. 2. Flowers yellow. Stem dark purple.

Poplar-leaved Abutilon. Fl. July, Aug. Clt. 1820. Pl. 2 to 6 feet.

61 A. HI'RTUM (Lam. dict. 1. p. 7. under *Sìda*,) leaves roundish, cordate, acuminate, toothed, clothed with white tomentum beneath; peduncles longer than the petioles; carpels 15-17, truncate, acute, shorter than the calyx. ⊙. S. Native of the East Indies.—Rumph. amb. 4. t. 10? S. pilòsa, Lher. stirp. 1. p. 130. Branches hairy with pili, but much less so than in the following species. Flowers pale-yellow.

Hairy Abutilon. Fl. July, Aug. Clt. 1820. Pl. 3 feet.

62 A. MÓLLE (Ort. dec. p. 65.) leaves cordate, orbicular, acuminate, unequally crenate-toothed, clothed with soft pubescence; peduncles 1-2-flowered, shorter than the petioles; carpels 8-10, 3-seeded, mucronate, acuminated, a little longer than the calyx; branches very hairy. ♄. S. Native of Peru. Hook. bot. mag. 2759. S. grandifòlia, Willd. enum. p. 724. Flowers yellow, rather large.

Soft-leaved Abutilon. Fl. Nov. Dec. Clt. 1816. Shrub 10 to 20 feet.

63 A. MOLLI'SSIMUM (Cav. diss. 2. p. 49. t. 14. f. 1.) leaves large, roundish, cordate, acuminate, toothed, velvety; peduncles usually 2-flowered, shorter than the petioles; carpels 11, truncate, 3-seeded, bidentate, equal in length with the 10-angled calyx. ♄. S. Native of Peru in woods near the river Maragnon. S. cistiflòra, Lher. stirp. 1. p. 127. t. 61. Corolla sulphur-coloured, a little longer than the calyx. Stem tomentose.

Very-soft-leaved Abutilon. Fl. June, July. Clt. 1789. Shrub 4 to 5 feet.

64 A. PU'LCHRUM (Coll. hort. rip. p. 129. t. 34. under *Sìda*,) stem erect, and is as well as the petioles very villous; leaves orbicularly cordate, unequally toothed, somewhat 3-lobed at the apex; peduncles solitary, 1-flowered, shorter than the petioles; carpels 10-12, globose, aggregate, mutic, 3-seeded. ♄. S. Native of the island of St. Martha. Flowers elegant, yellow, with a dark centre.

Fair Abutilon. Fl. July, Aug. Clt. 1826. Shrub 1 to 3 feet.

65 A. EXSTIPULA'RE (Cav. diss. 2. p. 56. t. 14. f. 2.) leaves ovate, cordate, acuminate, tomentose, without stipulas; pedicels solitary, shorter than the petioles; carpels 30, truncate, awnless, shorter than the calyx, 1-3-seeded. ♄. S. Native of the island of Bourbon. Flowers yellow.

Exstipular Abutilon. Shrub 3 feet.

66 A. TRUNCA'TUM (Cav. diss. 1. p. 35. t. 6. f. 7.) leaves roundish, cordate, truncate and obtuse at the apex, toothed, tomentose; pedicels longer than the petioles; carpels 9, awnless. ⊙. S. Native of St. Domingo. Carpels 1, or perhaps many-seeded. Flowers sulphur-coloured.

Truncate-capsuled Abutilon. Pl. 2 feet.

67 A. TERMINA'LE (Cav. diss. 1. p. 29. t. 6. and 6. t. 195. f. 2. under *Sìda*,) leaves ovate, cordate, deeply crenate, tomentose; racemes terminal, elongated, bracteate; carpels 10-12, awnless, villous, capitate, larger than the calyx, 3-seeded. ♄. S. Native near Monte-Video, &c. Flowers yellowish, rose-coloured on the outside. St. Hil. fl. bras. 1. p. 203.

Terminal-flowered Abutilon. Shrub 2 to 4 feet.

68 A. AFFI'NE (Spreng. syst. 3. p. 121. under *Sìda*,) shrubby; leaves cordate, oblong, crenate-toothed, hoary-tomentose beneath; peduncles terminal, corymbose; calyx silky; capsule villous, mutic. ♄. S. Native of Monte Video.

Allied Abutilon. Shrub.

69 A. PERMÓLLE (Willd. enum. p. 725. under *Sìda*,) leaves roundish, cordate, acuminate, unequally crenate, tomentose; peduncles axillary, solitary, upper ones somewhat racemose;

carpels 9-10, beaked, almost equal in length with the calyx, 3-seeded. ♄. S. Native of? Flowers yellow.

Softest-leaved Abutilon. Fl. July, Aug. Clt. 1817. Shrub 7 to 8 feet.

70 A. grandiflòrum; erect, branched, pubescent; leaves cordate, lobately-toothed, roundish, on very long petioles; peduncles solitary, 1-flowered; carpels numerous, pubescent. ♄. S. Native of Guinea. Flowers large, yellow.

Great-flowered Abutilon. Shrub 1 to 2 feet.

71 A. cornu'tum (Willd. enum. p. 724. under *Sìda*,) leaves ovate, cordate, toothed, clothed with soft pubescence on both surfaces; flowers panicled; carpels inflated, horned. ♄. S. Native of South America. Flowers yellow. Cells of capsule 5-6, 3-seeded. This plant belongs to section *Oligocárpæ*.

Horned-capsuled Abutilon. Shrub 10 feet.

72 A. pube'scens (Cav. diss. 1. p. 33. t. 7. f. 6. under *Sìda*,) pilose; leaves roundish, cordate, acuminate, angularly-crenate, tomentose; pedicels longer than the petioles; carpels 15, bidentate, truncate, larger than the calyx, 3-seeded. ♄. S. Native of St. Domingo. Flowers whitish.

Pubescent Abutilon. Pl. 3 feet.

73 A. orbicula'tum (D. C. prod. 1. p. 471. under *Sìda*,) leaves ovately-orbicular, somewhat kidney-shaped, toothed, hoary beneath; pedicels longer than petioles; carpels 13, younger ones tomentose, blunt, adult ones smooth, bidentate. ♄. G. Native of China. Flowers yellow?

Orbicular-leaved Abutilon. Fl. June, July. Clt. 1820. Shrub 3 feet.

74 A. I'ndicum (Lin. spec. 964. under *Sìda*,) leaves cordate, somewhat lobed, soft; stipulas reflexed; pedicels erect, 3 times longer than the petioles; carpels 13-15, 3-seeded, scabrous, longer than the calyx. ⊙. S. Native of the East Indies. Cav. diss. 1. p. 33. t. 7. f. 10. Abùtilon elongàtum, Mœnch. Flowers yellow.

Indian Abutilon. Fl. July, Aug. Clt. 1739. Pl. 2 feet.

75 A. vesica'rium (Cav. diss, 2. p. 55. t. 14. f. 3. under *Sìda*,) leaves ovate, cordate, toothed, sòmewhat tricuspidate, white beneath; pedicels twice as long as the petioles; carpels 10, truncate, awnless, acutish, 5-seeded. ♄. S. Native of Mexico. Flowers yellow.

Bladdery-capsuled Abutilon. Fl. July, Aug. Clt. 1822. Shrub 3 feet.

76 A. glau'cum (Cav. icon. 1. p. 8. t. 11. under *Sìda*,) leaves roundish, cordate, acuminate, coarsely toothed, clothed with soft glaucous tomentum; lower pedicels shorter than the petioles, upper ones longer; carpels 12-15, obtuse, shorter than the calyx; stem beset with glandular hairs. ♄. S. Native of Senegal. Flowers yellow. Carpels 1-3-seeded.

Glaucous-leaved Abutilon. Fl. Jul. Aug. Clt. 1824. Sh. 3 ft.?

77 A. a'lbidum (Willd. enum. p. 722. under *Sìda*,) leaves roundish, cordate, acuminate, toothed, hoary on both surfaces from soft tomentum; pedicels length of petioles; carpels 12-15, truncate, acute, almost equal in length with the calyx. ♄. G. Native of the Canary Islands. Sìda, no. 340. Bory. ess. isl. fort. Pedicels sometimes shorter, sometimes longer than the petioles. Flowers yellow. Carpels hairy, many-seeded?

Whitish-leaved Abutilon. Fl. July, Aug. Clt. 1822. Shrub 2 feet.

78 A. crassifòlium (Lher. stirp. 1. p. 125. t. 60. under *Sìda*,) leaves ovate, cordate, toothed, rather tricuspidate, hoary with tomentum; pedicels length of petioles; carpels 9-10, 2-pointed, 3-seeded. ♄. S. Native of Hispaniola. S. tricuspidàta, Cav. icon. p. 30. t. 6. f. 5. Flowers yellow.

Var. β, tomentòsum (Cav. descr. 164.) branches 3 or 4-sided. Native of America.

Thick-leaved Abutilon. Shrub 2 feet.

79 A. molli'comum (Willd. enum. p. 725. under *Sìda*,) leaves ovate-oblong, cordate, unequally toothed, tricuspidate, clothed with very soft tomentum; pedicels shorter than the petioles; carpels 9, acuminate, inflated. ♄. S. Native? S. serícea, Cav. descr. p. 164. Flowers yellow. Carpels 2-seeded.

Soft-haired Abutilon. Fl. July, Aug. Clt. 1816. Shrub 4 ft.

80 A. vitifòlium (Cav. icon. 5. p. 12. t. 420. under *Sìda*,) leaves cordate, 5-7-lobed; lobes acuminate, serrate, tomentose beneath; peduncles longer than the petioles, branched, umbellate; carpels 9, 6-seeded, each with 2 long awns at the apex. ♄. G. Native of Chili. Flowers large, rose-coloured.

Vine-leaved Abutilon. Shrub 6 feet.

81 A. acerifòlium (Lag. nov. gen. p. 21. under *Sìda*,) leaves cordate, somewhat peltate, 3-5-lobed, unequally toothed, villous; pedicels 1-flowered, longer than the petioles; carpels 10-12, inflated, each with 2 awns at the base on the outside. ♄. S. Native of New Spain. S. spínifex, and perhaps S. palmàta of Sesse, fl. mex. icon. ined. ex D. C. The whole plant is hispid. Flowers blue.

Maple-leaved Abutilon. Fl. July, Aug. Clt. 1820. Shrub 3 to 6 feet.

82 A. ri'gidum; erect, branched; leaves oval, obtuse, usually acuminated, unequally serrated on short petioles, white beneath from pubescence; pedicels solitary, 1-flowered, equal in length to the leaves. ♄. S. Native of Guinea. Flowers large, yellow. Perhaps a species of *Sìda*.

Stiff Abutilon. Shrub 2 to 4 feet.

83 A. Veluti'num; erect, branched; leaves ovate, acute, serrated, somewhat cordate at the base, pubescent; peduncles solitary, 1-flowered, longer than the leaves. ♄. S. Native of Guinea. Plant soft from pubescence. Perhaps a *Sìda*.

Velvety Abutilon. Shrub 2 to 4 feet.

Cult. The species of *Abùtilon* will thrive well in any light soil, and cuttings of them will root freely in sand or mould under a hand-glass, in heat. Some of the species are rather ornamental when in flower.

XXIX. NUTTA'LLIA (in honour of Thomas Nuttall, F.L.S. professor of mineralogy in the university of New Cambridge, North America, an acute botanist, author of Genera of North American Plants, &c.) Dick's mss. Hook. exot. fl. 3. t. 171. Callirrhòe, Nutt. in journ. acad. n. sc. philad. v. ii. p. 181.

Lin. syst. *Monadélphia, Polyándria*. Calyx naked, quinquefid. Anthers numerous. Stigmas numerous, filiform. Carpels numerous, 1-seeded, disposed in a ring or whorl around the central axis, not opening spontaneously as in *Málva* and *Althæ'a*. Elegant plants, with pedate leaves, and rather large reddish-purple flowers. Roots tuberous, rather fusiform.

1 N. digita'ta (Dick's mss. Hook. exot. fl. t. 171.) glaucous; leaves subpeltate 6-7-parted, with linear-entire or 2-parted segments, upper ones more simple; peduncles long, axillary, 1-flowered. ♃. H. Native of North America in prairies in the Arkansa territory. Callirrhòe digitàta, Nutt. l. c. Sìda digitàta, Spreng.

Digitate-leaved Nuttallia. Fl. Aug. Clt. 1824. Pl. 2 to 3 ft.

2 N. peda'ta (Nutt. mss. Hook. exot. fl. 3. t. 172.) leaves lacineately-pedate, upper ones trifid; flowers panicled. ♃. H. Native of North America in prairies in the Arkansa territory. Sìda pedàta, Spreng. This plant differs from the last in the panicled inflorescence.

Pedate-leaved Nuttallia. Fl. Aug. Clt. 1824. Pl. 2 to 3 ft.

Cult. These plants deserve to be cultivated in every collection on account of the elegance of their blossoms. They thrive best in peat soil mixed with sand, or vegetable mould. They may be increased by seeds, or sometimes by dividing the plants at the root. They require shelter in severe weather.

XXX. LAGUNE'A (in honour of Andreas Laguna, a Spanish physician and botanist of the sixteenth century. He translated Dioscorides into Spanish). Cav. diss. 3. p. 173. D. C. syst. 1. p. 474.—Solándra, Murr. comm. goet. 1784. Lam. ill. t. 580. but not of Swartz.

LIN. SYST. *Monadélphia, Polyándria.* Calyx naked, 5-cleft. Petals 5, spreading, with narrow claws. Anthers inserted on the sides and top of the tube. Stigmas 5. Capsules 5-celled, 5-valved, with a dissepiment in the middle of each valve, connected with the central filiform permanent axis. This genus differs from *Hibíscus* as *Sìda* does from *Málva.* Flowers axillary, solitary.

1 L. LOBA'TA (Willd. spec. 3. p. 733.) leaves cordate, 3-lobed; lobes oval-oblong, acuminate, toothed, with very narrow recesses. ⊙. H. Native of the Island of Bourbon. Solándra lobàta, Murr. com. goet. 1784. p. 21. t. 1. Triguèra acerifòlia, Cav. diss. 1. p. 41. t. 11. f. last. Lagunæ'a lobàta, Cav. diss. 5. t. 136. f. 1. Hibíscus Solándra, Lher. stirp. 1. t. 49. Flowers truly monopetalous, with a 5-parted limb of a white colour; they are disposed in something like a spike at the tops of the branches.

Lobed-leaved Lagunea. Fl. July, Aug. Clt. 1787. Pl. 2 ft.

2 L.? TRI'COLOR; pilose; stem erect, simple; leaves lanceolate, acute, rather cordate at the base. ⊙. S. Native of Sierra Leone. The corolla is of 5 petals of the same colour as those of *Hibíscus triònum.* Perhaps a distinct genus.

Three-coloured-flowered Lagunea. Pl. ½ foot.

3 L. SINUA'TA (Horn. hafn. 645.) leaves cordate, 3-lobed; lobes oblong, acuminate, toothed, with wide recesses. ⊙. S. Native of? Perhaps a variety of *L. lobàta.* L. angulàta, Hortul. Flowers purplish-white?

Scolloped-leaved Lagunea. Fl. July, Aug. Clt. 1817. Pl. 2 ft.

4 L. TERNA'TA (Cav. diss. 5. p. 279. t. 136. f. 2. under *Solándra,*) lower leaves 3-parted; lobes oblong, entire, middle one very long; upper leaves somewhat halbert-shaped, elongated. ⊙. S. Native of Senegal. Stem villous.

Ternate-leaved Lagunea. Pl. 1 foot.

5 L. ACULEA'TA (Cav. diss. 3. p. 173. t. 71. f. 1.) leaves 3-parted, with oblong-linear, deeply-toothed lobes; stem prickly, tomentose. ⊙? S. Native of Pondichery. Flowers yellow. Stigmas red. Calyx ruptured longitudinally. This plant is called *Cattacacheree* by the inhabitants of Pondichery.

Prickly Lagunea. Pl. 1½ foot.

Cult. Not worth cultivating except in botanical gardens. The seeds require to be sown on a moderate hot-bed, and when the plants are of sufficient size they should be shifted into other pots, and then placed in the green-house or planted out in the open border in a sheltered situation.

XXXI. INGENHOU'ZIA (Ingenhouze, a Mexican botanist.) Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 474.

LIN. SYST. *Monadélphia, Polyándria.* Calyx naked, 3-parted into ovate-lanceolate, acuminate lobes. Petals 5, with a campanulate urceolus on the inside of the petals. Stamens indefinite, monadelphous. Style 1. Fruit unknown.

1 I. TRI'LOBA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 474.) ♂. G. Native of Mexico. Herb resembling in habit *Gossýpium.* Leaves stalked, 3-lobed; lobes ovate-lanceolate, acute, entire. Pedicels 1-flowered, opposite the leaves. Flowers yellowish-red.

Three-lobed-leaved Ingenhousia. Pl. 2 feet?

Cult. The seeds of this plant will require to be raised on a hot-bed frame, and when the plants are of sufficient size they should be separated and planted singly in other pots, and after they have recovered this shifting, they may then be placed in the stove or greenhouse, where they will ripen their seed.

XXXII. EURYA'NTHE (from *ευρυς, eurys,* wide, and *ανθος, anthos,* a flower,) Cham. et Schlecht. in Linnæa. 3. p. 206.

LIN. SYST. *Polyándria, Monogýnia.* Calyx 5-parted, divided nearly to the base. Petals 5, twisted in æstivation. Stamens indefinite, free; filaments hardly connected at the base, unequal; anthers linear, 2-celled, fixed by the base, opening longitudinally. Ovary superior, egg-shaped, 3-celled, many-seeded, fixed to the central column. Style simple, deciduous, terminated by a simple stigma. Fruit 3-celled, 3-valved; valves with a dissepiment in the middle.—A malvaceous herb, with alternate digitately-parted leaves. This genus is allied to *Geraniàceæ,* but more closely to *Malvàceæ,* but it differs materially in the anthers being 2-celled, a circumstance which excludes it from that order as it is now constituted.

1 E. SCHIEDIA'NA (Cham. et Schlecht. l. c.) ⊙? ♃. G. Native of Mexico. Stipulas free. Racemes secund. Flowers large, flame-coloured.

Schiede's Euryanthe. Pl. 1 foot.

Cult. This plant will grow in a mixture of loam and sand, and it may either be increased by seed, or by cuttings, planted under a hand-glass.

ORDER XXXI. BOMBA'CEÆ (plants agreeing with *Bómbax,* in many important characters,) Kunth, diss. malv. p. 5. nov. gen. amer. 5. p. 294. D. C. prod. 1. p. 475.

Calyx naked at the base or involucrated with a few bracteas (f. 87. *a.*). Sepals 5, joined together into an urceolate-campanulate tube (f. 87. *b.*), sometimes truncate at the apex, sometimes irregularly imbricated, sometimes somewhat valvately-connate, and bursting laterally; the æstivation is therefore doubtful. Petals 5, regular (f. 87. *c.*) or wanting, when present they are usually convolute in æstivation, but sometimes imbricate. Stamens 5? 10-15 or more; filaments adnate to the base of the tube of the petals, but separated into 5 bundles (f. 87. *f.*); bundles containing 1 or many anthers, sometimes intermixed with a few sterile threads. Anthers 1-celled. Ovary of 5, rarely of 10 carpels, sometimes these are nearly distinct, sometimes so closely connected as to appear a single fruit (f. 86. *f.* f. 87. *g.*), opening variously. Styles distinct, more or less connected together. Fruit of various shapes. Seeds enveloped in wool or pulp, some of them are without albumen; these have corrugated or convolute cotyledons, but those furnished with albumen have flat cotyledons. This order is very closely allied to *Malvàceæ,* from which perhaps it is not distinct; it agrees with it in the 1-celled anthers, in the petals being usually convolute, and in habit, but differs from it in the calyx being imbricate, not truly valvate, in the staminiferous tube being divided into 5 bundles or sets at the apex, not monadelphous, as in that order. It comes also near to *Byttneriàceæ* and *Chlenàceæ* in habit, but it is easily distinguished from these two orders in the anthers being 1-celled, not 2-celled. The species are fine tropical trees and shrubs. Some of them are amongst the largest trees in the world; *Adansònia digitàta,* the *Baobab* of Senegal, or *Monkey-bread* of the English colonies on the coast of Guinea, has been seen with a

diameter of 25 feet, although the height is not great, at most 20 or 30 feet high, and specimens of *Bómbax ceìba*, *Eriodéndron anfractuòsum* and *Guineénsis*, and other species are not uncommon above 100 feet in height. The wood of all the plants contained in this order is soft and light, as in *Malvàceæ*, from which this order probably does not differ in its medical properties.

Synopsis of the Genera.

1 HELI'CTERES. Calyx tubular, 5-cleft. Stamens 5 to 15, monadelphous, but multifid at the apex. Ovary stipitate. Styles 5, joined at the base. Carpels 5, 1-celled, many-seeded, twisted or straight. Leaves simple.

2 MYRO'DIA. Calyx tubular, 4-5-toothed, bursting laterally. Column of stamens long. Anthers 10-15. Capsule drupaceous, 2-3-celled; cells 1-seeded. Leaves simple.

3 PLAGIA'NTHUS. Calyx 5-cleft. Petals 5, 2 of which are approximate, remote from the rest. Stigma clavate. Berry? Leaves simple.

4 MATI'SIA. Calyx irregularly 2-5-toothed, bursting. Column of stamens cleft into 5 at the apex, each division containing 12 anthers, all on the outer side. Drupe ovate, 5-celled; cells 1-seeded. Leaves simple.

5 POURRE'TIA. Calyx 5-parted, campanulate. Column of stamens 5-cleft at the apex. Capsule coriaceous, membranous, 5-winged, 1-celled, indehiscent, cell 1-seeded. Leaves entire.

6 MONTEZU'MA. Calyx hemispherical, truncate, sinuately-toothed. Stamens numerous, twisted around the style, monadelphous, with 5 distinct furrows. Capsule globose, 4-5-celled; cells many-seeded. Leaves entire.

7 OPHE'LUS. Calyx 5-cleft; lobes acute, reflexed. Stamens numerous, joined into a tube at the base, somewhat reflexed at the apex. Stigma multifid. Capsule woody, oblong-ovate, 12-celled, many-seeded. Leaves entire.

8 ADANSO'NIA. Calyx 5-parted, deciduous. Urceolus of the stamens dilated and expanded at the apex. Stigmas numerous. Capsule woody, indehiscent, 10-celled, many-seeded, full of farinaceous pulp. Leaves compound.

9 CAROLI'NEA. Calyx tubular, somewhat truncate, permanent. Petals very long. Stamens monadelphous at the base, but divided into many 12-24-anthered bundles at the top. Stigmas 5. Capsule woody, many-valved, 1-celled, many-seeded. Seeds enveloped in aril. Leaves compound. (f. 86.).

10 BO'MBAX. Calyx subquinquefid or truncate. Petals connected together, and with the staminiferous column at the base. Stamens numerous, sometimes purely monadelphous, sometimes divided into 5 bundles at the apex; filaments free. Capsule large and long, 5-celled, 5-valved; cells many-seeded. Seeds albuminous, enwrapped in wool. Leaves compound.

11 ERIODE'NDRON. Calyx obtusely 5-lobed. Petals connected together, and with the staminiferous column at the base. Stamens numerous, connected at the base in a short column, but divided into 5 bundles at the apex; bundles connected to the top, filiform, each bearing 2 or 3 anthers at the apex, linear or anfractuous, appearing like 1 anther. Leaves compound.

12 CHORI'SIA. Calyx campanulate, 2-5-lobed, furnished with 3 permanent bracteas at the base. Petals long. Tube of stamens double, the interior one slender, round, bearing 10 twin anthers, outer one short, 10-lobed, sterile, adnate to the interior above the base. Ovary sessile, ovate, 5-celled. Capsule 5-valved, 1-celled, many-seeded. Leaves compound.

13 DU'RIO. Calyx obtusely 5-lobed, girded by a 2-lobed involucel (f. 87. *a*. *b*.). Petals connected at the base. Stamens numerous, pentadelphous. Anthers anfractuous (f. 87. *d*.). Stigma simple. Fruit large, round, muricated (f. 87. *g*.), 5-celled (f. 87. *k*.); cells 4-5-seeded, pulpy inside. Leaves simple.

14 OCHRO'MA. Calyx funnel-shaped, hardly 5-cleft, 3 roundish, and 2 acutish. Anthers anfractuous. Stigmas 5. Capsule long, clothed on the inside with silky wool. Seeds oblong. Leaves lobed.

15 CHEIROSTE'MON. Calyx campanulate, 5-parted, deciduous, with 3 bracteas at the base. Petals none. Column of stamens 5-cleft at the apex, bearing 2 linear anthers on the back of each lobe. Capsule oblong, 5-angled, 5-valved; valves with a hairy dissepiment in the middle of each. Seeds carunculate, 15-18 in each cell. Albumen fleshy. Leaves lobed.

I. HELI'CTERES (from ἑλιξ *helix*, a screw; carpels twisted together in a spiral manner). Lin. gen. no. 1024. D. C. prod. 1. p. 474.).

LIN. SYST. *Monadélphia, Penta-Decándria.* Calyx tubular, somewhat 5-toothed. Petals 5, ligulate, unguiculate, a little toothed at the apex. Stamens 5-10-15, monadelphous, with the urceolus multifid at the apex, intermixed with sterile hairs. Ovary on a long stalk. Styles 5, joined at the base. Carpels 5, 1-celled, many-seeded, opening on the inside, generally regularly twisted together screw-wise, seldom straight. Seeds without albumen. Cotyledons spirally convolute. Shrubs and trees, usually clothed with stellate tomentum, with simple, unequally-cordate leaves and few-flowered axillary peduncles.

SECT. I. SPIROCARPÆ'A (from σπειρα, *speira*, a spire, and καρπος, *karpos*, a fruit; in allusion to the carpels being twisted together in a spiral manner). D. C. prod. 1. p. 475. Carpels twisted together, constituting a spiral, 5-furrowed, oblong, or ovate fruit.

1 H. ISÒRA (Lin. spec. 1366.) leaves cordate, ovate, serrate-toothed, acuminate, scabrous, tomentose beneath; flowers axillary, decandrous; fruit cylindrical, somewhat velvety, awl-shaped at the apex. ♄. S. Native of Malabar and the Moluccas. Sims, bot. mag. t. 2681.—Pluk. alm. t. 245. f. 2.—Rump. amb. 7. t. 17. f. 1.—Rheed. mal. 6. p. 55. t. 30. H. Jamaicénsis, Lam. dict. 3. p. 87. Leaves like those of the *Hazel*. Petals obovate, yellow. This plant is called Isóra-murri. by the inhabitants of Malabar.

Isora Screw-tree. Fl. June, July. Clt. 1733. Shrub 12 ft.

2 H. ROXBU'RGHII; leaves broad, obovate-roundish, acuminated, toothed, tomentose beneath as well as the branches; pedicels 2-3 together, short, axillary; petals reflexed. ♄. S. Native of the East Indies. H. Isòra, Roxb. but not of Lin. Flowers red. Peduncles twin, very short, bearing 2-3 pedicels.

Roxburgh's Screw-tree. Shrub 6 feet.

3 H. OVA'TA (Lam. St. Hil. fl. bras. 1. p. 273.) decandrous; leaves ovate or subcordate, with a short acumen, biserrate-toothed, dotted above from stellate down, but covered with

white tomentum beneath; petals exceeding the calyx; column of stamens exserted; carpels twisted. ♄. S. Native of Brazil. H. Braziliénsis, Mik. fasc. 4. H. corylifòlia, Nees. et Mart. nov. act. bonn. 12. p. 44. Peduncles 2-3-flowered. Petals yellowish-green at the base, but intensely red at the apex.

Ovate-leaved Screw-tree. Shrub 5 to 6 feet.

4 H. BREVISPÌRA (St. Hil. fl. bras. 1. p. 274. t. 54.) decandrous; leaves ovate, acute, somewhat cordate at the base, biserrate-toothed, velvety-tomentose; limbs of petals broadish, reflexed, twice the length of the calyx; column of stamens exserted; carpels short, twisted. ♄. S. Native of Brazil in the provinces of Minas Geraes and Minas Novas. Peduncles 2-flowered, equal in length to the petioles. Petals at first yellow, with a red spot at the base of each, at length becoming intensely scarlet.

Short-spired-carpelled Screw-tree. Shrub 4 to 6 feet.

5 H. BARUE'NSIS (Lin. mant. 122,) decandrous; leaves cordate, sharply-serrated, tomentose beneath: peduncles 2-flowered; calyx somewhat 2-lipped; carpels cylindrical, somewhat velvety, awl-shaped at top. ♄. S. Native of the Island of Baruco and the Isthmus of Panama, in woods by the sea-side. Jacq. amer. 236. t. 149. Lobes of calyx 5, irregularly joined into two lips. Petals linear, white. Calyx greenish-yellow. The bark of the trunk and principal branches being easily peeled off and very tough, is used instead of ropes.

Var. β, ovàta (D. C. prod. 1. p. 475.) leaves ovate, scarcely cordate, obtuse, toothed, tomentose beneath. ♄. S. Native? Perhaps a distinct species.

Baruco Screw-tree. Fl. Sept. Oct. Clt. 1739. Sh. 12 ft.

6 H. GUAZUMÆFÒLIA (H. B. et Kunth, nov. gen. amer. 5. p. 304.) decandrous; leaves obsoletely-cordate, somewhat ovate, unequal-sided, acuminate, serrate, hairy above, white from down beneath; peduncles 2-flowered; calyx 5-lobed; petals spatulate. ♄. S. Native on the banks of the river Orinoco and near Caripe in Cumana. Resembles *H. Baruénsis*. Flowers red.

Guazuma-leaved Screw-tree. Fl.? Clt. 1820. Shrub 8 ft.

7 H. GREWIÆFÒLIA (D. C. prod. 1. p. 476.) decandrous; leaves ovate, scarcely cordate at the base, acute, unequally and doubly serrate, downy on both surfaces; carpels cylindrical, somewhat velvety, awl-shaped at the apex. ♄. S. Native of the Island of Timor. Petals oblong with long claws. Fruit like that of *H. Baruénsis*, but more slender.

Grewia-leaved Screw-tree. Fl. June, July. Shrub 6 feet.

8 H. MACROPE'TALA (St. Hil. fl. bras. 1. p. 275.) decandrous; leaves ovate, acuminated, biserrate-toothed, nearly smooth; limb of petals broad, reflexed, covering the calyx, which is nearly 3-times shorter; column of stamens greatly exserted; carpels spirally twisted. ♄. S. Native of Brazil in the province of Minas Novas. Branches clothed with stellate hairs. Petals smooth.

Long-petalled Screw-tree. Fl. June. Tree 12 to 15 feet.

9 H. SARCARO'LHA (St. Hil. pl. usu. bras. no. 64. fl. bras. 1. p. 276.) leaves roundish-ovate or ovate, acute, slightly cordate, serrate-toothed, clothed with brown tomentum; petals narrow, hardly higher than the calyx; column of stamens twice that length; carpels twisted. ♄. S. Native of Brazil. A decoction of the roots of this shrub is used by the inhabitants of the Brazils, especially in the provinces of the mines, in syphilitic complaints, where they call it *sarcarolha*. Corolla vermillion.

Sarcarolha Screw-tree. Shrub 4 to 5 feet.

10 H. MEXICA'NA (H. B. et Kunth, nov. gen. amer. 5. p. 305.) decandrous; leaves ovate, somewhat cordate, unequally serrate, soft, and pubescent above, hoary from down beneath; calyx acutely 5-toothed; fruit ovate, somewhat velvety. ♄. S. Native of Mexico between Mazatlan and Chilpancingo. H. rùbra, Moc. et Sesse, fl. mex. ic. ined. Petals unequal, spatulate at the apex, red. Calyx velvety. Genitals scarcely twice as long as the corolla.

Mexican Screw-tree. Shrub 10 feet.

11 H. JAMAICE'NSIS (Jacq. amer. 235. t. 179. f. 99.) decandrous; leaves cordate, crenate, clothed with velvety down on both surfaces; flowers somewhat terminal, few, corymbose; fruit ovate, densely clothed with down. ♄. S. Native of Jamaica and St. Thomas. Jacq. hort. vind. t. 143.—Pluk. alm. 182. t. 245. f. 3.—Sloan. jam. 97. hist. 1. p. 22. Calyx greenish-yellow. Petals white. Tube of stamens very long.

Jamaica Screw-tree. Fl. June, July. Clt. 1739. Sh. 12 ft.

12 H. VERBASCIFÒLIA (Link. enum. 2. p. 200.) leaves cordate-acuminate, serrated, downy, green; peduncles axillary, few-flowered; fruit-stalk very long. ♄. S. Native of Brazil. Lodd. bot. cab. t. 504. Ker, bot. reg. t. 903. Corolla red.

Mullein-leaved Screw-tree. Fl. Ju. Jul. Clt. 1818. Sh. 8 ft.

13 H. FERRUGINA'TA (Link. enum. 2. p. 199.) leaves cordate, lanceolate, crenulate, downy, rusty beneath; flowers terminal, somewhat racemose; fruit-stalk very long. ♄. S. Native of Brazil. Corolla yellowish.

Rusty-leaved Screw-tree. Fl. June, July. Clt. 1823. Shrub 8 feet.

14 H. PENTA'NDRA (Lin. mant. 294.) pentandrous; leaves ovate, floral ones coloured. ♄. S. Native of Surinam. Calyx hispid, with bristly hairs.

Pentandrous Screw-tree. Shrub.

SECT. II. ORTHOCARPÆ'A (from *ορθος, orthos*, straight, and *καρπος, karpos*, a fruit; because the carpels are straight, not twisted as in the preceding section). D. C. prod. 1. p. 476. Carpels straight, approximate, not twisted together into a spire nor radiating.

15 H. ANGUSTIFÒLIA (Lin. spec. 1366.) decandrous; leaves lanceolate, acuminated, quite entire, white and downy beneath; pedicels many-flowered. ♄. G. Native of China about Canton. Obs. itin. p. 232. t. 5. Lour. coch. 530. Flowers pale-purple. Carpels clothed with stellate tomentum.

Narrow-leaved Screw-tree. Shrub 6 feet.

16 H. HIRSU'TA (Lour. coch. 530.) decandrous; leaves ovate-oblong, cordate, acuminate, doubly serrate, tomentose; peduncles many-flowered; fruit oblong, very hairy. ♄. G. Native of Cochin-china in woods. Willd. spec. 3. p. 721. Flowers pale-purple, in axillary, solitary, or crowded racemes.

Hairy Screw-tree. Shrub 6 feet.

17 H. VI'SCIDA (Blum. bijdr. ex. Schlecht. Linnæa. 1. p. 653.) decandrous; leaves roundish, cordate, acuminated, unequally serrated, somewhat 3-lobed, clothed with stellate-pubescence above, but with stellate viscid villi beneath; peduncles axillary, many-flowered, reflexed; petals spatulate; fruit oblong, hairy. ♄. S. Native of Java. Flowers red?

Viscid Screw-tree. Shrub 6 to 8 feet.

18 H. JAVE'NSIS (Blum. bijdr. ex. Schlecht. Linnæa. 1. p. 653.) decandrous; leaves oblong or oblong-lanceolate, acuminate, rounded at the base, subcordate, densely and obtusely serrulated, smooth above, but glaucous beneath, and are as well as the branches clothed with stellate down; peduncles axillary, twin, opposite, the leaves umbellately many-flowered. ♄. S. Native of Java. Flowers probably red.

Java Screw-tree. Shrub 6 feet.

19 H. SPICA'TA (Colebr. mss. in herb. Lamb.) villous; leaves oblong, acuminated, serrated; peduncles axillary, twin, spicately-racemose; column of stamens short; carpels straight. ♄. S. Native of the East Indies. Flowers red.

Spiked-flowered Screw-tree. Shrub 10 feet.

20 H. PRONIFLÒRA (Rich. act. soc. n. h. par. p. 111.) hexandrous; leaves cordate, oval, unequal-sided, unequally serrated,

acuminate, hairy on the nerves and petioles, beneath as well as branches; spikes short, axillary, 3-4-flowered. ♄. S. Native of Cayenne. Flowers scarlet.

Inclining-flowered Screw-tree. Fl. June, July. Shrub 6 ft.

21 H. Carthagene'nsis (Lin. spec. 1366.) polyandrous; leaves cordate, serrated, tomentose on both surfaces; flowers almost sessile, somewhat corymbose; fruit oblong. ♄. S. Native in the woods of Carthagena. Flowers fetid, purple.

Carthagena Screw-tree. Shrub 12 feet.

22 H. Sunda'ica; leaves oblong-lanceolate, serrated, acuminated, tomentose beneath; peduncles twin or solitary, axillary, racemose, few-flowered; fruit echinated; column of stamens very short. ♄. S. Native of the Straits of Sunda. (herb. Lamb. v. s.) Carpels apparently joined into the single fruit.

Sunda Screw-tree. Shrub 6 feet.

23 H. virga'ta (Wall. mss. in herb. Lamb.) leaves lanceolate, obtuse, mucronate, quite entire, tomentose beneath, smooth and green above; peduncles terminal and axillary, twin or tern 2-4-flowered; column of stamens short; carpels hispid. ♄. S. Native of the East Indies. Flowers red.

Twiggy Screw-tree. Shrub 6 feet.

24 H. oblónga (Wall. in Lin. soc. herb.) leaves oblong, serrated, rather rough from stellate pili; obliquely cordate at the base; peduncles extra-axillary, 2-flowered; carpels very rough, awl-shaped at the apex. ♄. S. Native of Pulo-Pinang.

Oblong-leaved Screw-tree. Shrub 6 to 8 feet.

25 H. lanceola'ta (D. C. prod. 1. p. 476.) leaves lanceolate, acuminate at both ends, hoary beneath; flowers axillary, disposed in short racemose panicles; petals linear, exceeding the genitals in length, bidentate at the base of the limb. ♄. S. Native of the East Indies. A very distinct species.

Lanceolate-leaved Screw-tree. Shrub 6 feet.

† *Species not sufficiently known.*

26 H. semitri'loba (Bert. in litt. D. C. prod. 1. p. 476.) leaves somewhat cordate, broad-ovate, somewhat 3-lobed, crenate-toothed, smooth above, hoary-velvety beneath, 5-nerved, reticulated; flowers terminal, corymbose. ♄. S. Native of St. Domingo. Fruit unknown.

Half-three-lobed Screw-tree. Shrub 6 feet.

27 H.? undula'ta (Lour. cochin. 531.) leaves lanceolate, waved; flowers usually terminal, crowded; fruit straight, stellately disposed. ♄. G. Native of Cochin-china in woods. Flowers greenish red. Perhaps a species of *Stercùlia*.

Waved-leaved Screw-tree. Tree 25 feet.

28 H.? panicula'ta (Lour. cochin. 531.) leaves ovate, entire, acute; flowers subterminal, loosely panicled; carpels straight, stellately-spreading. ♄. G. Native of Cochin-china. Perhaps a species of *Stercùlia*. Corolla reddish, spreading.

Panicled Screw-tree. Tree 40 feet.

Cult. Shrubs or trees of little beauty. They are free flowerers, and thrive best in a mixture of loam and peat. Cuttings taken off at a joint root freely in sand under a hand-glass. Seeds are easily transported in a living state from the places of their natural growth.

II. MYRO'DIA (from *μυρον*, *myron*, myrrh, perfume, and *οδμη*, *odme*, scent. *Myròdia turbinàta* exhales an agreeable perfume). Screb. gen. no. 1147. D. C. prod. 1. p. 477.

Lin. syst. *Monadélphia, Polyándria.* Calyx naked, tubular, 3-5-toothed, ruptured at the side. Petals oblong-linear. Column of stamens long, 5-toothed. Anthers 10-15. Stigmas 2-lobed. Capsules drupaceous, 2-3-celled; cells 1-seeded. Albumen wanting. Bracteoles 2-3 on each pedicel. Shrubs with simple entire leaves, and axillary or lateral, solitary, white flowers.

Sect. I. Eumyròdia (from *ευ*, *eu*, well, and *myròdia*; genuine species of *Myròdia*). D. C. prod. 1. p. 477. Anthers all placed on the top of the staminiferous tube.

1 M. turbina'ta (Swartz, fl. ind. occ. 2. p. 1227.) leaves ovate-oblong; calyx turbinate; staminiferous tube shorter than the petals; branches sparing. ♄. S. Native of the Caribbee Islands on the banks of torrents, and of Mexico. M. ovàta, Moc. et Sesse, fl. mex. icon. ined. Flowers white.

Turbinate-calyxed Myrodia. Fl.? Clt. 1793. Shrub 8 ft.

2 M. verticilla'ris (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 477.) leaves oblong, acuminate at both ends; calyx turbinate, irregularly scolloped; column of stamens rather shorter than the petals; floriferous branches whorled. ♄. S. Native of Mexico. Flowers white.

Whorled-branched Myrodia. Fl.? Shrub 6 feet?

3 M. penduliflòra (St. Hil. fl. bras. 1. p. 269. t. 53. A.) leaves obovate, obtusely acuminated on short petioles; peduncles slender, drooping, many-times longer than the petiole. ♄. S. Native of Brazil in the province of Rio Janeiro.

Pendulous-flowered Myrodia. Fl. Sept. Shrub 5 to 6 feet.

Sect. II. Quarari'bea (*Quararibe* is the name of the tree in Guiana). D. C. prod. 1. p. 477. Anthers scattered along the staminiferous column. Corolla twisted in æstivation, not imbricate as in the first section.

4 M. longiflòra (Swartz, fl. ind. occ. 2. p. 1229.) leaves lanceolate-oblong; calyx cylindrical; column of stamens longer than the petals. ♄. S. Native of Guiana on the banks of rivers. Quararíbea Guianénsis, Aubl. guian. 1. p. 962. t. 278. Cav. diss. 3. t. 71. f. 2. Flowers white. The bark of this tree being filamentose is used in Guiana for making lines.

Long-flowered Myrodia. Fl. May. Shrub 6 feet.

Cult. A light rich soil suits the species of this genus best; and half-ripened cuttings taken off at a joint root readily in sand under a hand-glass, placed in heat.

III. PLAGIA'NTHUS (from *πλαγιος*, *plagios*, oblique or lateral, *ανθος*, *anthos*, a flower; because two of the petals are remote from the rest, which causes the flower to have an oblique appearance). Forst. gen. t. 43. D. C. prod. 1. p. 477.

Lin. syst. *Monadélphia, Polyándria.* Calyx naked, 5-cleft. Petals 5, ovate, two of which are approximate and remote from the others. Stigma club-shaped. Berry? A branched shrub with narrow, fascicled leaves, and solitary, 1-flowered pedicels.

1 P. divarica'tus (Forst. l. c.). ♄. H. Native of New Zealand. Branches divaricating. Leaves small, in bundles, linear. Flowers solitary, small, reddish?

Divaricating-branched Plagianthus. Fl. June, July. Clt. 1820. Shrub 8 feet.

Cult. This shrub will stand our winters well if planted in a sheltered situation; young cuttings will root freely in sand under a hand-glass.

IV. MATI'SIA (in memory of M. Matis, an artist attached to the botanical expedition of Humboldt in New Granada). H. B. pl. æquin. 1. t. 2. nov. gen. amer. 5. p. 306. D. C. prod. 1. p. 477.

Lin. syst. *Monadélphia, Polyándria.* Calyx naked, irregularly 2-5-toothed, ruptured at the side, permanent. Petals ovate. Column of stamens 5-cleft at the apex, with 12 anthers on each lobe or division, all leaning to the outer side. Stigma 5-furrowed. Drupe ovate, 5-celled; cells 1-seeded. Albumen mealy? Cotyledons wrinkled.

1 M. corda'ta (H. B. l. c.). ♄. S. Native of New Granada

and the warmer parts of Peru. A tall tree with stalked, cordate, 7-nerved, entire, smooth leaves; and drooping, aggregate bundles of flowers, which are rose-coloured on the inside and silky on the outside, rising from the sides of the branches.

Cordate-leaved Matisia. Tree 30 to 40 feet.

Cult. A light rich soil will suit this tree well, and half-ripened cuttings taken off at a joint and planted in sand under a hand-glass will root freely, if placed in heat.

V. POURRE'TIA (in honour of Abbe Pourret, a French botanist who travelled in Spain; author of several botanical papers in the Memoirs of the Royal Academy of Toulouse). Willd. spec. 3. p. 844. D. C. prod. 1. p. 477. Cavanillèsia, Ruiz, et Pav. fl. per. p. 26.

Lin. syst. *Monadélphia, Polyándria.* Calyx naked, 5-parted, campanulate, permanent. Petals 5. Stamens joined in a cylinder at the base but divided into 5 bundles at the top. Stigma capitate. Capsules 1-celled, indehiscent, somewhat coriaceous, with 5 large, leafy wings; cells 1-seeded, many, usually abortive. Cotyledons twisted, chrysalus-like. Corr. ann. mus. 9. p. 293. t. 26. Trees with 5-7-lobed deciduous leaves, and umbels of flowers rising before the leaves.

1 P. arbòrea (Willd. spec. 3. p. 844.) leaves cordate. ♄. S. Native of Peru on the Andes. Cavanillèsia umbellàta, Ruiz. et Pav. prod. p. 97. t. 20. A tree with a thick trunk bulging out in the middle; wood spongy. Flowers umbellate, red, very fugacious.

Tree Pourretia. Tree 40 feet.

2 P. platanifòlia (H. B. pl. æquin. 2. p. 162. t. 133.) leaves somewhat peltate, 5-7-lobed. ♄. S. Native in the province of Carthagena. Cavanillèsia platanifòlia, H. B. et Kunth, nov. gen. amer. 5. p. 306. Petals flesh-coloured, clothed with rusty down on the outside. Flowers in umbels.

Plane-tree-leaved Pourretia. Tree 60 feet.

Cult. The species of this genus will thrive well in a mixture of loam and peat; the cuttings should not be too ripe and they should be taken off at a joint; they will then root freely in sand under a hand-glass, in a moist heat.

VI. MONTEZU'MA (in honour of Montezuma, once sovereign of Mexico). Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 477.

Lin. syst. *Monadélphia, Polyándria.* Calyx naked, hemispherical, truncate, sinuately-toothed. Petals 5, somewhat sinuated, large. Stamens indefinite, spirally twisted about the style, in a long column which has 5 somewhat distinct furrows. Style ending in a club-shaped ligulate stigma. Berry globose, 4-5-celled; cells many-seeded. A large spreading tree.

1 M. speciosíssima (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 477.). ♄. S. Native of Mexico. Leaves smooth, heart-shaped, acute, entire, stalked. Pedicels 1-flowered, rising from the branches beneath the leaves. Flowers large, of a purplish-scarlet colour.

Very-shewy Montezuma. Clt. 1827. Tree 40 feet.

Cult. This very shewy tree will thrive well in a mixture of loam and peat, and cuttings, not too ripe, taken off at a joint, will root freely in sand under a hand-glass, in a moist heat.

VII. OPHE'LUS (from *οφελος, ophelos*, use; in allusion to the economical use of the fruit in Cochin-china). Lour. coch. p. 412. D. C. prod. 1. p. 478.

Lin. syst. *Monadélphia, Polyándria.* Calyx naked, 5-cleft; lobes acute, spreading, reflexed. Petals 5, thick. Stamens indefinite, joined at the base into a tube, somewhat reflexed at the top. Stigma multifid. Berry woody, oblong-ovate, 12-celled, many-seeded. This tree is nearly allied to *Adansònia.*

1 O. situla'rius (Lour. l. c.). ♄. G. Native of the eastern coast of Africa by the sea-shore. Adansònia sítula, Spreng. syst. 3. p. 124. Leaves scattered, oblong, quite entire, smooth, stalked. Flowers white, solitary, terminal, 3 inches in diameter. The fruit is large and woody; it has a lid which is easily separated, and when cleared from the pulp and seed is used in Cochin-china for holding water or any liquor.

Bucket Ophelus. Tree 40 feet.

Cult. Require the same treatment as *Adansònia*, both in cultivation and propagation.

VIII. ADANSO'NIA (in honour of Michael Adanson, a French botanist and traveller at Senegal, author of Voyage de Senegal and Famille des Plantes, died 1727). Lin. gen. no. 836. D. C. prod. 1. p. 478.

Lin. syst. *Monadélphia, Polyándria.* Calyx naked, deciduous, 5-parted. Petals 5, joined almost to the middle. Urceolus of stamens expanded at the top. Style very long. Stigmas many, stellate. Capsules indehiscent, woody, 10-celled; cells many-seeded, filled with farinaceous pulp about the seeds. A spreading tree with a thick spongy trunk, palmate leaves, with 3 leaflets in the young plants, but 5-7 on the adult ones, and large, white flowers with purplish anthers, on long axillary solitary pedicels.

1 A. digita'ta (Lin. spec. 960.). ♄. S. Native of the western coast of Africa. Cav. diss. 5. p. 298. t. 15. Lam. ill. t. 588. Hook, bot. mag. t. 2791 and 2792. A. Baobáb, Gært. fr. 2. p. 253. t. 135.—Baobáb. Alp. ægyp. 66. t. 67.

This tree is called in many parts on the western coast of Africa *Monkey-bread, Sour-gourd,* and *Bahobab* in Egypt. It is considered the largest or rather the broadest tree in the world. Several trees measured by M. Adanson were from 65 to 78 feet in circumference, but very low in proportion. The trunks were from 12 to 15 feet high before they divided into many horizontal branches, which touched the ground at their extremities; these were from 45 to 55 feet long, and were so large, that each branch was equal to a monstrous tree; and where the water of a neighbouring river had washed away the earth, so as to leave the roots of one of these trees bare and open to the sight, they measured 110 feet long, without including those parts of the roots which remained covered. Adanson calculates as follows. That a tree of

1	year old is	1½	inch	in diameter and	5	inches in height.
20	do.	1	foot	do.	15	do.
30	do.	2	do.	do.	22	do.
100	do.	4	do.	do.	29	do.
1000	do.	14	do.	do.	58	do.
2400	do.	18	do.	do.	64	do.
5150	do.	30	do.	do.	73	do.

The tree arrives at a great age, whence it has been called *arbre de mille ans,* and whence too Humboldt has been led to speak of it as the "oldest organic monument of our planet." The tree yields a fruit which resembles a gourd, and which serves for vessels of various uses; the bark furnishes a coarse thread which they form into ropes, and into a cloth, with which the natives cover their middle from the girdle to the knees; the small leaves supply them with food in a time of scarcity, while the large ones are used for covering their houses. The dried leaves, reduced to a powder, constitute *halo,* a favourite article with the natives of the eastern coast of Africa, and which they mix daily with their food, for the purpose of diminishing the excess of perspiration occasioned by the heat of those climates; even Europeans find it serviceable in cases of diarrhœa, fevers, and other diseases. At Sierra Leone this tree does not grow larger than a common apple-tree. The wood is spongy, soft,

and light, and is of no use as timber. In Abyssinia the wild bees perforate it for the purpose of lodging their honey in the holes, which honey is reckoned the best in the country. On the eastern coast of Africa the tree is liable to the attack of a species of fungus, which vegetates in the woody part, and which, without changing its colour or appearance, destroys life, and renders the part so attacked very soft. Such trunks as have been so attacked are hollowed out into chambers, and within them are suspended the dead bodies of those who are refused the honour of burial. There they become mummies perfectly dry and well preserved, without any farther preparation or embalmment, and are known by the name of *guiriots*. The farinaceous pulp enveloping the seeds tastes somewhat like gingerbread, and is eaten with or without sugar by the natives. At Bangole it forms the principal part of the food of the natives, who season many of their dishes with it, especially a kind of gruel made of corn called *rooy*. It was the chief support of Major Pedley's expedition for 10 or 12 days. The juice, expressed and mixed with sugar or a syrup made of it, is used in putrid and pestilential fevers. At Cairo they reduce the pulp to a powder, and use it in these disorders, in the lientery, dysentery, and all sorts of fluxes. Owing to these circumstances, the fruit forms an article of commerce. The Mandingos carry it to the eastern and more southern parts of Africa, and through the medium of the Arabs it reaches Morocco and even Egypt. If the fruit is decayed or injured it is burned; the leys are boiled with rancid palm-oil, and the negroes use it instead of soap.

Digitate-leaved Adansonia, Monkey-bread-tree, or Ethiopian Sour-gourd. Fl Nov. Clt. 1724. Tree 30 feet.

Cult. A rich loamy soil suits this tree well; and large, ripened cuttings will root in a pot of sand under a hand-glass, in a moist heat.

IX. CAROLI'NEA (in honour of Sophia Caroline, Marchioness of Baden, a name which will be always dear to botanists). Lin. fil. suppl. p. 51 and 314. D. C. prod. 1. p. 478. —Pachìra, Aubl. guian. 2. p. 725.

Lin. syst. *Monadélphia, Polyándria* Calyx naked, cup-shaped, truncate, permanent. Petals 5, ligulate, and very long. Stamens monadelphous at the base, divided at the top into 5 or more many-anthered bundles; filaments forked, each fork bearing two anthers, one on each filament. Style very long. Stigmas 5, spreading. Capsules woody, 5-valved, 5-celled, with a dissepiment in the middle of each valve, but it is sometimes so narrow as to make the fruit appear 1-celled, many-seeded. Seeds covered with a kind of fleshy aril, and sometimes with silky wool. Cotyledons according to the younger Lin. are plaited.—Trees with palmate compound leaves and large showy flowers, which are solitary in the axillæ of the upper leaves.

1 C. pri'nceps (Lin. fil. suppl. 314.) leaflets 5-8, ovate-lanceolate, acuminate, smooth; peduncles equal with the membranous campanulate calyx, which has 5 glands at the base; petals recurved at the apex; tube of stamens much longer than the calyx. ♄. S. Native of Guiana, Trinidad, and Brazil, in places saturated with sea water. Pachìra aquática, Aubl. guian, 2. p. 725. t. 291 and 292. Cav. diss. 3. p. 176. t. 72. f. 1. Lam. ill. t. 589. Flowers large and very shewy. Petals yellow at the top, and greenish at the base. Filaments red. Anthers purple. Perhaps Pachìra nítida of H. B. et Kunth, nov. gen. amer. 5. p. 302? The fruit is eaten, but very flatulent when taken raw in any quantity (f. 86.).

FIG. 86.

Princely Carolinea. Fl. Sep. Clt. 1787. Shrub 10 feet.

2 C. affi'nis (Mart. fl. bras. 1. p. 85.) peduncles 3-times longer than the cylindrical, coriaceous, thick calyx, which has 5 glands at the base; petals erect; tube of stamens much longer than the calyx; anthers linear, fixed above the base; style tomentose at the base. ♄. S. Native of Para on the margins of canals and banks of rivers. Leaves not known. Flowers brownish-green on the outside, but whitish within.

Allied Carolinea. Shrub 6 to 10 feet.

3 C. fastuo'sa (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 478.) leaflets 5, obovate, obtuse; calyx truncate, quite entire; petals turned back on the calyx. ♄. S. Native of New Spain in moderately warm places. Xilóxochitl flòre capillàceo, Hern. mex. 68. icon. Flowers blood-coloured. Stamens monadelphous, not polyadelphous as in the figure. Leaflets emarginate at the apex, sometimes purplish.

Disdainful Carolinea. Shrub 12 feet.

4 C. insi'gnis (Swartz, fl. ind. occ. 2. p. 1202.) leaflets 5-7, obovate-oblong; calyx sinuated, smooth; petals erect, spreading at the top; anthers oblong, incumbent; ovary tomentose. ♄. S. Native of Martinique, Tobago, and other West India islands; also on the main land of South America, especially in Guiana, Cayenne, Brazil, and Vera Cruz. Lodd. bot. cab. 1004. Bómbax grandiflòrum, Cav. diss. 5. p. 295. t. 154. Flowers long, of a pale-red colour, downy without and smooth within. Anthers white. Style red.

Shewy-flowered Carolinea. Fl. July, Aug. Clt. 1796. Tree 60 feet.

5 C. arena'ria; leaves? flowers 4 inches long; tube of stamens near an inch and a half, smooth; anthers trochleately-arcuate or spiral. ♄. S. Native of Brazil in the province of Minas Novas. Pachìra arenària, St. Hil. fl. bras. 1. p. 261. Calyx long, cup-shaped, truncately 5-toothed, smooth, with a whorl of glands at the base. Petals narrow, ligulate, velvety-tomentose on both sides, brownish-green without, and white within. Filaments twin, smooth, red; anthers adhering by their middle, as in *C. marginàta*.

Sand Carolinea. Fl. May. Shrub 7 to 8 feet.

6 C. tomentòsa (Mart. fl. bras. 1. p. 85. t. 56.) leaflets 8-9, obovate, obtuse, coriaceous, tomentosely hairy; peduncles tomentose, equal in length to the coriaceous, urceolate calyx, which has many glands at the base; petals erect; tube of stamens length of calyx; anthers oblong; style smooth. ♄. S. Native of Brazil in the province of Minas Geraes. A small tree, with axillary, terminal, solitary flowers. Petals reflexed at the apex, covered with brownish tomentum on the outside, but white within. Filaments 5, forked or simple; anthers rose-coloured.

Tomentose Carolinea. Fl. Feb. Tree 10 to 15 feet.

7 C. longiflòra (Mart. fl. bras. 1. p. 86.) peduncles twice the length of the campanulate, coriaceous calyx; petals spreadingly reflexed; tube of stamens 3-times longer than the calyx; anthers kidney-shaped, fixed by the middle; style smooth. ♄. S. Native of Brazil in the province of Minas Geraes at the height of 1600 feet above the level of the sea. Flowers of a greenish-olive colour on the outside, but white within, wholly tomentose.

Long-flowered Carolinea. Shrub 10 to 15 feet.

8 C. macra'ntha; leaves? flowers a foot and a half long; tube of stamens 2 inches, smooth; anthers circinnately-trochleate. ♄. S. Native of Brazil in the province of Minas Geraes about Retiro. Pachìra macrántha, St. Hil. fl. bras. 1. p. 261. Calyx long, cup-shaped, truncately entire. Petals long, narrow, ligulate, velvety-tomentose on the outside, or greenish-brown,

smooth and reddish within on the lower part, but silky and whitish on the upper part. Filaments in pairs. This species comes near *C. insígnis*.

Large-flowered Carolinea. Tree 20 to 30 feet.

9 C. mìnor (Sims, bot. mag. t. 1412.) leaflets 7, elliptical-oblong, acute at both ends; calyx truncate; petals erect. ♄. S. Native of Mexico and Guiana. C. pompàlis, Moc. et Sesse, fl. mex. icon. ined. Bómbax Carolinioìdes, Donn, cant. 156. Petals green. Filaments red. Anthers yellow. Pedicels longer than the calyx, but in the figure of the fl. mex. much shorter than that in the bot. mag.

Smaller Carolinea. Fl. July, Aug. Clt. 1798. Shrub 10 ft.

10 C. campe'stris (Mart. fl. bras. 1. p. 86.) leaflets 3-5, obovate-oblong, bluntish, smooth on both surfaces; peduncles equal in length to the calyx, with many glands at the base; tube of stamens shorter than the calyx; anthers erect, kidney-shaped; style smooth. ♄. S. Native of Brazil in the province of Minas Geraes, in woods between Tapanhoacanga and Villa do Principe. Corolla reddish or olive-green outside, but greenish-white within. Calyx surrounded by a whorl of glands at the base.

Field Carolinea. Fl. May. Shrub 6 to 10 feet.

11 C. margina'ta; leaflets 7, inarticulated, obovate-lanceolate, obtusely acuminated, marginated, reticulately veined beneath and tomentose; flowers nearly a foot and a half; tube of stamens an inch and a half, woolly; anthers oblong, kidney-shaped. ♄. S. Native of Brazil in the province of Minas Geraes, where it is called *Painera do Campo* by the inhabitants. Pachìra marginàta, St. Hil. fl. bras. 1. p. 6. t. 51. Peduncles terminal under the leaf-bud, 1-flowered. Calyx cup-shaped, truncately entire, with many glands at the base. Petals clothed with brownish down on the outside, and with white wool on the inside. Filaments red, simple, or forked, in 5 bundles. Seeds covered with silky wool.

Marginate-leaved Carolinea. Fl. March. Shrub 8 feet.

12 C. a'lba (Lodd. bot. cab. t. 752.) ♄. S. Native of Brazil. A magnificent tree, with digitate leaves and strong-scented white flowers at the tops of the branches. Calyx flowing with honey. Filaments innumerable, 2-forked, joined into a tube at the base.

White-flowered Carolinea. Fl. July, Aug. Clt. 1817. Tree 20 feet.

Cult. A genus of magnificent shrubs or trees, with splendid leaves and shewy flowers, well adapted for stove conservatories; therefore they deserve to be generally cultivated. They thrive best in a rich loamy soil, and large cuttings taken off at a joint, not deprived of their leaves, will root in sand under a hand-glass, in heat.

X. BO'MBAX (from *βομβυξ, bombyx*, one of the Greek names for cotton; the pods are filled with a fine silky substance like cotton, but it is impossible to spin this substance into thread in consequence of the edges being perfectly smooth. See *Gossýpium.*) Lin. gen. no. 835. exclusive of many species. D. C. prod. 1. p. 478.

Lin. syst. *Monadélphia, Polyándria.* Calyx naked, campanulate, unequally 2-5-lobed, or truncately 5-toothed. Petals 5, joined together, and somewhat connected at the base with the column of the stamens. Stamens numerous, monadelphous at the base, but free at the apex. Anthers inserted by the middle, kidney-shaped or oblong, opening above by a transverse chink. Capsules large, 5-celled, 5-valved, woody; cells many-seeded. Seeds albuminous, enwrapped in silky cotton.—Large trees with soft spongy wood, commonly used for making canoes, palmate leaves, and large scarlet or white flowers usually rising laterally from the trunk or branches, either singly or in clusters.

1 B. Ceìba (Lin. spec. 959.) trunk prickly; leaves palmate, with 5 leaflets; fruit turbinate, concave at the apex. ♄. S. Native of South America, Jamaica, &c. &c. B. quinàtum, Jacq. amer. 192. t. 176. f. 1. Flowers large, pale-red. This is a very large tree; it is called *Ceiba* in some parts of South America. The wood is very light, and not much valued except for making canoes. Their trunks are so large, as when hollowed to make very large ones. In Columbus's first voyage it was related, that a canoe was seen at the island of Cuba made of one of these trees, which was 95 palms long, of a proportionable width, and capable of containing 150 men; and some writers have affirmed that there are trees of the silk-cotton growing in the West Indies, so large as not to be fathomed by 16 men, and so tall that an arrow cannot be shot to their tops. The canoes now made in the West Indies from this tree frequently carry from 15 to 20 hogsheads of sugar from six to twelve hundred weight each, the average about twenty-five tons burden. When sawn into boards and then well saturated with lime-water, the wood bears exposure to the weather many years; it is also formed into laths for roofs, curing pots, and hogshead heading. When the tree decays it becomes a nest for the Macaca beetle, the caterpillar which, when gutted and fried, is esteemed by many persons one of the greatest delicacies. The down which is enclosed in the seed-vessels is very soft and silky; it is seldom used except by the poorer inhabitants to stuff pillows or chairs; and it is generally thought unwholesome to lie upon. The same may be said of most of the species of *Bómbax* and *Eriodéndron*.

Ceiba, or Common Silk-cotton Tree. Clt. 1692. Tree 100 ft.

2 B. Malaba'ricum (D. C. prod. 1. p. 479.) trunk prickly; leaves palmate, with 5 or 7 oblong, entire, acuminated leaflets; fruit oblong, blunt. ♄. S. Native of Malabar and Bengal; also of Java. B. heptaphýllum, Cav. diss. 5. p. 296. Roxb. cor. 3. t. 247.—Rheed. mal. 3. t. 52. Flowers in fascicles near the extremities of the branches, scarlet or red on the inside, but pale on the outside. Calyx irregularly 2 or 3-lobed, or 5-6-cleft. The wool in the pods is used in India to stuff pillows and beds.—There is also a variety of this tree with white flowers.

Malabar Silk-cotton Tree. Tree 80 feet.

3 B. insi'gne (Wall. pl. rar. asiat. 1. p. 74. t. 79 and 80.) trunk unarmed; leaflets 9, obovate, short-acuminated, glaucous beneath, as well as the petioles; corolla 4-times longer than the 2-lobed calyx; stamens shorter than the corolla; petals villous on the outside; capsule very long. ♄. S. Native of the Burman empire near Yenangheun. Flowers large, red, very showy, solitary on the naked branches. Stamens monadelphous at the base, but separating into 4-5 bundles at the top. Anthers kidney-shaped, fixed by the middle, yellow.

Shewy Silk-cotton Tree. Tree 20 to 30 feet.

4 B. septena'tum (Jacq. amer. 193. exclusive of the synonymes,) trunk unarmed, corky; leaves palmate, with 7 entire leaflets. ♄. S. Native of Carthagena. B. heptophýllum, Lin. spec. 960. Flowers crimson. Fruit like that of *Eriodéndron anfractuòsum*.

Seven-leaved Silk-cotton Tree. Clt. 1699. Tree 66 feet.

5 B. Buonopoze'nse (Beauv. fl. d. ow. et de ben. 2. p. 42. t. 83.) trunk unarmed. ♄. S. Native of Guinea in the kingdom of Waree near Buonopozo. Calyx quite entire, capsule formed with a small circle on the margin. Flowers red, woolly on the outside.

Buonopozo Silk-cotton Tree. Tree 100 feet.

6 B. globòsum (Aubl. guian. 2. p. 701. t. 281.) trunk unarmed; leaves palmate, with 5 oval, blunt, entire, emarginate leaflets; calyx bluntly 5-lobed; fruit globose. ♄. S. Native of Guiana and Cayenne. Cav. diss. 5. p. 297. t. 155. Flowers disposed in axillary and terminal racemes. Pedicels 1-flowered. Calyxes smooth. Petals oblong, woolly on the outside, pale on the inside. Stamens shorter than the petals.

Globose-fruited Silk-cotton Tree. Clt. 1824. Tree 20 feet.

7 B. TOMENTO'SUM (St. Hil. fl. bras. 1. p. 263.) trunk unarmed; leaflets 5, ovate-lanceolate, entire, scabrous above, but cinereously-tomentose beneath, and dotted with black; peduncles hoary-tomentose, inflated just under the flower, hollow inside. ♄. S. Native of Brazil in the province of Goyaz near Villa Boa. Flowers in axillary fascicles, silky, white; petals obliquely emarginate; anthers 2-celled?

Tomentose Silk-cotton Tree. Fl. June. Tree 30 feet?

8 B. ELLI'PTICUM (H. B. et Kunth, nov. gen. amer. 5. p. 299.) trunk unarmed; leaves palmate, with 5 rounded, elliptical, quite entire, smooth leaflets, which are retuse at the apex; calyx entire. ♄. S. Native of South America. Petals rose-coloured on the inside, but covered with rusty tomentum on the outside. Filaments red, length of petals.

Elliptical-leafletted Silk-cotton Tree. Tree 60 feet.

9 B. PARVIFLÒRUM (Mart. fl. bras. 1. p. 91. t. 57.) trunk unarmed; leaflets 3-5, obovate-lanceolate, obtuse or emarginate, coriaceous, smooth; peduncles and calyxes smooth; petals tomentose, 3-times longer than the calyx; ovary smooth. ♄. S. Native of Brazil in the province of Minas Geraes at the river St. Francisco. Flowers silky-villous, 3 or 4 in a fascicle, rarely solitary. Anthers kidney-shaped.

Small-flowered Silk-cotton Tree. Fl. June, July. Tree 25 feet.

10 B. PUBE'SCENS (Mart. fl. bras. 1. p. 91. t. 58.) trunk unarmed; lower leaves quinate, upper ones ternate; leaflets obovate, elliptical, emarginate, coriaceous, smooth, or covered with black dots of stellate pili beneath; pedicels inflated and hollow under the flower, and are as well as calyxes, covered with black dots of stellate tomentum; petals tomentose, 3-times longer than the calyx; ovary smooth. ♄. S. Native of Brazil in the province of Minas Geraes, where the tree is called *Embirussu*, from the bark being very tough, which is made into ropes. Flowers white from silky tomentum.

Pubescent Silk-cotton Tree. Tree 25 to 30 feet.

11 B. CORIA'CEUM (Mart. fl. bras. 1. p. 93.) unarmed; leaflets 3, oblong, acutish, entire, coriaceous, smooth, marginated; fruit scabrous, pear-shaped. ♄. S. Native of Brazil on mount Arara-coara on the confines of Peru.

Coriaceous-leaved Silk-cotton Tree. Tree 30 feet.

12 B. RETU'SUM (Mart. fl. bras. 1. p. 92. t. 59.) trunk unarmed; leaflets 3-4 or 5, obovate, retuse, smooth; peduncles and calyxes smooth; petals 6-times longer than the calyx, finely tomentose; ovary tomentose. ♄. S. Native of Brazil in the province of Minas Geraes on hills. Peduncles axillary or terminal, solitary, or twin. Corolla white from tomentum. Anthers oblong.

Retuse-leaved Silk-cotton Tree. Fl. July. Tree 20 to 25 ft.

13 B. MUNCU'BA (Mart. fl. bras. 1. p. 93. t. 99.) trunk unarmed; leaflets 8, oblong, acuminated, quite entire, smooth; calyx cup-shaped; petals coriaceous, reflexed; stamens numerous, bifid at the top. ♄. S. Native of Brazil in the province of the river Niger, where it is called by the inhabitants *Muncuba*. It is also to be found on the banks of the river Amazon. Petals clothed on the outside with olive villi, but white inside. Flowers 2 or 3 together at the tops of the branches.

Muncuba Silk-cotton Tree. Fl. March, April. Tree 80 to 100 feet.

14 B. DI'SCOLOR (H. B. et Kunth, l. c.) trunk unarmed; leaves palmate, with 5 oblong, acuminated, crenulate leaflets, hairy and green above, hoary from tomentum beneath. ♄. S. Native of South America in warm places near St. Felipe in the province of Jaen de Bracamoros. Flowers white, about the size of those of a citron.

Two-coloured-leaved Silk-cotton Tree. Tree 30 feet.

† *Species not sufficiently known.*

15 B.? VILLÒSUM (Mill. dict. no. 3.) leaves 5-angled, villous; stem jointed. ♄. S. Native of New Spain. Flowers unknown. The down enclosed in the pod is of a fine purple colour, and the inhabitants of New Spain spin it and work it into garments, which they wear without dyeing.

Villous Silk-cotton Tree. Tree?

16 B. CUMANE'NSE (H. B. et Kunth, nov. gen. amer. 5. p. 300.) unarmed; leaves palmate, with 7 stalked, lanceolate, acuminate, quite entire, smooth leaflets, which are paler beneath. ♄. S. Native of South America near Cumana. Perhaps different from *B. septenàtum*.

Cumana Silk-cotton Tree. Tree 50 feet.

17 B. MOMPOXE'NSE (H. B. et Kunth, l. c.) trunk prickly; leaves palmate, with 7 and 9 almost sessile, obovate-lanceolate, acuminated, membranaceous, smooth leaflets, which are remotely toothletted towards the apex. ♄. S. Native of South America on the banks of the river Magdalena near Mompox. Flowers and fruit unknown.

Mompox Silk-cotton Tree. Tree 40 feet.

18 B. ORINOCE'NSE (H. B. et Kunth, l. c.) trunk unarmed; leaves palmate, with 5 and 6 oblong, acuminated, quite entire, membranaceous, smooth leaflets. ♄. S. Native on the banks of the river Orinoco. Flowers unknown.

Orinoco Silk-cotton Tree. Tree 60 feet.

Cult. The species of *Bómbax* grow best in rich loamy soil. Cuttings should not be too ripe, and if they are taken off at a joint they will root freely in sand under a hand-glass, in a moist heat; but plants raised from seeds brought from the places of their natural growth make finer trees. None of the species have ever flowered in our stoves, and it is not likely they ever will, as the most of them acquire a height of 50 or 60 feet before they attempt to flower in their native countries.

XI. ERIODE'NDRON (from *εριον, erion*, wool, and *δενδρον, dendron*, a tree; alluding to the capsule being filled with a fine silky woolly substance). D. C. prod. 1. p. 479.—Ceìba, Plum. gen. 42. t 32. Gært. fruct. 2. p. 244. t. 133.

LIN. SYST. *Monadélphia, Polyándria*. Calyx naked, irregularly 5-lobed; lobes usually twin. Petals 5, joined together as well as being connected with the column of the stamens at the base. Filaments joined together into a short tube at the base, but divided into 5 bundles at the apex; which are filiform and bearing each 1, 2, or 3 linear or anfractuous anthers at the apex, which have the appearance of one anther, they are either adnate or versatile. Style crowned by a 5-6-cleft stigma. The rest of the character as in *Bómbax*. Large trees with spongy wood, which is of little use except for making canoes, as the larger species of *Bómbax*. The leaves are palmate. The flowers are large, red, white, scarlet, rising singly or in clusters from the sides or tops of the branches.

1 E. LEIANTHE'RUM (D. C. prod. 1. p. 479.) anthers reticulated; leaflets 5-7, ovate, cuspidate, quite entire. ♄. S. Native of Brazil near Rio Janeiro. Bómbax eriánthus, Cav. diss. 5. p. 294. t. 152. f. 1. Trunk and branches prickly. Flowers subterminal and lateral at the tops of the branches. Corolla large, white, woolly on the outside. Anthers adnate, the whole length of the filaments.

Smooth-anthered Wool-tree. Clt. 1818. Tree 70 feet.

2 E. ANFRACTUÒSUM (D. C. prod. 1. p. 479.) anthers versatile, anfractuous; leaflets 5-7-8, entire, or serrulated above, lanceolate, cuspidate, glaucous beneath; trunk usually prickly. ♄. S. Bómbax pentándrum, Lin. spec. 959. Cav. diss. 5. p. 293. t. 151. Bómbax orientàle, Spreng. syst. 3. p. 124. Trunk prickly or rarely unarmed. Corolla smaller than that of *B. occi-*

dentàle, clothed with silky wool on the outside and yellowish on the inside.

Var. α, *I'ndicum* (D. C. prod. 1. p. 479.) flowers in fascicles from a short peduncle; yellowish on the inside, white on the outside. ♄. S. Native of the East Indies.—Rheed. mal. 3. t. 49. and 51.—Rumph. amb. 1. t. 80.

Var. β, *Africànum* (Brown, cong. p. 10.) flowers large, crimson, fascicled. ♄. S. Native of Guinea. This is the largest and tallest tree in Guinea, the trunk of which is made into very large canoes.

Winding-anthered Wool-tree. Clt. 1739. Tree 150 feet.

3 E. OCCIDENTA'LE; anthers anfractuous, versatile; leaflets 7, serrulated, smooth and green on both surfaces; flowers fascicled, pentandrous, woolly outside, and rose-coloured on the inside; trunk prickly. ♄. S. Native of the Caribbee islands and South America. Bómbax pentándrum, Jacq. amer. 191. t. 176. f. 70. B. occidentàle, Spreng. syst. 3. p. 124. Eriod. anfractuòsum β, Caribæ'um, D. C. prod. 1. p. 479. The flowers are said to be in short compound racemes by Jacquin.

Western Wool-tree. Clt. 1739. Tree 30 to 60 feet.

4 E. SAMAU'MA (Mart. fl. bras. 1. p. 89. t. 98.) anthers anfractuous, versatile; leaflets 5-7, oblong, quite entire, acuminated; trunk prickly; petals obovately-spatulate, covered with fulvous down on the outside. ♄. S. Native of Brazil near the river Japura, Bómbax Samaùma, Spreng. Flowers on the tops of the branches, solitary, lateral, or subterminal, cream-coloured. The wool contained in the fruit is called *Samauma* in Brazil, with which the natives stuff pillows and bolsters.

Samauma Wool-tree. Tree 80 to 100 feet.

5 E. ÆSCULIFÒLIUM (D. C. prod. 1. p. 479.) anthers anfractuous; leaflets 7-8, sharply serrated; trunk unarmed. ♄. S. Native of New Spain by the sea-shore near Campeche. Bómbax axillàre, Moc. et Sesse. fl. mex. icon. ined. Bómbax æsculifòlium, H. B. et Kunth. Leaflets lanceolate-oblong, acuminated and mucronate, smooth. Petals rose-coloured, hairy on the outside, equal in length with the stamens. Flowers, according to the figure in the fl. mex., axillary, and usually solitary, on very short thick pedicels. Flowers pentandrous, covered with rusty tomentum on the outside and rose-coloured and smooth within. (Kunth.)

Horse-chesnut-leaved Wool-tree. Tree 60 feet.

6 E. JASMINODÒRUM (St. Hil. fl. bras. 1. p. 265. t. 52.) anthers anfractuous; style jointed; leaflets 3, ovate, acute, apiculated, with entire undulated margins; petals reflexed, puberulous; tube of stamens thickened at the top and entire; filaments 1-anthered; petals reflexed, puberulous. ♄. S. Native of Brazil in the province of Minas Novas. Trunk unarmed. Peduncles solitary, axillary, and on the naked branches. Flowers smelling of jasmine. Petals white, obovate.

Jasmine-scented Wool-tree. Fl. May. Tree.

Cult. These trees thrive best in a rich loamy soil, and cuttings, not too ripe, taken off at a joint, not deprived of their leaves, will root freely if planted in sand under a hand-glass, placed in a moist heat; but plants raised from seeds make better trees. The trees grow to a large size before they flower in their native countries, it is therefore not likely they can ever be brought to flower in the stoves of this country.

XII. CHORI'SIA (in honour of J. L. Choris, an eminent artist who went round the world with Kotzebue, at the expense of Count Romanzoff, see *Romanzòvia*). Kunth. diss. malv. p. 6. nov. gen. amer. 5. p. 295. D. C. prod. 1. p. 480.

LIN. SYST. *Monadélphia, Polyándria.* Calyx campanulate, 2-5-lobed, with 3 permanent bracteas at the base. Petals 5, elongated. Staminiferous tube double, inner one slender, terete, bearing on the outside at the apex 5 2-anthered lobes, adnate to the base of the outer one, which is short and of 5 bifid sterile lobes. Ovary sessile, ovate, 5-celled? Style 1, filiform, exceeding in length the stamens, crowned by a 5-lobed capitate stigma. Capsule 5-valved, 1-celled? many-seeded. Seeds enveloped in wool. Prickly trees with digitate leaves and large flowers, which are solitary, twin, or tern, in the axils of the upper leaves, with 2 or 3 bracteas under each. Petals villous. Wood soft, spongy.

1 C. INSI'GNIS (H. B. et Kunth, nov. gen. amer. 5. p. 297. t. 485. f. 1.) petals oblong-spatulate, emarginate at the apex, with flat margins. ♄. S. Native on the banks of the river Amazon. Trunk ventricose. Leaflets 5, obovate-oblong, acuminate, smooth, glaucous beneath, obsoletely and undulately-crenated towards the top. Flowers white.

Remarkable Chorisia. Tree 50 feet.

2 C. SPECIÒSA (St. Hil. pl. usu. bras. no. 63. fl. bras. 1. p. 267.) petals ovately-spatulate, emarginate at the apex, with rather undulated margins; leaflets 5-7, lanceolate, acuminated, entire at the base, but the rest acutely serrated. ♄. S. Native of the provinces of Rio Janeiro and Minas Geraes, where it is called by the inhabitants *Arvore de Paina.* Petals white on the outside from down, but reddish and smooth within. The wool which accompanies the seeds is used to stuff bolsters and pillows in Brazil.

Shewy Chorisia. Fl. March. Tree 40 feet.

3 C. VENTRICÒSA (Nees. et Mart. act. bon. xi. p. 101. t. 9.) petals lanceolate-linear, acute, waved, pubescent outside; leaflets 5-7, ovate, acuminated; calyx 2-lobed. ♄. S. Native of Brazil on the banks of Rio das Contas and Rio Itiquirica. Trunk bulged in the middle, covered with spine-like processes. Flowers white. Bómbax ventricòsa, Arrud. in Kost. trav. p. 489. Neuw. bras. reis. 2. p. 247.

Ventricose-stemmed Chorisia. Tree 20 feet.

4 C. CRISPIFLÒRA (H. B. et Kunth, l. c. t. 485. f. 2.) petals linear, blunt, with undulately-curled margins; leaflets 5-7, lanceolate, acuminated, acutely serrated, reticulately nerved. ♄. S. Native of Brazil in woods near Rio Janeiro. Flowers white on the outside from down, but smooth and reddish within.

Curled-flowered Chorisia. Tree 40 feet.

Cult. The species of *Chorísia* require the same treatment as that recommended for *Eriodéndron* and *Bómbax*.

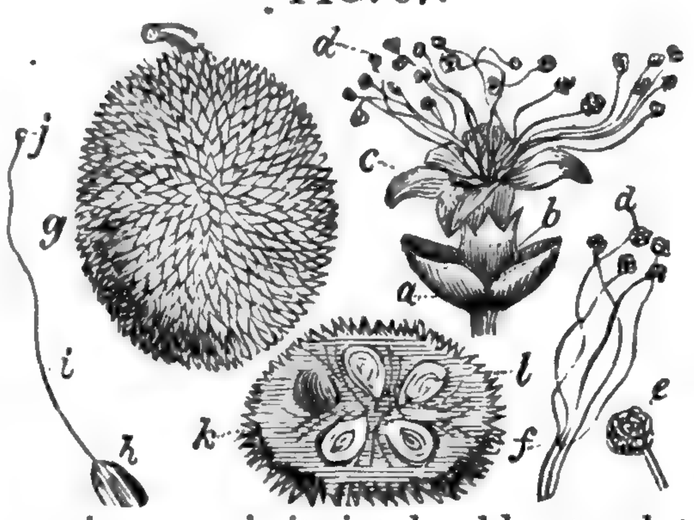
XIII. DU'RIO (from *Duryon*, the name of the fruit in the Malay language, which comes from *dury*, a thorn, in the same language, in allusion to the prickly fruit). Lin. syst. 698. but not of Adans. D. C. prod. 1. p. 480. Konig, in Lin. trans. vol 7. p. 266.

LIN. SYST. *Polyadélphia, Polyándria.* Calyx 5-lobed (f. 87. *b.*), girded by a 2-lobed, concave involucel (f. 87. *a.*). Petals 5, joined together at the base into a tube, longer than the calyx, with a spreading limb (f. 87. *c.*). Stamens numerous, disposed in 5 bundles (f. 87. *d.*), each of these bundles is divided into 5 1-anthered filaments (f. 87. *f.*). Anthers anfractuous (f. 87. *e. d.*). Ovary scaly (f. 87. *h.*). Style filiform (f. 87. *i.*). Stigma roundish (f. 87. *j.*). Fruit roundish (f. 87. *g.*), muricated, about the size of the bread-fruit, 5-celled (f. 87. *k.*); cells filled with pulp, 4-5-seeded (f. 87. *l.*). Seeds shining, ovate-oblong. A large tree with oblong, acuminated leaves, rounded at the base, of a lurid-silvery colour beneath and lepidoted.

1 D. ZIBETHÌNUS (Lin. syst. 698. Lam. ill. t. 641. Konig, in Lin. trans. vol. vii. t. 14, 15, and 16.). ♄. S. Native of the East Indies.—Rumph. amb. 1. p. 99. t. 20.—Rheed. mal. Leaves like those of the cherry, green and smooth above and covered with brownish scales beneath. The fruit is about the

size of a man's head. It is said to be the most delicious of all the fruits of India. The eatable part of it is that aril-like substance which contains the kernels, and which most resembles cream or the blanc-manger of our tables; but a considerable drawback from the extreme gratification it procures to the palate of the epicurean, is its intolerable stench; even the rinds emit such an offensive effluvia, that at Amboyna, as Rumphius and Valentine state, it is forbidden by the law to throw them out near any public path. Some compare this smell to that of putrid animal substances, others to that of rotten onions; but all agree that if the first repugnance is once overcome no fruit is more enticing than the *durion*. These qualities are so very well known, that it is surprising to find it mentioned in the Histoire des Voyages, and copied from thence by Lamarck in his Encyclopedie, that the fruit of the *durion* diffuses an excellent odour, but that its taste is rather unpleasant, it being that of fried onions. The fruit is used as a bait to entrap the civet-cat, which is very fond of it; hence the specific name.

FIG. 87.



Civet-cat Durion. Clt. 1825. Tree 80 feet.

Cult. This tree will thrive well in a rich loamy soil, and cuttings not too ripe, taken off at a joint, not deprived of their leaves, will root in sand under a hand-glass, in a moist heat.

XIV. OCHRO'MA (from ωχρος, *ochros*, yellow; in allusion to the wool in the pods being yellow, as well as to the colour of the flowers). Swartz, act. holm. 1798. p. 148. t. 6. D. C. prod. 1. p. 480.

Lin. syst. *Monadélphia, Pentándria.* Calyx tubular at the base, somewhat funnel-shaped, hardly 5-cleft, with 3 rounded flat lobes and 2 acutish ones. Petals 5, larger than the calyx. Anthers anfractuous. Stigmas 5. Capsules 5-celled, clothed on the inside with silky brownish wool. Seeds numerous, oblong. Trees with soft spongy wood, and long leaves, and solitary, terminal, 1-flowered peduncles.

1 O. lago'pus (Swartz, fl. ind. occ. 2. p. 1144. t. 23.) leaves cordate, 5-7-angled, rather lobed, toothletted, downy beneath, with rusty nerves. ♄. S. Native of Jamaica, Hispaniola, Porto-Rico and the hotter parts of Mexico on the mountains. Bómbax pyramidàle, Cav. diss. 5. p. 294. t. 155. Flowers large, erect, pale-brown or yellowish. Capsule more than a foot long. The wood of this tree is white, tender, and so light, that it is used instead of corks to fishing nets. The capsules contain a very fine, soft, rufous down, in which the seeds are involved, and which down is said to be used in the manufacture of English beavers.

Hare's-foot Ochroma. Clt. 1802. Tree 40 feet.

2 O. tomentòsa (Willd. enum. 693.) leaves cordate, somewhat 3-lobed, repand, rather tomentose beneath. ♄. S. Native of South America.

Tomentose-leaved Ochroma. Clt. 1816. Tree 20 feet.

Cult. These trees grow freely in a mixture of loam and peat, and cuttings will root freely under a hand-glass, in heat.

XV. CHEIROSTE'MON (from χειρ, *cheir*, the hand, and στημον, *stemon*, a stamen; the stamens are 5 in number, the filaments are united at the base, and are recurved at their top, which gives them the appearance of a hand). H. B. pl. æquin. 1. t. 44. nov. gen. amer. 5. p. 302. D. C. prod. 1. p. 480. Chiranthodéndron, Larr. diss. with a figure.

Lin. syst. *Monadélphia, Decándria.* Calyx somewhat campanulate, 5-parted, furnished with 3 bracteas on the outside at the base; sepals deciduous, thick, coloured on the inside, foveolate at the base, 5 inches long in the bud. Petals none. Stamens? Filaments connate into a tube which is 5-cleft at the top, with the lobes leaning to one side, exserted at the apex, mucronate, bearing on the back of each lobe two linear anthers which open lengthwise. Style 1. Stigma acute. Capsule oblong, 5-angled, 5-celled, 5-valved, with a villous dissepiment in the middle of each valve. Seeds 15-18 in each cell, egg-shaped, corunculate. Albumen fleshy. Embryo slender. Cotyledons flat. A tall tree 15 feet in diameter, with 5 or 6 lobed, palmate-nerved leaves, and solitary hoary-tomentose flowers on the branches nearly opposite the leaves, bi-bracteolate at the base.

1 C. platanoi'des (H. B. l. c.). ♄. S. Native of New Spain near Toluco. Tiles. act. Petrop. 5. p. 321. t. 9. Fisch. p. 581.—Hern. mex. 383. f. 1. and 459. f. 2.

Plane-like Cheirostemon. Clt. 1820. Tree 100 feet.

Cult. This fine tree succeeds well in a mixture of turfy loam and peat, or any rich light soil; and half-ripened cuttings, planted in pots of mould, without shortening their leaves, placed under a hand-glass in heat, will soon strike root.

Order XXXII. STERCULIA'CEÆ (plants agreeing with *Stercùlia* in important characters). Vent. R. Brown, cong. Kunth, diss. malv. p. 6. nov. gen. amer. 5. p. 309.—Byttneriàcæ, Tribe 1. Stercùleæ, D. C. prod. 1. p. 1. p. 481.

Flowers unisexual from abortion. Calyx naked, 4-5-lobed, deciduous, constantly valvate in æstivation. Petals wanting. Stamens 4-5-20, monadelphous around the rudiment of the pistil, always quinary or quaternary in number. Anthers bilocular. Styles equal in number to the cells of the ovary, joined into one, crowned by as many stigmas or lobes. Carpels 4-5, distinct, sometimes fewer from abortion, usually pedicellate, each crowned by a style, 1, or many-seeded, dehiscent above or indehiscent. Albumen fleshy or wanting. Embryo erect, in the seeds with albumen the cotyledons are flat and leafy, in those without albumen they are very thick and unequal, with an ovate, short radicle, pointing towards the hilum. This order is distinguished from *Malvàceæ* and *Bombàceæ* in the anthers being 2-celled, not 1-celled, from *Byttneriàceæ* in the carpels being distinct and stellately disposed, not joined together into 1 fruit. It is distinguished from *Tiliàceæ* in the filaments being monadelphous at the base, not free. The order is composed of large umbrageous tropical trees, with simple or compound leaves, and axillary panicles or racemes of small, white, greenish, or brownish flowers. The seeds of many of the *Stercùlias* are eatable, especially those of the famous *Kola* or *Cola* of Africa, which possess the property, being chewed, of rendering bad water pleasant to the palate. The seeds of the *Chica*, another noble species of the same genus, are highly esteemed in Brazil for the dessert. The seeds retain their vegetative properties a considerable length of time, therefore they are easily introduced in a living state from their places of natural growth, but the most secure mode would be to plant them in a box of mould, and either send them off directly, or allow them to vegetate before they are shipped.

Synopsis of the Genera.

1 STERCU'LIA. Flowers polygamous or monoecious. Stamens monadelphous; anthers 10-20 in one or two series, solitary or ternately aggregate. Carpels 5, distinct, stipitate, legume-formed, 1 or many-seeded, opening on the upper side.

2 TRI'PHACA. Flowers monoecious. Stamens 15, monadelphous. Style 1. Carpels 3, legume-formed, many-seeded.

3 REEVE'SIA. Flowers hermaphrodite. Stamens monadelphous. Anthers 15, sessile on the top of the tube. Capsule stipitate, 5-celled, 5-valved; cells 2-seeded; seeds winged at the base.

4 HERETIE'RA. Flowers monoecious. Stamens monadelphous; anthers 10, sessile on the top of the tube. Carpels 5, at length drupaceous, and carinately-winged, indehiscent; 1-seeded from abortion.

I. STERCU'LIA (from Sterculius, a god, derived from *stercus*. The Romans, in the height of Paganism have deified the objects of their greatest dislike, and the most immoral actions. They have the gods Sterculius Crepitus, and the goddesses Caca and Pertunda, &c. The flowers as well as the leaves of some species are fetid.) Lin. gen. no. 1086. D. C. prod. 1. p. 481.

LIN. SYST. *Monoe'cia, Monadélphia.* Calyx 5-lobed, somewhat coriaceous. Stamens monadelphous, disposed in a short sessile, or stipitate urceolus. Anthers adnate, 10-15-20 in one or two rows, solitary, or ternately-aggregate. Ovary stipitate or sessile. Carpels follicular, 5, or fewer from abortion, distinct, 1-celled, 1 or many-seeded, opening on the upper side; seeds disposed in 2 series, along the suture of the carpels. Seeds with fleshy albumen, and flat, leafy, equal cotyledons. Trees with simple or compound leaves and axillary panicles or racemes of flowers. This genus requires to be divided into other genera or sections according to the fructification, but as many of the species are not sufficiently known, they are here disposed artificially.

§ 1. *Leaves ovate or oblong, entire, or rarely 3-lobed.*

1 S. BLU'MII; leaves oblong-lanceolate, obtusely acuminated, quite entire, smooth; racemes simple; calycine segments connected at the apex; carpels ovate. ♄. S. Native of Java. S. lanceolàta, Blume, bijdr. ex. Schlecht. Linnæa. 1. p. 654.

Blume Sterculia. Tree 20 feet.

2 S. LANCEOLA'TA (Cav. diss. 5. p. 287. t. 144. f. 1.) leaves quite entire, smooth; racemes simple; calycine segments spreading; carpels few-seeded. ♄. G. Native of China. Lindl. bot. reg. 1256. Carpels oblong, crimson. Seeds black. Flowers reddish-brown, stellate, in small, axillary panicles. Leaves ovate-lanceolate. This differs from the preceding species in the sepals being spreading, not cohering at the base.

Lanceolate-leaved Sterculia. Tree 20 feet.

3 S. BALA'NGHAS (Lin. spec. 1438. excl. syn. Rumph.) leaves elliptic-oblong, bluntish, entire, nearly smooth; flowers panicled; segments of calyx linear, cohering at the apex; carpels ovate or obovate, many-seeded. ♄. S. Native of Malabar and Java. Cavàlam, Rheed. mal. 1. t. 49. S. Balánghas, Cav. diss. 5. p. 286. t. 143. Lois. herb. amer. t. 843.—Balánghas dicta, Burm. zeyl. 84. Flowers purplish. According to Rumphius the seeds are considered as esculent by the inhabitants of Amboyna, who roast them for this purpose, while the capsules are burned for the preparation of the pigment called cassoumba.

Balanghas Sterculia. Fl. June, Sept. Clt. 1787. Tree 30 feet.

4 S. NO'BILIS (Smith, in Rees' cyclop. no. 4.) leaves elliptic-oblong, entire, smooth; segments of calyx linear, cohering at the apex; carpels ovate, mucronate, 1-4-seeded. ♄. S. Native of China. S. monospérma, Vent. malm. t. 91. S. Balánghas, Ait. hort. kew. ed. 2. vol. 5. p. 338. Southwéllia nóbilis, Sal. par. lond. t. 69. exclusive of the synonymes. Flowers panicled, pale buff-coloured, with the odour of *Vanílla*. Seed black.

Noble Sterculia. Clt. 1787. Tree 20 feet.

5 S. ACUMINA'TA (Beauv. fl. d'ow. 1. t. 24.) leaves oblong-acuminated, quite entire, smooth, on long stalks; flowers in axillary panicles; anthers in two rows, sessile; carpels 1-2-seeded. ♄. S. Native of the tropical parts of Africa, particularly on the western coast. Flowers white, with spreading segments. Carpels usually 2, opposite from abortion. There are two varieties of the *Cola*, one with white, the other with reddish seeds. The seeds are about the size of horse-chesnuts.

The seeds of this species are known throughout tropical Africa by the name of *Cola* or *Kola*. They have long been celebrated by voyagers as possessing a high degree of value among the natives of Guinea, who take a portion of one of them before each of their meals, for they believe them to enhance the flavour of any thing they may subsequently eat or drink. The seeds formerly were said to be held in such high estimation among the natives of Guinea, that 50 of them were sufficient to purchase a wife, but at present 20 or 30 seeds can be purchased for a handful of cowries, while 2 or 3 tons of cowries would not purchase a perfect female at the present day. We have eaten the seeds, they have a very bitter taste; they are about the size of a pigeon's egg, of a brownish colour; they are supposed to possess the same properties as Peruvian-bark.

Acuminated-leaved Sterculia or Cola. Clt. 1795. Tr. 40 ft.

6 S. MACROCA'RPA; leaves oblong, acuminate, entire, smooth, on long stalks; flowers axillary, panicled; anthers in two rows, sessile? carpels 4-6-seeded. ♄. S. Native of Guinea. Flowers white. Pods generally 2 from abortion, opposite. The seeds of this tree are also known under the name of *Cola* in Guinea; they possess the same qualities as those of *Stercùlia acuminàta*.

Long-fruited Cola. Tree 40 feet.

7 S. LONGIFÒLIA (Vent. malm. no. 91. in adn.) leaves ovate-oblong, smooth, quite entire; flowers panicled, terminal; segments of calyx erect, hairy on the inside. ♄. S. Native of the East Indies. Flowers white from down. Fruit unknown.

Long-leaved Sterculia. Tree 20 feet.

8 S. RUBIGINÒSA (Vent. malm. no. 91. adn.) leaves oblong, acuminated, smooth above, but clothed with rusty tomentum beneath; racemes simple, tomentose; segments of calyx conniving at the apex; carpels acuminate, many-seeded, wrinkled, and naked on the inside. ♄. S. Native of Java. This tree, according to Smith, is the same as *S. Balánghas* of Cav.

Rusted-leaved Sterculia. Tree 20 feet.

9 S. PUBE'SCENS; leaves oval-oblong, cordate at the base, entire, rarely tricuspidate at the apex, covered with rusty down beneath, as well as the petioles and young branches, on long stalks; flowers in panicles, axillary, crowded; segments of calyx cohering at the apex; carpels 4-5, pubescent, 4-5-seeded. ♄. S. Native of Guinea. S. tragacántha, Lindl. bot. reg. 1363. Resembles *S. Balánghas*. Flowers greenish-red from down. Seeds small, red. There is a gum collected from this tree resembling gum tragacanth in its properties, but it is probable that many of the species have the same kind of substance, as it seems nothing more than the concrete state of the mucilage which is so universal in this order and the two preceding.

Downy-leaved Sterculia. Clt. 1793. Tree 20 feet.

10 S. GRANDIFLO'RA (Vent. malm. no. 91. in a note.) leaves

ovate, acuminated, entire, smooth; calycine segments spreading; tube of stamens almost sessile; styles 5, reflexed. ♄. S. Native of the East Indies and the Mauritius.

Great-flowered Sterculia. Clt. 1820. Tree.

11 S. NI'TIDA (Vent. malm. no. 91. in a note.) leaves lanceolate-oblong, acuminated, entire, smooth; calycine segments spreading; urceolus of stamens almost sessile. ♄. S. Native of Africa. Flowers probably dioecious, in axillary panicles.

Shining-leaved Sterculia. Tree 20 feet.

12 S. FRONDÒSA (Rich. act. soc. nat. par. p. 111.) leaves oblong-obovate, very blunt, somewhat repand, smooth, shining, crowded at the top of the branches; panicles axillary, on long peduncles. ♄. S. Native of French Guiana.

Leafy Sterculia. Tree 20 feet.

13 S. URCEOLA'TA (Smith, in Rees' cycl. no. 3.) leaves elliptical-oblong, acute, pale, coriaceous, smooth, young ones velvety beneath; panicles contracted, few-flowered, hardly longer than the petioles, tomentose; calyx bottle-shaped, stellately-tomentose, with the segments connected at the base. ♄. S. Native of the island of Honimoa near Amboyna. Clompànus mìnor. Rumph. amb. 3. p. 169. t. 107. Carpels many-seeded, scarlet. Flowers of a dirty-white colour, with an offensive smell. Seeds small, red.

Urceolate-calyxed Sterculia. Tree 20 feet.

14 S. COCCÍNEA (Roxb. hort. beng. p. 50.) leaves oblong-lanceolate, obtusely acuminated, smooth; panicles axillary and lateral, nodding; segments of calyx linear, spreading. ♄. S. Native of the East Indies in Silhet. Carpels scarlet, 6-seeded. Seeds covered with a black aril.

Scarlet-follicled Sterculia. Clt. 1817. Tree 20 feet.

15 S. LÆ'VIS (Wall. in Hook. bot. misc. pt. 3. p. 287.) leaves oblong-lanceolate, bluntly acuminated, glabrous; racemes axillary and lateral, drooping; segments of the calyx linear, spreading; follicles scarlet. ♄. S. Native of Pulo-Pinang. S. coccínea, Jack, mal. misc. vol. 1. pt. 1. Hook, bot. misc. pt. 3. p. 287. but not of Roxb. from which it differs in the follicles only containing 2-3 seeds, and in the flowers being racemose, not panicled. The seeds are covered with black pulpy aril.

Smoothed Sterculia. Shrub 10 feet.

16 S. SUBPELTA'TA (Blume, ex. Schlecht. Linnæa. 1. p. 654.) leaves on long petioles, somewhat peltate, oval-oblong, acuminated, quite entire, covered with cobwebbed tomentum beneath; racemes simple; carpels stalked, oblong, tapering to both ends. ♄. S. Native of Java. Young leaves cordate.

Subpeltate-leaved Sterculia. Tree 25 feet.

17 S. ANGUSTIFÒLIA (Roxb. hort. beng. p. 50.) leaves elliptic-lanceolate, tapering to both ends, acuminated, quite smooth; racemes axillary. ♄. S. Native of Nipaul. Reevèsia, Lindl.?

Narrow-leaved Sterculia. Tree 20 feet.

18 S. PARVIFLÒRA (Roxb. hort. beng. p. 50.) leaves obovate, acuminate, somewhat cordate at the base, smooth, except the nerves beneath, which are clothed with rusty down as well as petioles, panicles, and young branches; panicles axillary; sepals conniving at the apex. ♄. S. Native of Silhet and Pulo-Pinang. S. angustifòlia, Jack. mal. misc. 1. no. 1. p. 21. D. C. prod. 1. p. 482. but not of Roxb.

Small-flowered Sterculia. Shrub.

19 S. GUTTA'TA (Roxb. hort. beng. p. 50.) leaves ovate, blunt, thick, smooth, entire; racemes somewhat fascicled, spreading, longer than the leaves; calyxes woolly on the inside, spreading. ♄. S. Native of Malabar on the mountains. Ramena-Pou-Maram, Rheed. mal. 4. t. 61. Root aromatic. Flowers sweet-scented, pale-red, woolly on the inside.

Spotted Sterculia. Clt. 1825. Tree 70 feet.

20 S. WALLI'CHII; leaves ovate-oblong, entire, or with a few large teeth at the apex, smooth above, but villous on the nerves beneath; racemes long; flowers in fascicles; sepals very villous, at length spreading. ♄. S. Native of the East Indies.

Wallich's Sterculia. Tree 20 feet.

21 S. OBLONGIFÒLIA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 482.) leaves oblong, acute, tapering to the base, quite entire, smooth; flowers in lax racemes; calyxes spreading; genitals almost sessile; carpels somewhat drupaceous, 2-seeded. ♄. S. Native of Mexico.

Oblong-leaved Sterculia. Tree 30 feet.

22 S. HETEROPHY'LLA (Beauv. fl. d'ow. 1. t. 40.) leaves oblong, smooth, tapering to the base, on long stalks, entire or 3-lobed, irregularly toothed; flowers panicled, terminal. ♄. S. Native of Guinea in the kingdom of Waree. Flowers dirty-yellow. The seeds of this species are also called *Cola* in Guinea.

Various-leaved Sterculia. Tree 50 feet.

23 S. IVI'RA (Swartz, fl. ind. occ. 2. p. 1160.) leaves ovate, smooth, acuminated at the apex, entire, rarely 3-lobed; flowers panicled, hermaphrodite. ♄. S. Native of South America in woods. Ivìra prùriens, Aubl. guian. t. 279. I. crinìta, Cav. diss. 5. t. 162. Flowers yellowish, with spreading segments. Carpels covered with stiff bristles at the base, clothed on the inside with stinging, minute, rufous bristles. Seeds 3-5, black. This tree is called *Ivira* in South America.

Ivira Sterculia. Clt. 1793. Tree 60 feet.

24 S. IMBE'RBIS (D. C. prod. 1. p. 483.) leaves ovate, smooth, very blunt and cordate at the base, entire, acuminate; carpels naked at the base, pedicellate. ♄. S. Native of Cayenne. S. Ivìra, Rich. in Pers. ench. no. 10.

Beardless-carpelled Sterculia. Tree 30 feet.

25 S. DIVERSIFÒLIA (G. Don, in Loud. hort. brit. p. 392.) leaves coriaceous, oblong-lanceolate or lanceolate, entire or 3-lobed; lobes acuminate, smooth. ♄. G. Native of New Holland. The rest not seen. S. heterophylla, Cung. mss.

Diverse-leaved Sterculia. Clt. 1824. Tree 20 feet?

§ 2. *Leaves cordate, entire, or somewhat 3-lobed.*

26 S. ALA'TA (Roxb. cor. 3. p. 83. t. 287.) leaves very broad, ovate, acuminated, quite entire, smooth on both surfaces, cordate at the base, with a spreading recess, on long petioles; racemes axillary, solitary, shorter than the petioles; sepals long, lanceolate, acuminated, rusty on the outside as well as the peduncles. ♄. S. Native of Silhet, where the natives eat the seeds as a substitute for opium. Leaves 5-7-nerved at the base. Flowers reddish; sepals reflexed.

Winged Seven-Seeded Sterculia. Tree 30 feet.

27 S. MACROPHY'LLA (Vent. malm. no. 91. adn.) leaves cordate, roundish, entire, thick, tomentose beneath; carpels ovate, very smooth on the inside, 2-seeded. ♄. S. Native of the East Indies. Panicles terminal.

Large-leaved Sterculia. Tree 30 feet.

28 S. CORDA'TA (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 654.) leaves subcordate, oval, acuminated, quite entire, tomentose beneath; panicle nodding; flowers monoecious; calyx 5-cleft; ovaries joined. ♄. S. Native of Java.

Cordate-leaved Sterculia. Tree 30 feet.

29 S. CANDO'LLII (Wall. pl. rar. asiat. 1. p. 4.) leaves roundish, cordate, obtuse, entire, smooth, rather membranaceous; carpels ovate, quite smooth both on the inside and outside, 3-seeded. ♄. S. Native of the island of Timor. S. populifòlia, D. C. prod. 1. p. 483. but not of Roxb. Flowers unknown.

De Candolle's Sterculia. Tree 23 feet.

30 S. POPULIFÒLIA (Roxb. hort. beng. p. 50. Wall. pl. rar. asiat. 1. p. 3. t. 3.) leaves roundish-cordate, entire, membranaceous, acuminated, smooth; racemes axillary, branched, stalked; segments of the calyx linear, obtuse, revolute; follicles ovate, ventricose, terminated by a cultriform, very blunt wing, on long

stipes, smooth without, but villous within. ♄. S. Native of the Coromandel coast. S. populifòlia var. acutiúscula, D. C. prod. 1. p. 483. Flowers downy, scarlet inside, but yellowish on the outside. Seeds grey.

Poplar-leaved Sterculia. Fl. April. Tree 20 feet.

31 S. CHI'CA (St. Hil. fl. bras. 1. p. 278.) leaves 3-lobed, cordate, smooth above, but tomentose beneath; petioles smooth; panicle subterminal, broad, tomentose, rusty; genitals stipitate; ovary very villous; cells 8-ovulate. ♄. S. Native of Brazil in the province of Goyaz, where it is called *Chìca* by the inhabitants, who eat the seeds, which have a very agreeable taste; they are about the size of a pigeon's egg. Cambess. in St. Hil. pl. usu. bras. no. 46. Calyx spreading, yellowish on the outside, and brownish within.

Chica Sterculia. Fl. June. Tree 30 to 40 feet.

32 S. CORDIFÒLIA (Cav. diss. 5. p. 144. f. 2.) leaves subcordate, somewhat acuminate, smooth, sometimes bluntly 3-lobed; carpels acuminated, downy, bristly on the inside, many-seeded. ♄. S. Native of Senegal.

Heart-leaved Sterculia. Tree 20 feet.

33 S. TOMENTÒSA (Thunb. jap. icon. p. 38. but not fl. jap.) leaves cordate, 3-lobed, pubescent beneath; panicle very long, branched; sepals reflexed. ♄. G. Native of Japan.

Tomentose Sterculia. Tree 20 feet.

34 S. TRI'LOBA; leaves large, cordate, with a spreading recess, smooth on both surfaces, 7-nerved, and with 3-acuminated lobes. ♄. S. Native of the East Indies. (v. s. herb. Lamb.)

Three-lobed-leaved Sterculia. Tree 20 feet.

§ 3. *Leaves cordate, 5-lobed.*

35 S. PLATANIFÒLIA (Lin. fil. suppl. 423.) leaves palmately 3-5-lobed, smooth on both surfaces; panicle branched, axillary; calyxes rotate, reflexed. ♄. H. Native of Japan and China. Cav. diss. 5. t. 145. Hibíscus símplex, Lin. spec. 977. Firmiàna, Mars. act. pat. 1. t. 1, 2. Culhàmia, Forsk. descr. 96. syn. dub. ex Salisb. Flowers green. Carpels membranous. A beautiful tree, with leaves like those of the *Sycamore*.

Plane-tree-leaved Sterculia. Fl. July. Clt. 1757. Tree.

36 S. COLORA'TA (Roxb. cor. 1. p. 26. t. 25.) leaves smooth, palmately 5-lobed; lobes acuminate; calyxes cylindrical-clavate; carpels oblong, smooth, membranaceous, on long stalks. ♄. S. Native of the East Indies on the mountains. Calyxes and carpels reddish-scarlet. Flowers racemose. Seeds yellow.

Coloured-calyxed Sterculia. Fl. April. Clt. 1818. Tree 40 feet.

37 S. U'RENS (Roxb. cor. 1. p. 26. t. 24.) leaves pubescent, 7-8-nerved at the base, and cordate with the lobes overlapping each other, 5-lobed at the apex; lobes acuminate; calyxes campanulate; carpels ovate, hispid. ♄. S. Native of the mountains on the Coromandel coast. Panicles terminal, every part covered with a glutinous, farinaceous, yellow down. Flowers small, yellow. The wood is soft and spongy. It is used to make Hindoo guitars. The bark is exceedingly astringent, and tinges the saliva reddish. The seeds are roasted and eaten by the natives; they taste very like parched peas. The capsules are covered on the outside with yellow down, and many stiff, stinging hairs.

Stinging Sterculia. Clt. 1793. Tree 40 feet.

38 S. VILLÒSA (Roxb. hort. beng. p. 50.) leaves 5-7-lobed, acute, villous beneath; lobes 3-lobed; calyxes 5-parted, spreading; carpels coriaceous, scabrous from stellate hairs. ♄. S. Native of Coromandel. Smith in Rees' cycl. no. 16. Racemes panicled.

Villous Sterculia. Clt. 1805. Tree 30 feet.

39 S. PELTA'TA; leaves on long footstalks, peltate, 5-lobed, middle and lower lobes acuminated, the 2 intermediate ones obtuse, with wide, rounded recesses, smooth above, and pubescent beneath; petioles and young branches white from tomentum. ♄. G. Native of China. (v. s. herb. Lamb.)

Peltate-leaved Sterculia. Tree 20 feet.

40 S. HELI'CTERES (Pers. ench. 2. p. 240.) leaves half 5-lobed, somewhat villous beneath; lobes ovate-roundish, acute; calyxes campanulate, with spreading segments, velvety on the outside. ♄. S. Native of Carthagena in woods. Helícteres apétala, Jacq. amer. 238. t. 181. f. 79. Stamens 14-15. Carpels divaricating. Flowers dirty-yellow, with purple spots.

Helicteris-like Sterculia. Clt. 1820. Tree 40 feet.

41 S. CARICÆFÒLIA; leaves palmately 5-lobed, with wide recesses; lobes spatulately-obovate, acuminated at the apex, beset with brown hairs on the nerves beneath, and petioles. ♄. S. Native of Sierra Leone. (v. s. herb. Lamb.)

Carica-leaved Sterculia. Tree 20 feet.

42 S. ACERIFÒLIA (Cuning. mss. in Loud. hort. brit. p. 392.) leaves palmate, 5-lobed. ♄. S. Native of New Holland.

Maple-leaved Sterculia. Clt. 1824. Tree 30 feet.

43 S. PUNCTA'TA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 483.) leaves villous beneath, palmately 5-cleft; lobes ovate-roundish, acuminate; branches and petioles dotted; calyx rotate; carpels 4-seeded, bristly on the inside. ♄. S. Native of New Spain. Panicle branched. Sepals acutish, villous as well as the peduncles.

Dotted-branched Sterculia. Tree 20 feet.

44 S. ABYSSI'NICA (R. Br. in Salt's trav. app.) leaves 3 or obsoletely 5-lobed, coriaceous, smooth, peltately cordate, with the recess closed; racemes panicled; sepals villous, spreading. ♄. S. Native of Abyssinia. Leaves like those of the *Ivy*.

Abyssinian Sterculia. Tree.

§ 4. *Leaves palmate, compound.*

45 S. FŒ'TIDA (Lin. spec. 1431.) leaves compound, with 7-9-oblong, lanceolate, acuminated leaflets; flowers panicled. ♄. S. Native of the East Indies. Cav. diss. 5. t. 141. Sonn. voy. t. 132. Clompànus màjor, Rumph. amb. 3. t. 107. Anthers 15. Carpels many-seeded. Flowers brownish, tinged with red at the base, of an ungrateful smell, as well as every part of the plant when bruised or cut. The wood is pale, lasting, and does not split; it is therefore very proper for the turner, and being well varnished makes handsome vases, &c. It has nothing of the ill smell which the flowers have. The leaves, and especially the bark, are aperient, repellent, diuretic, and diaphoretic. The seeds are oily, and if swallowed incautiously they bring on nausea and vertigo. This happens probably when eaten raw.

Fetid Sterculia. Fl. June, July. Clt. 1690. Tree 20 feet.

46 S. VERSI'COLOR (Wall. pl. asiat. rar. 1. p. 48. t. 59.) leaves peltately-digitate; leaflets 5, oblong, acuminated, tomentose beneath; panicles axillary, branched; flowers monoecious. ♄. S. Native of the East Indies on hills about Segaen, opposite the city of Ava. Flowers at first yellow, but changing to deep orange-colour. Peduncles red. Segment of the calyx connivent at the apex, but at length spreading.

Party-coloured-flowered Sterculia. Fl. Oct. Tree 16 feet.

† *Species the names of which are only known.*

47 S. SCATI'GERA (Wall. mss. in Lin. soc. herb.) carpels large, membranous, veiny, with a seed or tubercle at the base of each. ♄. S. Native of Malabar.

Spine-bearing Sterculia. Tree.

48 S. LANCÆFÒLIA (Roxb. hort. beng. p. 50.) ♄. S. Native of the East Indies at Silhet.

Lance-leaved Sterculia. Tree 30 feet.

Cult. All the species will thrive in a light loamy soil, or a mixture of loam and peat. Ripened cuttings, not deprived of their leaves, will strike root readily in sand under a hand-glass;

those of the stove species require a moist heat. The seeds are difficult to import, therefore they should be sown in boxes, and the plants raised before they are sent off from the places of their natural growth.

II. TRI'PHACA (from τρεις, *treis*, three, and φακη, *phake*, a lentil; in allusion to the three carpels.) Lour. coch. 577. D.C. prod. 1. p. 483.

Lin. syst. *Monoe'cia*, *Monadélphia*. Flowers monoecious. Calyx 5-cleft. Petals none. Stamens in the male flower 15, monadelphous. Style one in the female flower, crowned by a trifid stigma. Carpels 3, legume-shaped, inflated, acuminated, tomentose, many-seeded. Seeds 4-5, oblong-ovate.

1 T. Africa'na (Lour. l. c.) ♄. S. Native on the eastern coast of Africa on the Mozambique coast. Leaves on long stalks, cordate, quite entire. Cymes lateral and terminal. Flowers yellow. Perhaps a species of *Stercùlia*.

African Triphaca. Tree 40 feet.

Cult. This tree will thrive well in a mixture of loam and peat, and ripened cuttings, not deprived of their leaves, will root freely in sand under a hand-glass, in a moist heat.

III. REEVE'SIA (in honour of John Reeves, F. L. S., now resident at Canton, from whose exertions the botany of China has received material assistance, and to whom the British gardens are indebted for many of the fairest ornaments they contain). Lindl. bot. reg. 1236.

Lin. syst. *Monadélphia*, *Dodecándria*. Calyx campanulate, 5-toothed, imbricate in æstivation, tomentose. Petals 5, unguiculate, convolute in æstivation. Stamens joined into a long filiform tube. Anthers 15, sessile, collected into a little head, 2-celled, bursting lengthwise. Ovary sessile, within the antheriferous head. Capsule stipitate, woody, obovate, 5-angled, 5-celled, 5-valved, without any central axis. Seeds 2 in each cell, winged at the base.—A tree with alternate, exstipulate, lanceolate, acuminated, smooth, entire leaves, with the petioles jointed at the top, and compound, terminal, or axillary racemes of white flowers. This tree joins the *Sterculiàceæ* with *Byttneriàceæ*. It agrees with *Stercùlia* in the flowers, but with *Pterospérmum* in the seeds.

1 R. thyrsoi'dea (Lindl. bot. reg. 1236.) ♄. G. Native of China.

Thyrse-like-flowered Reevesia. Fl. Jan. Clt. 1824. Tree 20 feet.

Cult. This tree will require to be propagated and cultivated in the same manner as that recommended for the green-house species of *Stercùlia*.

IV. HERETIE'RA (in honour of Charles Louis L. Heretier de Brutelle, a celebrated French botanist, died in 1800, author of many botanical works,) Dry. in Ait. hort. kew. 3. p. 546. D. C. prod. 1. p. 484.—Balanópteris, Gært. fruct. 2. p. 94.—Samandùra, Lin. fl. zeyl. no. 433.

Lin. syst. *Monoe'cia*, *Monadélphia*. Flowers monoecious. Calyx 5-toothed. Stamens in male flowers 5-10, with the filaments joined into a tube; anthers sessile on the top of the tube. Anthers in the female flowers 10, sessile, 2 between each carpel. Carpels 5, 1-styled, containing few ovulæ, at length drupaceous, coriaceous, with a winged keel, indehiscent, 1-seeded from abortion. Albumen none. Embryo very thick, with fleshy unequal cotyledons, and an ovate, acuminated, radicle. Plumule 2-leaved.—Trees with simple, alternate, lepidoted, entire leaves, and axillary panicles of small, red flowers.

1 H. littora'lis (Ait. hort. kew, l. c.) leaves oval-oblong, rounded at the base, coriaceous, silvery beneath; carpels marked lengthwise with a nerve above. ♄. S. Native of the Philippine islands, Moluccas, Java, &c.—Rheed. mal. 6. t. 21.—Rumph. amb. 3. t. 63. Balanópteris Tothìla, Gært. fruct. 2. t. 99. Leaves large, coriaceous. Flowers small, reddish.

Shore Looking-glass Plant. Clt. 1788. Tree 20 feet.

2 H. Fo'mas (Willd. spec. 4. p. 971.) leaves reticulately veined beneath. ♄. S. Native of the East Indies on the banks of rivers in the kingdom of Ava, where it is called *Fómas*.—Syms. itin. ed. gall. 3. p. 100. t. 28. Leaves silvery beneath.

Fomas Looking-glass Plant. Tree 20 feet.

3 H. mi'nor (Lam. dict. 3. p. 229.) carpels with a longitudinal furrow above. ♄. S. Native of the Mauritius, where it is probably cultivated. Balanópteris mìnor, Gært. fruct. 2. t. 98. f. 2. This is probably the same as *H. Fòmas*.

Smaller Looking-glass Plant. Clt. 1824. Tree 14 feet.

Cult. These trees thrive well in sandy loam, or a mixture of loam and peat. Large ripened cuttings root freely in sand under a hand-glass, in a moist heat. Trees with fine large foliage. Seeds do not retain their vegetative powers long.

Order XXXIII. BYTTNERIA'CEÆ (plants agreeing with *Byttnèria* in some important characters.) Brown congo, Kunth, diss. malv. p. 6. nov. gen. amer. 5. p. 309.—Hermanniàceæ, Vent.

Calyx sometimes naked (f. 92. *a.* f. 88. *b.*), sometimes girded by an involucre (f. 93. *b.*). Sepals more or less connected at the base (f. 92. *a.* f. 93. *a.* f. 94. *a.*), constantly valvate in æstivation. Petals 5, hypogynous, alternating with the sepals (f. 93. *c.*), convolute in æstivation, of various forms, rarely unequal or wanting (f. 90. *c.*). Stamens equal in number to the sepals or petals (f. 91. *f.*), or double triple, or multiple, that number (f. 92. *d.* f. 93. *d.*), filaments monadelphous (f. 92. *d.* f. 93. *e.*), or variously divided at the top (f. 92. *c.* f. 89. *h.*), some of them are sometimes sterile (f. 92. *d.*); anthers 2-celled (f. 92. *c.*), behind. Carpels 5 (f. 88. *d.* f. 89. *g.* f. 91. *d.* f. 92. *e.* f. 93. *h.*), joined into one ovary, crowned by as many distinct or connected (f. 92. *g.* f. 93. *g.*) styles. Albumen oily or fleshy, rarely wanting. Embryo straight, with an inferior radicle, and leafy, flat, or plaited cotyledons, or they convolute around the plumule, but they are sometimes very thick in the exalbumenous seeds. This order differs from *Malvàceæ*, *Bombàceæ*, *Tiliàceæ*, and *Eleocárpeæ*, with which it agrees in habit, in the valvate æstivation of the calyx, and the convolute æstivation of the corolla: from *Malvàceæ* and *Bombàceæ* in the anthers being 2-celled, not 1-celled, as in those orders; from *Tiliàceæ* and *Eleocárpeæ* in the filaments being monadelphous, and from *Sterculiàceæ* in the carpels being connected into one fruit, not distinct, as in that order. It is composed of trees and shrubs, usually natives within the tropics; some few are to be found in the north and south of Africa, and a few in the north of Asia. They are furnished with simple lobed or toothed stipulate leaves, and usually with beautiful flowers. *Astrapæ'a*, and some genera related to it, are amongst the most elegant plants in the world. The flowers of a species of *Pentápetes*, called by the Indians *Machucunha*, give out a mucilaginous refrigerent juice, which is employed in gonorrhœa. *Guazùma ulmifòlia* has its fruit filled

with a pleasant mucilage, which is sweet and very agreeable. An extract of the bark of the same plant is used in Martinique to clarify sugar; its old bark is employed in the form of a strong decoction as a sudorific. The *Walthèria Durandínha* contains a great deal of mucilage, and is employed by the Brazilians as an antisyphilitic. The seeds of *Theobròma Cacào* are the cacao of the shops, and from whence the chocolate is obtained. Seeds of most of the genera are easily introduced in a living state from their native places, but those of *Theobròma* soon become rancid.

Synopsis of the Genera.

TRIBE I.

BYTTNERIE'Æ. *Petals usually concave, and arched at the base* (f. 88. *b.*), *but expanded into a ligula at the apex. Stamens* 10-30 *or more, divided into* 5 (f. 89. *h.*) *or* 10 *bundles. Filaments* 5, *sterile, ligulate* (f. 88. *b.*), *with* 5 *alternate fertile ones, solitary or ternately-pentadelphous* (f. 89. *l. h.*), *rarely* 1-*anthered; these are opposite the petals. Ovary* 5-*celled* (f. 88. *d.*); *cells usually* 2-*seeded. Seeds sometimes exalbumenous, with thick cotyledons, sometimes albumenous, with leafy, flat, or convolute cotyledons.*

1 THEOBRO'MA. Sepals 5 (f. 88. *a.*). Petals 5 (f. 88. *b.*), arched at the base. Urceolus of stamens with 5 horns, and between them 5 2-anthered filaments. Style filiform, crowned by a 5-parted stigma. Capsule 5-celled, valveless (f. 88. *d.*). Seeds imbedded in pulp (f. 88. *c.*). Albumen wanting. Cotyledons thick, oily, corrugated.

2 ABRO'MA. Calyx 5-parted. Petals 5, with the claws saccate at the base. Urceolus of stamens 10-cleft, 5 of which bear 3 anthers each, the other 5 petal-formed. Capsule 5-celled, 5-winged, many-seeded. Seeds arillate. Albumen fleshy. Cotyledons leafy, transversely flexuous.

3 GUAZU'MA. Sepals 5 or diversely connate, 2-3-parted. Petals 5, 2-horned at the apex. Filaments hardly connate at the base, divided into 5 sterile lobes, and 5 alternate threads, which are trifid at the apex, each division bearing an anther. Styles 5, conniving. Capsule woody, tubercled, valveless, 5-celled, opening by 10 holes at the apex, many-seeded. Seeds ovate. Cotyledons plaited.

4 GLOSSOSTE'MON. Calyx 5-parted. Petals 5, terminating in a filiform acumen. Stamens 25-35, monadelphous at the base, divided into 5 bundles; and 5 sterile strap-formed processes. Ovary 1, 5-celled; cells many-seeded. Style 1, crowned by 5 stigmas. Capsule covered with bristles.

5 COMMERSO'NIA. Calyx 5-parted. Petals 5, dilated, and saccate at the base, tapering gradually into a ligula at the apex. Stamens 10, connate at the base, 5 of which are sterile and petaloid, stellately spreading; the other 5 are awl-shaped and fertile, bearing 1-2 anthers each. Styles 5. Ovary 5-celled; cells 3-5, ovulate. Capsule 3-5 valved, echinated with bristles. Albumen fleshy. Inflorescence cymose.

6 BYTTNE'RIA. The same as *Commersònia*, but the fertile filaments are awl-shaped, bearing 2anthers each, and the petals are drawn out into a ligula on the back, between the lobes of the concave part. Albumen wanting.

7 AYE'NIA. Calyx 5-parted. Petals with long claws, arched, broadest at the apex, terminated by pedicellate glands. Urceolus of stamens 10-15-toothed, 5 or 10 of these are sterile, and 5 fertile, 1-anthered. Style crowned by a pentagonal stigma. Carpels 5, 2-valved, conniving into a subglobose, echinated, single fruit. Albumen wanting.

8? KLEINHO'VIA. Calyx 5-parted. Petals 5, one of which is longer than the rest, and cleft at the apex. Stamens monadelphous, divided at the top into 5 bundles opposite the petals, each bundle bearing 3 anthers on the back. Ovary stipitate. Style crowned by a subcrenated stigma. Capsule inflated, turbinate, 5-angled, 5-celled, 5-seeded. Seeds roundish. Cotyledons spirally twisted around the plumule.

TRIBE II.

LASIOPETA'LEÆ. *Calyx* 5-*parted, petaloid* (f. 80. *b.*), *permanent or marcescent. Petals minute* (f. 90. *c.*), *scale-formed, rarely wanting. Filaments awl-shaped, connate at the base, when* 5 *they are opposite the petals and fertile, when* 10 *the alternate ones are sterile. Anthers incumbent, with contiguous lobes. Ovary* 3-5-*celled; cells* 2-8-*ovulate. Carpels* 5, 2-*valved, usually closely connected, or sometimes nearly free. Seeds strophiolate at the base. Albumen fleshy. Embryo straight. Cotyledons flat, leafy.*

9 SERI'NGIA. Calyx marcescent. Petals wanting. Filaments 10, alternate ones sterile. Anthers bursting by dorsal chinks. Carpels 5, 2-valved, 2-3-seeded. Strophiola of seeds crenate. Stipulas small, deciduous.

10 LASIOPE'TALON. Calyx permanent (f. 90. *c.*). Petals 5, gland-formed. Filaments 5, free. Anthers bursting by 2 pores on the inside. Ovary 1, 3-celled; cells containing 2-ovulæ. Capsule 3-valved (f. 90. *b.*), with valvular dissepiments, opening at the cells. Strophiola of seeds jagged. Stipulas wanting.

11 GUICHENO'TIA. Calyx permanent. Petals 5, gland-formed. Filaments 5, free. Anthers opening by lateral chinks. Ovary 5-celled; cells containing 5-ovulæ, densely tomentose on the inside. Stipulas wanting.

12 THOMA'SIA. Calyx permanent, veiny. Petals 5, scale-formed or wanting. Filaments for the most part connate at the base, 5 or 10. Anthers bursting by lateral chinks. Ovary 3-celled; cells containing 2-8-ovulæ. Capsule 3-valved, with valvular dissepiments, opening at the cells. Strophiola of seed crenate. Stipulas leafy, permanent.

13 KERAUDRE'NIA. Calyx permanent. Petals wanting. Filaments 5, fertile, imbricately conniving at the base. Anthers bursting by dorsal chinks. Ovary 3-celled; cells containing many-ovulæ. Styles 3, partly connected. Capsule echinately-tomentose, 1-celled from abortion, 3-valved. Strophiola of seed entire. Stipulas minute, permanent.

TRIBE III.

HERMANNIE'Æ. *Calyx* 5-*lobed, permanent, sometimes naked, sometimes involucrated. Petals* 5, *spirally twisted before expan-*

sion. Stamens 5 (f. 91, *e.*), *monadelphous at the base, all fertile, and opposite the petals* (f. 91. *b.*). *Anthers ovate, 2-celled* (f. 91. *e.*). *Carpels connected into a single fruit* (f. 91. *d.*). *Albumen fleshy. Embryo inclosed, curved with an inferior, ovate radicle, and flat leafy entire cotyledons.*

14 Melo'chia. Calyx naked, or furnished with 1-3 bracteas at the base. Petals spreading. Styles 5. Capsule 5-celled, 5-valved. Valves with a dissepiment in the middle of each. Seeds 1-2 in each cell. Peduncles many-flowered, opposite the leaves.

15 Riedle'ia. Calyx naked, or furnished with 1-3 bracteas at the base. Petals spreading. Styles 5. Carpels 5, connected into a sub-globose 5-celled capsule, at length becoming distinct, and opening by a longitudinal chink, each containing 1-2 seeds, with the central axis free.

16 Walthe'ria. Calyx furnished with a 3-leaved lateral deciduous involucel. Style 1, crowned by a pencil-formed stigma. Capsule 1-celled, 2-valved, 1-seeded, or perhaps there are 5 carpels, and 4 of which are abortive.

17 Althe'ria. Calyx girded by a 3-leaved involucel. Stamens 5, joined into a monadelphous tube. Anthers bursting on the outside. Ovary pentagonal. Styles 5, connected. Carpels 5, joined, 1-seeded. Seeds fixed by the centre.

18 Herma'nnia. Calyx naked, campanulate. Filaments monadelphous at the base, lanceolate, usually winged. Styles 5, connected together. Capsule 5-celled, 5-valved; cells many-seeded.

19 Mahe'rnia. Calyx naked, campanulate. Limbs of petals obcordate (f. 91. *b.*), spirally convolute. Filaments monadelphous at the base (f. 91. *c.*), each dilated in the middle into a cordate tubercle, or a little hollow (f. 91. *g.*). Styles 5, sometimes joined (f. 91. *d.*). Capsule 5-celled, 5-valved (f. 91. *d.*), many-seeded.

Tribe IV.

Dombeya'cea. *Calyx 5-lobed* (f. 92. *a.* f. 93. *a.*). *Petals* 5 (f. 92. *b.* f. 93. *c.*), *flat, large, somewhat unequal-sided, convolute in æstivation. Stamens* (f. 92. *e.* f. 93. *e.*) *multiple the number of petals in one series, monadelphous* (f. 92. *c.* and *d.*), *rarely all fertile* (f. 92. *d*), *usually with some of them sterile* (f. 92. *d.*); *these are either awl-shaped or strap-formed, others fertile. There are commonly* 2 *or* 3 (f. 92. *c.*) *fertile ones between each sterile one* (f. 92. *d.*), *more or less joined together. Styles* 3-5, *joined* (f. 92. *g.*), *or free. Ovulæ in each cell* 2 *or more. Embryo straight in the axis of a fleshy albumen. Cotyledons leafy, usually bifid, twisted or flat.*

20 Rui'zia. Calyx girded by a 3-leaved involucel. Stamens numerous, monadelphous, all bearing anthers. Style 10. Carpels 10, 2-seeded, closely cohering. Seeds somewhat triquetrous, not winged.

21 Penta'petes. Calyx girded by an unilateral, 3-leaved involucel. Stamens with 3 antheriferous filaments between each sterile one. Style 1, 5-toothed at the apex, or styles 5, connected. Capsule 5-celled, 5-valved, many-seeded. Seeds naked, not winged.

22 Asso'nia. Calyx girded by a 3-crenate, 1-leaved involucel. Antheriferous filaments 15, 3 fertile between each sterile one. Styles 5, very short. Carpels 5, 2-seeded, closely connected into a single capsule. Seeds rather triquetrous, not winged.

23 Dombe'ya. Calyx girded by an unilateral 3-leaved involucel. Stamens 15-20, hardly monadelphous at the base, 5 sterile, with 2 or 3 fertile ones between each sterile one. Style 1, divided at the apex into 5 reflexed stigmas. Carpels 5, 2-valved, 1 or many-seeded, closely connected into a single capsule. Cotyledons twisted, bifid.

24 Melha'nia. In every respect the same as *Dombèya*, but the stamens are 10, 5 sterile, and 5 alternate fertile, bearing 1-2 anthers each.

25 Troche'tia. Calyx without an involucel (f. 92. *a.*). Stamens 20, monadelphous at the base (f. 92. *e.*), 5 of which are sterile (f. 92. *d.*). Style filiform (f. 92. *f.*). Capsule 5-celled, 5-valved. Seeds small, roundish, wingless.

26 Pterospe'rmum. Calyx naked or involucrated, tubular at the base. Stamens 20, 5 of which are sterile. Style cylindrical, crowned by a thickish stigma. Capsule woody, 5-celled, 5-valved. Seeds ending in a wing. Albumen sparing or wanting.

27 Vise'nia. Calyx naked. Stamens 5, monadelphous at the base, without any sterile ones. Carpels 5, connate, 2-valved, 1-seeded. Seeds fixed to the bottom of the carpels, ending in a wing at the apex. Albumen sparing.

28 Astrapæ'a. Umbel of flowers girded by a many-leaved common involucrum; leaflets roundish-ovate, 2 outer ones opposite. Calyx of 5 sepals, furnished with 1 bractea on the outside. Petals convolutely closed, as in *Malvaviscus*. Stamens 2-5, in a long tube, 5 sterile, and 20 fertile. Ovary 5-celled. Style 1, crowned by 5 stigmas. Seed free, not winged.

Genera allied to Dombeyàceæ.

29 Ky'dia. Calyx campanulate, 5-toothed, girded by a 4-6-leaved involucel; leaflets of involucel adnate to the calyx. Petals 5, obliquely obcordate. Stamens in a long tube, divided at the apex into 5 4-anthered bundles. Ovary 1. Style trifid. Stigmas dilated. Capsule 3-celled, 3-valved, 3-seeded. Seeds fixed to the bottom of the cells.

30 Glu'ta. Calyx campanulate, deciduous, naked. Petals 5, lanceolate, adhering to the long stipe-formed torus. Stamens monadelphous, adhering around the torus. Anthers round, versatile. Ovary obovate. Style 1.

31 Mara'nthus. Calyx naked, about the length of the petals. Stamens numerous, rather connate at the base, all fertile. Anthers 2-celled. Style 1, lateral, crowned by a simple stigma. Drupe oval, villous, 2-celled; cells 1-seeded. Seeds fixed by the base.

Tribe V.

Wallichie'æ. *Calyx 5-lobed* (f. 93. *a.*), *girded by a* 3-5 *leaved* (f. 93. *b.*) *involucel, which is distant from the flower. Petals* 5 (f. 93. *c.*), *flat. Stamens numerous, in a long tube* (f. 93. *e.*), *outer ones smallest. Anthers* 2-*celled, erect.*

32 ERIOLÆ'NA. Calyx tomentose, girded by a 5-leaved involucel; leaflets jagged, 3 inner ones largest, all shorter than the calyx. Petals unguiculate. Stamens disposed in many series, monadelphous, outer ones shortest, all fertile. Style solitary, villous, crowned by numerous aggregate, small stigmas.

33 WALLI'CHIA. Involucel small, of 3-4 leaves, distant from the flower. Calyx 4-parted. Petals 4, reflexed, with thick velvety claws. Stamens about 20, in a monadelphous conical tube, outer ones shortest. Ovary ovate, 8-celled. Style 1, crowned by 8 stigmas. Cells of capsule 1-seeded.

34 GOETHE'A. Calyx girded by a large, bladdery, 4-5-parted involucel (f. 93. *b.*). Petals 5, connected a little at the base (f. 93. *c.*). Filaments in a long monadelphous column (f. 93. *e.*). Anthers ovate, 2-celled. Style elongated, cleft at the apex into 8-10 stigmas (f. 93. *g.*). Carpels 5, coriaceous, 1-seeded (f. 93. *h.*).

Tribe I.

BYTTNERIE'Æ (plants agreeing with *Byttnèria*, in important characters,) D. C. prod. 1. p. 484.—Byttneriàceæ veræ, Kunth. diss. malv. p. 6. nov. gen. et spec. amer. 5. p. 309.

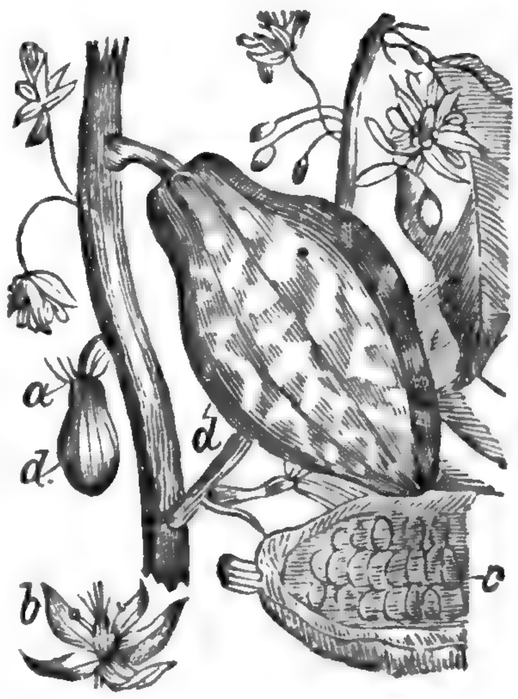
Petals 5, generally concavely arched at the base (f. 88. *b.*), expanding into a ligula at the apex (f. 88. *b.*). Stamens 10-30 or more. Tube of stamens variously divided, with 5 or 10 sterile segments (f. 88. *c.*), and 5-30 2-celled anthers opposite the petals. Styles 5 or style 5-cleft. Ovary 5-celled (f. 88. *d.*); cells usually 2, rarely many-seeded (f. 88. *c.*). Seeds sometimes exalbuminous, with thick cotyledons, sometimes albuminous, with leafy, flat, or convolute cotyledons.

I. THEOBRO'MA (from θεος, *theos*, god, and βρωμα, *bromà*, food; celestial food. The seeds of *T. cacáo* furnish the chocolate.) Juss. gen. 276. Kunth, nov. gen. amer. 5. p. 316. D. C. prod. 1. p. 484.—Cacào, Tourn. inst. t. 444.

LIN. SYST. *Monadélphia, Decándria.* Calyx of 5 sepals (f. 88. *a.*). Petals 5, arched at the base (f. 88. *b.*), drawn out into a spatulate ligula at the apex. Urceolus of stamens furnished with 5 little horns, and between each there are 5 2-anthered filaments. Style filiform. Stigma 5-parted. Capsule 5-celled, without valves (f. 88. *d.*). Seeds embedded in a soft pulp (f. 88. *c.*). Albumen none. Cotyledons thick, oily, wrinkled. Trees with large simple leaves, and with the flowers rising in clusters from the branches, only 1-3 of which produce fruit.

1 T. CACA'O (Lin. spec. 1100.) leaves quite entire, elliptic-oblong, acuminated, quite smooth; fruit oblong, smooth. ♄. S. Native of South America at the height of 600 feet. Lodd. bot. cab. t. 554. Cacào satìva, Lam. dict. 1. p. 553. ill. t. 653. Cacào theobròma, Tuss. ant. t. 13. Cacào mìnus, Gært. fruct. 2. p. 190. t. 122. Cat. carol. 3. t. 6. Flowers brownish, inodorous. The Mexicans call the beverage obtained from these nuts *chocolalt*; hence chocolate, from *chacot*, sound, and *alte* or *atte*, water. Fruit large, long, smooth, yellow, red, or of both colours, about 3 inches in diameter; rind fleshy, near half an inch in thickness, flesh-coloured within; pulp whitish, the consistence of butter, separating from the rind in a state of ripeness, and adhering only to it by filaments, which penetrate it and reach to the seeds. Hence it is known when the seeds are ripe by the rattling of the capsule when it is shaken. The pulp has a sweet and not unpleasant taste, with a slight acidity; it is sucked and eaten raw by the natives. The seeds are large, about 25 in number in each capsule; when fresh they are of a flesh-colour: gathered before they are ripe, they preserve them in sugar, and thus they are very grateful to the palate: they quickly lose their power of vegetation if taken out of the capsule, but kept in they preserve that power for a long time. The trees bear leaves, fruit, and flowers all the year through; but the usual seasons for gathering the fruit are June and December. The third year from seed it shows for fruit. A tree yields from two to three pounds of seed annually. These seeds are remarkably nourishing, and agreeable to most people, which occasions them to be kept in most houses in America as a necessary part of the provisions of the family. In this intention they are first brought to a pulverisable state by drying or roasting in a proper apparatus; they are then ground or powdered very fine, a little arnotta, and sometimes orange-water, aromatic spices, and some aromatic perfumes added, and made into a paste, which is formed into cakes or rolls of one pound each; they are much charged with oil, but mix well with milk or water. This simple preparation of chocolate is the most natural and the best. It is daily used amongst most families in the eastern part of South America, where the tree is largely cultivated, and affords a nutritious food for children as well as adults. But chocolate made abroad cannot by law be imported into this country, consequently all chocolate consumed in Great Britain ought to be made here. It is composed principally of the kernel of the cacao as above mentioned, but the art is in very few hands; and it is believed that a small portion of soap is added to most British chocolate, in order to cause it to froth when it is dissolved in hot water. The original manner of making chocolate by the Spaniards was to use cacao nut, maize, and raw sugar, as expressed from the cane, with a little arnotta added to give it a colour, mixed together and ground between two stones; they made a kind of bread, which served them equally for solid food and for drink, eating it dry when hungry, and steeping it in hot water when thirsty. The Indians to one pound of roasted nut put one pound of sugar, dissolved in rose-water, and half a pound of flour of maize. But the Spaniards and other nations afterwards added a great number of other ingredients to the composition of chocolate; all of which rather spoil than mend it, vanilla excepted. In Spain chocolate is made up in various ways, with almonds, pepper, arnotta, cinnamon, anise, vanilla, &c. which is mixed at discretion; they frequently mix their paste with orange water, which they think gives it a greater consistence and firmness. The *cacào* used on board of ships and in the West Indies, usually is nothing more than the ground seeds without any admixture.

FIG. 88.



The trees in the island of Trinidad and the Spanish Main are planted in low moist savannahs under the shade of *Erythrìna umbròsa*, generally two rows of *Cacào* for one of *Erythrìna*. Those grown in the jurisdiction of Carthagena are said to excel those of the Caraccas, Maracayba, and Guayaquil, both as to size and goodness of fruit. The Magdalena *cacào* is said to be much more oily than that grown at Caraccas; to correct this the former is mixed with the latter. The fruit is gathered when ripe, after which it is opened and the seeds taken out, and left in the air to dry. When fully dried they are put into bags, and sent to the market and sold. The *Cacào* trees so much delight in water, that the ground where they are planted must be reduced to a mire, and if not carefully supplied with water they

do not thrive. They must also be planted in the shade of other trees; for this purpose the plantations are always formed some years before the cacao seeds are sown, by planting *Erythrìna umbròsa*, or other umbrageous trees, in rows at certain distances, so as to admit of 1, 2 or 3 rows of *Cacào* between each row of such trees. The seeds are sown 2 or 3 together, at about 2 yards distant in the rows, and when the plants are about a foot high all are removed except the strongest plant. No countries are better adapted for *Cacào* than Guayaquil, the Caraccas, and the island of Trinidad, as they consist of savannahs or wide plains overflowed with water, and in summer plentifully supplied by canals or rivulets. The culture of the tree requires no other attention besides that of clearing the ground from weeds and shrubs. This is so necessary that if neglected these vegetables will in a few years destroy the *cacào* plantations by robbing the soil of all its nourishment.

There are several varieties which differ chiefly in the size, colour, and shape of the capsules.

Common *Cacao* or Chocolate-nut. Clt. 1739. Tree 16 feet.

2 T. Guiane'nsis (Willd. spec. 3. p. 1422.) leaves acuminate, repandly-toothed, tomentose beneath. ♄. S. Native of Guiana in moist woods. Cacào Guianénsis, Aubl. guian. 2. t. 275. Calyx green without, but yellow within. Petals yellow. Fruit ovate, 5-angled, clothed with rusty down. The kernel is white, and very good eating when fresh. This is probably the *Dùrio eriopìla*, Lin.

Guiana Chocolate-nut. Clt. 1803. Tree 10 feet.

3 T. sylve'stris; leaves entire, downy beneath; fruit downy. ♄. S. Native of Guiana. Cacào sylvéstris, Aubl. guian. 2. p. 687. t. 276. This is asserted by Willdenow to be the *Dùrio eriopìla* of Lin. but upon what authority we know not, as there is no specimen of it in the Linnean herbarum. Flowers yellow.

Wood Chocolate-nut. Tree 16 feet.

4 T. bi'color (H. B. pl. equin. 1. p. 104. t. 30.) leaves oblong, obliquely-cordate, whitish beneath, and 7-nerved. ♄. S. Native of New Granada in warm valleys. Fruit drupaceous, oval, indehiscent, variously excavated, silky. The seeds are mixed with the common *Cacào* by the inhabitants.

Two-coloured-leaved Chocolate-nut. Clt. 1820. Tree 20 ft.

5 T. angustifòlia (Moc. et Sesse, fl. mex. ined. D. C. prod. 1. p. 484.) leaves oblong, tapering to both ends, acuminated at the apex, 3-nerved at the base, pale beneath. ♄. S. Native of Brazil and Mexico. T. speciòsa, Willd. herb. ex Spreng. Flowers of a dirty peach-colour. Limb of petals oblong, stipitate. Sterile filaments obovate-oblong, a little longer than the petals. Fruit ovate.

Narrow-leaved Chocolate-nut. Tree 20 feet.

6 T. ovatifòlia (Moc. et Sesse, fl. mex. icon. ined.) leaves ovate, very entire, 3-nerved at the base, somewhat cordate-peltate, blunt at the apex, hoary from tomentum beneath. ♄. S. Native of Mexico. Flowers small. Sepals acuminate. Fruit egg-shaped, wrinkled from elevated ribs.

Ovate-leaved Chocolate-nut. Tree 15 feet.

Cult. All the species of *Theobròma* will thrive well in a light rich soil, or a mixture of loam and peat, in a moist heat. Cuttings will root in sand under a hand-glass, in heat. Seeds do not long retain their power of vegetation.

II. ABRO'MA (from *a* priv. and *βρωμα*, *broma*, food; not fit for food, in opposition to *Theobròma*,) Lin. fil. suppl. 341. Sal. par. 102. Kunth, nov. gen. 5. p. 318.

Lin. syst. *Monadélphia*, *Decándria*. Calyx 5-parted. Petals 5, with the claws dilated and saccate at the base. Urceolus of stamens 10-cleft, 5 of which bear 3 anthers each, with the alternate 5 petal-like, and sterile. Capsules 5-celled, 5-winged, many-seeded. Seeds arillate. Albumen fleshy. Cotyledons leafy, transversely flexuous. Small trees, with hairy lobed leaves and extra-axillary or terminal few-flowered peduncles at the tops of the branches.

1 A. augu'sta (Lin. fil. suppl. 341.) branches soft, velvety-tomentose; adult leaves cordate, ovate-oblong, acuminated, serrulated, glabrous, or covered with simple or stellate down beneath, lower leaves roundish, cordate, 3-5-angled; wings of capsule truncated at the apex, with the exterior angle acutish. ♄. S. Native of the East Indies. A. augústa and A. Whelèri, Willd. spec. 3. p. 1424 and 1425. A. fastuòsa, Jacq. vind. 3. p. 3. t. 1. Gært. fruct. 1. p. 306. t. 64. Peduncles terminal opposite the leaves. Lower leaves cordate, 3-5-lobed, 5-7-nerved, upper ones ovate-lanceolate, undivided. Flowers drooping, of a dark dirty purple-colour.

August Abroma. Fl. Aug. Clt. 1770. Tree 10 feet.

2 A. fastuo'sa (R. Br. in hort. kew. ed. 2. vol. 4. p. 409.) branches muricated; adult leaves scabrous from forked or simple bristles; wings of capsule somewhat truncate at the apex, with the exterior angle acuminated. ♄. S. Native of the island of Timor and New Holland. A. fastuòsum, Gært. fruct. 1. p. 307. t. 64. Sal. par. lond. t. 102. Lower leaves cordate, acutely 5-lobed, upper ones ovate, somewhat cordate, undivided. Flowers dark-purple.

Disdainful Abroma. Fl. June, Oct. Clt. 1800. Tree 10 ft.

3 A. mo'llis (D. C. prod. 1. p. 485.) branches rather velvety; adult leaves cordate, acuminated, serrated, velvety from very short, soft, crowded down, and stellate bristles; lower leaves roundish, cordate, somewhat 5-lobed; wings of capsule truncate at the apex, with the exterior angle obtuse. ♄. S. Native of the Moluccas and Java. Lower leaves cordate, roundish, scarcely lobed; upper ones also cordate, acuminated, serrated, on very short stalks, all are soft and velvety to the touch. Flowers dark-purple.

Soft-leaved Abroma. Tree 10 feet?

Cult. The species of *Abròma* will thrive well in any light rich soil, or a mixture of loam and peat. Cuttings will root freely in sand under a hand-glass, in heat. Seeds ripen in abundance.

III. GUAZU'MA (a name of Mexican origin, employed by Plumier,) Plum. gen. 36. t. 18. Juss. Cav. and Pers. D. C. prod. 1. p. 485.—Bubròma, Schreb. gen. no. 1216.

Lin. syst. *Monadélphia*, *Decándria*. Calyx of 5 sepals, diversely connate, 2-3-parted. Petals 5, ending in a bifid ligula at the apex. Filaments of stamens monadelphous at the base, with a very short exserted tube, divided into 5 sterile, ovate, entire lobes, and 5 linear fertile ones, which are trifid at the apex, each division bearing 1 anther each at their apexes. Styles 5, conniving. Capsules woody, tubercled, filled with mucilage, imperfectly 5-valved, 5-celled, opening by a tenfold number of holes, many-seeded. Seeds angular. Albumen fleshy. Cotyledons flattish. Trees covered with stellate down. Leaves alternate, simple, cordate and unequal at the base, caducous. Stipulas lateral. Peduncles axillary and terminal, somewhat dichotomously branched. The species are probably mere varieties.

1 G. ulmifòlia (Lam. dict. 3. p. 52.) adult leaves smooth on both surfaces. ♄. S. Native of the West Indies. Theobròma Guazùma, Lin. spec. 1100. Plum. ed. Burm. t. 144. but with the leaves less cordate, and the racemes less elongated. Pluk. alm. t. 77. f. 5. Bubròma Guazùma, and perhaps B. Invìra, Willd. enum. 806. The leaves, according to M. De Candolle, are ovate or oblong, unequally toothed, acuminate at the apex; younger ones hardly downy on the nerves, with stellate hairs. Petals yellow, with two purple awns at the apex. A wide spreading tree, not unlike the elm, with leaves that sleep hanging quite down, whilst the petioles remain entirely stiff and straight.

It grows in the lowlands of Jamaica and other West India Islands, forming a very agreeable shade for the cattle, and supplying them with food in dry weather, when all the herbage is burned up or exhausted. The pods are filled with mucilage, which is very agreeable to the palate; it can be sweetened at pleasure. It has the taste of green figs. The wood is light, and so easily wrought, that it is generally used by coach-makers in all the side pieces. (Browne.) It is also frequently cut into staves for casks. A decoction of the inner bark is very glutinous, and very like that of elm. It is said to be excellent in elephantiasis, a disorder to which the negroes are much subject. The old bark passes for a sudorific, and is said to be excellent in diseases of the chest, for this purpose boil three or four ounces in three pints of water, and let it be reduced to two.

Elm-leaved Bastard-cedar or Orme d'Amerique. Fl. Aug. Sep. Clt. 1739. Tree 40 to 60 feet.

2 G. tomentò'sa (H. B. et Kunth, nov. gen. amer. 5. p. 320.) leaves rather hairy above, but clothed with fine white tomentum beneath. ♄. S. Bubròma tomentòsum, Spreng. Perhaps sufficiently distinct from both the other species. Flowers yellow; petals ciliated. Leaves serrated.

Var. α, *Mompoxénsis* (H. B. et Kunth, l. c.) corymbs twice as long as the leaves; calyx 2-parted. ♄. S. Native of South America about Mompox, at the river Magdalena, and in New Andalusia.

Var. ? β, *Cumanénsis* (H. B. et Kunth, l. c.) panicles one-half shorter than the leaves; calyx 3-parted. ♄. S. Native of South America near Cumana. Perhaps a proper species.

Tomentose-leaved American Elm. Clt. 1816. Tree 12 feet.

3 G. polybo'trya (Cav. icon. 3. p. 51. t. 299.) leaves velvety-tomentose from starry down beneath, younger ones pubescent above, adult ones smooth. ♄. S. Native of New Spain and St. Domingo, and perhaps of Brazil, if Bubròma polybótryum, Willd. enum. 806. is the same.—Guacìmo, Hern. mex. 401. f. 1. Leaves equal at the base and toothed.

Many-racemed Bastard-cedar. Clt. 1816. Tree 20 feet.

4 G. Blu'mii; leaves ovate-oblong, acuminated, cordate at the base, unequal-sided and unequally toothed, stellately-puberulous above, white beneath from stellate down. ♄. S. Native of Java. G. tomentòsa, Blum. bijdr. ex Schlecht. Linnæa. 1. p. 655. but not of Kunth.

Blume's Bastard-cedar. Tree 30 feet.

5 G. grandiflòra; leaves large, oblong, abruptly acuminated, quite entire, 3-nerved, pale beneath; peduncles subracemose, and are as well as the calyxes densely tomentose. ♄. S. Native of Brazil. Bubròma grandiflòrum, Willd. herb. ex Spreng. syst. 3. p. 332.

Great-flowered American Elm. Tree 40 feet.

6 G. Invi'ra; leaves subcordate, lanceolate, unequally serrated, smoothish. ♄. S. Native of Brazil, where it is called *Invira*. Bubròma Invìra, Willd. enum. 806.

Invira American Elm. Tree 40 feet.

Cult. The species thrive well in a mixture of loam and peat, or any rich light soil; and cuttings root freely in any kind of soil if placed under a hand-glass in heat. The seeds retain their power of vegetation a considerable time.

IV. GLOSSOSTE'MON (from γλωσσα, *glossa*, tongue, and στημων, *stemon*, a stamen; in allusion to the shape of the sterile filaments,) Desf. mem. mus. 3. p. 238. t. 2. H. B. et Kunth, nov. gen. amer. 5. p. 311. in a note. D. C. prod. 1. p. 485.

Lin. syst. *Monadélphia, Polyándria.* Calyx 5-parted. Petals 5, each terminated by a filiform point. Stamens 25-35, monadelphous at the base, divided at the top into 5 distinct bundles, with a sterile tongue-shaped filament in the middle of each bundle. Ovary 1, 5-celled; cells many-seeded. Style 1. Stigmas 5. Capsule globose, covered with bristles. This genus is allied on the one hand to *Sparmánnia* and on the other to *Byttnèria*.

1 G. Bruguie'ri (D. C. prod. 1. p. 486.) ♄. F. Native of Persia near Bagdad. Leaves stalked, ovate, roundish, somewhat lobed, toothed, hispid from starry hairs. Flowers corymbous, rose-coloured.

Bruguiere's Glossostemon. Shrub 10 feet?

Cult. This shrub only requires to be sheltered from the frost. Cuttings will root freely in sand under a hand-glass.

V. COMMERSO'NIA (in honour of Philibert Commerson, M.D. a French botanist from Bourg in Brest. He accompanied M. de Bougainville in his voyage round the world; on this voyage he stopped at the Isle of France, where he died in 1774, after having explored that island, and collected a great number of new plants). Forst. gen. 43. t. 22. H. B. et Kunth, nov. gen. amer. 5. p. 311. in a note. D. C. prod. 1. p. 486.

Lin. syst. *Monadélphia, Decándria.* Calyx 5-cleft, petal-like, permanent. Petals 5, dilated and saccate at the base, with inflexed margins tapering gradually into a long ligula at the top, adhering to the fertile filaments at the base. Stamens 10, with the filaments connate at the base, with 5 sterile petal-like filaments, which spread stellately at the apex, alternating with 5 fertile 1-2-anthered ones; these are opposite the petals. Anthers 2-lobed, opening by a chink on both sides. Styles 5. Ovary 5-celled, 5-valved, each cell containing 3 or 5 ovulæ. Capsules 3-5-valved, echinated with villous bristles. Albumen fleshy. Cotyledons flat. Inflorescence cymose. Perhaps sufficiently distinct from *Byttnèria*.

1 C. echina'ta (Forst. l. c.) stem arboreous; leaves ovate-lanceolate, smoothish above, hoary beneath. ♄. S. Native of the Moluccas, New Caledonia, as well as the Friendly and Society Islands.—Rumph. amb. 3. p. 119. There is a variety with cordate, ovate, or unequal leaves. Flowers panicled, hoary.

Echinate-fruited Commersonia. Fl. June, July. Clt. 1806. Tree 20 feet.

2 C. a'spera (Colebr. mss. in Roxb. fl. ind. 2. p. 383. under *Buttnèria*,) leaves broad, cordate, entire, obtuse, with a short acumen, pubescent beneath, twice as long as the petioles; umbels of flowers axillary, corymbose; capsules very large, with stout short, remote thorns. Shrubby, unarmed. ♄. ب. S. Native of Chittagong in the East Indies. B. grandifòlia, D. C. prod. 1. p. 486. Stems 2 or 3 feet in circumference. Flowers small, yellowish, and villous without; pink-coloured within. This is probably the largest species known. The fruit resembles *Datùra*, whence its Bengalee name, *Climbing Dhootura*. It is a large, rambling, or climbing shrub.

Rough Commersonia. Shrub cl.

3 C. Jave'nsis; stem arboreous; leaves ovate-oblong, acuminated, unequally cordate, scabrous from stellate down above, and white beneath from tomentum. ♄. S. Native of Java. C. echinàta, Blum. bijdr. ex Schlecht. Linnæa. 1. p. 655.

Java Commersonia. Tree.

4 C. herba'cea; leaves cordate, acuminated, toothed; calyx reflexed; mucrones of petals hairy; peduncles axillary, few-flowered. ♃. S. Native on the coast of Coromandel on the Circar mountains. Buttnèria herbàcea, Roxb. cor. 1. t. 29. Flowers small, purple.

Herbaceous Commersonia. Pl. 1 foot.

5 C. Jackia'na (Wall. in Roxb. fl. ind. 2. p. 386. under *Buttnèria*,) leaves oblong, acuminated, entire, on very short petioles; flowers axillary, corymbose, on long peduncles; capsules echinated, with softish thorns. ♄. ب. S. Native of the East Indies on the hills of Penang. A large, climbing, unarmed shrub, rough

with stellate hairs. Flowers larger than those of the *C. áspera* species, yellowish ?

Jack's Commersonia. Fl. Sept. Shrub cl.

6 C. PLATYPHY'LLA (Andr. bot. rep. no. 603. t. 519. under *C. echinàta*,) hairy; stem shrubby; leaves broad, ovate, acuminated, unequally toothed, obliquely cordate, hairy on both surfaces. ♄. S. Native of the Molucca Islands. Sims, bot. mag. t. 519. Flowers white, in axillary panicles.

Var. β, Leschenáultii (D. C. prod. 1. p. 486.). M. de Candolle has a specimen from the botanic garden of Calcutta which is very like *C. platyphýlla*, but the leaves are equally serrate, smooth above; the panicles are axillary and leafy, and the floriferous branches opposite the leaves. Perhaps a proper species ?

Broad-leaved Commersonia. Fl. Ju. Jul. Clt. 1806. Sh. 4 ft.

7 C. PILÒSA (Roxb. fl. ind. 2. p. 381. under *Buttnèria*) leaves with from 3-5 acute angles, toothed, 7-nerved, with a large long gland on the middle one near the base; umbels of flowers axillary, proliferous; mucrones of petals filiform; stem twining. ♄. ◡. S. Native of Chittagong in the East Indies. Petals yellow on the outside and red within, of a bright orange-colour at the top. Younger branches hairy. This climbs to a great extent.

Hairy-branched Commersonia. Fl. Sept. Shrub cl.

8 C. GAUDICHAU'DI (Gay. in litt. D. C. prod. 1. p. 486.) stem shrubby; leaves profoundly cordate, unequal-sided; hispid above, tomentose beneath. ♄. G. Native of New Holland on the eastern coast. Flowers probably white.

Gaudichaud's Commersonia. Shrub 3 feet.

9 C. FRASE'RI (Gay, ex Spreng. syst. 1. p. 954.) leaves ovate-oblong, serrated, tomentose beneath; cymes opposite the leaves; sterile filaments elongated, petal-like, spatulate. ♄. G. Native of New Holland.

Fraser's Commersonia. Shrub 3 to 4 feet.

Cult. These shrubs will grow well in a mixture of loam and peat, and ripened cuttings will root readily in sand under a hand-glass, those of the first seven in heat.

VI. BYTTNE'RIA (in honour of David Sigismund Augustus Byttner, once a professor of botany in the University of Gottingen; who published in 1750 a catalogue of the plants in the garden of an amateur named Cunon). Lœfl. itin. 313. Lin. gen. no. 268. but not of Duhamel. D. C. prod. 1. p. 486.

LIN. SYST. *Monadélphia, Decándria.* Calyx 5-cleft. Petals 5, unguiculate, concave at the base, drawn into a ligula between the lobes of the concave part, which is variously divided. Tube of stamens urceolate, variously divided, with 5 sterile segments and 5 alternate, fertile ones opposite the petals, bearing twin or subglobose anthers. Style short, smooth, crowned by 5 stigmas. Capsule subglobose 5-lobed, echinated; carpels 1-seeded from abortion. Albumen wanting. Cotyledons convolute. Erect or scandent shrubs. Leaves simple. Umbels simple, disposed in something like racemes or panicles, rarely in corymbs. Flowers small, usually dark purple. Calyx and corolla valvate. This genus differs from *Commersònia* in the ligula of the petals being inserted on the back of the cucullate part of the petals, not gradually ending in a ligula as in that genus.

§ 1. *Unarmed species, native of New Holland (allied to Commersònia). Rulingia, R. Brown. These plants perhaps agree better with Commersònia than with Byttnèria. This section is no doubt a distinct genus.*

1 B. DASYPHY'LLA (Gay, in litt. D. C. prod. 1. p. 486,) leaves ovate-lanceolate, unequally serrated, hairy on both surfaces; mucrones of petals exceeding the calyx. ♄. G. Native of Van Diemen's Land. Commersònia diphýlla, Andr. bot. rep. t. 603. Flowers white, in terminal corymbs.

Thick-leaved Byttneria. Fl. June, Jul. Clt. 1780. Sh. 4 ft.

2 B. PANNÒSA (D. C. prod. 1. p. 486.) leaves ovate-lanceolate, unequally serrate-toothed, pubescent above, hairy beneath; mucrones of petals shorter than the segments of the calyx. ♄. G. Native of New Holland. Rulíngia pannòsa, R. Br. in bot. mag. t. 2191. Byttnèria inodòra, Gay. ined. Lasiopétalum tomentòsum, Cels. B. austràlis, Sieb. Flowers white from tomentum, in axillary panicles.

Cloth-leaved Byttneria. Fl. Ju. Jul. Clt. 1800. Sh. 3 ft?

3. B. HERMANNIÆFÒLIA (Gay, in litt. D. C. prod. 1. p. 486.) leaves ovate, unequally crenate-toothed, tomentose beneath; mucrones of petals shorter than the segments of the calyx. ♄. G. Native of New Holland about Port Jackson. Flowers white.

Hermannia-leaved Byttneria. Fl. June, Jul. Clt. 1823. Sh.

§ 2. *Unarmed species, natives of America, and one from the Mauritius.*

4 B. MACROPHY'LLA (H. B. et Kunth, nov. gen. amer. 5. p. 315.) leaves cordate, ovate-roundish, obtuse, serrate-crenate, marked at the base with a clear spot, and are as well as branches pubescent; peduncles many-flowered, axillary, usually in threes. ♃. S. Native of New Granada near Honda. Points of petals dark-purple.

Long-leaved Byttneria. Pl. 1 to 2 feet.

5 B. MELASTOMOÌDES (St. Hil. fl. bras. 1. p. 144. t. 28.) stem suffruticose, nearly simple; leaves ovate, quite entire, smooth, upper ones lanceolate; panicle terminal, elongated, nearly simple; tube of stamens 5-lobed; lobes very obtuse, 3-crenate, sterile; anthers sessile beneath the lobes. ♄. S. Native of Brazil. Racemes compound, involucrated, disposed in umbel-like fascicles along the rachis.

Melastoma-like Byttneria. Fl. July. Shrub 2 feet.

6 B. GAYA'NA (St. Hil. fl. bras. 1. p. 145.) stem shrubby, scandent, unarmed; leaves oblong, or oblong-lanceolate, long-acuminated, quite entire, smoothish; peduncles axillary, umbelliferous; tube of stamens 5-cleft, with the antheriferous divisions a little below. ♄. ◡. S. Native of Brazil in the province of St. Paul. Petals dark-purple, ending in yellow points.

Gay's Byttneria. Fl. March. Shrub climbing.

7 B. SIDÆFÒLIA (St. Hil. fl. bras. 1. p. 146.) stem suffruticose, climbing, unarmed; leaves heart-shaped, acuminated, very acute, quite entire; corymbs sublateral; tube of stamens 10-cleft, 5 sterile divisions broadest, antheriferous, 5, very short and narrow. ♄. ◡. S. Native of Brazil on the banks of the river Parahyba near Uba. Petals smooth, white.

Sida leaved Byttneria. Fl. Feb. Shrub cl. or tw.

8 B. BRASILIE'NSIS (Spreng. syst. 1. p. 790.) leaves subcordate-oblong, acuminated, triple-nerved, serrated, floccosely-tomentose; peduncles axillary, subracemose; branches terete, tomentose. ♄. S. Native of Brazil.

Brazilian Byttneria. Shrub.

9 B. CATALPÆFÒLIA (Jacq. hort. schœnbr. 1. t. 46.) leaves cordate, quite entire, smooth, acuminate; stem climbing. ♄. ◡. S. Native of Caraccas. Flowers white. Peduncles solitary or tern, axillary, panicled.

Catalpa-leaved Byttneria. Clt. 1823. Shrub cl.

10 B. HETEROPHY'LLA (Hook, bot. misc. pt. 3. p. 287. t. 61.) climbing; leaves cordate, with a short acumen, entire, lobed, or palmate; petals with a tooth on each side of the saccate part. ♄. ◡. S. Native of the Mauritius, and Madagascar. Telfàiria volùbilis, Newm. mss. Heterophýllum ramòsum, Bojer. mss. Panicles axillary. Leaves pubescent in the axils of the veins. Calyx scarlet. Petals yellow, but reddish on the back, ending in a long, linear, ciliated point.

Various-leaved Byttneria. Shrub climbing.

§ 3. *Species prickly on the stems, branches, petioles, and nerves.*

11 B. HIRSU`TA (Ruiz et Pav. fl. per. 3. p. 10.) leaves cordate, acute, crenate, hairy beneath, with the ribs and petioles prickly; peduncles compound, crowded. ♄. S. Native of Peru on the Andes. Flowers umbellate, involucrate. Petals yellow at the base but purple at the apex.

Hairy Byttneria. Shrub 2 to 3 feet.

12 B. MO'LLIS (H. B. et Kunth, nov. gen. amer. 5. p. 314. t. 481. *a* and *b*.) leaves cordate, acuminated, crenate, unarmed, soft, tomentose, marked with a clear spot at the base; branches prickly, villous, tomentose; umbels 7-11-flowered, axillary, and opposite the leaves, solitary or tern. ♄? S. Native of South America near Santa Fe de Bogota. Calyx red. Points of petals white.

Soft-leaved Byttneria. Shrub 3 to 4 feet.

13 B. CORDA`TA (Lam. dict. 3. p. 523.) leaves cordate, acuminate, serrate, with 1 gland beneath, pubescent; petioles unarmed; stems prickly; peduncles pendulous, usually tern, unequal 6-7-flowered, umbellate. ♄. S. Native of Peru near Lima, in hedges at Chancay. Cav. diss. 5. p. 291. t. 150. Ræm. et Schultz. syst. 1. p. 469. exclusive of synonym of Willd. Petals white, villous, with yellow mucrones.

Cordate-leaved Byttneria. Fl. July. Clt. 1793. Sh. 4 ft.

14 B. CELTOÌDES (St. Hil. fl. bras. 1. p. 141. t. 24.) stem shrubby, procumbent, prickly; leaves ovate-oblong, with a long acumen, cordate at the base, obsoletely serrated, puberulous on both surfaces, roughish above; panicle axillary, umbelliferous, shorter than the leaves; tube of stamens 10-cleft, each division containing 5 anthers. ♄. S. Native of Brazil near Canabraba. Petals dark-purple.

Celtis-like Byttneria. Fl. April. Shrub 6 to 7 feet.

15 B. SAGITTÆFÒLIA (St. Hil. fl. bras. 1. p. 142. t. 27.) stem suffruticose, erect; leaves arrow-shaped, acute, upper ones toothed at the top; petioles triquetrous; raceme terminal; tube of stamens 5-lobed; lobes 3-toothed, sterile; anthers sessile beneath the lobes. ♄. S. Native of Brazil in the province of Minas Geraes. Petals yellowish-green, ending in dark-purple ligulæ. Raceme composed of involucrated umbels. The stem is covered with tubercles or prickles, which are evident under a microscope.

Var. β, *pubérula* (St. Hil. l. c.) stem puberulous; leaves less rough, entire at the apex; bracteas leafy; umbels much longer than in the species. Province of St. Paul.

Arrow-leaved Byttneria. Shrub 2 feet.

16 B. AUSTRA`LIS (St. Hil. fl. bras. 1. p. 145.) stem shrubby, prickly, scandent? leaves oblong with long acumens, obtuse at the base, quite entire, bearded in the axils of the nerves; peduncles sublateral, umbelliferous; tube of stamens 5-lobed. ♄. ⏑. S. Native of Brazil in the province of St. Catherine. Petals ending in dark purple points.

Southern Byttneria. Shrub cl.

17 B. SULCA`TA (Ruiz. et Pav. fl. per. 3. p. 10.) leaves cordate, ovate, serrated, pubescent, with the ribs and petioles prickly; peduncles twin, 3-5-flowered. ♄. S. Native in the warmer parts of Peru. Petals green at the base, with dark-purple points.

Furrowed-stemmed Byttneria. Shrub.

18 B. LANCEOLA`TA (Moc. et Sesse, fl. mex. icon. ind. D. C. prod. 1. p. 487.) leaves ovate-lanceolate, somewhat cordate, rarely serrated, acuminate, and are unarmed as well as the petioles; stem prickly, climbing, angular; peduncles tern, 5-7-flowered. ♄. S. Native of Mexico on the mountains. Petals white with purple points.

Lanceolate-leaved Byttneria. Shrub cl.

19 B. OVA`TA (Lam. dict. 1. p. 522.) leaves ovate, serrate-toothed, smooth; petioles unarmed; branches 5-angled, prickly; stem erect; pedicels 3-6, axillary, 1-flowered, drooping. ♄. S. Native of Peru. Cav. diss. 5. p. 291. t. 149. f. 1. Flowers villous, white, with purple ciliated mucrones.

Ovate-leaved Byttneria. Shrub 8 feet.

20 B. MICROPHY'LLA (Lin. mant. 209.) leaves elliptical, quite entire, but emarginate at the apex; prickles stipular; pedicels short, 3-9, axillary, 1-flowered. ♄. S. Native of St. Domingo near Port au Prince. Cav. diss. 5. p. 292. t. 143. f. 2. Jacq. hort. vind. t. 29. Flowers white with purple mucrones.

Small-leaved Byttneria. Fl. Ju. Clt. 1816. Shrub 5 ft.

21 B. TERETICAU'LIS (Lam. dict. 1. p. 523.) leaves lanceolate, acuminated, quite entire; branches, petioles, and stems terete, prickly; pedicels solitary, lateral, 1-flowered. ♄. S. Native of Peru. Cav. diss. 5. p. 292. t. 149. f. 2. Flowers white, with purple mucrones?

Round-stemmed Byttneria. Shrub 4 feet.

22 B. SCA`BRA (Lin. syst. 197.) leaves lanceolate, toothed, somewhat hastate at the base; branches, petioles, and peduncles angular; stems prickly; peduncles axillary, numerous, subumbellate; tube of stamens 10-crenate. ♄. S. Native of South America between Cayenne and Couron. Cav. diss. 5. p. 291. t. 148. f. 1. Aubl. guian. t. 96. Flowers white, with red mucrones; anthers yellow.

Scabrous Byttneria. Fl. July. Clt. 1793. Shrub 3 to 5 ft.

23 B. CARTHAGENE'NSIS (Jacq. amer. ed. pict. p. 41.) cauline leaves ovate, those of the branches ovate-lanceolate, bluntly acuminate, entire; ribs of leaves, petioles, and rambling branches prickly; racemes short, axillary, aggregate. ♄. S. Native of Carthagena at the margins of woods. B. aculeàta, Jacq. amer. 76. Chætæ`a aculeàta, Jacq. enum. 17. Flowers small, white, withered mucrones.

Carthagena Byttneria. Fl. Sept. Oct. Shrub 5 to 6 feet.

† *Species not sufficiently known.*

24 B. ACUMINA`TA (Bred. ex Willd. rel. in Ræm. and Schult. syst. 5. p. 470.) leaves ovate, acuminate, unarmed; petioles somewhat prickly; stem round, prickly. ♄. S. Native of Caraccas.

Acuminate-leaved Byttneria. Shrub.

25 B. SALICIFÒLIA (H. et. B. ex Willd. rel. in Ræm. and Schult. syst. 5. p. 470.) leaves lanceolate, smooth; stem angular, and is as well as the petioles and ribs of leaves prickly. ♄. S. Native of Cumana.

Willow-leaved Byttneria. Shrub.

26 B. CORYLIFÒLIA (H. et B. l. c.) leaves oblong, somewhat cordate, serrate, acute; stem prickly. ♄. S. Native of South America.

Hazel-leaved Byttneria. Fl.? Shrub?

Cult. The species of this genus are of easy culture; they thrive best in a mixture of loam and peat. Ripened cuttings of the stove species root freely in mould or sand under a hand-glass, in heat, and young cuttings of the greenhouse species will root freely in sand under a hand-glass; they also may be raised from seeds, which sometimes ripen in this country. The herbaceous kinds may be either increased by dividing the plants at the roots or by seeds. None of them are worth cultivating except in general collections.

VII. AYE`NIA (in honour of the Duke D'Ayen of the house of Noailles, who has contributed to the progress of botany by

his zeal in collecting plants), Lin. gen. no. 1020. D. C. prod. 1. p. 487.

LIN. SYST. *Monadélphia, Decándria.* Calyx 5-parted. Petals 5, arched, broadest at the apex, with long claws, ending each in 1 or 2 pedicellate glands. Urceolus of stamens 10-15-toothed, 5 or 10 of which are sterile, and the 5 alternate ones bearing 1 anther each. Style 1. Stigma 5-angled. Carpels 5, 2-valved, 1-seeded, conniving into a somewhat globose echinated fruit. Albumen wanting. Cotyledons leafy, convolute. Plants with simple, serrate leaves, and axillary, few-flowered peduncles.

1 A. PUSI'LLA (Lin. spec. 1354.) leaves ovate, smoothish, sharply serrated; stems prostrate; peduncles short, 2-3-flowered, axillary. ☉. S. Native of the Caribbee Islands, as well as of Peru. Cav. diss. 5. p. 289. t. 147. Lin. in act. holm. 1756. p. 23. t. 2. Dayènia, Mill. illust. t. 118.—Sloane, hist. t. 132. f. 2. A weak shrubby plant. Petals reddish, each ending in a black mucrone.

Least Ayenia. Fl. July, Oct. Clt. 1756. Shrub ½ foot.

2 A. LÆVIGA'TA (Swartz, fl. ind. occ. 2. p. 1131.) leaves ovate, quite smooth, entire; urceolus exserted, 10-toothed, besides the stamens. ♄. S. Native of Jamaica in bushy places, but rare. Flowers blood-coloured. Peduncles axillary, solitary, filiform, 1-flowered.

Smooth-leaved Ayenia. Shrub 2 feet.

3 A. TOMENTÒSA (Lin. spec. 1354.) leaves ovate, roundish, tomentose; urceolus exserted, 5-toothed besides the stamens. ♄? S. Native of Cumana in South America. Lœfl. itin. 230. no. 3.

Tomentose Ayenia. Shrub 2 feet.

4 A. SIDÆFÒLIA (Lœfl. itin. 257.) leaves ovate-oblong, doubly serrated, tomentose beneath. ♄. S. Native of South America. This species is joined by Linneus to *A. tomentòsa*. Flowers reddish. Urceolas 5-toothed besides the stamens.

Sida-leaved Ayenia. Shrub.

5 A. MA'GNA (Lin. spec. 1354.) leaves cordate, ovate, acuminate, serrated, pubescent; peduncles many-flowered, longer than the petioles; urceolus 5-toothed. ♄. S. Native of Cumana in South America and in Mexico. A. cardiopétala, Moc. et Sesse, fl. mex. icon. ind. Flowers small, greenish, or red.

Large Ayenia. Shrub 2 to 5 feet.

6 A. CORDIFÒLIA (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 488.) leaves cordate, serrated, pubescent; pedicels numerous, aggregate, shorter than the petioles. ☉. S. Native of Mexico on the mountains.

Heart-leaved Ayenia. Fl. June, July. Pl. 1 foot.

Cult. The species of *Ayènia* are of easy culture; they succeed best in a rich loamy soil. Cuttings of the shrubby kinds root freely in sand, under a hand-glass, in a moist heat. The seeds of *A. cordifòlia* requires to be sown on a hot-bed, and when the plants are of sufficient size they may be planted out in the open border in a sheltered situation. None of the species are worth cultivating, except in general collections.

VIII. KLEINHO'VIA (in honour of Kleinhoff, once director of the botanic garden in Batavia). Lin. gen. no. 1024. Gært. fruct. 2. p. 261. t. 137. H. B. et Kunth, nov. gen. amer. 5. p. 313. D. C. prod. 1. p. 488.

LIN. SYST. *Monadélphia, Polyándria.* Calyx 5-parted (f. 89. *a.*). Petals 5, (f. 89. *e.*) one of which is longer than the rest and cut at the apex (f. 89. *b.*). Filaments of stamens monadelphous at the base (f. 89. *d.*), divided into 5 bundles at the top (f. 89. *h.*), each bundle bearing 3 2-lobed anthers on the back (f. 89. *l.*), opposite the petals. Ovary stipitate. Carpels 5 (f. 89. *g.*), constantly connected together, each containing 5-ovulæ. Style 1. Stigma somewhat crenate. Capsule inflated, turbinate, 5-angled, 5-celled, 5-seeded (f. 89. *g.*). Seeds roundish. Cotyledons spirally twisted about the plumule.

1 K. HO'SPITA (Lin. spec. 1365.) ♄. S. Native of the Molucca Islands.—Rumph. amb. 3. p. 113. Cav. diss. 5. p. 18. t. 146. This is a smooth tree, with broad, cordate, acuminate, entire leaves, bearing divaricate racemes of small, pink flowers, so as to form a terminal panicle. Rumphius observes that the leaves when bruised have a smell like violets. especially the young ones.

FIG. 89.

We have seen this plant in Trinidad, where it appears to be herbaceous, about 6 or 8 feet high, with many stems rising from the root.

Stranger Kleinhovia. Fl. July, Sept. Clt. 1800. Tr. 20 ft.

Cult. This tree will grow well in any light rich soil, and cuttings will root freely in sand under a hand-glass, in heat.

Tribe II.

LASIOPETA'LEÆ (plants agreeing with *Lasiopétalum* in important characters.) Gay, diss. p. 8. and mem. du mus. 7. p. 431. H. B. et Kunth, nov. gen. amer. 5. p. 313. Calyx 5-parted, petal-like (f. 90. *b.*), permanent or marcescent. Petals minute, scale-formed (f. 90. *c.*), rarely wanting. Filaments of stamens awl-shaped, connate at the base, sometimes 5, opposite the petals, sometimes 10, alternately sterile and fertile. Anthers incumbent, with contiguous lobes. Ovary 3-5-celled; cells containing from 2 to 8-ovulæ. Carpels 5, 2-valved, usually closely connate into a single fruct, but sometimes somewhat free. Seeds strophiolate at the base. Albumen fleshy. Embryo straight. Cotyledons flat, leafy. New Holland shrubs.

IX. SERI'NGIA (Nicholas Charles Seringe, a Swiss botanist, author of numerous papers in De Candolle's Prodromus). Gay, diss. p. 12. D. C. prod. 1. p. 488.

LIN. SYST. *Decándria, Monogýnia.* Calyx marcescent. Petals wanting. Filaments 10, with the 5 alternate ones sterile. Anthers bursting by dorsal chinks. Carpels 5, 2-valved, 2-3-seeded, each ending in a style. Strophiola of seed crenate.

1 S. PLATYPHY'LLA (Gay, diss. p. 13. t. 1. and 2.). ♄. G. Native of New Holland on the eastern coast. Lasiopétalum arboréscens, Ait. hort. kew. ed. 2. vol. 2. p. 36. Peduncles opposite the leaves, bearing many flowers, in crowded cymes. Stipulas small, deciduous. Leaves ovate-lanceolate, grossly toothed. Flowers yellowish from tomentum.

Broad-leaved Seringia. Fl. April, July. Clt. 1802. Shrub 4 to 5 feet.

Cult. This shrub will thrive well in a mixture of sand, loam, and peat, and young cuttings planted in the same kind of soil under a hand-glass will root readily, or it may be increased by seeds, which occasionally ripen in this country.

X. LASIOPE'TALUM (from λασιος, *lasios*, woolly, and πεταλον, *petalon*, a petal; in allusion to the calyx being woolly.) Smith, in Lin. trans. 4. p. 216. D. C. prod. 1. p. 489.

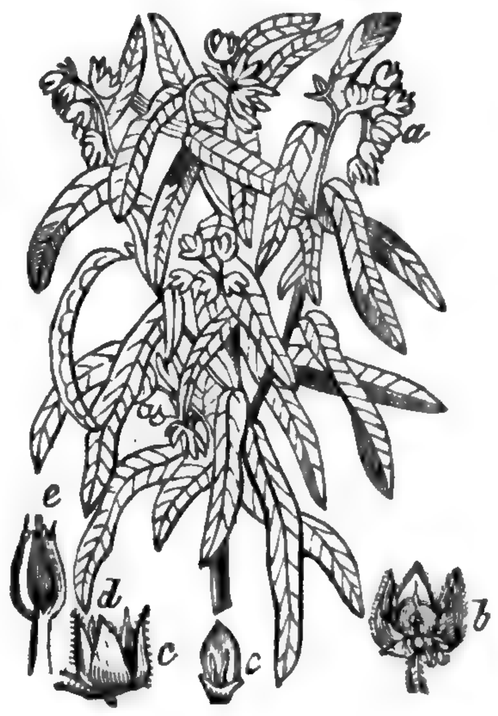
LIN. SYST. *Pentándria, Monogýnia.* Calyx permanent (f. 90. *b.*). Petals 5, in the form of glands. Filaments 5, free. Anthers bursting by 2 pores on the inside (f. 90. *e.*). Ovary 1, 3-celled; cells containing 2-ovulæ. Capsules 3-valved, with valvular dissepiments opening at the cells. Strophiola of seeds jagged. Stipulas wanting. Leaves linear-lanceolate, quite entire, rusty beneath. Inflorescence in cymes opposite the leaves.

1 L. FERRUGI'NEUM (Smith, in Andr. bot. rep. t. 208.) segments of calyx tomentose on both sides. ♄. G. Native of New Holland. Vent. malm. t. 59. Sims, bot. mag. t. 1766. Cav. diss. p. 16. t. 3. Calyx covered with brown tomentum. Petals small, dark-purple.

Rusty Lasiopetalum. Fl. April, July. Clt. 1791. Sh. 2 to 4 ft.

2 L. PARVIFLÒRUM (Rudge, in Lin. trans. 10. p. 297. t. 19. f. 1.) segments of calyx smooth on the inside. ♄. G. Native of New Holland. Gay, diss. p. 17. t. 4. Flowers small, yellowish-brown from tomentum.

FIG. 90.



Small-flowered Lasiopetalum. Fl. Apr. Jul. Clt. 1810. Sh. 3 ft.

Cult. These are very pretty shrubs; they grow best in a mixture of loam, peat, and sand, and ripened cuttings will root freely in sand under a hand-glass.

XI. GUICHENO'TIA (in honour of Anthony Guichenot, who went round the world with Captain Baudin along with Riedle and Leschenault.) Gay, diss. p. 20. D. C. prod. 1. p. 489.

LIN. SYST. *Pentándria, Monogýnia.* Calyx permanent. Petals 5, gland-formed. Filaments 5, free. Anthers bursting by lateral chinks. Ovary 5-celled; cells containing 5 ovulæ, clothed with dense tomentum within. Stipulas wanting. Leaves 3 in a whorl, linear-lanceolate, entire. Inflorescence racemose.

1 G. LEDIFÒLIA (Gay, diss. p. 19. t. 5.). ♄. G. Native of New Holland on the western coast. Shrub hoary all over. This is a perfectly distinct genus from *Lasiopétalum ledifòlium* of Vent., which is now *Borònia ledifòlia*. Calyx grey-tomentose. Petals dark-purple.

Ledum-leaved Guichenotia. Shrub 2 feet.

Cult. This is a very pretty shrub, which will thrive well in a mixture of sand, loam, and peat, and ripened cuttings will root readily in sand under a hand-glass.

XII. THOMA'SIA (in memory of Peter and Abraham Thomas, collectors of Swiss plants in the time of Haller.) Gay, diss. p. 20. D, C. prod. 1. p. 489.

LIN. SYST. *Penta-Decándria, Monogýnia.* Calyx permanent, veiny. Petals 5, scale-formed, or wanting. Filaments 5 or 10, for the most part connate at the base. Anthers bursting by lateral chinks. Ovary 3-celled; cells containing from 2-8-ovulæ. Capsules 3-valved, dissepiments formed from the edges of the valves. Strophiola of seed crenate. Stipulas leafy, permanent. Leaves ovate, lobed, clothed on both surfaces with hispid tomentum. Inflorescence racemose, opposite the leaves. Bracteas 3-parted.

§ 2. *Pentandrous species with a long style, and with 2 seeds in each cell of the capsule.*

1 T. PURPU'REA (Gay, diss. p. 22. t. 6.) leaves linear-elliptical, entire; stipulas leafy; petals 5; capsules stipitate, smooth, with 3 deep furrows. ♄. G. Native of New Holland on the south-west coast. Lasiopétalum purpùreum, Sims, bot. mag. t. 1755. Lasiopétalum purpuráscens, Lois. herb. amat. t. 294. Calyx purple.

Purple-flowered Thomasia. Fl. April, July. Clt. 1803. Shrub 1 to 2 feet.

2 T. FOLIÒSA (Gay, diss. p. 24. t. 7.) leaves ovate, cordate, bluntly 5-7-lobed; stipulas minute; petals wanting; capsules sessile, tomentose, with 3 furrows. ♄. G. Native of New Holland on the south-west coast.

Leafy Thomasia. Fl. April, July. Clt. 1823. Shrub 1 ft.

§ 2. *Decandrous species with a short style, and from 3 to 8 seeds in each cell of the capsule.*

3 T. SOLANA'CEA (Gay, diss. p. 26. t. 6.) petals 5; leaves sinuate-lobed, hairy. ♄. G. Native of New Holland on the south-west coast. Lasiopétalum triphýllum, Smith in Rees' cyclop. Lasiopétalum solanàceum, Sims, bot. mag. t. 1486. Leaves the largest of all the genus. Calyx pinkish-purple.

Solanum-flowered Thomasia. Fl. April, July. Clt. 1803. Shrub 1 to 5 feet.

4 T. TRIPHY'LLA (Gay, diss. p. 28.) leaves sinuately-angular, smoothish on the back; petals wanting; capsules mucronate. ♄. G. Native of New Holland in Van Lewin's Land. Lasiopétalum triphýllum, Labill. nov. holl. 1. p. 63. t. 88. Leaves appearing ternate from being furnished with a large, stalked stipula on each side.

Three-leaved Thomasia. Fl. April, July. Clt. 1824. Shrub 2 to 4 feet.

5 T. QUERCIFÒLIA (Gay, diss. p. 29.) leaves 3-lobed, pinnatifid, clothed with rough tomentum beneath; petals wanting; capsules mutic. ♄. G. Native of New Holland. Lasiopétalum quercifòlium, Andr. bot. rep. t. 459. Sims, bot. mag. 1485. Flowers purplish.

Oak-leaved Thomasia. Fl. April, July. Clt. 1803. Shrub 1 to 3 feet.

6 T. DIFFU'SA; leaves 3-lobed; stems diffuse; petals wanting? ♄. G. Native of New Holland. Flowers white.

Diffuse Thomasia. Fl. April, July. Clt. 1825. Sh. ½ foot.

Cult. *Thomàsia* is a genus of pretty under shrubs, which deserve to be cultivated in every collection; they will thrive well in a mixture of loam, sand, and peat, and ripened cuttings will root freely in sand, under a hand-glass.

XIII. KERAUDRE'NIA (in honour of — Keraudren, a French nobleman?). Gay, diss. p. 31. D. C. prod. 1. p. 489.

LIN. SYST. *Pentándria, Monogýnia.* Calyx permanent. Petals wanting. Filaments 5, fertile, imbricate and conniving at the base. Anthers bursting by dorsal chinks. Ovary 3-celled, each cell containing many ovulæ. Styles 3-parted, connected. Capsules echinately-tomentose, 1-celled from abortion, 3-valved, with valvular dissepiments. Seeds twin, with an entire strophiola. Stipulas minute, permanent. Leaves sinuately waved. Inflorescence corymbose, with jointed pedicels.

1 K. HERMANNIÆFÒLIA (Gay, diss. p. 32. t. 8.). ♄. G. Native of New Holland on the western coast. A stiff shrub.

Hermannia-leaved Keraudrenia. Fl.? Shrub 1 foot.

Cult. This shrub will thrive well in a mixture of loam and peat, and ripened cuttings will root readily in sand under a hand-glass.

Tribe III.

HERMANNIE Æ (plants agreeing with *Hermánnia* in important characters). D. C. prod. 1. p. 490. Hermanniàceæ, Kunth, malv. p. 11. nov. gen. amer. 5. p. 312. Flowers hermaphrodite. Calyx 5-lobed, permanent, sometimes naked, sometimes somewhat involucrated. Petals 5, spirally twisted before expansion, with the claws usually adnate to the tube of the stamens. Stamens 5, monadelphous at the base, all fertile and opposite the petals. Anthers ovate, 2-celled. Styles 5, connected into 1, crowned by as many stigmas. Carpels 5, joined into 1 fruit; cells or carpels usually 2-seeded. Albumen fleshy. Embryo enclosed, straight, or curved, with an ovate, inferior radicle, and flat, leafy, entire cotyledons.

XIV. MELO'CHIA (a name altered from the Arabic name of *Córchorus olitòrius*, *Melóchich* or *Melókhych*, which is used in the East as a salad-plant). H. B. et Kunth, nov. gen. amer. 5. p. 322.—Melòchia, spec. Lin. gen. no. 829. D. C. prod. 1. p. 490.

LIN. SYST. *Monadélphia*, *Pentándria*. Calyx 5-cleft, naked, or furnished with 1-3 calyculate bracteas. Petals 5, spreading. Stamens 5, monadelphous at the base. Styles 5, more or less connected. Capsules 5-celled, 5-valved, opening at the cells, bearing a dissepiment in the middle of each valve. Seeds from 1-2 in each cell. Herbs or subshrubs with simple serrated leaves. Flowers terminal, axillary, and opposite the leaves, capitate, umbellate, or glomerate, spicate, corymbose or panicled, rarely solitary, white, red, lilac, yellow, purple, violet, and of 2 colours. Calyx valvate. Petals twisted. The genus *Reidlèia* does not appear to differ generically from *Melòchia*, and perhaps it would be better if these two genera were again united. Those species said to have 10-valved capsules, more properly belong to the genus *Riedlèia* as it now stands.

1 M. PYRAMIDA'TA (Lin. syst. p. 510.) leaves ovate, acute, serrated, smooth; upper ones oblong or linear-oblong; peduncles 5-10-flowered, capitate, opposite the leaves; petioles and branches puberulous; tube of stamens 5-cleft at the top; capsule pyramidal at both ends. ♄. S. Native of the Caribbee Islands and Brazil. Cav. diss. 6. p. 319. t. 172. f. 1. M. Domingénsis, Jacq. vind. 1. t. 30. Flowers flesh-coloured or violaceous, yellow at the claws.

Pyramidal-capsuled Melochia. Fl. July, Aug. Clt. 1768. Shrub 1 to 2 feet.

2 M. ULMARIOÌDES (St. Hil. fl. 1. p. 159.) stem twiggy; cauline leaves ovate, heart-shaped, acute, dentately serrated, smoothish above, but pubescent beneath; panicle terminal, cymose, elongated; tube of stamens cleft in 5, even to the middle; capsule globose, villous, 10-valved at the apex. ♄. S. Native of Brazil in the province of Rio Grande do Sul at the river Uruguay.

Ulmaria-like Melochia. Fl. Jan. Shrub 1 to 2 feet.

3 M. SERI'CEA (St. Hil. fl. bras. 1. p. 160.) stem twiggy, nearly simple, hairy; cauline leaves heart-shaped, unequally silky; panicle terminal, simple, interrupted; tube of stamens deeply 5-cleft; capsule globose, villous, 10-valved at the apex. ♄. S. Native of Brazil near Villa Rica. Flowers yellow?

Silky Melochia. Fl. Feb. Pl. 3 to 5 feet.

4 M. GRAMINIFÒLIA (St. Hil. fl. bras. 1. p. 160. t. 31.) stem nearly simple, twiggy; leaves on short petioles, linear, acute, remotely serrated, smooth; panicle terminal, very slender; tube of stamens nearly entire; capsule subglobose, at length 10-valved. ♄. S. Native of Brazil in the province of Minas Novas in dried-up marshes. Petals purple, but yellow at the base with purple veins.

Grass-leaved Melochia. Fl. June. Pl. 1 to 1½ foot.

5 M. TURPINIA'NA (H. B. et Kunth, nov. gen. amer. 5. p. 323. t. 432.) leaves somewhat unequal-sided, ovate, acute, truncate, and somewhat cordate at the base, doubly crenate-serrated, pubescent above, hoary from tomentum beneath; umbels 7-10-flowered, longer than the petioles. ♄. S. Native of New Granada. Flowers red or violaceous.

Turpin's Melochia. Fl. June, July. Shrub 1 to 2 feet.

6 M. TOMENTÒSA (Lin. spec. 932.) leaves unequal-sided, ovate-oblong, acute, serrated, with plaited lines, hoary from tomentum on both surfaces as well as the branchlets; umbels 3-8-flowered, axillary, longer than the petioles, but they are opposite the leaves on the branchlets. ♄. S. Native of the Caribbee Islands in dry fields as well as on the sandy sea-coast of Cumana. H. B. et Kunth, nov. gen. amer. 5. p. 323. Flowers purple. Style 5-cleft.

Var. β, *frutéscens* (Jacq. obs. 2. p. 24.) differing from the species in its habit being much harder, as well as the leaves being much smaller. Flowers violaceous. Perhaps a distinct species.

Tomentose Melochia. Fl. May, June. Clt. 1768. Shrub 6 to 7 feet.

7 M. MACROPHY'LLA (H. B. et Kunth, nov. gen. amer. 5. p. 324.) leaves equal-sided, ovate, acute, cordate, crenate-serrated, hairy above, but clothed with fine, soft, hoary tomentum beneath; umbels many-flowered, equal in length with the petioles. ♄. S. Native of New Andalusia near Bordones. Flowers white.

Long-leaved Melochia. Shrub 3 to 6 feet.

8 M. LILACÌNA (St. Hil. fl. bras. 1. p. 162.) stems decumbent, branched; leaves on short petioles, cordate at the base, unequally serrated, plaited, silky-villous on both surfaces, lower ones somewhat oblong-ovate, intermediate ones ovate or ovate-roundish, uppermost ones roundish-ovate, or roundish; flowers glomerate, disposed in interrupted spikes; tube of stamens entire; capsule ovate, 5-lobed, villous, 5-valved. ♃. S. Native of Brazil in the province of Minas Geraes, not far from the river St. Francisco. Flowers lilac.

Lilac-flowered Melochia. Fl. Aug. Pl. decumbent.

9 M. HERMANNIOÌDES (St. Hil. fl. bras. 1. p. 163. t. 32.) stem suffruticose, prostrate; leaves usually obovate, very obtuse, toothed, quite entire at the base, pilose on both surfaces; heads of flowers subumbellate; peduncles opposite the leaves, hairy; tube of stamens 5-cleft; capsule somewhat obcordately-globose, 5-lobed. ♄. S. Native of Brazil in the province of the Missions, in grassy fields. Petals violaceous.

Hermannia-like Melochia. Fl. Jan. Feb. Shrub prostrate.

10 M. SI'MPLEX (St. Hil. fl. bras. 1. p. 164.) stem suffruticose, nearly simple; leaves lanceolate, finely denticulated, puberulous on the nerves; flowers axillary, and at the tops of the branches in fascicles; capsule spherical, pilose, 5-valved. ♄. S. Native of Brazil in the province of St. Paul, in the northern part. Petals purple or violet at the top but yellow at the base.

Simple-stemmed Melochia. Fl. Mar. Shrub 1 foot.

11 M. NEPETOÌDES (St. Hil. fl. bras. 1. p. 165.) stem suffruticose; leaves ovate, cordate at the base, crenate, puberulous above, but pubescent beneath; heads of flowers axillary; peduncles longer than the petioles, pubescent; capsule pyramidal at both ends, broad. ♄. S. Native of Brazil in the province of Minas Novas, on the banks of a rivulet called Sucuriu. Flowers purplish.

Nepeta-like Melochia. Fl. May. Shrub 1½ foot.

12 M. BETONICÆFÒLIA (St. Hil. fl. bras. 1. p. 165.) leaves ovate-oblong, cordate at the base, crenate-toothed, rather pubescent above, but pubescent beneath; heads of flowers axillary, with the peduncle shorter than the petiole; tube of stamens 5-cleft; capsule pyramidal at both ends, pubescent, with the lobes of the exterior angle furnished with a tooth. ♄. S. Native of Brazil in the province of Minas Novas. Flowers white.

Betony-leaved Melochia. Fl. May. Shrub 1 to 2 feet.

13 M. CORDIFO'RMIS (St. Hil. fl. bras. 1. p. 160.) leaves heart-shaped, acute, somewhat doubly-toothed, puberulous above, but tomentose beneath; heads of flowers axillary, stalked; tube of stamens 5-cleft at the apex. ♄. S. Native of Brazil in the province of Minas Novas. Flowers pale-purple.

Heart-leaved Melochia. Fl. June. Shrub 1 to 2 feet.

14 M. PARVIFÒLIA (H. B. et Kunth, nov. gen. amer. p. 325.) leaves small, oblong or obovate-oblong, obtuse at both ends, crenate-serrated, roughish above, but clothed with close-pressed hairs beneath; flowers crowded in umbels at the tops of the branches. ♄. S. Native of South America in arid places near Caraccas. Flowers white.

Small-leaved Melochia. Fl. Jul. Aug. Clt. 1819. Sh. 1½ ft.

15 M. LANA'TA (St. Hil. fl. bras. 1. p. 167.) stem suffruti-

cose, erect, branched, woolly, canescent; leaves ovate-elliptical, toothed, quite entire at the base, silky-villous above, but woolly and hoary beneath; heads of flowers stalked, opposite the leaves, dense; tube of stamens profoundly 5-cleft. ♄. S. Native of Brazil in the province of Minas Geraes, near Olho d'Agoa.

Var. β, inclùsa (St. Hil. l. c.) leaves narrower, elliptic, less woolly; heads of flowers less woolly; stamens inclosed; petals much smaller; style a little longer than the petals.

Woolly Melochia. Fl. Sep. Oct. Shrub 1 to 2 feet.

16 M. Portorice'nsis (Spreng. syst. 3. p. 29.) leaves oblong, obtuse, crenated, hoary tomentose on both surfaces; peduncles umbelliferous, short. ♄. S. Native of Porto-Rico. M. crenàta, Bertero.

Porto-Rico Melochia. Shrub 1 to 2 feet.

Cult. Melòchia is a genus of plants hardly worth cultivating except in botanic gardens. They thrive well in any light rich soil, and cuttings root readily in the same kind of soil under a hand-glass, in heat. They may be also increased by seeds, which generally ripen in this country.

XV. RIEDLE'IA (in honour of M. Riedle, a French naturalist, who accompanied Captain Baudin round the world.) D. C. prod. 1. p. 490.—Riedlèia, Vent. choix. no. 37.—Mougeòtia, Kunth. diss. p. 12. nov. gen. amer. 5. p. 326.—Visènia, Houtt. Pfl. syst. 6. p. 287. Spreng. syst. 3. p. 29.

Lin. syst. *Monadélphia, Pentándria.* Calyx 5-cleft, naked, or furnished with 1-3 calyculate bracteas. Petals 5, spreading. Stamens 5, monadelphous at the base. Styles 5. Carpels 5, joined into a simple fruit, which is therefore 5-celled and 5-valved, at length separating into 5 1-2-seeded divisions, which open longitudinally, and are free from the central axis.—Inflorescence various. Flowers small, white, yellow or red.

1 R. polysta'chia (D. C. prod. 1. p. 490.) leaves oblong, acute, blunt and serrated at the base, pubescent above, but beset with silky hairs beneath, as well as on the branchlets; panicle terminal, leafless, of many stalked cymose or side-flowered racemes. ♂. S. Native of South America near Honda at the river Magdalena. Mougeòtia polystàchia, H. B. et Kunth, nov. gen. amer. 5. p. 328. t. 483. f. a and b. Flowers yellow.

Many-spiked Riedleia. Fl. July, Aug. Clt. 1827. Pl. 2 to 3 feet.

2 R. chamæ'drys; stems prostrate, hairy; leaves ovate or roundish-ovate, very blunt, dentately serrated, pilose, younger ones silky; racemes sub-corymbose, axillary; tube of stamens profoundly 5-cleft; capsule globose, composed of 5 bifid carpels. ♄. S. Native of Brazil. Melòchia chamæ'drys, St. Hil. fl. bras. 1. p. 161. Flowers yellow.

Germander-like Riedleia. Fl. Jan. Pl. prostrate.

3 R. mo'llis (D. C. prod. 1. p. 491.) leaves ovate, acute, rounded and somewhat cordate at the base, serrated, clothed with silky pubescence above, but hoary from soft tomentum beneath; umbels axillary, many-flowered, much longer than the petioles. ♄. S. Native of South America near Honda and Santanna in New Granada. Mougeòtia móllis, H. B. et Kunth, l. c. Petals white, but yellow towards the middle.

Soft Riedleia. Shrub 1 to 2 feet.

4 R. tiliæfo'lia (D. C. prod. 1. p. 491.) leaves cordate, toothed, younger ones clothed with velvety tomentum, adult ones smooth; corymbs terminal, many-flowered; fruit velvety. bluntly 5-sided. ♄. S. Native of the island of Timor. Habit almost of *R. odoràta* or *R. velutìna.*

Lime-tree-leaved Riedleia. Shrub 2 feet.

5 R. crena'ta (D. C. prod. 1. p. 491.) leaves roundish, crenated, tomentose, lined; umbels stalked, axillary, and terminal. ♄. S. Native of South America. Melòchia crenàta, Vahl. symb. 3. p. 86. t. 68. Flowers white or yellow.

Crenate-leaved Riedleia. Shrub.

6 R. odora'ta (D. C. prod. 1. p. 491.) leaves ovate, somewhat cordate, doubly serrated, acute, smooth; corymbs axillary, stalked. ♄. S. Native of the islands of Tanna and Tongataboo in the South Seas. Melòchia odoràta, Forst. prod. 253. Wisènia I'ndica, Gmel. syst. 505. Visènia I'ndica, Houtt. pfl. syst. 6. t. 46. f. 3. Flowers white or red.

Sweet-scented Riedleia. Shrub.

7 R. veluti'na (D. C. prod. 1. p. 491.) lower leaves cordate, upper ones ovate, acuminate, simply serrated, soft and velvety on both surfaces; corymbs axillary, stalked, few-flowered. ♄. S. Native of Bengal and Java. Very like *R. odoràta.* Flowers probably red or white.

Velvety Riedleia. Fl. June, July. Clt. 1823. Shrub 1 to 2 ft.

8 R. corymbòsa (Moc. et Sesse, fl. mex. icon. ined. D. C. prod. 1. p. 491.) leaves cordate, orbicular, acuminated at the apex, villous; corymbs axillary, loose, stalked. ♄. S. Native of Mexico on mountains. Flowers purple, twice the size of those of *R. odoràta.*

Corymbose-flowered Riedleia. Shrub 3 feet.

9 R. trunca'ta (D. C. prod. 1. p. 491.) leaves wedge-shaped, toothed at the apex, smooth above, hoary from stellate tomentum beneath; flowers solitary; capsules depressed. ♄. S. Native of the East Indies. Melòchia truncàta, Willd. spec. 3. p. 601. Flowers white or flesh-coloured.

Truncated-leaved Riedleia. Fl. June, July. Clt. 1817. Shrub 2 feet.

10 R. depre'ssa (D. C. prod. 1. p. 491.) leaves ovate, serrated, velvety-tomentose; pedicels 1-3-flowered, opposite the leaves; capsules bluntly 5-sided, with ciliated angles. ♄. S. Native of the island of Cuba near Havannah, and of St. Martha. Melòchia depréssa, Lin. spec. 910. exclusive of the synonyme of Miller. Cav. diss. 6. p. 320. t. 173. f. 1. a. differs from ours in the stipulas being spreading, lanceolate, not erect subovate. Pedicels shorter, axillary, 1-flowered. Flowers flesh-coloured, but according to Cavanilles sulphur-coloured.

Depressed Riedleia. Fl. June, July. Clt. 1817. Shrub ½ ft.

11 R. Peruvia'na (D. C. prod. 1. p. 491.) leaves ovate, serrated, tomentose; flowers solitary, axillary; capsules globose, villous. ♄. S. Native of Peru. Melòchia Peruviàna, Desrous. in dict. encyl. 4. p. 83. Stem shrubby, dwarf. Flowers citron-coloured.

Peruvian Riedleia. Shrub 2 feet.

12 R. supi'na (D. C. prod. 1. p. 491.) leaves ovate, serrated; flowers capitate; stems procumbent. ⊙. S. Native of the East Indies. Melòchia supìna, Lin. spec. 944.—Pluk. alm. t. 132. f. 4. Flowers red.

Trailing Riedleia. Fl. June, July. Clt. 1823. Pl. trailing.

13 R. corchorifo'lia (D. C. prod. 1. p. 491.) leaves ovate, somewhat 3-lobed, serrated, smooth; flowers generally terminal, capitate, sessile. ⊙. S. Native of Ceylon and Java. Melòchia corchorifòlia, Lin. spec. 944. Cav. diss. 6. p. 321. t. 174. f. 2.—Dill. elth. t. 176. f. 217. Corolla pale-purple, with a yellow bottom.

Corchorus-leaved Riedleia. Fl. June, July. Clt. 1733. Pl. 1 ft.

14 R. radia'ta (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 655.) leaves ovate-lanceolate, acuminated, serrated, rather pubescent on the midrib on both surfaces; lower leaves ovate, sublobate; spikes umbellate, terminal. ⊙? S. Native of Java.

Rayed Riedleia. Pl. 1 to 2 feet.

15 R. infla'ta (D. C. prod. 1. p. 491.) leaves ovate, somewhat acuminated, obsoletely cordate, doubly-serrated, clothed on both surfaces with close-pressed hairs; peduncles axillary, trifid, many-flowered, one-half shorter than the petioles. ♃? S. Na-

tive of New Granada in humid shady places. Mougeòtia inflàta, H. B. et Kunth, nov. gen. amer. 5. p. 330. t. 484. Flowers white, but yellow towards the base.

Inflated Riedleia. Pl. 1 foot.

16 R. NODIFLO'RA (D. C. prod. 1. p. 491.) leaves ovate, acuminated, serrated, smooth, younger ones covered with close-pressed hairs; flowers axillary, conglomerate, sessile. ♄. S. Native of South America and the West India Islands in hedges. Melòchia nodiflòra, Swartz. fl. ind. occ. 2. p. 1139. Mougeòtia nodiflòra, H. B. et Kunth, nov. gen. amer. 5. p. 330. Melòchia carpinifòlia, Wendl. obs. 52. Flowers pale-red.

Knot-flowered Riedleia. Fl. June, July. Clt. 1800. Shrub 2 to 6 feet.

17 R. BORBO'NICA (D. C. prod. 1. p. 491.) leaves ovate-lanceolate, acuminate, serrated, somewhat villous; flowers axillary, conglomerate, sessile. ♄. S. Native of the island of Bourbon. Melòchia Borbónica, Cav. diss. 6. p. 321. t. 174. f. 1. Corolla yellow, hardly longer than the calyx. Fruit villous.

Bourbon Riedleia. Shrub 3 feet.

18 R. BERTERIA'NA (D. C. prod. 1. p. 492.) leaves ovate, somewhat cordate, serrated, smooth; heads of flowers globose, dense on stalks, which are the length of the petioles. ♄. S. Native of Guadaloupe. Melòchia Berteriàna, Balb. in litt.

Bertero's Riedleia. Shrub 2 feet.

19 R. ERIA'NTHA (D. C. prod. 1. p. 492.) leaves ovate, toothed, hairy, on very short petioles; flowers axillary, crowded, sessile; calyxes villous; carpels 5, distinct. ♄. S. Native of Cayenne. Flowers yellow?

Woolly-flowered Riedleia. Shrub 2 to 3 feet.

20 R. HIRSU'TA (D. C. prod. 1. p. 492.) leaves ovate, acute, villous; heads of flowers terminal, rather spike-formed, crowded, hairy; calyxes with 3 bracteas. ♄. S. Native of New Granada and the Caribbee islands. Melòchia hirsùta, Cav. diss. 6. p. 323. t. 175. f. 1. Mougeòtia hirsùta, H. B. et Kunth, nov. gen. amer. 5. p. 331. Flowers yellow.

Hairy Riedleia. Shrub 1½ foot.

21 R. VENO'SA (D. C. prod. 1. p. 492.) leaves ovate, serrated, veiny, tomentose beneath; peduncles distinct, terminal, many-flowered; stem hairy. ♄. S. Native of Jamaica in very arid places. Melòchia venòsa, Swartz. fl. ind. occ. 2. p. 1137. Flowers large, yellow.

Veiny-leaved Riedleia. Shrub 3 feet.

22 R. CONCATENA'TA (D. C. prod. 1. p. 492.) leaves ovate-lanceolate, toothed, smooth; racemes terminal, crowded. ♃. S. Native of the East Indies. Melòchia concatenàta, Lin. spec. 944. Cav. diss. 6. t. 175. f. 2.—Pluk. alm. t. 9. f. 5. Flowers yellow. Capsule globose, sessile.

Concatenated-flowered Riedleia. Fl. June, July. Clt. 1810. Shrub 3 feet.

23 R. JAMAICE'NSIS (D. C. prod. 1. p. 492.) leaves ovate-lanceolate, toothed, clothed with close-pressed villi, but smoothish above; racemes terminal, leafless, interrupted. ♄. S. Native of Jamaica. Melòchia Jamaicénsis, Balb. ined. Stamens joined into a cylinder. Fruit velvety. Flowers yellow?

Jamaica Riedleia. Shrub 2 feet.

24 R. CARACASA'NA (D. C. prod. 1. p. 492.) leaves cordate, crenate, tomentose beneath; flowers capitate, almost sessile, axillary, and opposite the leaves. ♄. S. Native of Caraccas. Mougeòtia Caracasàna, H. B. et Kunth, nov. gen. amer. 5. p. 329. Melòchia Caracasàna, Jacq. icon. rar. 3. t. 507. Flowers large, white.

Caraccas Riedleia. Fl. May, July. Clt. 1817. Shrub 2 feet.

25 R. SERRA'TA (Vent. choix. t. 37.) leaves ovate, cordate, acuminated, serrated, villous on both surfaces; petioles and branches hispid; stipulas lanceolate-linear, almost the length of the petioles; flowers axillary, glomerate, almost sessile. ♃. S. Native of Porto-Rico and St. Domingo. Flowers purple, 3 to 5 in a bundle, disposed in an interrupted spike.

Serrated-leaved Riedleia. Pl. 1 to 2 feet.

Cult. *Riedlèia* is a genus of plants not worth cultivating except in botanic gardens; they will thrive well in any light rich soil, and cuttings of the shrubby and herbaceous perennial kinds will root freely in sand under a hand-glass, in heat, but this will in most cases be unnecessary, as the greater part of the species ripen seed freely in this country; these require to be sown in pots in spring, and placed in a hot-bed, as well as those of the annual species, and when the plants are of a sufficient size they should be potted off into separate pots, and placed in the stove.

XVI. WALTHE'RIA (in honour of Augustus Frederick Walther, a German botanist, once professor of medicine in the university of Leipsic; he described the plants of his own garden in 1735. It is also understood to commemorate Thomas Walter, an English botanist, author of Flora Caroliniana in 1798, and Richard Walter, who went round the world with Admiral Anson in 1740 and 1744.) Lin. gen. no. 827. D. C. prod. 1. p. 492.

LIN. SYST. *Monadélphia, Pentándria.* Calyx 5-cleft, furnished with a lateral 1-3-leaved deciduous involucel. Petals 5. Style 1. Stigma pencilled or tubercled. Capsule 1-celled, 2-valved, 1-seeded, or truly of 5 carpels, 4 of which are abortive.—Shrubs with the habit of *Melòchia.* Flowers small, usually yellow, disposed in terminal or axillary, stalked heads, rarely in panicles, rising in clusters from the branches.

1 W. AMERICA'NA (Lin. spec. 941. exclusive of the synonymes of Smith and Breyn,) leaves ovate-oblong, plaited, acutely and unequally toothed, tomentose on both surfaces; heads of flowers axillary, stalked; calyx very villous; petals rather pubescent. ♂. S. Native of the Bahama Islands, Surinam, and Caribbee Islands. W. arboréscens, Cav. diss. 6. p. 316. t. 170. f. 1. W. I'ndica, Jacq. icon. rar. 1. t. 130. There is a variety of this plant which bears sessile heads of flowers, and perhaps not distinct from *W. I'ndica;* and there is also another variety with elongated peduncles, bearing as if it were many concatenated bundles of flowers. Flowers yellow.

American Waltheria. Fl. May, Oct. Clt. 1691. Shrub 4 ft.

2 W. I'NDICA (Lin. spec. 941.) leaves oval, plaited, downy, bluntly-toothed; heads of flowers axillary, sessile. ♄. S. Native of the East Indies. The heads of flowers being sessile, of a tawny-yellow colour, is sufficient to distinguish it from *W. Americàna.*

Indian Waltheria. Fl. July, Aug. Clt. 1759. Shrub 1 to 3 ft.

3 W. VISCOSI'SSIMA (St. Hil. fl. bras. 1. p. 150.) plant very clammy; stem suffruticose; leaves ovate-oblong, acuminated, cordate at the base, somewhat falcate, velvety-tomentose on both surfaces; panicle leafy; flowers glomerate; calyx hairy; tube of stamens nearly entire; stigma oblong, tuberculated. ♄. S. Native of Brazil in the northern parts of the provinces of Minas Geraes and Minas Novas. Flowers of an orange-yellow colour.

Very-clammy Waltheria. Fl. May, June. Shrub 1 to 2 feet.

4 W. FERRUGI'NEA (St. Hil. fl. bras. 1. p. 150.) stem arborescent, branched; leaves oblong, acute, velvety-tomentose above, but truly tomentose beneath; heads of flowers axillary, on short peduncles; petals shorter than the calyx; tube of stamens 5-cleft; stigma simple. ♄. S. Native of Brazil in the province of Minas Geraes, not far from Villa do Principe. Flowers yellow.

Rusty Waltheria. Fl. March. Shrub 5 to 6 feet.

5 W. ANGUSTIFO'LIA (H. B. et Kunth, nov. gen. amer. 5. p. 332.) leaves oblong, narrow, and acute at the top, rounded at the base, serrated, clothed with soft tomentum; spikes of flowers glomerate, stalked, much longer than the petioles. ♄. S. Native

of South America between Bordones and Cumana. Resembles *W. Americàna*. Perhaps *W. angustifòlia*, Lin. spec. 941. exclusive of the synonymes? Flowers yellow.

Narrow-leaved Waltheria. Shrub 1 to 2 feet.

6 W. corchorifo'lia (Pers. ench. 2. p. 216.) leaves oblong-elliptic, tomentose on both surfaces; heads of flowers axillary, compact, on long peduncles; calyx very villous; corolla smooth. ♄. S. Native of Rio Janeiro in Brazil. W. ellíptica, St. Hil. fl. bras. 1. p. 152. Flowers yellow.

Corchorus-leaved Waltheria. Shrub 2 feet?

7 W. gla'bra (Poir. dict. 7. p. 325.) leaves ovate-lanceolate, mucronately serrated, and are as well as the stem very smooth; heads of flowers ranged alternately on an axillary stalk; calyxes ciliated. ♄. S. Native of Guadaloupe. W. læ'vis, Schrank. pl. monac. t. 55. Link. enum. 2. p. 179. Petals yellow, linear.

Smooth Waltheria. Fl. July. Clt. 1823. Shrub 3 feet.

8 W. corda'ta (Smith in Rees' cyclop. vol. 37.) leaves smooth, cordate, broad-ovate, even, acutely and unequally toothed; heads of flowers solitary, axillary, on stiff peduncles. ♄. S. Native of the West Indies. Flowers yellow.

Heart-leaved Waltheria. Shrub 3 feet.

9 W. cinera'scens (St. Hil. fl. bras. 1. p. 152.) stem shrubby, naked; leaves somewhat imbricated, somewhat ovate-orbicular, very obtuse, cordate at the base, coarsely-serrated, tomentose on both surfaces, cinereous; heads of flowers terminal; calyx villous; tube of stamens 5-cleft. ♄. S. Native of Brazil in the province of Minas Novas. Flowers yellow.

Cinereous Waltheria. Shrub 4 feet.

10 W. mari'tima (St. Hil. fl. bras. 1. p. 153.) stem suffrutescent, branched; leaves rather imbricate, ovate, obtuse, deeply-serrated; pilose on both surfaces, and with fine glandular tubercles; heads of flowers terminal; calyx acuminated, pilose; tube of stamens nearly entire. ♄. S. Native of Brazil near Meiahype, not far from Benevente. Flowers yellow.

Sea-side Waltheria. Fl. Sept. Shrub 1½ foot.

11 W. lana'ta (St. Hil. fl. bras. 1. p. 154.) stem suffruticose, nearly simple; leaves ovate, acutish, plaited, lower and middle ones villous above, but villously-tomentose beneath, uppermost ones woolly, hoary-glaucous; heads of flowers terminal, rarely as if they were axillary, covered with woolly tomentum; tube of stamens entire. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers yellow.

Woolly Waltheria. Fl. Oct. Shrub 1 foot.

12 W. lopha'nthus (Forst. prod. no. 252.) leaves roundish, cordate, serrated, stalked, clothed with silky down; heads of flowers stalked, with imbricate bracteas. ♄. S. Native of the Marquis Islands in the South Seas. Lophánthus tomentòsus, Forst. car. gen. 14. Flowers probably yellow.

Crest-flowered Waltheria. Shrub 3 feet?

13 W. erioca'rpa (D. C. prod. 1. p. 493.) leaves oval, plaited, toothed, tomentose; stipulas bristly-ciliated, permanent; heads of flowers on short peduncles; branches, petioles, and peduncles clothed with down. ♄. S. Native of Brazil. Flowers yellow.

Hairy-fruited Waltheria. Shrub.

14 W. ova'ta (Cav. diss. 6. p. 317. t. 171. f. 2.) leaves roundish-ovate, unequally toothed, tomentose; heads of flowers sessile, leafy. ♄. S. Native of Peru. Flowers yellow. Stipulas linear, deciduous.

Ovate-leaved Waltheria. Shrub 4 feet.

15 W. elli'ptica (Cav. diss. 6. p. 316. t. 171. f. 2.) leaves oblong, obtuse, toothed, tomentose; heads of flowers axillary, compact, glomerate; calyx very villous; corolla smooth. ♄. S. Native of the East Indies. Flowers yellow. Stipulas lanceolate, deciduous.

Elliptical-leaved Waltheria. Fl. July. Clt. 1812. Shrub 3 ft.

16 W. Durandi'nha (St. Hil. fl. bras. 1. p. 153. pl. usu. bras. no. 34.) stem suffruticose, ascending; leaves ovate or ovate-orbicular, obtuse, cordate at the base, lower ones pilose, upper ones tomentose and glaucous; heads of flowers terminal, and few axillary; calyx pubescent; petals bearded above the claw; tube of stamens entire. ♄. S. Native of Brazil on the banks of the river Uruguay, where it is called *Durandinha*. The inhabitants use it with success in diseases of the chest, and in decoction as an antisiphilitic, at least to allay the inflammation commonly attending that disease. It is also used to cure wounds. Flowers yellow.

Durandinha Waltheria. Fl. Dec. Feb. Shrub 1½ foot.

17 W. gra'cilis (St. Hil. fl. bras. 1. p. 154.) stem simple, suffruticose at the base; leaves ovate, or ovate-elliptic, obtuse, plaited, lower ones pilose, upper ones tomentose and canescent; heads of flowers terminal, few, axillary; tube of stamens nearly entire. ♄. S. Native of Brazil. Flowers yellow.

Slender Waltheria. Fl. Oct. Shrub ½ to 1½ foot.

18 W. glabriu'scula (St. Hil. fl. bras. 1. p. 153.) stem suffruticose at the base, nearly simple; leaves elliptic or roundish, obtuse, smoothish; heads of flowers terminal and very few, axillary; calyx villous; tube of stamens 5-cleft. ♄. S. Native of Brazil. Flowers yellow.

Smoothish Waltheria. Fl. April. Shrub ½ foot.

19 W. commu'nis (St. Hil. fl. bras. 1. p. 155.) stem shrubby at the base, nearly simple, hairy; leaves ovate-oblong or rarely ovate, obtuse, somewhat cordate at the base; pilose on both surfaces, ciliated; heads of flowers hairy-tomentose, terminal; tube of stamens very short, 5-cleft. ♄. S. Native of Brazil in the province of Minas Geraes. Flowers yellow.

Common Waltheria. Shrub ½ foot.

20 W. microphy'lla (Cav. diss. 6. p. 317. t. 170. f. 2.) leaves oblong, obtuse, plaited, serrulated, hoary, tomentose; heads of flowers sessile. ♄. S. Native of the East Indies.—Pluk. alm. t. 150. f. 5. The whole plant is covered with fine tomentum. Leaves small. Flowers yellow.

Small-leaved Waltheria. Fl. June, Jul. Clt. 1824. Sh. 4 ft.

21 W. longifòlia (D. C. prod. 1. p. 493.) leaves oblong, acutish, toothed, pubescent beneath; heads of flowers sessile, and disposed on the branches as if they were in interrupted spikes. ♄. S. Native of the Caribbee Islands. Flowers yellow.

Long-leaved Waltheria. Shrub 4 feet.

22 W. a'stropus (Spreng. syst. 3. p. 31.) leaves ovate, nearly sessile, deeply toothed, obtuse, rough from stellate down; heads of flowers corymbose, terminal. ♄. S. Native of Brazil. A'stropus tomentòsus, Spreng. Neu. endt.

Starry Waltheria. Shrub 2 to 4 feet.

Cult. This is a genus of unimportant shrubs, not worth cultivating except in general collections. The species will thrive well in a rich loamy soil, or a mixture of loam and peat, and cuttings will root readily in sand, under a hand-glass, in heat.

XVII. ALTHE'RIA (a name abridged from *Walthèria*). Pet. Th. nov. gen. mad. no. 64. D. C. prod. 1. p. 493.

Lin. syst. *Monadélphia, Pentándria.* Calyx 5-cleft, girded by a 3-leaved involucel. Petals 5. Stamens 5, joined into a tube; anthers bursting on the outside. Ovary 5-sided. Styles 5, joined. Carpels 5, joined, 1-seeded. Seeds fixed to the central placenta.

1 A. Madagascarie'nsis (D. C. prod. 1. p. 493.). ♄. S. Native of Madagascar. Visènia Madagascariénsis, Spreng. An erect, hairy herb, with cordate serrated leaves, and small, axillary, yellow flowers, which are disposed in bundles.

Madagascar Altheria. Shrub 2 feet.

Cult. This plant will thrive well in a mixture of loam, peat,

and sand, and cuttings will strike root freely in sand under a hand-glass, in heat, or it may be raised from seeds, which is perhaps the best mode.

XVIII. HERMA'NNIA (in honour of Paul Hermann, who travelled in Ceylon, afterwards professor of botany at Leyden, author of some botanical works; died in 1695). Lin. gen. no. 628. D. C. prod. 1. p. 493.

Lin. syst. *Monadélphia, Pentándria.* Calyx almost naked, campanulate, 5-cleft. Petals 5. Stamens 5. Filaments lanceolate, usually winged, monadelphous at the very base. Styles 5, joined into 1. Capsules 5-celled, 5-valved; cells many-seeded. Shrubs with usually drooping yellow flowers and generally clothed with starry tomentum. Leaves entire or toothed. Peduncles axillary, few-flowered. All natives of the Cape of Good Hope.

Sect. I. Trione'lla (a name altered from *Triònum*, the bladder ketmy; in allusion to the bladdery calyx). D. C. prod. 1. p. 493. Calyx inflated, but particularly so after flowering. Filaments of stamens much dilated.

1 H. multi'fida (D. C. prod. 1. p. 493.) leaves hoary, palmate-parted, with pinnate-parted lobes and somewhat complicated, linear, entire lobules; pedicels 1-flowered, shorter than the leaves; calyx inflated, puberulous. ♄. G. H. bipinnàta, var. Burch. cat. no. 1627. trav. 1. p. 310. Flowers yellow?

Multifid-leaved Hermannia. Shrub 3 feet.

2 H. Halica'caba (D. C. prod. 1. p. 493.) leaves whitened beneath and dotted above, lower ones palmately 5-parted, upper ones 3-parted with pinnatifid lobes, middle lobe longest; peduncles 2-4-flowered, shorter than the leaves; calyxes inflated, puberulous. ♄. G. H. bipinnàta, var. Burch. cat. no. 2020. Perhaps only a variety of *H. multífida*. Flowers yellow.

Winter-cherry-calyxed Hermannia. Shrub 1 to 3 feet.

3 H. comòsa (Burch. cat. no. 1683.) leaves tomentose, ovate, sinuately-toothed; stipulas lanceolate-linear; peduncles 2-flowered; calyx inflated, furnished with hairy, tufted appendages. ♄. G. Flowers yellow?

Tufted-appendaged Hermannia. Shrub 2 feet.

4 H. althæifòlia (Lin. spec. 941.) leaves tomentose, obovate, plaited, crenate; stipulas ovate-lanceolate, 3-5-nerved; peduncles solitary or twin, 2-3-flowered, longer than the leaves. ♄. G. Curt. bot. mag. t. 307. Cav. diss. 6. t. 179. f. 2. H. aúrea, Jacq. schœnbr. t. 214. Flowers dark-yellow or sulphur-coloured.

Hollyhock-leaved Hermannia. Fl. Mar. July. Clt. 1728. Shrub 3 feet.

5 H. plica'ta (Willd. spec. 3. p. 589.) leaves tomentosely-hairy, ovate, somewhat cordate, wrinkled, toothletted; stipulas ovate, acute; peduncles 2-3-flowered; calyx cylindrical when in flower, but at length becoming inflated. ♄. G. H. althæifòlia, Jacq. schœnbr. t. 213. exclusive of the synonyme. Flowers deep-yellow. Stipulas 3-nerved.

Plaited-leaved Hermannia. Fl. Nov. Dec. Clt. 1774. Shrub 3 to 4 feet.

6 H. ca'ndicans (Ait. hort. kew. 2. p. 412.) leaves clothed with white tomentum, roundish-ovate, crenated; stipulas lanceolate-awl-shaped; peduncles 2-3-flowered; calyx campanulate, spreading. ♄. G. Jacq. schœnbr. 1. t. 117. H. præmórsa, Wendl. obs. 51. Flowers yellow.

Whitish-leaved Hermannia. Fl. April, June. Clt. 1774. Shrub 3 to 4 feet.

7 H. mo'llis (Willd. enum. p. 692.) leaves covered with white tomentum, oblong, obtuse, toothed, wedge-shaped, and quite entire at the base; peduncles 2-flowered; calyx campanulate, velvety. ♄. G. Scarcely distinct from *H. cándicans*. Flowers yellow.

Soft-leaved Hermannia. Fl. May, Ju. Clt. 1814. Sh. 3 ft.

8 H. decu'mbens (Willd. enum. suppl.) leaves pubescently tomentose, oblong, unequally toothed, rounded at both ends; stipulas ovate, somewhat toothed; peduncles 3-4-flowered, drooping; calyx inflated, globose, very villous. ♄. G. Spreng. neu. entd. 1. p. 299. Flowers yellow.

Decumbent Hermannia. Fl. May, June. Clt. 1821. Shrub decumbent.

9 H. hyssopifòlia (Lin. spec. 942.) leaves pubescent, wedge-shaped, lanceolate, obtuse, toothed at the apex; flowers terminal, aggregate, racemose; calyx inflated, hairy. ♄. G. Cav. diss. 6. t. 181. f. 3. Flowers straw-coloured.

Hyssop-leaved Hermannia. Fl. April, July. Clt. 1725. Shrub 3 to 6 feet.

10 H. trifolia'ta (Lin. spec. 942.) leaves sessile, cuneated, obcordate, somewhat crenated at the apex, clothed with white tomentum; stipulas oblong, obtuse, resembling lateral leaflets; flowers aggregate, pendulous; calyx inflated, hairy. ♄. G. Cav. diss. 6. t. 182. f. 2. Stem very humble, and as if it were creeping. Flowers yellow.

Trifoliate Hermannia. Fl. May, Aug. Clt. 1752. Shrub trailing.

11 H. triphy'lla (Cav. diss. 6. t. 178. f. 3. but not of Lin.) leaves somewhat scabrous, 3-parted, with wedge-shaped partitions, which are truncated, and toothed at the apex, middle one stalked; stipulas lanceolate-awl-shaped. ♄. G. H. triphýlla, Lin. is a species of *Connàrus*. Flowers pale-yellow.

Three-leaved Hermannia. Fl. May, July. Clt. 1819. Shrub 4 to 6 feet.

12 H. glandulòsa (Link. enum. 2. p. 179.) leaves oval, unequally crenate, somewhat pubescent; stipulas ovate, acute, usually cut; stem covered with glandular pubescence. ♄. G. Flowers yellow. Perhaps this species does not belong to this section.

Glandular-stemmed Hermannia. Fl. May, July. Clt. 1822. Shrub 2 to 3 feet.

13 H. fra'grans (Link. enum. 2. p. 179.) leaves stalked, oval, obtuse, waved, crenate, and are as well as the stem clothed with hairy-tomentum. ♄. G. Native of the Cape of Good Hope. Flowers yellow.

Fragrant Hermannia. Clt. 1822. Shrub 2 to 3 feet.

Sect. II. Hermanne'lla (a diminutive of *Hermánnia*). D. C. prod. 1. p. 494. Calyx not or scarcely inflated. Filaments of stamens gradually dilated.

14 H. disermæfòlia (Jacq. schœnbr. t. 121.) leaves clothed with white tomentum, lanceolate, serrated, bluntish, with waved margins; stipulas awl-shaped; peduncles 1-flowered, short. ♄. G. This species is confused by Persoon with *H. trifurcàta*. Flowers orange-coloured, mixed with red.

Two-awned-leaved Hermannia. Fl. Mar. April. Clt. 1795. Shrub 2 to 5 feet.

15 H. di'sticha (Schrad. and Wendl. sert. han. t. 10.) leaves hispidly-villous, roundish-ovate, obtuse, toothed; stipulas somewhat ovate, acuminate; pedicels 1-flowered, shorter than the leaves; calyx angular. ♄. G. H. rotundifòlia, Jacq. schœnbr. t. 118. Flowers deep-yellow. Pedicels very short.

Distich-branched Hermannia. Fl. May, Aug. Clt. 1789. Shrub 3 to 6 feet.

16 H. melochioìdes (Burch. cat. no. 2957.) leaves smooth, ovate, unequally toothed; stipulas ovate-acuminated; pedicels 1-flowered, shorter than the leaves; filaments filiform-linear. ♄. G. Flowers yellow.

Melochia-like Hermannia. Fl. May, Jul. Clt. 1818. Shrub 1 to 2 feet.

17 H. bryonifòlia (Burch. cat. no. 2141.) leaves scabrous,

with stellate tomentum, cordate, ovate, unequally toothed; stipulas linear-lanceolate; pedicels 1-flowered, drooping. ♄. G. Leaves resembling those of *Málva bryonifòlia*. Flowers yellow.

Bryony-leaved Hermannia. Fl. May, July. Clt. 1818. Shrub 1 to 3 feet.

18 H. SALVIFÒLIA (Lin. suppl. 302.) leaves tomentosely hispid, wrinkled, oblong, bluntish, quite entire, almost sessile; stipulas long, lanceolate-awl-shaped; pedfcels 2-3-flowered; flowers naked. ♄. G. Cav. diss. 6. t. 180. f. 2. Flowers yellow.

Sage-leaved Hermannia. Fl. Apr. Jul. Clt. 1795. Sh. 3 to 6 ft.

19 H. MI'CANS (Schrad. and Wendl. sert. han. t. 5.) leaves clothed with hispid down, wrinkled, oblong, very blunt, somewhat toothed at the apex, on short petioles; stipulas lanceolate-awl-shaped; flowers aggregate, involucrated. ♄. G. H. latifòlia, Jacq. schœnbr. t. 119. Leaves yellowish from stellate down. Flowers dark-yellow.

Glittering-leaved Hermannia. Fl. May, Aug. Clt. 1790. Shrub 3 to 6 feet.

20 H. INVOLUCRA'TA (Cav. diss. 6. p. 328. t. 177. f. 1.) leaves clothed with hispid tomentum, oblong, acutish, quite entire, almost sessile; stipulas lanceolate-awl-shaped; flowers solitary, involucrated with lanceolate bracteas. ♄. G. Resembles the two preceding. Flowers pale-yellow.

Involucrated-flowered Hermannia. Fl. May, June. Clt. 1794. Shrub 2 feet.

21 H. SCORDIFÒLIA (Jacq. schœnbr. 1. t. 120.) leaves oblong, obtuse, crenated, stalked, tomentose beneath; stipulas awl-shaped; pedicels 1-2-3-flowered, rather longer than the leaves; calyx spreading. ♄. G. Leaves green and roughish above, clothed with white short tomentum beneath. Flowers yellow.

Germander-leaved Hermannia. Fl. April, Nov. Clt. 1794. Shrub 3 to 5 feet.

22 H. DENUDA'TA (Lin. fil. suppl. 301.) leaves smooth, lanceolate, serrated, glaucous; stipulas ovate, acuminated; pedicels usually twin, 2 or 4-flowered. ♄. G. Cav. diss. 6. t. 181. f. 1. Jacq. schœnbr. t. 122. Flowers deep-yellow.

Naked Hermannia. Fl. May, July. Clt. 1774. Shrub 3 to 4 feet.

23 H. ALNIFÒLIA (Lin. spec. 942.) leaves smooth, obovate-wedge-shaped, very obtuse, crenate, emarginate, plaited; stipulas ovate, awl-shaped at the apex; peduncles usually 2-3-flowered, disposed in racemes at the tops of the branches. ♄. G. Curt. bot. mag. t. 299. Cav. diss. 6. p. 329. t. 179. f. 1. Jacq. schœnbr. t. 291. Flowers pale-yellow, small.

Alder-leaved Hermannia. Fl. Feb. May. Clt. 1728. Shrub 2 to 6 feet.

24 H. CUNEIFÒLIA (Jacq. schœnbr. 1. t. 124.) leaves pubescent, obovate-wedge-shaped, truncated, emarginate, toothed; stipulas ovate, acute; racemes terminal; pedicels 1-flowered. ♄. G. Leaves much smaller than those of the preceding species, but the flowers are larger, of a pale-yellow colour.

Wedge-leaved Hermannia. Fl. Aug. Sep. Clt. 1791. Shrub 3 to 5 feet.

25 H. HOLOSERI'CEA (Jacq. schœnbr. t. 292.) leaves clothed with soft white tomentum, oblong, wedge-shaped, rounded and toothed at the top; stipulas lanceolate; racemes terminal, panicled. ♄. G. Flowers small, yellow.

Holosericeous Hermannia. Fl. May, June. Clt. 1792. Shrub 3 to 4 feet.

26 H. HIRSU'TA (Schrad. and Wendl. sert. han. t. 4.) leaves white from tomentum beneath, oblong-obovate, wedge-shaped, unequally toothed at the apex; stipulas semi-cordate, acuminated; racemes lateral; pedicels elongated, 2-flowered. ♄. G. Branches hairy, divaricating. Leaves green on the upper surface. Flowers deep yellow.

Hairy Hermannia. Fl. May, Ju. Clt. 1790. Sh. 3 to 5 ft.

27 H. HISPI'DULA (Rchb. ex Spreng. syst. 3. p. 27.) leaves oblong, tapering to both ends, denticulated, rather hispid; stipulas ovate-lanceolate; flowers loosely panicled. ♄. G. Flowers yellow.

Hispid Hermannia. Fl. Mar. Apr. Clt.? Shrub 2 to 4 ft.

28 H. SCA'BRA (Cav. diss. 6. t. 182. f. 2.) leaves scabrous above, but tomentose beneath, wedge-shaped, oblong, unequally toothed at the apex, quite entire at the base; stipulas semi-cordate, acuminated; pedicels 2-3-flowered. ♄. G. Jacq. schœnbr. t. 127. exclusive of the synonymes. H. áspera, Wendl. obs. 52. H. hírta, Sparm. Flowers pale-yellow.

Scabrous-leaved Hermannia. Fl. Mar. April. Clt. 1789. Shrub 2 to 4 feet.

29 H. MULTIFLÒRA (Jacq. schœnbr. t. 128.) leaves smoothish, wedge-shaped, oblong, truncated, toothed at the apex; stipulas oblong, acute; racemes few-flowered; calyx campanulate. ♄. G. Flowers pale-yellow. Pedicels 1-2-flowered.

Many-flowered Hermannia. Fl. March, May. Clt. 1791. Shrub 3 to 5 feet.

30 H. FLA'MMEA (Jacq. schœnbr. t. 129.) leaves smooth, wedge-shaped, lanceolate, truncated, and toothed at the apex; racemes terminal; peduncles 1-2-flowered; calyx somewhat reflexed. ♄. G. Flowers orange-coloured or red.

Flame-flowered Hermannia. Fl. year. Clt. 1794. Sh. 1 to 3 ft.

31 H. ANGULA'RIS (Jacq. schœnbr. t. 126.) leaves smooth above, but hoary beneath, wedge-shaped, lanceolate, truncated and toothed at the apex; peduncles 2-flowered; calyx with 5, winged angles. ♄. G. Stem scabrous from fascicled tomentum. Flowers yellow, in short terminal racemes. Perhaps this species would have been better placed in the first section.

Angular-calyxed Hermannia. Fl. April, May. Clt. 1791. Shrub 2 to 4 feet.

32 H. TRIFU'RCA (Lin. spec. 942.) leaves rather velvety, wedge-shaped, lanceolate, blunt, entire or 3-toothed at the apex; racemes many-flowered; pedicels 1-flowered, leaning to one side; calyx campanulate. ♄. G. Cav. diss. 6. t. 178. f. 2. Jacq. schœnbr. t. 125. Flowers pale red.

Three-forked-leaved Hermannia. Fl. April, July. Clt. 1789. Shrub 1 to 4 feet.

33 H. ODORA'TA (Ait. hort. kew. 2. p. 412.) leaves velvety, wedge-shaped, lanceolate, obtuse, lower ones 3-5-toothed at the apex, upper ones entire; stipulas linear-awl-shaped; calyx campanulate, spreading. ♄. G. Flowers yellow.

Sweet-scented Hermannia. Fl. Feb. Oct. Clt. 1780. Shrub 2 to 4 feet.

34 H. LAVANDULÆFÒLIA (Lin. spec. 942.) leaves clothed with velvety tomentum, lanceolate, obtuse, quite entire; stipulas linear-awl-shaped; peduncles 1-2-flowered; calyx angular, campanulate. ♄. G. Cav. diss. 6. t. 180. f. 1. Jacq. schœnbr. t. 215.—Dill. elth. t. 147. f. 176. Flowers yellow.

Lavender-leaved Hermannia. Fl. May, July. Clt. 1732. Shrub 2 to 6 feet.

35 H. VELUTÌNA (Burch. cat. no. 3393.) leaves clothed with velvety tomentum, oblong-lanceolate, quite entire, mucronate at the apex; stipulas linear, acute, twice as long as the petioles; racemes few-flowered. ♄. G. Flowers yellow. Resembles *H. lavandulæfòlia*.

Velvety-leaved Hermannia. Fl. May, Jul. Clt. 1818. Sh. 3 ft.

36 H. LINIFÒLIA (Lin. mant. 256.) leaves linear; peduncles 1-flowered. ♄. G. Flowers yellow?

Flax-leaved Hermannia. Shrub 2 feet.

37 H. FILIFÒLIA (Lin. fil. suppl. 302.) leaves smooth, with scabrous edges, linear, 3-sided, quite entire; stipulas long, linear; flowers axillary, and terminal, twin, and tern. ♄. G. Cav. diss. 6. p. 332. t. 180. f. 3. Jacq. schœnbr. t. 123. Flowers of a reddish-sulphur colour.

Thread-leaved Hermannia. Fl. May, Aug. Clt. 1816. Shrub 1 to 3 feet.

38 H. PROCU'MBENS (Cav. diss. 6. t. 177. f. 2.) leaves smoothish, oblong, pinnatifidly-toothed, lower ones ovate, upper ones elongated; stipulas cordate, acute; stem procumbent; racemes few-flowered. ♄. G. Flowers pale-yellow.

Procumbent Hermannia. Fl. May, June. Clt. 1792. Shrub procumbent.

39 H. TENUIFÒLIA (Sims, bot. mag. t. 1348.) leaves pinnatifid, with linear, entire, acute lobes. ♄. G. Flowers nodding, yellow, on very short pedicels. Leaves smooth in the specimen but scabrous in the figure.

Thin-leaved Hermannia. Fl. Ju. Jul. Clt.? Shrub 2 feet.

40 H. INCI'SA (Willd. spec. 3. p. 599.) leaves pinnatifid, with linear-lanceolate, quite entire segments; petals unguiculate, deeply-toothed. ♄. G. Flowers yellow? with wedge-shaped filaments. Habit of *Mahérnia*.

Cut-petalled Hermannia. Fl. June, July. Clt. 1806. Shrub 2 to 3 feet.

41 H. GRANDIFLÒRA (Ait. hort. kew. ed. 2. vol. 4. p. 141.) leaves lanceolate, smooth, upper ones quite entire, lower ones serrated at the apex. ♄. G. Flowers large, red?

Great-flowered Hermannia. Fl. year. Clt. 1791. Shrub 1 ft.

42 H. PULVERULE'NTA (Andr. bot. rep. t. 164.) leaves roughish and whitish, bipinnatifid; peduncles 2-flowered, very long. ♄. G. Flowers of a dirty-yellow colour. Resembles *Mahérnia* but has lanceolate filaments.

Powdered-leaved Hermannia. Fl. May, Aug. Clt. 1820. Shrub 2 to 4 feet.

43 H. ARGE'NTEA (Smith, in Rees' cycl. vol. 17.) leaves beset with starry scales, doubly pinnatifid, with decurrent lobes; peduncles racemose, 1-flowered. ♄. G. Leaves almost like those of *Lavándula multífida*, but smaller and scaly. Flowers orange-coloured, mixed with yellow. Calyx short, campanulate.

Silvery Hermannia. Fl. May, July. Clt. 1820. Sh. 2 to 4 ft.

44 H. CORONOPIFÒLIA (Link. enum. 2. p. 180.) leaves linear, pinnatifid, fleshy, smoothish; stem pubescent. ♄. G.

Buckhorn-leaved Hermannia. Fl. June, July. Clt. 1823. Shrub 2 feet.

Cult. The species of *Hermánnia* grow freely in any light rich soil, or a mixture of loam and peat; and young cuttings will root readily in the same kind of soil, under a hand-glass. They are all free flowerers and worth cultivating.

XIX. MAHE'RNIA (an anagram of *Hermánnia*). Lin. mant. 59. D. C. prod. 1. p. 496.

LIN. SYST. *Monadélphia, Pentándria.* Calyx naked, campanulate, 5-cleft. Petals 5, with an obcordate limb, spirally twisted, and straightish claws (f. 91. *b.*). Filaments 5 (f. 91. *f.*), monadelphous at the base (f. 91. *c.*), dilated into a cordate tubercle, or a cup-formed process in the middle (f. 91. *g.*). Styles 5, sometimes joined into 1 (f. 91. *d.*). Capsules 5-celled, 5-valved (f. 91. *f.*), many-seeded. Small shrub with the habit of *Hermánnia*, with toothed or pinnatifid leaves, and drooping, red, or yellow flowers. All natives of the Cape of Good Hope.

1 M. VERTICILLA'TA (Lin. mant. 59.) leaves disposed in whorls, entire, or trifid, linear, ciliated; stem decumbent; peduncles 1-2-flowered, involucrated. ♄. G. Cav. diss. 6. t. 176. f. 1. Hermánnia ciliàris, Lin. fil. suppl. 302.—Pluk. mant. t. 344. f. 3. Flowers yellow, with red veins. There are 2 varieties of this plant, one with almost smooth leaves, the other with ciliated leaves. The leaves are opposite, pinnatifid, or trifid, and the stipulas are large and trifid, giving the appearance of whorled leaves.

Whorled-leaved Mahernia. Fl. Ju. Aug. Clt. 1820. Sh. 2 ft.

2 M. RESEDÆFÒLIA (Burch. cat. no. 2280.) leaves smooth, pinnate-parted, with linear, entire lobes; stipulas cut, trifid. ♄. G. Resembles *M. verticillàta*. Flowers yellow, streaked with red. Peduncles elongated, 2-flowered.

Mignonette-leaved Mahernia. Fl. June, Aug. Clt. 1816. Shrub 1 to 2 feet.

3 M. BIPINNA'TA (Lin. syst. 253.) leaves smooth, twice pinnate-parted into linear lobes; peduncles axillary, elongated, 2-flowered. ♄. G. Cav. diss. 6. t. 176. f. 2. M. pinnàta, Curt. bot. mag. t. 277. Hermánnia pinnàta, Lin. 943. exclusive of the synonymes. Flowers drooping, red.

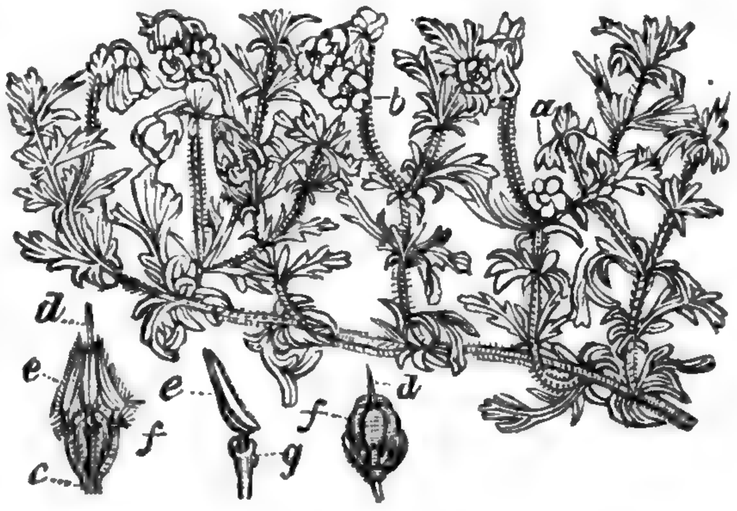
Bipinnate-leaved Mahernia. Fl. June, Oct. Clt. 1752. Shrub 1 foot.

4 M. INCÌSA (Jacq. schœnbr. 1. t. 54.) leaves pinnate-lobed, covered with glandular, stellate, and simple down; peduncles usually 2-flowered. ♄. G. Curt. bot. mag. t. 353. Flowers in the bud of a deep-crimson, as they open they incline to a deep-orange, and finally become yellowish.

Cut-leaved Mahernia. Fl. Jul. Aug. Clt. 1792. Sh. 2 to 4 ft.

5 M. DIFFU'SA (Jacq. schœnbr. 2. t. 201.) leaves smooth, pinnatifid; peduncles 2-flowered, and are erect as well as branches; stem scabrous, procumbent, diffuse. ♄. G. Lodd. bot. cab. t. 187. Hermánnia diffùsa, Lin. fil. suppl. 302. Flowers drooping, yellow.

FIG. 91.



Diffuse Mahernia. Fl. June, Aug. Clt. 1774. Shrub 1 to 2 feet.

6 M. HETEROPHY'LLA (Cav. diss. 6. p. 324. t. 178. f. 1.) leaves opposite, and in whorls, scabrous from scattered stellated tomentum, linear-wedge-shaped, coarsely-toothed; stipulas linear, entire; peduncles velvety, somewhat terminal, 2-4-flowered. ♄. G. Hermánnia grossulariæfòlia, Lin. spec. 943. Flowers bright-yellow.

Various-leaved Hermannia. Fl. April, July. Clt. 1731. Shrub 1 to 2 feet.

7 M. ERODIOI'DES (Burch. cat. no. 1491.) leaves smooth, ovate, obtuse, deeply toothed, with unequal, obtuse lobules; stipulas ovate; peduncles 2-flowered, twice as long as the leaves. ♄. G. Flower probably yellow.

Erodium-like Mahernia. Shrub 1 foot?

8 M. SESSILIFO'LIA (D. C. prod. 1. p. 496.) leaves pinnate-parted, with linear, entire, acute lobes; lower leaves, as well as stems, beset with bristly hairs; branches twiggy, smooth at the top; peduncles 1-2-flowered. ♄. G. Flowers yellow?

Sessile-leaved Mahernia. Fl. June, July. Clt. 1818. Shrub 1 to 2 feet.

9 M. RU'TILA (Jacq. ex Spreng. syst. 3. p. 28.) leaves subpinnatifid, oblong, cut, scabrous; stem procumbent, hairy? ♄. G.

Ruddy Mahernia. Fl. June, July. Shrub 1 foot.

10 M. PULCHE'LLA (Cav. diss. 6. p. 325. t. 177. f. 3.) leaves smooth, pinnatifid, with entire or cut, blunt lobes; stipulas ovate, ending in a bristle; peduncles 2-flowered, drooping, shorter than the leaves; stem erect, rather scabrous. ♄. G. Hermánnia pulchélla, Lin. fil. suppl. 302. Flowers small, reddish.

Neat Mahernia. Fl. June, Aug. Clt. 1792. Shrub ½ to 1 ft.

11 M. FRA'GRANS (Rchb. ex Spreng. syst. 3. p. 29.) leaves linear-lanceolate, acutely and deeply pinnatifid, hispid from stellate hairs beneath; stipulas 3-parted; bracteas connate; pedicels hispid. ♄. G. Flowers red?

Fragrant Mahernia. Fl. April, July. Shrub 1 foot.

12 M. VERNICA'TA (Burch. cat. no. 1461. trav. 1. p. 278.)

the whole plant is very smooth; leaves pinnatifid, with entire, blunt lobes; stipulas ovate; peduncles usually 2-flowered, shorter than the leaves; stem erect. ♄. G. Flowers nodding, of a vermilion colour.

Varnished Mahernia. Fl. June, Aug. Clt. 1816. Shrub 1 to 2 feet.

13 M. glabra'ta (Cav. diss. 6. p. 326. t. 200. f. 1.) leaves roughish from dots and stellated down, lanceolate, distantly, pinnatifidly toothed; stipulas ovate, mucronate; peduncles very long, 2-flowered. ♄. G. Jacq. schœnbr. 1. t. 53. Hermánnia glabràta, Lin. fil. suppl. 301. Mahérnia odoràta, Andr. bot. rep. t. 85. Flowers drooping, yellow, with a scent like the *Jonquil*; they are rather large.

Smooth Mahernia. Fl. April, June. Clt. 1789. Shrub 1 to 2 feet.

14 M. oxalidiflo'ra (Burch. cat. no. 1536. trav. 1. p. 295.) leaves smooth, pinnatifid, with entire, acutish lobes; stipulas ovate, acute; branches erect, rather scabrous; peduncles 1-2-flowered, longer than the leaves. ♄. G. Resembles *M. vernicàta*, but with the leaves more deeply cut, and with flowers twice the size. Flowers red or yellow.

Oxalis-flowered Mahernia. Fl. April, July. Clt. 1817. Shrub 1 to 2 feet.

15 M. grandiflo'ra (Burch. trav. 1. p. 295. and bot. reg. 3. t. 224.) leaves lanceolate-cuneated, obtuse, serrate-toothed, white beneath; peduncles usually 2-flowered, divaricating, and are as well as the calyxes clammy. ♄. G. Paters. trav. p. 60 with a figure. Flowers campanulate, the largest of all the genus, drooping, red. M. Burchéllii, Sweet.

Great-flowered Mahernia. Fl. May, July. Clt. 1812. Shrub 1 to 2 feet.

16 M. biserra'ta (Cav. diss. 6. p. 326. t. 200. f. 2.) leaves smooth, ovate-lanceolate, unequally toothed; stipulas lanceolate, mucronate; peduncles 3-flowered, length of leaves. ♄. G. Hermánnia biserràta, Lin. fil. suppl. 302. Flowers yellow. Habit of *Hermánnia*.

Twice-serrate-leaved Mahernia. Shrub 1 to 2 feet.

17 M. vesica'ria (D. C. prod. 1. p. 497.) leaves clothed with stellate hairs beneath, lanceolate, pinnatifid, with 2-3-toothed lobes; stipulas setaceous; stem hairy; flowers terminal, racemose; peduncles 1-flowered; fruit inflated, 5-angled. ♄. G. Native of? Hermánnia vesicària, Cav. diss. 6. p. 331. t. 181. f. 2. M. odoràta, var. β? incìsa, Pers. ench. 2. p. 218. Flowers yellow. Filaments obcordate, hairy.

Bladdery-capsuled Mahernia. Fl. May, July. Clt. 1818. Shrub 1 to 2 feet.

18 M. linnæoi'des (Burch. cat. no. 1878.) leaves ovate-roundish, crenated, clothed with dots of stellate down; stipulas acute; pedicels 1-2-flowered, much longer than the leaves. ♃. G. Flowers red? A very distinct species, with the habit of *Linnæ'a boreàlis*.

Linnæa-like Mahernia. Pl. ½ foot.

19 M.? viola'cea (Burch. cat. no. 3098.) leaves ovate, obtuse, toothed, smooth; peduncles 1-3-flowered, longer than the leaves, and opposite them. ♃? G. Flowers of a violet-colour. Plant with the habit of *Melòchia pyramidàta*.

Violaceous-flowered Mahernia. Pl. 1 foot.

20 M. spino'sa (Burch. trav. 1. p. 279.) leaves minute, wedge-shaped, usually 3-toothed at the apex, and are smooth as well as the erect, branched stem. ♄. G.

Spinose Mahernia. Shrub 1 to 2 feet.

Cult. *Mahérnia* is a genus of pretty little shrubs. An equal mixture of loam and peat suits them best, and young cuttings taken off at a joint, and planted in the same kind of soil, under a hand-glass, will root readily.

Tribe IV.

DOMBEYA'CEÆ (plants agreeing with *Dombèya* in important characters.) Kunth, malv. p. 12. D. C. prod. 1. p. 497.

Calyx 5-lobed (f. 92. *a*.). Petals 5, flat, large, rather unequal-sided (f. 92. *b*.), convolute when in the bud. Stamens multiple the number of petals, in one row, monadelphous (f. 92. *d. c*.), rarely all fertile, but generally intermixed with sterile thread-like filaments, or strap-formed ones (f. 92. *d*.); with 2 or 3 fertile ones between each sterile one (f. 92. *c*.). Styles 3-5, joined (f. 92. *f*.) or free. Ovulæ 2 in each cell, or if more they are disposed in 2 rows. Embryo straight, located in the axis of a fleshy albumen. Cotyledons leafy, usually bifid, twisted, or flat. This tribe contains shrubs and trees usually with large elegant flowers.

XX. RUI'ZIA (in honour of Don Hippolito Ruiz, a traveller in Peru and Chili, author of Flora Peruviana et Chilensis, in 5 vols. 4to. in conjunction with Pavon, see *Pavònia*.) Cav. diss. p. 3. 117. D. C. prod. 1. p. 497.

Lin. syst. *Monadélphia, Polyándria*. Calyx permanent, 5-parted, surrounded by a 3-leaved, deciduous involucel. Petals 5. Stamens 30-40, joined into an urceolus, all bearing anthers. Styles 10. Carpels 10, woody-membranous, 2-seeded, cohering closely together. Seeds rather triquetrous, not winged.—Shrubs, natives of the Mauritius. Leaves lobed or entire, clothed with mealy down beneath. Peduncles axillary, bifid, corymbose. Flowers small.

1 R. corda'ta (Cav. diss. 3. p. 117. t. 36. f. 2.) leaves cordate, oblong, acuminated, repand, hoary. ♄. S. Native of the island of Bourbon. Flowers pale-yellow.

Cordate-leaved Ruizia. Shrub 6 feet.

2 R. loba'ta (Cav. diss. 3. p. 118. t. 36. f. 1.) leaves cordate, crenated, 3-5-lobed, oblong, middle lobe longest and acuminated, hoary beneath, and smooth above. ♄. S. Native of the island of Bourbon. Flowers pale-red.

Lobed-leaved Ruizia. Clt. 1816. Shrub 6 feet.

3 R. varia'bilis (Jacq. schœnbr. 3. t. 295.) leaves of flowering branches palmatifid, those of sterile branches palmate-parted, hoary beneath. ♄. S. Native of the island of Bourbon. R. palmàta, Cav. diss. 3. p. 119. t. 37. f. 1. Flowers pale-red.

Var. β, *laciniàta* (Cav. diss. 3. p. 119. t. 37. f. 2.) leaves palmate-parted, with linear, very narrow, pinnatifid lobes. ♄. S. Native of the island of Bourbon. Flowers pale-red.

Variable-leaved Ruizia. Fl. May. Clt. 1792. Shrub 10 ft.

Cult. The species of *Ruízia* thrive well in a mixture of loam, sand, and peat; and cuttings will root freely if planted in the same kind of soil under a hand-glass, in heat.

XXI. PENTA'PETES (one of the names given by the Greeks to Cinquefoil, from πεντε, *pente*, five, in allusion to the 5-celled fruit.) Lin. gen. no. 834. D. C. prod. 1. p. 498.—Brotèra, Cav. icon. 5. p. 19.

Lin. syst. *Monadélphia, Polyándria*. Calyx deciduous, girded by a unilateral, 3-leaved involucel. Petals 5. Stamens with 3 antheriferous filaments between each sterile one. Style 1, with 5 teeth at the apex, or 5 styles joined together. Capsule 5-celled, 5-valved, many-seeded. Seeds naked, never winged.—Annual herbs, with undivided leaves, and axillary, 1 or few-flowered peduncles. Flowers shewy.

1 P. phœni'cea (Lin. spec. 958.) leaves lanceolate, halbert-shaped, serrated; flowers 1-2, axillary, drooping; anthers 15; style 1, 5-toothed at the apex. ♂. S. Native of the East

Indies. Mill. fig. t. 200. Ker. bot. reg. t. 575.—Rumph. amb. 5. p. 288. t. 100. f. 1.—Rheed. mal. 10. p. 1. t. 1. Flowers drooping, scarlet.

Scarlet-flowered Pentapetes. Fl. July, Aug. Clt. 1690. Pl. 2 to 3 feet.

2 P. ANGUSTIFÒLIA (Blum. bijdr. ex Schlecht. Linnæa. 1. p. 655.) leaves linear-lanceolate, serrated, roundish and cordate at the base; flowers 1-2, axillary, drooping; fertile anthers 15; style clavate, sulcated. ⊙? S. Native of Java. Flowers probably red or scarlet.

Narrow-leaved Pentapetes. Pl. 1 to 3 feet.

3 P. OVA'TA (D. C. prod. 1. p. 498.) leaves ovate, serrated; peduncles axillary, 2-3-flowered; anthers 5; styles 5. ⊙. S. Native of New Spain. Brotèra ovàta, Cav. icon. 5. p. 19. t. 433. Sprengèlia modésta, Schultz. obs. 134. Flowers reddish-yellow. Perhaps generically distinct from *P. phœnicea*.

Ovate-leaved Pentapetes. Fl. June, Sep. Clt. 1805. Pl. 2 ft.

Cult. Beautiful flowering plants, which will grow freely in a mixture of loam, sand, and peat, or any light rich soïl; and cuttings soon strike root in sand or mould under a hand-glass, in heat. They are also easily increased by seeds, which generally ripen in this country.
